Abstract: Pain is one of the most common symptoms experienced by patients with cancer at all stages of the disease, many of whom experience poor pain control. Findings from earlier studies suggest that mobile health (mHealth) approaches may have value in the field of pain management. Currently, development is at an early stage and the needs and preferences of users are not yet well understood. The aim of this study is to report the design and development of a mHealth-based pain recording system for this population to support effective pain management. A user-centred design (UCD) approach with multiple stages, including usability testing, was adopted for achieving this and ensure the system's clinical utility. Usability testing was conducted on highfidelity clickable prototypes developed for the system with eleven representative system users. The system

was wellreceived, and all participants found it well-aligned with their needs and easy to use, with only a few addressable usability issues reported. Captured usability metrics indicated that the under-development system has the potential to be effective, efficient and satisfying for users.

Volume: 16

Issue: 5

Pages: 570-576

Date: Sep

Short Title: Incorporating Mental Health Into Lifestyle Medicine

ISSN: 1559-8276

DOI: 10.1177/15598276221084250

Accession Number: WOS:000808881700001

Abstract: The evidence-based interconnection between mental health with lifestyle medicine practice is discussed. The extent to which physical health, and mental and behavioral health overlap are significant, and their interaction is seen in many ways. These bidirectional influences form a continuous thread through all lifestyle medicine pillars. The intersection of mental health and lifestyle should be considered and applied to provide optimal evidence-based lifestyle medicine for all patient populations who will benefit from the specific attention to diet, physical activity, relationships, stress, sleep, and substance use. Lifestyle medicine can be utilized to directly address and treat a range of mental health symptoms and disorders, and physical illnesses. In addition, behavior change skills and addressing the psychological factors contributing to barriers are crucial to helping patients reach their lifestyle medicine goals. Approaches to practice that attend to, and address, mental and behavioral health are relevant to and necessary for all types of providers who work within the lifestyle medicine framework.

Title: Communication strategies in psychologically informed osteopathic practice: A case report

Journal: International Journal of Osteopathic Medicine

Volume: 47

Date: Mar

Short Title: Communication strategies in psychologically informed osteopathic practice: A case report

ISSN: 1746-0689

DOI: 10.1016/j.ijosm.2022.10.009

Article Number: 100647

Accession Number: WOS:000964436100001

Abstract: Introduction: This paper presents qualitative data from communication between an osteopath and patient participating in a research study to develop a new psychologically informed pain management course. Presentation: 'Adam', aged 49, presented with persistent pain and multiple health problems including HIV and depression. His aim in joining the study was to find ways to stay independent. Evaluation: Existing osteopathic evaluations of musculoskeletal dysfunction were supported by psychological assessments of health beliefs and coping strategies. Intervention: Psychological and mindfulness exercises were integrated into six osteopathic treatment sessions to support symptom relief, patient learning and self-management. Data analysis: Audio-recordings were analysed qualitatively using Linguistic Ethnography. Outcomes: Communication moved from 'mechanistic' pain discourses about diagnosis and structural damage towards 'facilitative' narratives involving shared sense-making about broader embodied experiences. Physical outcomes were similar to previous osteopathic treatment but with longer lasting effects due to more effective self-management, decreased fear-avoidance and increased physical activity. Conclusion: This patient reported that a psychologically informed pain management course had increased his body awareness and ability to live well despite pain. Individual case findings are not generalisable, but these data appear to support an ecological-enactive model of osteopathic practice and suggest promising directions for future research.

Short Title: Virtual Coaching Delivered by Pharmacists to Prevent COVID-19 Transmission

ISSN: 0018-5787

DOI: 10.1177/00185787211032354

Article Number: 00185787211032354

Accession Number: WOS:000672918800001

Abstract: Background: While the role of pharmacists in the current pandemic control has been recognized worldwide, their coaching efforts to improve public's behaviors that could prevent COVID-19 transmission has been rarely investigated. Objectives: To assess whether pharmacist-based virtual health coaching sessions could increase the proportion of people who practised healthy social behaviors, to test whether this model can increase the public acceptance of COVID-19 vaccines, and to measure whether these behaviors could actually prevent contracting COVID-19. Method: In this randomized controlled trial, adults who matched specific criteria were randomly allocated into 2 arms. The active arm received 12 pharmacist-based virtual coaching sessions delivered via Zoom(R) over a month. Participants allocated to the control arm received no coaching. At the end of the last coaching session, both groups were asked to complete a structured questionnaire for outcome assessment. Participants in the active group were followed up to 2 weeks after the end of the last coaching session to check if they contracted COVID-19 or not. The SPSS software version 26.0 (IBM Corp., Chicago, IL) was used for statistical analysis. Results: Of the 300 participants who gave consent for participation, 295 completed the study (147 from the active arm and 148 from the control arm). The proportion of those using face masks, avoiding crowds, and willing to be isolated if infected in the active arm was increased from 51.70%, 53.74%, and 59.86% at baseline to 91.83%, 80.27%, and 96.59% at the end of coaching, respectively (all with $P < .05$). In addition, the proportion of behaviors, such as disinfecting surfaces, not touching the T-zone, and avoid sharing personal belongings with colleagues at work was increased from 36.05%, 27.89%, and 46.93% at baseline to 63.94%, 52.38%, and 87.75% at the end of coaching, respectively (all with $P < .05$). Avoid touching the T-zone (OR = 0.43; 95% CI, 0.24-0.89) and using disposable tissues (OR = 0.30; 95% CI, 0.18-0.77), each versus using face masks appropriately were more likely to get COVID-19. Conclusion: Pharmacist-based virtual health coaching could be a potential strategy to increase the proportion of behaviors that could curtail the spread of COVID-19.

Article Number: 100135

Accession Number: WOS:000781934400004

Abstract: Purpose: Given their negative influence on community health, vaccine hesitancy and resistance are emerging challenges that require healthcare intervention. Therefore, this study aimed to assess the impact of physician-pharmacist collaborative health coaching on rates of hesitancy and resistance for a COVID-19 vaccine. **Methods:** After an initial assessment of rates of hesitancy and resistance for a COVID-19 vaccine was conducted, hesitant and resistant participants were approached, recruited, and randomized into an active and control group. Pharmacists-physicians collaborative coaching intervention was delivered to active group subjects over two months through Facebook live sessions. The outcome measures were assessed in both groups before coaching, directly after coaching, and a month after coaching. **Results:** The proportions of hesitancy and resistance for a COVID-19 vaccine among subjects in the active group were significantly reduced from 64.3% and 35.7% before coaching to 20.1% and 7.8% directly after coaching, respectively. These proportions were further reduced to 11.1% and 3.3% a month after coaching, respectively. Furthermore, the mean scores for knowledge on, and attitude towards COVID-19 vaccine were significantly increased from 4.6 +/- 1.8 and 4.1 +/- 1.7 before coaching to 7.5 +/- 3.1 and 8.9 +/- 3.8 directly after coaching, respectively. However, the change in mean score of beliefs about COVID-19 vaccines among active group subjects was not significant. **Conclusion:** High rates of hesitancy and resistance for a COVID-19 vaccine were found in Jordan. These rates can be significantly reduced through online pharmacists-physicians collaborative coaching, which can also improve knowledge of and attitude towards COVID-19 vaccines. ISSN: 0007-1048

DOI: 10.1111/bjh.14134

Accession Number: WOS:000383772300003

Abstract: Adherence to medication, commonly reported as being 50% in chronic diseases, is of great concern in healthcare. Medication non-adherence is particularly apparent in chronic diseases, where treatment is often preventative and may provide little or no symptomatic relief or feedback for the patient. A lot of research has been undertaken to describe the extent of non-adherence to long-term anticoagulation therapy, particularly with vitamin K antagonists and more recently with direct oral anticoagulants. However, the literature is scarce with respect to describing adherence to anticoagulation in terms of the behavioural aspects that influence medicine use. Utilizing the COM-B (capability, opportunity, motivation and behaviour) psychological model of non-adherence, we present the available evidence, not only in terms of describing the extent of the non-adherence problem, but also describing why patients do not adhere, offering theory-driven and evidence-based solutions to improve long-term adherence to chronic anticoagulation therapy. Lessons learned are not only applicable within the field of anticoagulation but throughout haematology.

Title: Improving outpatient medication counselling in hospital pharmacy settings: a behavioral analysis using the theoretical domains framework and behavior change wheel

Journal: Pharmacy Practice-Granada

Volume: 19

Issue: 2

Date: Apr-Jun

Short Title: Improving outpatient medication counselling in hospital pharmacy settings: a behavioral analysis using the theoretical domains framework and behavior change wheel

ISSN: 1885-642X

DOI: 10.18549/PharmPract.2021.2.2271

Article Number: 2271

Accession Number: WOS:000669799600002

Abstract: Background: Despite the importance of medication counselling for patients, it is common knowledge that it is often sub-optimally carried out by pharmacy staff. While some interventions have been designed to help improve counselling, no study till date has used the Capability Opportunity and Motivation behavior model (COM-B) or Theoretical Domains Framework (TDF) as a basis for identifying evidence-based intervention strategies to improve medication counselling. Objective: To understand barriers/facilitators to optimal medication counselling by conducting a behavioral analysis using the COM-B model and TDF, and use the Behavior Change Wheel (BCW) as a basis for identifying evidence-based intervention strategies and policy categories that could be used to improve outpatient medication counselling by pharmacy staff in hospital settings located within Northwest Nigeria. Methods: Semi-structured interviews were used to collect data from 25 purposively sampled pharmacy staff working at eight major public hospitals, from January till March 2020. Data from the interviews were then transcribed and deductively coded using the COM-B model and TDF. These findings were then used to identify areas requiring change, as well as the intervention type and policy functions required to support these changes. Results: Findings from the behavioral analysis revealed shortfalls in pharmacy staff capability, opportunity and motivation with respect to outpatient medication counselling. To improve their counselling behaviors, change was identified as necessary in eight TDF domains namely 'knowledge', 'interpersonal skills', 'memory' 'environmental context', 'social influences', 'intentions', 'reinforcement' and 'beliefs about capabilities'. Seven intervention functions including 'education', 'training', 'modelling', 'enablement' and 'environmental restructuring', in addition to three policy categories ('guidelines', 'regulations' and 'environmental/social planning') were also identified as relevant to future intervention design. Conclusions: Various factors were identified as affecting medication counselling by the pharmacy staff, with several of them requiring changes if counselling was to be improved upon. Multi-component interventions combining several of these intervention functions are recommended for hospital authorities and other relevant stakeholders to improve outpatient medication counselling.

Short Title: Health care providers' perception of facilitators and barriers for the practice of skin-to-skin contact in Saudi Arabia: A qualitative study

ISSN: 0266-6138

DOI: 10.1016/j.midw.2019.102577

Article Number: 102577

Accession Number: WOS:000505935200004

Abstract: Objectives: To identify Health Care Providers' (HCPs') perceived facilitators, barriers and requirements for implementing the practice of Skin-to-Skin Contact (SSC) immediately after vaginal birth. Design: A descriptive qualitative study with semi-structured interviews. Two theoretical frameworks were used to guide the data analysis: Theoretical Domains and the Grol and Wensing's barriers to and facilitators of change in health care practice. Settings: Two public hospitals in Jeddah, Saudi Arabia with 7000 and 6000 births per year, respectively. Participants: A purposeful sample of 20 obstetricians, midwives, and nurses. Findings: The HCPs' perceived facilitators included buy-in of the practice of SSC. Existing or potential barriers included the absence of a detailed policy and guidelines to support the practice of SSC, lack of capabilities and motivations to implement the practice of SSC, mothers not interested in SSC, lack of professional collaboration, staffing and time constraints, and a medicalised birth environment that prioritised interventions over SSC. Conclusion and implication to practice: The insights gained from identification of facilitators and barriers for SSC practice in this study can assist the development of a tailored multi-level implementation strategy at the individual, social and organisational levels to provide continuous uninterrupted SSC immediately after birth. The practice of SSC could likely be successfully implemented if there is multidisciplinary collaboration that prioritises the practice of SCC. (c) 2019 Published by Elsevier Ltd.

Short Title: A theory-based implementation program for alcohol screening and brief intervention (ASBI) in general practices: Planned development and study protocol of a cluster randomised controlled trial

ISSN: 1551-7144

DOI: 10.1016/j.cct.2016.10.008

Accession Number: WOS:000389166100011

Abstract: Background: Previous studies have shown that alcohol screening and brief intervention (ASBI) in general practices can lead to significant reductions in alcohol consumption among patients, yet ASBI is rarely implemented into routine clinical practice. The aim of this paper is to describe the development and evaluation of an ASBI implementation program aimed at increasing ASBI delivery rates of general practitioners (GPs) and decreasing patients' alcohol consumption. Methods/design: This study protocol describes the step-wise development and evaluation of an ASBI implementation program. A four-step method is used to identify relevant determinants of change and intervention components based on the Behaviour Change Wheel and the Theoretical Domains Framework. The program will be evaluated in general practices in The Netherlands in a two-arm cluster randomised controlled trial which investigates the effect of the program on GPs' ASBI delivery behaviour as well as on patients' alcohol consumption. Discussion: Effective theory- and practice-based strategies to implement ASBI in general practices are highly needed. Using a stepwise method we described the development of a program consisting of an e-learning module, a tailored feedback module and environmental support and materials. We hypothesize that this program will result in an increase of GPs' ASBI delivery behaviour. Secondly, we expect an overall decrease in percentage of patients with excessive or problematic alcohol use and a higher proportion of patients from GPs receiving the ASBI implementation program decreasing their alcohol consumption, compared to patients from GPs in the control group. DOI: 10.1007/s11121-016-0653-4

Accession Number: WOS:000379611400003

Abstract: Despite the evidence base, alcohol screening and brief intervention (ASBI) have rarely been integrated into routine clinical practice. The aim of this study is to identify strategies that could tackle barriers to ASBI implementation in general practice by involving primary healthcare professionals and addiction prevention experts. A three-round online Delphi study was carried out in the Netherlands. The first-round questionnaire consisted of open-ended questions to generate ideas about strategies to overcome barriers. In the second round, participants were asked to indicate how applicable they found each strategy. Items without consensus were systematically fed back with group median ratings and interquartile range (IQR) scores in the third-round questionnaire. In total, 39 out of 69 (57 %) invited participants enrolled in the first round, 214 participants completed the second round, and 144 of these (67 %) completed the third-round questionnaire. Results show that participants reached consensus on 59 of 81 strategies, such as the following: (1) use of E-learning technology, (2) symptom-specific screening by general practitioners (GPs) and/or universal screening by practice nurses, (3) reimbursement incentives, (4) supportive materials, (5) clear guidelines, (6) service provision of addiction care centers, and (7) more publicity in the media. This exploratory study identified a broad set of strategies that could potentially be used for overcoming barriers to ASBI implementation in general practice and paves the way for future research to experimentally test the identified implementation strategies using multifaceted approaches.

