

**3rd International Symposium**  
**Basal Ganglia Speech Disorders and Deep Brain Stimulation**  
*Institute of Neurology,*  
*Queen Square, London WC1N 3BG, UK*  
*24 & 25 March 2014*

**Symposium Background:**

The ability to communicate in an articulate and effective way is a highly complex and highly valued human need that can be severely affected by dysfunction of the basal ganglia. Medical and surgical treatments can have no effect on speech, in spite of their beneficial effect on movement.

The 3<sup>rd</sup> International Symposium on “*Basal Ganglia Speech disorders and deep brain stimulation*” aims to bring together a unique group of the world’s most prominent researchers and practitioners in the field of Movement Disorders, Functional Neurosurgery, speech motor control and rehabilitation.

This area of neurological studies remains relatively new and as such it presents many opportunities for the advancement of research and patient care.
