

The images above show views of the completed model. The stilts and frame of the structure would be built from 80mm thick bamboo poles lashed together and weighted with concrete inside one hollowed out end. The floor would be built from 80mm thick bamboo poles lashed together. The walls and roof would be built from a combination of 30mm thick bamboo poles and prefabricated grass mat sections. The lean-to also shown in these photographs, which is part of the original model kit, could be easily adapted to provide a bicycle shelter. Hopefully the structure would only need to be secured by weights, with no need to damage any of the ground in the quad.