Short Title: Female genital mutilation and cutting in the Arab League and diaspora: A systematic review of preventive interventions

ISSN: 1360-2276

DOI: 10.1111/tmi.13749

Accession Number: WOS:000777504400001

Abstract: Objectives Female Genital Mutilation and Cutting (FGM/C) is an act of gender-based violence (GBV) and a global public health issue with well-documented adverse outcomes. With the rise in global migration, there is an increasing prevalence of FGM/C among Arab diaspora living in the West and Global South. What remains unclear is how to reduce the practice. This study was designed to identify interventions exerting an effect on reducing the practice of FGM/C. Methods A systematic review of peer-reviewed articles was conducted on interventions targeting individuals and/or the broader community to prevent FGM/C within the Arab League and its diaspora, up to December 2021. Databases searched included PubMed, Medline, Web of Science, PsycINFO, EMBASE, CINAHL, BIOSIS, ASSIA and Scopus. Quality assessment used the Mixed Methods Appraisal Tool (MMAT) 2018. Results Twelve of 896 studies met the inclusion criteria. Eight interventions relied entirely on education with short-term gains but unchanged practices. Three interventions used social marketing and mixed media. Only one study took a multi-sectoral approach. Conclusions At a macro level, opportunities to reduce or to end the practice of FGM/C exist through legislation, policy, a public health approach grounded in gender equality and human rights. Using multi-sectoral actions that consider the social context and challenge social norms at macro, meso and micro levels appears more effective than individual-level interventions. Promoting advocacy and developing supportive environments to reduce GBV, enhance gender equality and empower communities is crucial for interventions to succeed and achieve the Sustainable Development Goal target of FGM/C abandonment by 2030.

Short Title: Exercise in allogeneic bone marrow transplantation: a
qualitative representation of the patient perspective

ISSN: 0941-4355

DOI: 10.1007/s00520-022-06931-9

Accession Number: WOS:000769287000001

Abstract: Purpose Exercise is emerging as a vital aspect of care to alleviate the physical and psychosocial symptom burden associated with allogeneic bone marrow transplantation (BMT). Understanding the patient perspective regarding exercise is important to move towards implementation. This study aimed to characterise experiences and views regarding participation in an exercise program in adults receiving treatment for haematological disease with allogeneic BMT. Methods Individual semi-structured interviews were conducted with 35 participants from either an early- or late-commencing supervised group-based exercise program. Using an inductive, conventional approach to qualitative content analysis data were independently analysed by two researchers. Results Six major themes and 33 sub-themes were identified: this encompassed motivation, physical opportunity and capability to exercise; psychosocial effects of group-based exercise; experienced impact of participation in an exercise program; and intervention design considerations. Key barriers to exercise included symptom severity and fluctuating health and distance or difficult access to an exercise facility or equipment, whilst facilitators included encouragement from staff; peer support in the group-based setting; flexibility; education; and ability to measure change. Conclusion This study highlights the importance of a flexible approach to exercise with consideration of individual symptoms and preferences. The perceived psychological impact of exercise should not be underestimated; future exercise programs should be designed in partnership with patients, with consideration of group-based activities to reduce social isolation if this is feasible in the treatment context. Intervention design should also acknowledge the individual's physical and psychological capability, opportunity and automatic and reflective motivation to

direct and sustain exercise behaviours following BMT.

Title: How do dental practitioners, educators and students diagnose and manage caries risk and caries lesions? A COM-B analysis

Journal: Community Dentistry and Oral Epidemiology

Date: 2022 Mar

Short Title: How do dental practitioners, educators and students diagnose and manage caries risk and caries lesions? A COM-B analysis

ISSN: 0301-5661

DOI: 10.1111/cdoe.12735

Accession Number: WOS:000762356700001

Abstract: Objective The International Caries Classification and Management System (ICCMS (TM)), a comprehensive, evidence-informed, best clinical practice system, comprises a 4D cycle: 1D-Determine risk; 2D-Detect and assess lesions; 3D-Decide on a personalized care plan; and 4D-Do preventive and tooth-preserving care. The aim of this study was to establish how Colombian dental practitioners, educators and students diagnose and manage caries risk and caries lesions using the COM-B model and the ICCMS (TM) system. Methods A total of 1094 participants (practitioners: n = 277; educators: n = 212; students: n = 605) completed a previously validated 79-item questionnaire which explores, based on the COM-B model, the practitioners' self-reported caries diagnosis and management behaviours. Descriptive statistics, Welch's ANOVAs and multiple linear regressions were computed. Results All groups generally performed the behaviours within the 4-D categories 'Most of the time' to 'Always' (students: 4.06 +/- 0.95; educators: 3.94 +/- 0.98; practitioners: 3.86 +/- 1.01). The most frequently performed diagnosis behaviours (1D/2D) were for practitioners assessing initial/moderate lesions (4.09 +/- 1.01) and for educators and students cleaning teeth before lesion assessment (4.41 +/- 0.80 and 4.38 +/- 0.77 respectively). The least frequently performed decision/management (3D/4D) behaviour was non-operative care for moderate-caries lesions (when applicable) (practitioners: 2.64 +/- 1.23; educators: 2.68 +/- 1.17; students: 3.22 +/- 1.41). Opportunity (Resources and Relevance) was the best COM-B predictor for diagnostic behaviours, whereas capability and opportunity (Relevance) were the strongest predictors for management behaviours. Conclusion Colombian practitioners, educators and students diagnose and manage caries risk and caries lesions implementing best practice with a high to very high frequency.

Title: Barriers to Optimal Child Sleep among Families with Low Income: A Mixed-Methods Study to Inform Intervention Development
Journal: International Journal of Environmental Research and Public Health

Volume: 20

Issue: 1

Date: Jan

Short Title: Barriers to Optimal Child Sleep among Families with Low Income: A Mixed-Methods Study to Inform Intervention Development

DOI: 10.3390/ijerph20010862

Article Number: 862

Accession Number: WOS:000910187900001

Abstract: This study gathered formative data on barriers to optimal child sleep to inform the development of a sleep intervention for parents of preschool-aged children in low-income households. Parents (n = 15, age: 34 +/- 8 years, household income: \$30,000 +/- 17,845/year) reporting difficulties with their child's sleep participated in this study. Mixed methods included an online survey and semi-structured phone interview. Items assessed barriers/facilitators to optimal child sleep and intervention preferences. Interview transcripts were coded using inductive analyses and constant-comparison methods to generate themes. Derived themes were then mapped onto the Theoretical Domains Framework to contextualize barriers and inform future intervention strategies. Themes that emerged included: stimulating bedtime activities, child behavior challenges, variability in children's structure, parent work responsibilities, sleep-hindering environment, and parent's emotional capacity. Parent's intervention preferences included virtual delivery (preferred by 60% of parents) to reduce barriers and provide flexibility. Mixed preferences were observed for the group (47%) vs. individual (53%) intervention sessions. Parents felt motivated to try new intervention strategies given current frustrations, the potential for tangible results, and knowing others were in a similar situation. Future work will map perceived barriers to behavior change strategies using the Behavior Change Wheel framework to develop a parenting sleep intervention.

Article Number: 126
Accession Number: WOS:000472555200003
Abstract: As water crises become severe, the desire to explore alternative strategies that focus on the demand-side of water-conservation increase. Changing behaviour through persuasion (message framing) can be an integral part of providing water demand solutions. In this study, we examined the effectiveness of messages related to household water use on water scarcity and intentions to act. We tested whether relationships between communication and water conservation were mediated via increasing capability, opportunity, and motivation behaviour (COM-B dimensions). We applied two message types related to concern about severe water scarcity and conservation strategies to the behaviour change conditions in two combinations: (1) severe water scarcity and water-saving tips/strategies, and (2) severe water scarcity and no water-saving tips/strategies. There was broad support for the hypothesis that COM-B dimensions would mediate the effect of message type on water scarcity concern and intentions to act in conservation activities. Households that received the message framed in terms of water-saving tips/strategies expressed greater water scarcity concern and higher intention to act than those that received the no water-saving tips/strategies message. Mediation analyses showed that the message framed in terms of specific water-saving tips/strategies was mediated by increasing households' capacity (self-efficacy), opportunity and/or motivation in water-conservation actions. Thus, specific water-conservation strategies made available to households have a stronger impact on water-conservation behaviour because these messages appeal to behavioural change conditions.

Title: Interventions to Increase Colorectal Cancer Screening Uptake in Primary Care: A Systematic Review

Journal: Journal of the American Board of Family Medicine

Volume: 35

Issue: 4

Pages: 840-858

Date: Jul-Aug

Short Title: Interventions to Increase Colorectal Cancer Screening Uptake in Primary Care: A Systematic Review

ISSN: 1557-2625

DOI: 10.3122/jabfm.2022.04.210399

Accession Number: WOS:000834339600019

Abstract: Objective: We systematically reviewed and summarized previous studies that examined facilitators and barriers to implementing interventions to increase CRCs uptake in primary care practice. Methods: We searched PubMed, Medline (EBSCO), and CINAHL databases, from the inception of these databases to April 2020. The search strategy combined a set of terms related to facilitators/barriers, intervention implementation, CRCs, and uptake/participation. A priori set inclusion and exclusion criteria were used during both title/abstract screening and full-text screening phases to identify the eligible studies. Quality of the included studies was appraised using quality assessment tools, and data were extracted using a predetermined data extraction tool. We classified facilitators and barriers according to the Consolidated Framework for Implementation Research domains and constructs and identified the common facilitators and barriers looking at how common they were across studies. Results: A total of 12 studies were included in the review. Engagement of the clinic team, leadership team, and partners, clinics' motivation to improve CRCs rates, use of the EMR system, continuous monitoring and feedback system, and having a supportive environment for implementation were the most commonly reported implementation facilitators. Limited time for the clinic team to devote to a new project, challenges in getting accurate, timely data related to CRCs, limited capacity/support to use the EMR system, and disconnect between clinic team members were the most commonly reported implementation barriers. Conclusions: The synthesized findings improve our understanding of facilitators of and barriers to the implementation of interventions to increase CRCs participation in primary care practice, and inform the customized implementation strategies. Many of the included studies had limited use of rigorous implementation science frameworks to guide their implementation and evaluation, which precludes a comprehensive understanding of the implementation factors specific to CRCs interventions in primary care. Future studies assessing the CRCs intervention implementation factors would benefit from the use of implementation science frameworks. (J Am Board Fam Med 2022;35:840-858.)

Abstract: Physical inactivity is the fourth leading risk factor for global mortality, causing an estimated 3.3 million deaths worldwide. Characteristics of the built environment, including buildings, public spaces, pedestrian and cycling infrastructure, transportation networks, parks, trails and green spaces can facilitate or constrain physical activity. However, objective study of built environment interventions on physical activity remains challenging due to methodological limitations and research gaps. Existing methods such as direct observations or surveys are time and labour intensive, and only provide a static, cross-sectional view of physical activity at a specific point in time. The aim of this study was to develop a novel method for objectively and inexpensively assessing how built environment changes may influence physical activity. We used a novel, unobtrusive method to capture real-time, in situ data from a convenience sample of 25 adults along a newly constructed urban greenway in an area of high deprivation in Belfast, UK. Walk/bike-along interviews were conducted with participants using a body-worn or bicycle-mounted portable digital video camera (GoPro HERO 3+ camera) to record their self-determined journeys along the greenway. This is the first study to demonstrate the feasibility of using wearable sensors to capture participants' responses to the built environment in real-time during their walking and cycling journeys. These findings contribute to our understanding of the impact of real-world environmental interventions on physical activity and the importance of precise, accurate and objective measurements of environments where the activity occurs.

Article Number: 103
Accession Number: WOS:000631176100002
Abstract: Objective Field interventions employed to improve preventive health behaviors and outcomes generally use well-established approaches; however, recent studies have reported that health education and promotional interventions have little to no impact on health behaviors, especially in low- and middle-income countries. We aimed to develop a conceptual framework to improve intervention designs that would internalize these concerns and limitations. Results We identified three major experimental design- and implementation-related concerns associated with mental models, including the balance between the treatment and control groups, the treatment group's willingness to adopt suggested behaviors, and the type, length, frequency, intensity, and sequence of treatments. To minimize the influence of these aspects of an experimental design, we proposed a mental model-based repeated multifaceted (MRM) intervention design framework, which represents a supportive intervention design for the improvement of health education and promotional programs. The framework offers a step-by-step method that can be used for experimental and treatment design and outcome analysis, and that addresses potential implementation challenges.

Abstract: Background. Low back pain is the leading worldwide cause of years lost to disability and the problem is worsening. This paper describes and demonstrates the scholarly development and contextual refinement of a primary care program for acute low back pain in Sydney, Australia. Methods. Hybrid theoretical frameworks were applied, and co-design was used to contextualise the program to the local healthcare setting. Results. The program was developed in four stages. In stage 1, the scientific evidence about management of acute low back pain in primary care was examined. In stage 2, stakeholders (patients and clinicians) were consulted in nationwide surveys. Data from stages 1 and 2 were used to design an initial version of the program, called My Back My Plan. Stage 3 involved the contextual refinement of the program to the local setting, MQ Health Primary Care. This was achieved by co-design with primary care clinicians and patients who had sought care for low back pain at MQ Health Primary Care clinics. In stage 4, a panel of Australian experts on clinical care for low back pain reviewed the contextualised version of My Back My Plan and final amendments were made. Conclusion. My Back My Plan has been developed using an innovative scholarly approach to intervention development.

Short Title: What drives general practitioners in the UK to improve the quality of care? A systematic literature review

DOI: 10.1136/bmjopen-2020-001127

Article Number: e001127

Accession Number: WOS:000674241700029

Abstract: BackgroundIn the UK, the National Health Service has various incentivisation schemes in place to improve the provision of high-quality care. The Quality Outcomes Framework (QOF) and other Pay for Performance (P4P) schemes are incentive frameworks that focus on meeting predetermined clinical outcomes. However, the ability of these schemes to meet their aims is debated.Objectives(1)

To explore current incentive schemes available in general practice in the UK, their impact and effectiveness in improving quality of care and (2) To identify other types of incentives discussed in the literature. Methods This systematic literature review was conducted using the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines. Six databases were searched: Cochrane, PubMed, National Institute for Health and Care Excellence Evidence, Health Management Information Consortium, Embase and Health Management. Articles were screened according to the selection criteria, evaluated against critical appraisal checklists and categorised into themes. Results 35 articles were included from an initial search result of 22087. Articles were categorised into the following three overarching themes: financial incentives, non-financial incentives and competition. Discussion The majority of the literature focused on QOF. Its positive effects included reduced mortality rates, better data recording and improved sociodemographic inequalities. However, limitations involved decreased quality of care in non-incentivised activities, poor patient experiences due to tick-box exercises and increased pressure to meet non-specific targets. Findings surrounding competition were mixed, with limited evidence found on the use of non-financial incentives in primary care. Conclusion Current research looks extensively into financial incentives, however, we propose more research into the effects of intrinsic motivation alongside existing P4P schemes to enhance motivation and improve quality of care.

Short Title: Mental health professionals' perceived barriers and enablers to shared decision-making in risk assessment and risk management: a qualitative systematic review

DOI: 10.1186/s12888-021-03304-0

Article Number: 594

Accession Number: WOS:000722600000001

Abstract: Background Risk assessment and risk management are fundamental processes in the delivery of safe and effective mental health care, yet studies have shown that service users are often not directly involved or are unaware that an assessment has taken place.

Shared decision-making in mental health systems is supported by research and advocated in policy. This systematic review (PROSPERO: CRD42016050457) aimed to explore the perceived barriers and enablers to implementing shared decision-making in risk assessment and risk management from mental health professionals' perspectives. Methods PRISMA guidelines were followed in the conduct and reporting of this review. Medline, CINAHL, EMBASE, PsycINFO, AMED and Internurse were systematically searched from inception to December 2019. Data were mapped directly into the Theoretical Domains Framework (TDF), a psychological framework that includes 14 domains relevant to behaviour change. Thematic synthesis was used to identify potential barriers and enablers within each domain. Data were then matched to the three components of the COM-B model: Capability, Opportunity, and Motivation. Results Twenty studies met the eligibility criteria. The findings of this review indicate that shared decision-making is not a concept commonly used in mental health services when exploring processes of risk assessment and risk management. The key barriers identified were 'power and best interest' (social influences) and 'my professional role and responsibility' (social/professional role and identity). Key enablers were 'therapeutic relationship' (social influences) and 'value collaboration' (reinforcement). The salient barriers, enablers and linked TDF domains matched COM-B components 'opportunity' and 'motivation'. Conclusion The review highlights the need for further empirical research to better understand current practice and mental health professionals' experiences and attitudes towards shared decision-making in risk assessment and risk management.

Abstract: It is necessary for a cancer survivor to have good health behavior. Essential exercise and proper diet are helpful to decrease the risk of recurrence of the disease and the development of a new cancer type. People from low socioeconomic status are more likely to participate in risky health behaviors and have a higher chance of recurrence of cancer. It is important to have a motivational system for cancer survivors that motivates them to perform regular physical activities. In this article, we discuss the development of an mHealth system, which aims to increase physical activity in Native American populations with culturally appropriate motivational text and video messages. The system also includes an e-journal to monitor and maintain proper healthcare. We will also analyze the pilot data to evaluate the usability and the effectiveness of the system.

Title: The impact of a multifaceted intervention to reduce potentially inappropriate prescribing among discharged older adults: a before-and-after study

Journal: Journal of Pharmaceutical Policy and Practice

Volume: 13

Issue: 1

Date: Jul

Short Title: The impact of a multifaceted intervention to reduce potentially inappropriate prescribing among discharged older adults: a before-and-after study

DOI: 10.1186/s40545-020-00236-0

Article Number: 39

Accession Number: WOS:000619843800001

Abstract: Background: Potentially inappropriate prescribing (PIP) is associated with the incidence of adverse drug reactions, drug-related hospitalization and other negative outcomes in older adults. After hospitalization, older adults might be discharged with several types of PIPs. Studies have found that the lack of healthcare professionals' (HCPs) knowledge regarding PIP is one of the major contributing factors in this issue. The purpose of this study is to investigate the impact of a multifaceted intervention on physicians' and clinical pharmacists' behavior regarding potentially inappropriate medication (PIM) and potential prescribing omission

(PPO) among hospitalized older adults. Methods: This is a before-and-after study that took place in a tertiary Malaysian hospital. Discharge medications of patients ≥ 65 years old were reviewed to identify PIMs/PPOs using version 2 of the STOPP/START criteria. The prevalence and pattern of PIM/PP0 before and after the intervention were compared. The intervention targeted the physicians and clinical pharmacists and it consisted of academic detailing and a newly developed smartphone application (app). Results: The study involved 240 patients before (control group) and 240 patients after the intervention. The prevalence of PIM was 22% and 27% before and after the intervention, respectively ($P = 0.213$). The prevalence of PP0 in the intervention group was significantly lower than that in the control group (42% Vs. 53.3%); $P = 0.014$. This difference remained statistically significant after controlling for other variables ($P = 0.015$). The intervention was effective in reducing the two most common PP0s; the omission of vitamin D supplements in patients with a history of falls ($P = 0.001$) and the omission of angiotensin converting enzyme inhibitor in patients with coronary artery disease ($P = 0.03$). Conclusions: The smartphone app coupled with academic detailing was effective in reducing the prevalence of PP0 at discharge. However, it did not significantly affect the prevalence or pattern of PIM.

Title: Factors related to reducing free sugar intake among white ethnic adults in the UK: a qualitative study

Journal: Bdj Open

Volume: 4

Issue: 1

Date: Feb

Short Title: Factors related to reducing free sugar intake among white ethnic adults in the UK: a qualitative study

DOI: 10.1038/bdjopen.2017.24

Article Number: 17024

Accession Number: WOS:000582630300001

Abstract: OBJECTIVE/AIMS: To determine the barriers and enablers to behavioural change to reduce free sugar intake related to dental caries in a sample of UK adults who identify their ethnicity as White. MATERIALS AND METHODS: Qualitative study comprising semi-structured interviews of 27 participants. Interviews were recorded, transcribed and analysed using thematic analysis methods. The Capability-Opportunity-Motivation-Behaviour model (COM-B) and the Theoretical Domains Framework (TDF) were used to guide the derivation of themes. RESULTS: Data saturation occurred at 27

interviews. The COM-B Model and TDF domains captured various factors that may influence the consumption of free sugar. TDF elements which are reflected in the study are: Knowledge; Psychological skills; Memory, attention, and decision processes; Behavioural regulation; Physical skills; Social influence; Environmental context and resources; Social and professional role and identity; Beliefs about capabilities; Beliefs about consequence; Intentions and goals reinforcement; and Emotions. COM-B Model elements which are reflected in the study are: psychological capabilities, physical capabilities, social opportunities, physical opportunities, reflective motivation, and automatic motivation. DISCUSSION AND CONCLUSION: The COM-B model and TDF framework provided a comprehensive account of the barriers and facilitators of reducing sugar intake among white ethnic groups.

Title: Views, experiences and contributory factors related to medication errors associated with direct oral anticoagulants: a qualitative study with physicians and nurses

Journal: International Journal of Clinical Pharmacy

Volume: 44

Issue: 4

Pages: 1057-1066

Date: Aug

Short Title: Views, experiences and contributory factors related to medication errors associated with direct oral anticoagulants: a qualitative study with physicians and nurses

ISSN: 2210-7703

DOI: 10.1007/s11096-022-01448-x

Accession Number: WOS:000814493700001

Abstract: Background Direct oral anticoagulants (DOACs) have become preferable for the management of thromboembolic events. Recent publications have however identified high volume of medication errors related to DOACs. There is limited literature on why and how such errors occur or happen in clinical practice. Aim This study aimed to explore views, experiences, contributory factors related to DOACs medication errors from the perspectives of healthcare professionals. Method Semi-structured interviews using online videoconferencing were conducted with physicians and nurses from tertiary care hospitals in three different regions in Saudi Arabia. Questions included views, experiences and perceived factors contributing to errors. Interviews were transcribed verbatim and were thematically analyzed using MAXQDA Analytics Pro 2020 (VERBI

Software). Results The semi-structured interviews (n = 34) included physicians (n = 20) and nurses (n = 14) until data saturation was achieved. The analysis identified five themes: Factors related to healthcare professionals (e.g. knowledge, confidence and access to guidelines); Factors related to patients (e.g. comorbidity, polypharmacy, medication review, and communication barriers); Factors related to organization (e.g. guidelines, safety culture and incidents reporting system); Factors related to the DOACs medications (e.g. lack of availability of antidotes and dosing issues); and Strategies for error prevention/mitigation (e.g. the need for professional training and routine medication review).

Conclusion Healthcare professionals identified errors in relation to DOACs as multifactorial including their own and patient lack of knowledge, lack of clinical guidelines and organizational factors including safety culture. Medication review and reconciliation on discharge were key strategies suggested to reduce DOACs related errors. These strategies support the role of pharmacists as direct patients care providers to minimize DOACs errors.

Title: Cervical screening uptake: A cross-sectional study of self-reported screening attitudes, behaviours and barriers to participation among South Asian immigrant women living in Australia

Journal: Womens Health

Volume: 18

Date: May

Short Title: Cervical screening uptake: A cross-sectional study of self-reported screening attitudes, behaviours and barriers to participation among South Asian immigrant women living in Australia

ISSN: 1745-5057

DOI: 10.1177/17455057221096240

Accession Number: WOS:000797214700001

Abstract: Introduction: Cervical cancer remains a major cause of morbidity and mortality among women from low and lower middle-income countries, as well as underserved population subgroups in high-income countries. Migration from South Asia to Australia has increased over the last decade, and immigrant women from this region have been reported as a subgroup, with less than optimal cervical screening participation in Australia. This study examined cervical screening uptake and associated behavioural attitudes among South Asian immigrant women living in Queensland Australia. Methods: A cross-sectional, Internet-based survey was used to collect data from a convenience sample of 148 South Asian women living in Queensland.

The main outcome measure was receipt of cervical screening test ever (yes/no) and its recency (within 2 years/more than 2 years). The survey also examined participants' views on barriers towards screening and ways to enhance it. Results: Of 148 women who completed the survey, 55.4% (n=82) reported ever having a cervical screening test before and 43.9% (n = 65) reported having it in previous two years. Not having a previous cervical screening test was significantly associated with duration of stay in Australia for less than five years, not having access to a regular general practitioner (GP), not being employed, having low cervical cancer knowledge level and not knowing if cervical screening test is painful or not. Most commonly reported barriers to screening uptake included considering oneself not at risk, lack of time and lack of information. The most favoured strategy among participants was encouragement by GP and awareness through social media advertisements. Conclusion: This study provided insights into factors that need consideration when developing future targeted interventions.

Accession Number: WOS:000725666600001

Abstract: Purpose: Mechanisms of Change (MoC) explain how strategies used to enhance the uptake of evidence in social and human services enable change in the behaviors of individual practitioners, organizational leaders or entire organizations, and systems. One such strategy is the use of implementation support practitioner (ISPs). This study examines the mechanisms through which ISPs facilitate behavior supportive of the implementation of research-supported interventions. Methods: A systematic, integrative review was conducted. The conceptualization of MoCs built on a model by Dalkin and colleagues. Results: Based on a unique combination of

knowledge, skills, and attitudes, ISPs install trust in and among their stakeholders and utilize this trust to promote meaningful and relevant learning; provide ongoing opportunities for learning, reflection, and support; help to span boundaries; and positively motivate stakeholders. Discussion: ISPs do not represent a short cut to better implementation. They represent an additional implementation challenge that requires dedicated attention and resources.

DOI: 10.1007/s10916-022-01899-9

Article Number: 15

Accession Number: WOS:000918944200002

Abstract: Goal-setting is often used in eHealth applications for behavior change as it motivates and helps to stay focused on a desired outcome. However, for goals to be effective, they need to meet criteria such as being specific, measurable, attainable, relevant and time-bound (SMART). Moreover, people need to be confident to reach their goal. We thus created a goal-setting dialog in which the virtual coach Jody guided people in setting SMART goals. Thereby, Jody provided personalized vicarious experiences by showing examples from other people who reached a goal to increase people's confidence. These experiences were personalized, as it is helpful to observe a relatable other succeed. Data from an online study with a between-subjects with pre-post measurement design (n=39 participants) provide credible support that personalized experiences are seen as more motivating than generic ones. Motivational factors for participants included information about the goal, path to the goal, and the person who accomplished a goal, as well as the mere fact that a goal was reached. Participants also had a positive attitude toward Jody. We see these results as an indication that people are positive toward using a goal-setting dialog with a

virtual coach in eHealth applications for behavior change. Moreover, contrary to hypothesized, our observed data give credible support that participants' self-efficacy was lower after the dialog than before. These results warrant further research on how such dialogs affect self-efficacy, especially whether these lower post-measurements of self-efficacy are associated with people's more realistic assessment of their abilities.

Short Title: Addressing people's current and future states in a reinforcement learning algorithm for persuading to quit smoking and to be physically active

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0277295

Article Number: e0277295

Accession Number: WOS:000925734000049

Abstract: Behavior change applications often assign their users activities such as tracking the number of smoked cigarettes or planning a running route. To help a user complete these activities, an application can persuade them in many ways. For example, it may help the user create a plan or mention the experience of peers. Intuitively, the application should thereby pick the message that is most likely to be motivating. In the simplest case, this could be the message that has been most effective in the past. However, one could consider several other elements in an algorithm to choose a message. Possible elements include the user's current state (e.g., self-efficacy), the user's future state after reading a message, and the user's similarity to the users on which data has been gathered. To test the added value of subsequently incorporating these elements into an algorithm that selects persuasive messages, we conducted an experiment in which more than 500 people in four conditions interacted with a text-based virtual coach. The experiment consisted of five sessions, in each of which participants were suggested a preparatory activity for quitting smoking or increasing physical activity together with a persuasive message. Our findings suggest that adding more elements to the algorithm is effective, especially

in later sessions and for people who thought the activities were useful. Moreover, while we found some support for transferring knowledge between the two activity types, there was rather low agreement between the optimal policies computed separately for the two activity types. This suggests limited policy generalizability between activities for quitting smoking and those for increasing physical activity. We see our results as supporting the idea of constructing more complex persuasion algorithms. Our dataset on 2,366 persuasive messages sent to 671 people is published together with this article for researchers to build on our algorithm.

Short Title: Users' needs for a digital smoking cessation application and how to address them: A mixed-methods study

ISSN: 2167-8359

DOI: 10.7717/peerj.13824

Article Number: e13824

Accession Number: WOS:000848627000003

Abstract: Background: Despite their increasing prevalence and potential, eHealth applications for behavior change suffer from a lack of adherence and from dropout. Advances in virtual coach technology provide new opportunities to improve this. However, these applications still do not always offer what people need. We, therefore, need a better understanding of people's needs and how to address these, based on both actual experiences of users and their reflections on envisioned scenarios. Methods: We conducted a longitudinal study in which 671 smokers interacted with a virtual coach in five sessions. The virtual coach assigned them a new preparatory activity for quitting smoking or increasing physical activity in each session. Participants provided feedback on the activity in the next session. After the five sessions, participants were asked to describe barriers and motivators for doing their activities. In addition, they provided their views on videos of scenarios such as receiving motivational messages. To understand users' needs, we took a mixed-methods approach. This approach triangulated findings from qualitative data, quantitative data, and the literature. Results: We identified 14 main themes that describe people's views of their current and future behaviors concerning an eHealth application. These themes relate to the behaviors

themselves, the users, other parties involved in a behavior, and the environment. The most prevalent theme was the perceived usefulness of behaviors, especially whether they were informative, helpful, motivating, or encouraging. The timing and intensity of behaviors also mattered. With regards to the users, their perceived importance of and motivation to change, autonomy, and personal characteristics were major themes. Another important role was played by other parties that may be involved in a behavior, such as general practitioners or virtual coaches. Here, the themes of companionableness, accountability, and nature of the other party (i.e., human vs AI) were relevant. The last set of main themes was related to the environment in which a behavior is performed. Prevalent themes were the availability of sufficient time, the presence of prompts and triggers, support from one's social environment, and the diversity of other environmental factors. We provide recommendations for addressing each theme. Conclusions: The integrated method of experience-based and envisioning-based needs acquisition with a triangulate analysis provided a comprehensive needs classification (empirically and theoretically grounded). We expect that our themes and recommendations for addressing them will be helpful for designing applications for health behavior change that meet people's needs. Designers should especially focus on the perceived usefulness of application components. To aid future work, we publish our dataset with user characteristics and 5,074 free-text responses from 671 people.

Title: Oral health educational interventions for nursing home staff and residents

Journal: Cochrane Database of Systematic Reviews

Issue: 9

Short Title: Oral health educational interventions for nursing home staff and residents

ISSN: 1469-493X

DOI: 10.1002/14651858.CD010535.pub2

Article Number: Cd010535

Accession Number: WOS:000389599000011

Abstract: Background Associations between nursing home residents' oral health status and quality of life, respiratory tract infections, and nutritional status have been reported. Educational interventions for nurses or residents, or both, focusing on knowledge and skills related to oral health management may have the

potential to improve residents' oral health. Objectives To assess the effects of oral health educational interventions for nursing home staff or residents, or both, to maintain or improve the oral health of nursing home residents. Search methods We searched the Cochrane Oral Health Trials Register (to 18 January 2016), the Cochrane Central Register of Controlled Trials (CENTRAL) (the Cochrane Library, 2015, Issue 12), MEDLINE Ovid (1946 to 18 January 2016), Embase Ovid (1980 to 18 January 2016), CINAHL EBSCO (1937 to 18 January 2016), and Web of Science Conference Proceedings (1990 to 18 January 2016). We searched ClinicalTrials.gov and the World Health Organization International Clinical Trials Registry Platform for ongoing trials to 18 January 2016. In addition, we searched reference lists of identified articles and contacted experts in the field. We placed no restrictions on language or date of publication when searching the electronic databases. Selection criteria Randomised controlled trials (RCTs) and cluster-RCTs comparing oral health educational programmes for nursing staff or residents, or both with usual care or any other oral healthcare intervention. Data collection and analysis Two review authors independently screened articles retrieved from the searches for relevance, extracted data from included studies, assessed risk of bias for each included study, and evaluated the overall quality of the evidence. We retrieved data about the development and evaluation processes of complex interventions on the basis of the Criteria for Reporting the Development and Evaluation of Complex Interventions in healthcare: revised guideline (CREDECI 2). We contacted authors of relevant studies for additional information. Main results We included nine RCTs involving 3253 nursing home residents in this review; seven of these trials used cluster randomisation. The mean resident age ranged from 78 to 86 years across studies, and most participants were women (more than 66% in all studies). The proportion of residents with dental prostheses ranged from 62% to 87%, and the proportion of edentulous residents ranged from 32% to 90% across studies. Eight studies compared educational interventions with information and practical components versus (optimised) usual care, while the ninth study compared educational interventions with information only versus usual care. All interventions included educational sessions on oral health for nursing staff (five trials) or for both staff and residents (four trials), and used more than one active component. Follow-up of included studies ranged from three months to five years. No study showed overall low risk of bias. Four studies had a high risk of bias, and the other five studies were at unclear risk of bias. None of the trials assessed our predefined primary outcomes 'oral health' and 'oral health-related quality of life'. All trials assessed our third primary outcome, 'dental or denture plaque'. Meta-analyses showed no evidence of a difference between interventions and usual care for dental plaque (mean difference -0.04, 95% confidence interval (CI) -0.26 to 0.17; six trials; 437 participants; low quality evidence) or denture plaque (standardised mean difference -0.60, 95% CI -1.25 to 0.05; five trials; 816 participants; low quality evidence). None of the studies assessed adverse events of the intervention. Authors' conclusions We found insufficient evidence to draw robust conclusions about the effects of oral health educational interventions for nursing home

staff and residents. We did not find evidence of meaningful effects of educational interventions on any measure of residents' oral health; however, the quality of the available evidence is low. More adequately powered and high-quality studies using relevant outcome measures are needed.

Short Title: Contextual Factors and Programme Theories Associated with Implementing Blue Prescription Programmes: A Systematic Realist Review

ISSN: 0966-0410

DOI: 10.1155/2023/6551521

Article Number: 6551521

Accession Number: WOS:000973425800002

Abstract: Nature-based social prescribing such as "blue prescription" promotes public health and health improvement of individuals with long-term health conditions. However, there is limited evidence explaining the relationship of contexts, mechanisms, and outcomes of implementing blue prescription programmes (BPPs) in health and social care settings that could inform policy and practice. We conducted a systematic realist review by searching PubMed, Web of Science, PsycInfo, Scopus, MEDLINE, and CINAHL for articles published in English between January 2000 and June 2022 about health and social care professionals providing referral to or prescription of blue space activities (e.g., swimming, fishing, surfing, etc.) with health-related outcomes. Components and descriptions of BPP implementation were extracted and used to develop themes of contextual factors used to develop programme theories and a logic model demonstrating the mechanisms of BPP implementation. Sixteen studies with adequate to strong quality were included from 8,619 records. After participating in BPPs referred to or prescribed by health and social care professionals, service users had improvements in their physical, cognitive (mental), social health, and proenvironmental knowledge. Service user-related contextual factors were referral information, free

equipment, transportation, social support, blue space environments, and skills of service providers. Programme-related contextual factors were communication, multistakeholder collaboration, financing, and adequate service providers. Programme theories on service user enrolment, engagement, adherence, communication protocols, and programme sustainability explain the mechanisms of BPP implementation. BPPs could promote health and wellbeing if contextual factors and programme theories associated with service users' characteristics and programme delivery are considered in the design, delivery, and evaluation of BPPs. Our study was registered with PROSPERO (CRD42020170660).

Pages: 210-221

Date: Feb

Short Title: The attitudes and beliefs of the child protection workforce and why they matter to children who live with violence

ISSN: 1356-7500

DOI: 10.1111/cfs.12954

Accession Number: WOS:000826275000001

Abstract: In Australia, like other developed countries, there has been an increase in reports to child protection services about children experiencing domestic violence. While there is research on the importance of the skills and knowledge of the child protection workforce for this growing problem, little is available about practitioner attitudes and beliefs. This paper presents findings on research undertaken in New South Wales, which is the most populated state in Australia. The research considered the attitudes and beliefs of the statutory child protection workforce about domestic violence. It relied on a large-scale survey of 1041 child protection practitioners. In order to compare the attitudes and beliefs of

child protection workforce with those of the general community, the survey replicated questions from the Australian National Community Attitudes towards Violence against Women Surveys. Overall, the attitudes and beliefs of the workforce more closely reflected contemporary theory and evidence about domestic violence than those of the community. The research also examined variations in the attitudes and beliefs of the child protection workforce according to practitioner characteristics, finding variations by gender. The implications for the fields of child protection and social work are discussed.

Title: The challenges of trying to increase preventive healthcare for children in general practice: results of a feasibility study

Journal: BMC Family Practice

Volume: 16

Date: Aug

Short Title: The challenges of trying to increase preventive healthcare for children in general practice: results of a feasibility study

DOI: 10.1186/s12875-015-0306-x

Article Number: 94

Accession Number: WOS:000358983400001

Abstract: Background: In Australia, general practice, the linchpin for delivery of preventive health care to large segments of the population, provides child-immunisation and preventive health alongside government services. Despite this, less than half of eligible children complete a Healthy Kids Check (HKC), a preschool preventative health assessment available since 2008. Using a rigorous theoretical process, the barriers that affected delivery and reduced general practitioner and practice nurse motivation to provide HKCs, were addressed. The resulting multifaceted intervention, aimed at increasing the proportion of children receiving evidence informed HKCs from general practice, was piloted to inform a future randomised controlled trial. Methods: The intervention was piloted in a before and after study at three sites located southeast of Melbourne, between February and October 2014. The HKC-intervention involved: 1) Delivery of training modules that motivated reception and clinical staff by delivering key messages about local prevalence rates and the "Core Story of Child Development" 2) Practical advice to prepare clinics for specific HKC-examinations 3) Workflow advice regarding systems that included all staff in the HKC process, and 4) Provision of a "Community Resources Folder" that enabled decision making and referrals. A major component of the intervention incorporated the promotion of

structured developmental screening by the practice team using Parents' Evaluation of Developmental Status. Results: Twenty of 22 practitioners and practice managers agreed to join the study. Post-training questionnaires showed participants had developed their skills working with young children as a result of the training and all respondents believed they had successfully implemented standardised HKC services. Post intervention proportions of children completing HKCs significantly increased in two of the practices and quality improvements in HKC-processes were recorded across all three sites. Conclusion: This pilot study confirmed the feasibility of delivering a multi-faceted intervention to increase HKCs from general practice and demonstrated that significant quality improvements could be made. Future studies need to extend the intervention to other states and research the health outcomes of HKCs.

Title: Factors influencing the implementation of medicine risk communications by healthcare professionals in clinical practice: A systematic review

Journal: Research in Social & Administrative Pharmacy

Volume: 19

Issue: 1

Pages: 28-56

Date: Jan

Short Title: Factors influencing the implementation of medicine risk communications by healthcare professionals in clinical practice: A systematic review

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2022.07.003

Accession Number: WOS:000892465200004

Abstract: Background: Regulatory medicines risk communications aim to prevent patient harm through the dissemination of safety information to healthcare professionals (HCPs), patients, and the public. Evidence suggests that in addition to implementing the required changes, HCPs also respond to these communications through unintended and unwarranted actions and behaviours such as stopping medicine courses unnecessarily, and blanket actions spilling over to unintended patients' populations. Misunderstanding and mis-implementation of medicines risk communications could jeopardise patients' safety and clinical outcomes. Therefore, it is important to understand the determinants that affect HCPs responses to

medicines risk communications. This systematic review aims to identify the factors that affect the implementation of risk communications by healthcare professionals. Methods: Fifteen databases, including EMBASE, PubMed, Scopus, Web of science, CINAHL PLUS were searched in April–May 2018, and the search was updated again in June 2021 to identify studies reporting on factors influencing HCPs' uptake of medicine risk alerts. We used keywords such as risk communication, safety update, and safety regulation. Studies were excluded if they did not involve pharmacovigilance or patient safety alerts; or if they only focused on measuring HCPs' practice after alerts; or evaluating the effectiveness of risk minimisation measures without reporting on factors affecting HCPs' actions. Studies relating to occupational hazards, case reports, interventional studies, and studies not involving HCPs were also excluded. The Mixed Method Appraisal Tool (MMAT) was used to assess the quality of the included studies. A Narrative synthesis approach was undertaken using thematic analysis and concept mapping, followed by a critical reflection of the synthesis. Results: Twenty-eight studies met our criteria and were included in the synthesis. We identified four themes summarising the factors influencing HCPs' implementation of risk communications. These include HCPs: knowledge of medicine alerts; perceptions of alerts; attitudes, and concerns regarding medicine alerts; and the self-reported impact of these alerts. Our concept mapping exercise identified key interactions between different stakeholders, and these interactions determine HCPs' implementation of medicine risk communications. These stakeholders comprise of alert developers, including the sources and senders of safety information, and the receivers of safety information including health care institutions, HCPs, patients and their carers. Conclusions: Healthcare professionals are crucial to translating risk communication messages into clinical practice. However, if they have inadequate information about the content of the alert, and have inaccurate perceptions about the alert, they may not implement the required clinical changes as intended. Communication of medicine risk alerts does not always translate into improved patient care, due to a complex interaction between stakeholders involved in the creation and implementation of these alerts. These complex interactions should be the subject of future research efforts to understand the alert-implementation trajectory and identify the mediators for change and interventions to improve implementation.

Title: Effect of Exercise Interventions on Health-Related Quality of Life After Stroke and Transient Ischemic Attack A Systematic Review and Meta-Analysis

Journal: Stroke

Volume: 52

Issue: 7

Pages: 2445-2455

Date: Jul

Short Title: Effect of Exercise Interventions on Health-Related Quality of Life After Stroke and Transient Ischemic Attack A Systematic Review and Meta-Analysis

ISSN: 0039-2499

DOI: 10.1161/strokeaha.120.032979

Accession Number: WOS:000667919500053

Abstract: Exercise interventions have been shown to help physical fitness, walking, and balance after stroke, but data are lacking on whether such interventions lead to improvements in health-related quality of life (HRQoL). In this systematic review and meta-analysis, 30 randomized controlled trials (n=1836 patients) were found from PubMed, OVID MEDLINE, Web of Science, CINAHL, SCOPUS, The Cochrane Library, and TRIP databases when searched from 1966 to February 2020 that examine the effects of exercise interventions on HRQoL after stroke or transient ischemic attack. Exercise interventions resulted in small to moderate beneficial effects on HRQoL at intervention end (standardized mean difference, -0.23 [95% CI, -0.40 to -0.07]) that appeared to diminish at longer-term follow-up (standardized mean difference, -0.11 [95% CI, -0.26 to 0.04]). Exercise was associated with moderate improvements in physical health (standardized mean difference, -0.33 [95% CI, -0.61 to -0.04]) and mental health (standardized mean difference, -0.29 [95% CI, -0.49 to -0.09]) domains of HRQoL while effects on social or cognitive composites showed little difference. Interventions that were initiated within 6 months, lasted at least 12 weeks in duration, involved at least 150 minutes per week, and included resistance training appeared most effective. Exercise can lead to moderate beneficial effects on HRQoL and should be considered an integral part of stroke rehabilitation.

Short Title: Effect of a Collaborative Care Model on Depressive Symptoms and Glycated Hemoglobin, Blood Pressure, and Serum Cholesterol Among Patients With Depression and Diabetes in India The INDEPENDENT Randomized Clinical Trial

ISSN: 0098–7484

DOI: 10.1001/jama.2020.11747

Accession Number: WOS:000564288700011

Abstract: Importance Mental health comorbidities are increasing worldwide and worsen outcomes for people with diabetes, especially when care is fragmented. Objective To assess whether collaborative care vs usual care lowers depressive symptoms and improves cardiometabolic indices among adults with diabetes and depression. Design, Setting, and Participants Parallel, open-label, pragmatic randomized clinical trial conducted at 4 socioeconomically diverse clinics in India that recruited patients with type 2 diabetes; a Patient Health Questionnaire–9 score of at least 10 (range, 0–27); and hemoglobin A(1c)(HbA(1c)) of at least 8%, systolic blood pressure (SBP) of at least 140 mm Hg, or low-density lipoprotein (LDL) cholesterol of at least 130 mg/dL. The first patient was enrolled on March 9, 2015, and the last was enrolled on May 31, 2016; the final follow-up visit was July 14, 2018. Interventions Patients randomized to the intervention group (n = 196) received 12 months of self-management support from nonphysician care coordinators, decision support electronic health records facilitating physician treatment adjustments, and specialist case reviews; they were followed up for an additional 12 months without intervention. Patients in the control group (n = 208) received usual care over 24 months. Main Outcomes and Measures The primary outcome was the between-group difference in the percentage of patients at 24 months who had at least a 50% reduction in Symptom Checklist Depression Scale (SCL–20) scores (range, 0–4; higher scores indicate worse symptoms) and a reduction of at least 0.5 percentage points in HbA(1c), 5 mm Hg in SBP, or 10 mg/dL in LDL cholesterol. Prespecified secondary outcomes were percentage of patients at 12 and 24 months who met treatment targets (HbA(1c) < 7.0%, SBP < 130 mm Hg, LDL cholesterol < 100 mg/dL [< 70 mg/dL if prior cardiovascular disease]) or had improvements in individual outcomes ($\geq 50\%$ reduction in SCL–20 score, ≥ 0.5 -percentage point reduction in HbA(1c), ≥ 5 -mm Hg reduction in SBP, ≥ 10 -mg/dL reduction in LDL cholesterol); percentage of patients who met all HbA(1c), SBP, and LDL cholesterol targets; and mean reductions in SCL–20 score, Patient Health Questionnaire–9 score, HbA(1c), SBP, and LDL cholesterol. Results Among 404 patients randomized (mean [SD] age,

53 [8.6] years; 165 [40.8%] men), 378 (93.5%) completed the trial. A significantly greater percentage of patients in the intervention group vs the usual care group met the primary outcome (71.6% vs 57.4%; risk difference, 16.9% [95% CI, 8.5%–25.2%]). Of 16 prespecified secondary outcomes, there were no statistically significant between-group differences in improvements in 10 outcomes at 12 months and in 13 outcomes at 24 months. Serious adverse events in the intervention and usual care groups included cardiovascular events or hospitalizations (4 [2.0%] vs 7 [3.4%]), stroke (0 vs 3 [1.4%]), death (2 [1.0%] vs 7 [3.4%]), and severe hypoglycemia (8 [4.1%] vs 0). Conclusions and Relevance Among patients with diabetes and depression in India, a 12-month collaborative care intervention, compared with usual care, resulted in statistically significant improvements in a composite measure of depressive symptoms and cardiometabolic indices at 24 months. Further research is needed to understand the generalizability of the findings to other low- and middle-income health care settings. This randomized clinical trial compares the effect of a collaborative care model that integrates management of depression and enhanced diabetes care on depressive symptoms and HbA(1c), SBP, and LDL cholesterol measures among individuals with depression and diabetes in India. Question Among patients with diabetes and depression in India, does a 12-month collaborative care intervention that includes nonphysician care coordinators, decision support functions in electronic health records, and specialist case reviews improve depressive symptoms and measures of cardiometabolic health more than usual care at 24 months? Findings In this randomized clinical trial that included 404 patients at urban clinics in India with poorly controlled diabetes and depression, patients in the collaborative care intervention group, compared with the usual care group, were significantly more likely to achieve the composite outcome of at least a 50% reduction in the 20-item Symptom Checklist Depression Scale score and at least 1 of the following: reduction of at least 0.5 percentage points in hemoglobin A(1c), reduction of at least 5 mm Hg in systolic blood pressure, or reduction of at least 10 mg/dL in low-density lipoprotein cholesterol at 24 months (71.6% vs 54.7%). Meaning Among patients with diabetes and depressive symptoms in urban India, a multicomponent collaborative care intervention resulted in statistically significantly greater improvements in a composite measure of depressive symptoms and cardiometabolic indices compared with usual care.

Article Number: 103624

Accession Number: WOS:000992884700001

Abstract: Objective: To explore the perceptions and experiences of healthcare professionals, including female health visitors, female health workers, community midwives, and heads of departments of healthcare facilities, regarding the importance of the Safe Motherhood Initiative (SMI), its pillars, and its foundational principles. Design: Qualitative descriptive exploratory study. Setting: This study was conducted in healthcare centres in 10 districts in Pakistan: six in Gilgit Baltistan, two in Chitral, and two in Sindh. Participants: Healthcare professionals were recruited using a purposive sampling technique. In total, 14 in-depth interviews were conducted. Findings: The following themes emerged through thematic analysis: (1) health and well-being of mothers and newborns; (2) strengthening the SMI pillars; (3) equity of health services; and (4) effective strategies for behaviour modification. Each theme had two categories. Key conclusions: The health and well-being of mothers and newborns are key indicators; as such, interventions should be made to promote their quality of life. Capacity building and refresher training on antenatal care, childbirth, postnatal care, postabortion care, and family planning can be considered effective to enhance the competencies of healthcare professionals. Implications for practice: The findings of this study suggest that healthcare professionals should receive training to enhance their competencies and provide safe care. (c) 2023 Elsevier Ltd. Title: A systematic review of randomized controlled trials of interventions to improve adherence among orthodontic patients aged 12 to 18

Journal: Angle Orthodontist

Volume: 85

Issue: 2

Pages: 305-313

Date: Mar

Short Title: A systematic review of randomized controlled trials of interventions to improve adherence among orthodontic patients aged 12 to 18

ISSN: 0003-3219

DOI: 10.2319/031214-184.1

Accession Number: WOS:000350531200019

Abstract: Objective: To investigate the effectiveness of interventions to enhance adherence among orthodontic patients aged 12 to 18 years. Specific adherence outcomes included were recall of information given by the orthodontic team, attendance at orthodontic appointments, self-reported oral hygiene behavior, and clinical indexes of oral hygiene. Materials and Methods: Electronic searches of Medline via OVID (January 1, 1966 through March 1, 2012), EMBASE, and the Cochrane central register of control trials from its inception through March 2012, as well as a hand search, were undertaken to identify relevant studies. Results: Through the electronic searches, 381 article were identified. Initial screening of the abstracts and titles by all review authors identified 21 articles that met the inclusion criteria for this review. The full articles were then retrieved. Four randomized controlled trials were found, all of which used different methods of intervention: a system of rewards or awards, the Hawthorne effect, written information, and demonstration of the microbiology of plaque. All the interventions, except the use of award/reward, were associated with improvements in adherence. Conclusion: The literature advocates the use of several methods to improve compliance/adherence among orthodontic patients. Although there is insufficient evidence to allow clinicians to choose a single method, the results demonstrate the value of spending time with patients to illustrate the importance of adherence. Future studies should develop multiple methods of assessing patient adherence, including self-report, behavioral observation and recording, and change in clinical indexes. Such studies should test different types of interventions for effectiveness.

Title: Narrative as a learning tool for coaches of athletes with a disability: using stories to translate research into practice

Journal: Physical Education and Sport Pedagogy

Date: 2021 Nov

Short Title: Narrative as a learning tool for coaches of athletes

with a disability: using stories to translate research into practice
ISSN: 1740-8989

DOI: 10.1080/17408989.2021.2006619

Accession Number: WOS:000723923000001

Abstract: Background Provided that coaches play a key role in shaping the sport experiences of athletes with a disability, they represent an important point of intervention for enhancing the quality of athletes' participation in disability sport. Despite the importance of their role, few evidence-informed learning resources are available to support the development of disability sport coaches. Purpose The purpose of this study was to produce a novel evidence-informed learning tool for disability sport coaches in entry level and developmental coaching domains. The goal of this tool was to demonstrate and provide information about coach behaviours that facilitate quality experiences for athletes with disabilities. Methodology The format selected for this tool was a creative nonfiction (i.e. an evidence-informed story). Using the Knowledge to Action Framework as a guide, the tool was developed through a four-stage process: (1) identifying and creating primary sources of knowledge through a literature review and original research; (2) synthesizing primary sources of knowledge to select target behaviours and behavioural determinants; (3) crafting the story to demonstrate and provide information about target behaviours and related outcomes; and (4) obtaining feedback from stakeholders (i.e. disability sport athletes, coaches, and administrators) to tailor the knowledge included in the story to the appropriate context. Findings In the first stage, 23 studies focused on quality experiences and/or coaches in disability sport were identified through a review of the literature. The findings of these studies were combined with the results of three original studies conducted by the research team. A synthesis of these findings resulted in the selection of two behavioural determinants (confidence and attitudes) and 13 coach behaviours (aligning with transformational leadership theory) for inclusion in the tool (Stage 2). The story that formed the basis for the tool was crafted in Stage 3, which combined the behaviours and behavioural determinants identified in Stage 2 with a plotline, setting, and characters based on the experience of the first author and stakeholder input. The tool was revised several times to incorporate stakeholder feedback in Stage 4. Implications This paper describes the development of a practical resource for coaches and coach educators in disability sport. As such, we provide a detailed and rigorous procedure for translating evidence into a narrative format with the potential for application in diverse learning contexts. In addition, we reviewed and synthesized evidence that may contribute to enhanced theoretical understandings of coaching effectiveness in disability sport. Taken together, the information presented in this paper offers important theoretical, methodological, and practical implications for researchers, coaches, and coach developers in disability sport.

Title: A Personalized Home-Based Rehabilitation Program Using Exergames Combined With a Telerehabilitation App in a Chronic Stroke Survivor: Mixed Methods Case Study

Journal: Jmir Serious Games

Volume: 9

Issue: 3

Date: Jul-Sep

Short Title: A Personalized Home-Based Rehabilitation Program Using Exergames Combined With a Telerehabilitation App in a Chronic Stroke Survivor: Mixed Methods Case Study

ISSN: 2291-9279

DOI: 10.2196/26153

Article Number: e26153

Accession Number: WOS:000704787100006

Abstract: Background: In Canada, only 11% of stroke survivors have access to outpatient and community-based rehabilitation after discharge from inpatient rehabilitation. Hence, innovative community-based strategies are needed to provide adequate postrehabilitation services. The VirTele program, which combines virtual reality exergames and a telerehabilitation app, was developed to provide stroke survivors with residual upper extremity deficits, the opportunity to participate in a personalized home rehabilitation program. Objective: This study aims to determine the feasibility of VirTele for remote upper extremity rehabilitation in a chronic stroke survivor; explore the preliminary efficacy of VirTele on upper extremity motor function, the amount and quality of upper extremity use, and impact on quality of life and motivation; and explore the determinants of behavioral intention and use behavior of VirTele along with indicators of empowerment. Methods: A 63-year-old male stroke survivor (3 years) with moderate upper extremity impairment participated in a 2-month VirTele intervention. He was instructed to use exergames (5 games for upper extremity) for 30 minutes, 5 times per week, and conduct videoconference sessions with a clinician at least once per week. Motivational interviewing was incorporated into VirTele to empower the participant to continue exercising and use his upper extremities in everyday activities. Upper extremity motor function (Fugl-Meyer Assessment-upper extremity), amount and quality of upper extremity use (Motor Activity Log-30), and impact on quality of life (Stroke Impact Scale-16) and motivation (Treatment Self-Regulation Questionnaire-15) were measured before (T1), after (T2) VirTele intervention, and during a 1-(T3) and 2-month (T4) follow-up period. Qualitative data were collected through logs and semistructured interviews. Feasibility data (eg, number and duration of videoconference sessions and adherence) were documented at the end of each week. Results: The participant completed 48 exergame

sessions (33 hours) and 8 videoconference sessions. Results suggest that the VirTele intervention and the study protocol could be feasible for stroke survivors. The participant exhibited clinically meaningful improvements at T2 on the Fugl-Meyer and Stroke Impact Scale-16 and maintained these gains at T3 and T4. During the follow-up periods, the amount and quality of upper extremity use showed meaningful changes, suggesting more involvement of the affected upper extremity in daily activities. The participant demonstrated a high level of autonomous motivation, which may explain his adherence. Performance, effort, and social influence have meaningful weights in the behavioral intention of using VirTele. However, the lack of control of technical and organizational infrastructures may influence the long-term use of technology. At the end of the intervention, the participant demonstrated considerable empowerment at both the behavioral and capacity levels. Conclusions: VirTele was shown to be feasible for use in chronic stroke survivors for remote upper extremity rehabilitation. Meaningful determinants of behavioral intention and use behavior of VirTele were identified, and preliminary efficacy results are promising. Short Title: Does extraversion increase following a three-hour flirt training? Exploring two training routes

ISSN: 0036-5564

DOI: 10.1111/sjop.12803

Accession Number: WOS:000770153900001

Abstract: Flirting situations are opportunities to behave in extraverted ways. However, it is not clear whether engaging in flirting behavior predicts extraversion. The current study explored whether extraversion increases following a 3-h flirt training and compared two training routes to flirting. A two-arm randomized pre-

post design with two active conditions were used. Ninety-six adults between 18 and 49 years (67.7% women) were randomized to either: (1) a problem-oriented training strategy that aims to compensate for problems and deficits related to flirting; or (2) a strengths-oriented training strategy that capitalizes on individuals' strengths and resources. The outcome variables were assessed before and 30 days after the training. Participants in both conditions reported higher scores in flirting behavior as well as in extraversion following the trainings. The results suggest that flirt trainings are potentially interesting indirect intervention approaches to increase the expression of extraversion.

Abstract: Osteoarthritis (OA) is a leading cause of pain and disability worldwide. Despite the existence of evidence-based treatments and guidelines, substantial gaps remain in the quality of OA management. There is underutilization of behavioral and rehabilitative strategies to prevent and treat OA as well as a lack of processes to tailor treatment selection according to patient characteristics and preferences. There are emerging efforts in multiple countries to implement models of OA care, particularly focused on improving nonsurgical management. Although these programs vary in content and setting, key lessons learned include the importance of support from all stakeholders, consistent program delivery and tools, a coherent team to run the program, and a defined plan for outcome assessment. Efforts are still needed to develop, deliver, and evaluate models of care across the spectrum of OA, from prevention through end-stage disease, in order to improve care for this highly prevalent global condition. Issue: 5

Date: Mar

Short Title: Barriers and Enablers to Food Waste Recycling: A Mixed Methods Study amongst UK Citizens

DOI: 10.3390/ijerph19052729

Article Number: 2729

Accession Number: WOS:000768852800001

Abstract: We aim to identify influences on UK citizens' household food waste recycling as a basis for designing strategies to increase household food waste collection rates via local services. Using a UK dataset (n = 1801) and the COM-B (Capability-Opportunity-Motivation-Behaviour) model as a theoretical framework, we conduct quantitative regression and supporting thematic analyses to investigate influences on citizens' recycling of food waste. Results show that automatic motivation (e.g., emotions and habit) and psychological capability (e.g., knowledge) predict household food waste recycling. Physical opportunity (i.e., dealing with food waste in other ways such as home-composting or feeding pets/strays, time and financial costs) was the main barrier to recycling food waste identified in thematic analyses. Participants also reported automatic motivation-related barriers such as concerns over pests, odour, hygiene and local authorities' food waste collection capabilities. Based on findings we recommend the development of clear, consistent communications aimed at creating positive social norms relating to recycling and increasing knowledge of what can and cannot be put in food waste bins. Improved functional design and free distribution of bins and compostable caddy liners developed according to user-

centred needs for cleanliness, convenience and hygiene are also needed. These will not be sufficient without a nationally uniform, efficient and reliable system of household food waste collection.

Title: Antibiotic resistance awareness: a public engagement approach for all pharmacists

Journal: International Journal of Pharmacy Practice

Volume: 25

Issue: 1

Pages: 93-96

Date: Feb

Short Title: Antibiotic resistance awareness: a public engagement approach for all pharmacists

ISSN: 0961-7671

DOI: 10.1111/ijpp.12287

Accession Number: WOS:000394429100012

Abstract: ObjectivesThe main objective of this study was to promote knowledge about antibiotic resistance development and good stewardship principles amongst the general population through pharmacy student-led public engagement workshops in high schools.

MethodsStructured questionnaires, based on the Key Stage 4 curriculum were initially used to assess awareness and knowledge of antibiotic resistance issues amongst year 10 and 11 (GCSE stage) high school pupils. A Prezi-style presentation () was subsequently developed to deliver a positive message that the young learners could share with friends and family. Key FindingsMisconceptions still exist regarding the correct and appropriate use of antibiotics. The person-person approach adopted by this study was well received, key antibiotic stewardship messages being delivered to the general population through either educational surveys or hands-on workshops. ConclusionsIt is widely acknowledged that antibiotic resistance is one of the biggest threats facing society today. As healthcare professionals, pharmacists in all sectors have a crucial role to play in educating the public about antibiotics and how to use them effectively. This article describes the different ways by which all pharmacists can help educate the public on key issues, with particular emphasis on the next generation.

Title: Feasibility of a community pharmacy antimicrobial stewardship intervention (PAMSI): an innovative approach to improve patients' understanding of their antibiotics

Journal: Jac-Antimicrobial Resistance

Volume: 2

Issue: 4

Date: Dec

Short Title: Feasibility of a community pharmacy antimicrobial stewardship intervention (PAMSI): an innovative approach to improve patients' understanding of their antibiotics

DOI: 10.1093/jacamr/dlaa089

Article Number: dlaa089

Accession Number: WOS:000733835400008

Abstract: Background: Community pharmacy staff have an opportunity to play a pivotal role in antimicrobial stewardship (AMS) due to their expertise in medicines and accessibility to patients.

Objectives: To develop and test the feasibility of a pharmacy AMS intervention (PAMSI) to increase community pharmacy staff's capability, opportunity and motivation to check antibiotic appropriateness and provide self-care and adherence advice when dispensing antibiotics. Methods: The PAMSI was centred around an Antibiotic Checklist, completed by patients and pharmacy staff, to facilitate personalized advice to the patient, based on their reported knowledge. An educational webinar for staff and patient-facing materials were also developed. Staff and patients completing Antibiotic Checklists were invited to provide feedback via questionnaires. Results: In February 2019, 12 community pharmacies in England trialled the intervention. Forty-three pharmacy staff evaluated the educational webinar and reported increases in their understanding, confidence, commitment and intention to use the tools provided to give adherence and self-care advice. Over 4 weeks, 931 Antibiotic Checklists were completed. Staff reported being more focused on giving advice and able to address patients' knowledge gaps (mainly: likely symptom duration; alcohol and food consumption advice; possible side effects from antibiotics; returning unused antibiotics to the pharmacy), resulting in increased self-reported effective and meaningful conversations. Conclusions: Implementation of a PAMSI is feasible and effectively promotes AMS. Pharmacy staff and commissioners should consider this within their AMS plans. An optional digital format of the Antibiotic Checklist should be explored, for patients who are not collecting their antibiotic prescriptions themselves, and to save printing costs.

Short Title: Randomised controlled trial of pharmacist-led patient counselling in controlling hypoglycaemic attacks in older adults with type 2 diabetes mellitus (ROSE-ADAM): A study protocol of the SUGAR intervention

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2020.07.012

Accession Number: WOS:000633997800008

Abstract: Introduction: Hypoglycaemia is one of the most serious adverse effects of diabetes treatment. Older adults are at the highest risk to develop hypoglycaemia. Several studies have established the important positive role of educational interventions on achieving glycaemic control and other clinical outcomes, however, there is still a lack in studies that evaluate the impact of such type of interventions on hypoglycaemia risk in elderly patients with type 2 diabetes. The purpose of this research is to evaluate the effectiveness of pharmacist-led patient counselling on reducing hypoglycaemic attacks in older adults with type 2 diabetes mellitus.

Methods: and analysis: This study is an open-label, parallel controlled randomised trial, which will be conducted in the outpatient clinics at the largest referral hospital in the north of Jordan. Participants who are elderly (age ≥ 65 years), diagnosed with type 2 diabetes mellitus, and taking insulin, sulfonylurea, or any three anti-diabetic medications will be randomly assigned to intervention (SUGAR Handshake) and control (usual care) groups. The SUGAR Handshake participants will have an interactive, individualised, medications-focused counselling session reinforced with a pictogram and a phone call at week six of enrolment. The primary outcome measure is the frequency of total hypoglycaemic events within 12 weeks of follow up. Secondary outcomes include the frequency of asymptomatic, symptomatic, and severe hypoglycaemic events, hypoglycaemia incidence, and time to the first hypoglycaemic attack. We will also conduct a nested qualitative study for process evaluation. Ethics and dissemination: The Human Research Ethics Committee of the University of Lincoln and the Institutional Review

Board of King Abdullah University Hospital approved this protocol. The findings of this study will be presented in international conferences and published in a peer-reviewed journal. Trial registration number: The study protocol has been registered with ClinicalTrials.gov, NCT04081766.

Title: Assessing the Feasibility and Acceptability of Health Coaching as a New Diabetes Management Approach for the People with Type 2 Diabetes in Saudi Arabia: A Protocol for a Mixed Methods Feasibility Study

Journal: International Journal of Environmental Research and Public Health

Volume: 19

Issue: 22

Date: Nov

Short Title: Assessing the Feasibility and Acceptability of Health Coaching as a New Diabetes Management Approach for the People with Type 2 Diabetes in Saudi Arabia: A Protocol for a Mixed Methods Feasibility Study

DOI: 10.3390/ijerph192215089

Article Number: 15089

Accession Number: WOS:000887298400001

Abstract: Background: Over recent years, the Middle East, and especially Saudi Arabia, has faced multiple changes, including structural-demographic and economic shifts. This has led to massive changes in the population's lifestyle, including more unhealthy diets and increases in physical inactivity. As a result, accelerating rates of chronic diseases, including type 2 diabetes mellitus (T2DM) are a major public health concern. Current diabetes care in Saudi Arabia focuses on increasing the awareness of patients through various approaches, mainly based on health education, which is found to be suboptimal and ineffective for improving long-term outcomes. This study aims to assess the feasibility and acceptability of using a client-centred approach called health coaching that supports, enables, and engages T2DM patients to take the central role of controlling their own conditions by developing new crucial skills. Methods: A mixed methods randomised controlled feasibility study of health coaching will be used. Participants (n = 30) are adults with T2DM with poorly controlled diabetes (A1C \geq 7) who can read and write in Arabic. Eligible participants are randomly allocated to either an intervention or control group for 12 weeks. COM-B model and Behaviour Change Technique Taxonomy version 1 (BCTTv1) guide the intervention curriculum. Predetermined

progression criteria will be used to determine whether to proceed to a larger trial or not. Outcomes will be measured at baseline and 3 months. The study's primary aim is to assess the process of eligibility, recruitment, retention and completion rates, acceptability and suitability of intervention and the time to complete each procedure. The preliminary efficacy of health coaching is the secondary outcome that includes different measurements, such as HbA1c, blood pressure, body mass index (BMI), waist circumference, weight, patients' self-efficacy, and diabetes self-management. Discussion: This is the first study to explore the feasibility, acceptability, and preliminary efficacy of health coaching that used the Capability, Opportunity, Motivation, Behaviour (COM-B) model and BCTTv1 as guidance to develop the intervention for adults with T2DM in Saudi Arabia. The findings of this study will be used to inform the larger RCT trial if it is shown to be feasible and acceptable.

Title: Behavioural Change Techniques in Health Coaching-Based Interventions for Type 2 Diabetes: A Systematic Review and Meta-Analysis

Journal: BMC Public Health

Volume: 23

Issue: 1

Date: Jan

Short Title: Behavioural Change Techniques in Health Coaching-Based Interventions for Type 2 Diabetes: A Systematic Review and Meta-Analysis

DOI: 10.1186/s12889-022-14874-3

Article Number: 95

Accession Number: WOS:000915837000002

Abstract: Background Given the high rates globally of Type 2 Diabetes Mellitus (T2DM), there is a clear need to target health behaviours through person-centred interventions. Health coaching is one strategy that has been widely recognised as a tool to foster positive behaviour change. However, it has been used inconsistently and has produced mixed results. This systematic review sought to explore the use of behaviour change techniques (BCTs) in health coaching interventions and identify which BCTs are linked with increased effectiveness in relation to HbA1C reductions. Methods In line with the PICO framework, the review focused on people with T2DM, who received health coaching and were compared with a usual care or active control group on HbA1c levels. Studies were systematically identified through different databases including

Medline, Web of science, and PsycINFO searches for relevant randomised controlled trials (RCTs) in papers published between January 1950 and April 2022. The Cochrane collaboration tool was used to evaluate the quality of the studies. Included papers were screened on the reported use of BCTs based on the BCT taxonomy. The effect sizes obtained in included interventions were assessed by using Cohen's d and meta-analysis was used to estimate sample-weighted average effect sizes (Hedges' g). Results Twenty RCTs with a total sample size of 3222 were identified. Random effects meta-analysis estimated a small-sized statistically significant effect of health coaching interventions on HbA1c reduction ($g(+) = 0.29$, 95% CI: 0.18 to 0.40). A clinically significant HbA1c decrease of ≥ 5 mmol/mol was seen in eight studies. Twenty-three unique BCTs were identified in the reported interventions, with a mean of 4.5 (SD = 2.4) BCTs used in each study. Of these, Goal setting (behaviour) and Problem solving were the most frequently identified BCTs. The number of BCTs used was not related to intervention effectiveness. In addition, there was little evidence to link the use of specific BCTs to larger reductions in HbA1c across the studies included in the review; instead, the use of Credible source and Social reward in interventions were associated with smaller reductions in HbA1c. Conclusion A relatively small number of BCTs have been used in RCTs of health coaching interventions for T2DM. Inadequate, imprecise descriptions of interventions and the lack of theory were the main limitations of the studies included in this review. Moreover, other possible BCTs directly related to the theoretical underpinnings of health coaching were absent. It is recommended that key BCTs are identified at an early stage of intervention development, although further research is needed to examine the most effective BCTs to use in health coaching interventions.

clinical and productivity outcomes in office employees with type 2 diabetes: study protocol for a randomized controlled trial

DOI: 10.1186/s12889-022-13676-x

Article Number: 1269

Accession Number: WOS:000818797400005

Abstract: Background: Prolonged sedentary time is associated with an increased incidence of chronic disease including type 2 diabetes mellitus (DM2). Given that occupational sedentary time contributes significantly to the total amount of daily sedentariness, incorporating programmes to reduce occupational sedentary time in patients with chronic disease would allow for physical, mental and productivity benefits. The aim of this study is to evaluate the short-, medium- and long-term effectiveness of a mHealth programme for sitting less and moving more at work on habitual and occupational sedentary behaviour and physical activity in office staff with DM2. Secondary aims. To evaluate the effectiveness on glycaemic control and lipid profile at 6- and 12-month follow-up; anthropometric profile, blood pressure, mental well-being and work-related post-intervention outcomes at 3, 6 and 12 months. Methods: Multicentre randomized controlled trial. A sample size of 220 patients will be randomly allocated into a control (n = 110) or intervention group (n = 110), with post-intervention follow-ups at 6 and 12 months. Health professionals from Spanish Primary Health Care units will randomly invite patients (18-65 years of age) diagnosed with DM2, who have sedentary office desk-based jobs. The control group will receive usual healthcare and information on the health benefits of sitting less and moving more. The intervention group will receive, through a smartphone app and website, strategies and real-time feedback for 13 weeks to change occupational sedentary behaviour. Variables: (1) Subjective and objective habitual and occupational sedentary behaviour and physical activity (Workforce Sitting Questionnaire, Brief Physical Activity Assessment Tool, activPAL3TM); 2) Glucose, HbA1c; 3) Weight, height, waist circumference; 4) Total, HDL and LDL cholesterol, triglycerides; (5) Systolic, diastolic blood pressure; (6) Mental well-being (Warwick-Edinburgh Mental Well-being); (7) Presenteeism (Work Limitations Questionnaire); (8) Impact of work on employees health, sickness absence (6th European Working Conditions Survey); (9) Job-related mental strain (Job Content Questionnaire). Differences between groups pre- and post- intervention on the average value of the variables will be analysed. Discussion: If the mHealth intervention is effective in reducing sedentary time and increasing physical activity in office employees with DM2, health professionals would have a low-cost tool for the control of patients with chronic disease.

Accession Number: WOS:000967237200001

Abstract: Introduction: Studies have indicated that half of all patients with diabetes do not take their medication as prescribed. Patient social circles, including professionals (health care providers) and nonprofessionals (family and friends) might contribute to low medication adherence. Therefore, this study explored the point of view of healthcare providers and family members of patients with diabetes on patient medication adherence. Methods: Our study included health care providers and family members using in-depth, semi structured interviews. The theoretical domain framework (TDF) was used to explore their perspectives. TDF was used to build a topic guide and to frame the data analysis. The interviews were transcribed verbatim and thematically analyzed using the MAXQDA 2022 program. Results: The participants identified a variety of factors potentially associated with diabetes medication adherence. Most factors were related to the environmental context and resources such as the burden of polypharmacy, medication shortages, and long wait times for care. In addition, factors related to patient beliefs concerning diabetes complications and insulin injections were reported. Several factors were identified that related to knowledge and social influences. Discussion: Interventions that target the factors identified by the social circle of patients with diabetes might improve medication adherence and promote better disease management outcomes.

Article Number: 100567

Accession Number: WOS:000982647500001

Abstract: Seclusion and sedentary lifestyle are the main causes of many psychological and physical health problems. They may be among the top 10 causes of death and disability in the world. The pandemic crisis context of COVID has deepened these problems, especially for older adults who have been isolated, deprived of their relatives and of doing physical activities. In this paper, we introduce an adaptive, personalized, and context-aware persuasive platform to stimulate physical activities of older adults without deception or coercion. Our persuasion approach is customizable, in the sense that every older adult has its personal profile. It is also adaptive because it can use a persuasion loop to change the persuasion strategy when the older adult does not adhere to the proposed persuasion strategy. Furthermore, our persuasion approach is context-aware as it takes account of contextual location and weather information in the provision of the persuasion strategy. To validate our approach, we implemented "ActiveSenior". Then, we carried out a large-scale challenge for one month to approve the results of our persuasive approach. The evaluation of the acceptance of our ActiveSenior system was encouraging as most of the interviewed participants were satisfied. In addition, the obtained results showed a marked improvement in the physical activity of older adults, quantified by the number of steps taken per day.

Short Title: Prioritizing the target audience for a hearing awareness campaign in Australia using the TARPARE model

ISSN: 0957-4824

DOI: 10.1093/heapro/daac041

Accession Number: WOS:000785844400001

Abstract: Lay Summary Hearing loss affects one in six Australians, and it is estimated that around one-third of all hearing loss is preventable. Over the past decade, there have been repeated calls for a national health campaign that can raise awareness of hearing health. In order to work out which population segments to target as part of a campaign, we used a model called the TARPARE model to look at which groups a campaign would be most effective for. To help us

do this, we asked a group of health experts to provide their input through a survey. Young children and caregivers received the highest score based on their survey responses and the TARPARE model. The responses from the health experts also revealed three key themes to consider for a hearing campaign: Accessibility and availability of hearing services, Deciding on a preventative or treatment-focused approach, and The difficulty of changing behavior. Hearing loss affects one in six Australians, and it is estimated that around one-third of all hearing loss is preventable. Over the past decade, there have been repeated calls for the development of a national campaign in Australia, aimed at raising the public's awareness of hearing health. We identified six target groups either at risk of developing hearing loss, vulnerable to poor outcomes as a result of untreated hearing loss, or lacking awareness of hearing health services, and applied the TARPARE model as a way of gathering insight into how a national hearing campaign might prioritize these different population segments. An online survey of prominent Australian academics, health practitioners and advocacy professionals with expertise in hearing health and/or public health promotion was created, through which their views on each of six potential target groups that had been identified as likely recipients of a potential hearing health campaign was sought. Young children and caregivers received the highest score based on survey responses and TARPARE criteria. A qualitative analysis of open-ended survey responses from the survey respondents revealed three key themes to consider as part of a potential campaign: Accessibility and availability of hearing services, Deciding on a preventative or treatment-focused approach, and The difficulty of changing behavior. Title: Quantifying behavioural determinants relating to health professional reporting of medication errors: a cross-sectional survey using the Theoretical Domains Framework

Journal: European Journal of Clinical Pharmacology

Volume: 72

Issue: 11

Pages: 1401-1411

Date: Nov

Short Title: Quantifying behavioural determinants relating to health professional reporting of medication errors: a cross-sectional survey using the Theoretical Domains Framework

ISSN: 0031-6970

DOI: 10.1007/s00228-016-2124-z

Accession Number: WOS:000385175700013

Abstract: The aims of this study were to quantify the behavioural determinants of health professional reporting of medication errors in the United Arab Emirates (UAE) and to explore any differences

between respondents. A cross-sectional survey of patient-facing doctors, nurses and pharmacists within three major hospitals of Abu Dhabi, the UAE. An online questionnaire was developed based on the Theoretical Domains Framework (TDF, a framework of behaviour change theories). Principal component analysis (PCA) was used to identify components and internal reliability determined. Ethical approval was obtained from a UK university and all hospital ethics committees. Two hundred and ninety-four responses were received. Questionnaire items clustered into six components of knowledge and skills, feedback and support, action and impact, motivation, effort and emotions. Respondents generally gave positive responses for knowledge and skills, feedback and support and action and impact components. Responses were more neutral for the motivation and effort components. In terms of emotions, the component with the most negative scores, there were significant differences in terms of years registered as health professional (those registered longest most positive, $p = 0.002$) and age (older most positive, $p < 0.001$) with no differences for gender and health profession. Emotional-related issues are the dominant barrier to reporting and are common to all professions. There is a need to develop, test and implement an intervention to impact health professionals' emotions. Such an intervention should focus on evidence-based behaviour change techniques of reducing negative emotions, focusing on emotional consequences and providing social support. aEuro cent This research used the Theoretical Domains Framework to quantify the behavioural determinants of health professional reporting of medication errors. aEuro cent Questionnaire items relating to emotions surrounding reporting generated the most negative responses with significant differences in terms of years registered as health professional (those registered longest most positive) and age (older most positive) with no differences for gender and health profession. aEuro cent Interventions based on behaviour change techniques mapped to emotions should be prioritised for development.

Short Title: Exploring behavioural determinants relating to health

professional reporting of medication errors: a qualitative study using the Theoretical Domains Framework

ISSN: 0031-6970

DOI: 10.1007/s00228-016-2054-9

Accession Number: WOS:000378727500013

Abstract: Effective and efficient medication reporting processes are essential in promoting patient safety. Few qualitative studies have explored reporting of medication errors by health professionals, and none have made reference to behavioural theories. The objective was to describe and understand the behavioural determinants of health professional reporting of medication errors in the United Arab Emirates (UAE). This was a qualitative study comprising face-to-face, semi-structured interviews within three major medical/surgical hospitals of Abu Dhabi, the UAE. Health professionals were sampled purposively in strata of profession and years of experience. The semi-structured interview schedule focused on behavioural determinants around medication error reporting, facilitators, barriers and experiences. The Theoretical Domains Framework (TDF; a framework of theories of behaviour change) was used as a coding framework. Ethical approval was obtained from a UK university and all participating hospital ethics committees. Data saturation was achieved after interviewing ten nurses, ten pharmacists and nine physicians. Whilst it appeared that patient safety and organisational improvement goals and intentions were behavioural determinants which facilitated reporting, there were key determinants which deterred reporting. These included the beliefs of the consequences of reporting (lack of any feedback following reporting and impacting professional reputation, relationships and career progression), emotions (fear and worry) and issues related to the environmental context (time taken to report). These key behavioural determinants which negatively impact error reporting can facilitate the development of an intervention, centring on organisational safety and reporting culture, to enhance reporting effectiveness and efficiency.

Short Title: Physical therapists' perceptions of and satisfaction with delivering telerehabilitation sessions to patients with knee osteoarthritis during the Covid-19 pandemic: Preliminary study

ISSN: 1478–2189

DOI: 10.1002/msc.1666

Accession Number: WOS:000810433700001

Abstract: Objective: This preliminary study was conducted to explore physical therapists' (PT) perceptions of and satisfaction with delivering telerehabilitation sessions to patients with knee osteoarthritis during the Covid-19 pandemic. Study design: An exploratory preliminary study using an internet-based survey followed by focus group sessions. Methods: A programme of sessions was administered by 12 PTs from the Physical Therapy Department at Prince Sultan Military Medical City. An internet-based survey containing 17 statements was completed by the PTs. Results: With regard to telephone-delivered care, four statements related to patients' privacy, programme convenience, safe patients time and money achieved consensus agreement ($\geq 75\%$ agreed or strongly agreed), there was majority agreement ($\geq 50\%$ of respondents agreed or strongly agreed) with seven of the statements regarding the effectiveness, affordability and safety of the programme, but there was no consensus with regard to the remaining five statements. In addition, most of the participants (84.6%) believed that a telephone consultation should cost 25% or 50% less than a face-to-face session. Conclusion: Despite the lack of physical contact with patients, the PTs agreed that telerehabilitation would offer patients an easy method of being prescribed a therapeutic programme, save time and money, and maintain patient privacy. Further, the PTs reported barriers and suggested adaptations for this method of service delivery.

ISSN: 1356-1294

DOI: 10.1111/jep.13616

Accession Number: WOS:000691707800001

Abstract: Objective To describe the perspectives of healthcare professionals regarding the implementation of Shared decision-making (SDM) in primary healthcare centres (PHCCs) in Saudi Arabia. Methods Qualitative semi-structured interviews were conducted with a purposive and snowball sample of healthcare professionals in PHCCs. Interviews have been recorded, transcribed, translated and thematically analysed. Themes were mapped to the COM-B model. Results Sixteen healthcare professionals were interviewed. The data analysis identified six themes and 14 sub-themes. The six themes are patient related factors, health professional related factors, environmental context and resources, patient-physician communication, patient-physician preferences toward SDM and physicians' perceived value and benefits of SDM. Physicians are unlikely to practice SDM in the context of time pressures, shortage of physicians, lack of treatment options, and decision-making aids. The findings also underscored the importance of building a trustworthy physician-patient relationship through the use of effective conversation techniques. Conclusions There are multiple barriers to SDM in primary care. Unless these barriers are addressed, it is unlikely that physicians will effectively or fully engage in SDM with patients.

DOI: 10.3390/ijerph19020784

Article Number: 784

Accession Number: WOS:000758540600001

Abstract: Background: Media outlets influence social attitudes toward health. Thus, it is important that they share contents which promote healthy habits. The Mediterranean diet (MedDiet) is associated with lower cardiovascular disease risk. Analysis of tweets has become a tool for understanding perceptions on health issues. Methods: We investigated tweets posted between January 2009 and December 2019 by 25 major US media outlets about MedDiet and its components as well as the retweets and likes generated. In addition, we measured the sentiment analysis of these tweets and their dissemination. Results: In total, 1608 tweets, 123,363 likes and 48,946 retweets about MedDiet or its components were analyzed. Dairy (inversely weighted in MedDiet scores) accounted for 45.0% of the tweets (723/1608), followed by nuts 19.7% (317/1608). MedDiet, as an overall dietary pattern, generated only 9.8% (157/1608) of the total tweets, while olive oil generated the least number of tweets. Twitter users' response was quantitatively related to the number of tweets posted by these US media outlets, except for tweets on olive oil and MedDiet. None of the MedDiet components analyzed was more likely to be liked or retweeted than the MedDiet itself. Conclusions: The US media outlets analyzed showed reduced interest in MedDiet as a whole, while Twitter users showed greater interest in the overall dietary pattern than in its particular components. Short Title: Healthcare professionals' perspectives of deprescribing in older patients at the end of life in hospice care: a qualitative study using the Theoretical Domains Framework

ISSN: 0961-7671

DOI: 10.1093/ijpp/riad005

Accession Number: WOS:000942793900001

Abstract: Objectives This study aimed to investigate healthcare

professionals' barriers to and enablers of deprescribing in older hospice patients at the end of life and prioritise relevant theoretical domains for behaviour change to be incorporated into future interventions to facilitate deprescribing. Methods Twenty doctors, nurses and pharmacists from four hospices in Northern Ireland participated in qualitative semistructured interviews using Theoretical Domains Framework (TDF)-based topic guides. Data were recorded, transcribed verbatim and analysed inductively using thematic analysis. Deprescribing determinants were mapped to the TDF enabling the prioritisation of domains for behaviour change. Key findings Four prioritised TDF domains represented key barriers to deprescribing implementation; lack of formal documentation of deprescribing outcomes (Behavioural regulation), challenges in communication with patients and families (Skills), lack of implementation of deprescribing tools in practice (Environmental context/resources) and patient and caregiver perceptions of medication (Social influences). Access to information was identified as a key enabler (Environmental context/resources). Perceived risks versus benefits of deprescribing were identified as a key barrier or enabler (Beliefs about consequences). Conclusions This study highlights that further guidance on deprescribing in the context of end-of-life is required to address the growing problems of inappropriate prescribing, Guidance should consider factors such as the adoption of deprescribing tools, monitoring and documentation of deprescribing outcomes and how best to discuss prognostic uncertainty.

Short Title: 'We're Farmers Not Foresters': Farmers' Decision-Making and Behaviours towards Managing Trees for Pests and Diseases

DOI: 10.3390/f13071030

Article Number: 1030

Accession Number: WOS:000833777300001

Abstract: Policy makers are challenged to find ways of influencing and supporting land manager behaviours and actions to deal with the impacts of increasing pressure from tree pests and diseases. This paper investigates attitudes and behaviours of farmers towards managing trees on farmland for pests and diseases. Data collection with farmers included deliberative workshops and semi-structured interviews. Data were thematically analyzed using the COM-B

(Capacity/Opportunity/Motivation–Behaviour) model to understand the drivers of farmer behaviour for tree health. Results suggested farmers had some knowledge, experience and skills managing trees, but they did not recognize this capacity. Social norms and networks impacted the context of opportunity to act for tree health, along with access to trusted advice and labour, and the costs associated with management action. Motivational factors such as self-efficacy, perceived benefits of acting, personal interest and sense of agency were impacted by farmers' self-identity as food producers. The COM-B model also provides a framework for identifying intervention design through a Behaviour Change Wheel. This suggests that enhancing self-efficacy supported by the right kind of advice and guidance, framed and communicated in farmers' terms and brokered by appropriate knowledge intermediaries, seems critical to building action amongst different farmer types and attitudinal groups.

Issue: 1

Date: Apr

Short Title: A parallel randomised controlled trial of the Hypoglycaemia Awareness Restoration Programme for adults with type 1 diabetes and problematic hypoglycaemia despite optimised self-care (HARPdoc)

DOI: 10.1038/s41467-022-29488-x

Article Number: 2229

Accession Number: WOS:000788852000013

Abstract: Impaired awareness of hypoglycaemia (IAH) is a major risk for severe hypoglycaemia in insulin treatment of type 1 diabetes (T1D). To explore the hypothesis that unhelpful health beliefs create barriers to regaining awareness, we conducted a multi-centre, randomised, parallel, two-arm trial (ClinicalTrials.gov NCT02940873) in adults with T1D and treatment-resistant IAH and severe hypoglycaemia, with blinded analysis of 12-month recall of severe hypoglycaemia at 12 and/or 24 months the primary outcome. Secondary outcomes included cognitive and emotional measures. Adults with T1D,

IAH and severe hypoglycaemia despite structured education in insulin adjustment, +/- diabetes technologies, were randomised to the "Hypoglycaemia Awareness Restoration Programme despite optimised self-care" (HARPDdoc, n = 49), a psychoeducation programme uniquely focussing on changing cognitive barriers to avoiding hypoglycaemia, or the evidence-based "Blood Glucose Awareness Training" (BGAT, n = 50), both delivered over six weeks. Median [IQR] severe hypoglycaemia at baseline was 5[2-12] per patient/year, 1[0-5] at 12 months and 0[0-2] at 24 months, with no superiority for HARPDdoc (HARPDdoc vs BGAT incident rate ratios [95% CI] 1.25[0.51, 3.09], p = 0.62 and 1.26[0.48, 3.35], p = 0.64 respectively), nor for changes in hypoglycaemia awareness scores or fear. Compared to BGAT, HARPDdoc significantly reduced endorsement of unhelpful cognitions (Estimated Mean Difference for Attitudes to Awareness scores at 24 months, -2.07 [-3.37,-0.560], p = 0.01) and reduced scores for diabetes distress (-6.70[-12.50,-0.89], p = 0.02); depression (-1.86[-3.30, -0.43], p = 0.01) and anxiety (-1.89[-3.32, -0.47], p = 0.01). Despite positive impact on cognitive barriers around hypoglycaemia avoidance and on diabetes-related and general emotional distress scores, HARPDdoc was not more effective than BGAT at reducing severe hypoglycaemia. Impaired awareness of hypoglycaemia (IAH) is a risk for severe hypoglycaemia in insulin treatment of type 1 diabetes (T1D). Here the authors report that a group programme focussing on changing cognitive barriers to avoiding hypoglycaemia (HARPDdoc) does not reduce severe hypoglycaemia more than a programme focussing on behaviours (BGAT) in a randomized control trial in adults with T1D and treatment-resistant IAH and severe hypoglycaemia.

ISSN: 1743-7199

DOI: 10.1080/17437199.2022.2090411

Accession Number: WOS:000815384200001

Abstract: Embracing the Bayesian approach, we aimed to synthesise evidence regarding barriers and enablers to physical activity in adults with heart failure (HF) to inform behaviour change intervention. This approach helps estimate and quantify the uncertainty in the evidence and facilitates the synthesis of qualitative and quantitative studies. Qualitative evidence was annotated using the Theoretical Domains Framework and represented as a prior distribution using an expert elicitation task. The maximum a posteriori probability (MAP) for the probability distribution for the log OR was used to estimate the relationship between physical activity and each determinant according to qualitative, quantitative, and qualitative and quantitative evidence combined. The probability distribution dispersion (SD) was used to evaluate uncertainty in the evidence. Three qualitative and 16 quantitative studies were included (N = 2739). High pro-b-type natriuretic peptide (MAP = -1.16; 95%CrI: [-1.21; -1.11]) and self-reported symptoms (MAP = -0.48; 95%CrI: [-0.40; -0.55]) were suggested as barriers to physical activity with low uncertainty (SD = 0.18 and 0.19, respectively). Modifiable barriers were symptom distress (MAP = -0.46; 95%CrI: [-0.68; -0.24], SD = 0.36), and negative attitude (MAP = -0.40; 95%CrI: [-0.49; -0.31], SD = 0.26). Modifiable enablers were social support (MAP = 0.56; 95%CrI: [0.48; 0.63], SD = 0.26), self-efficacy (MAP = 0.43; 95%CrI: [0.32; 0.54], SD = 0.37), positive physical activity attitude (MAP = 0.92; 95%CrI: [0.77; 1.06], SD = 0.36).

Abstract: Background & aims: Nutrition following liberation of mechanical ventilation and throughout acute hospitalisation may be important in aiding recovery. While oral nutrition is the most common mode of nutrition provision in this time period, it is unclear what factors influence oral nutrition intake due to limited research in the area to date. This article outlines the methods for a scoping review to explore and collate reported barriers and facilitators to oral nutrition intake in patients following liberation of mechanical ventilation. Methods: A scoping review will be conducted, and the following databases searched: MEDLINE, Embase, Emtree, and CINAHL. Grey literature, including but not limited to conference abstracts and theses will be searched for via ProQuest, Scopus, Web of Science and PsychInfo. Study selection, data extraction and data charting will be conducted by two reviewers. Data will be synthesised into figures and tables, with the COM-B framework providing a structure for grouping themes and findings. Included literature will comprise of primary research studies, reviews and grey literature from 2000 onward, that include critically ill adult patients who have been recruited in an ICU, received a therapy usually delivered in ICU, or had an average length of ICU stay greater than or equal to two days. Studies that report the presence of oral nutrition-related barriers or facilitators following liberation of mechanical ventilation will be considered for inclusion. DOI: 10.1111/risa.13875

Accession Number: WOS:000740795200001

Abstract: Many people, especially those with low numeracy, are known to have difficulty interpreting and applying quantitative information to health decisions. These difficulties have resulted in a rich body of research about better ways to communicate numbers. Synthesizing this body of research into evidence-based guidance, however, is complicated by inconsistencies in research terminology and researcher goals. In this article, we introduce three taxonomies intended to systematize terminology in the literature, derived from an ongoing systematic literature review. The first taxonomy provides a systematic nomenclature for the outcome measures assessed in the studies, including perceptions, decisions, and actions. The second taxonomy is a nomenclature for the data formats assessed, including numbers (and different formats for numbers) and graphics. The third taxonomy describes the quantitative concepts being conveyed, from the simplest (a single value at a single point in time) to more complex ones (including a risk-benefit trade-off and a trend over time). Finally, we demonstrate how these three taxonomies can be used to resolve ambiguities and apparent contradictions in the literature.

Abstract: Systems that react to emotional information allow for better satisfaction of the user's needs, stated or otherwise. Special support should be built-in, in order to read and measure the time-variable user's affective state. This paper presents how cursor movement can accurately measure two basic emotional states and introduces a way to measure the emotional flow graph of an application, which allows for better user design.

Short Title: Physical Activity on Prescription in Routine Health Care: 1-Year Follow-Up of Patients with and without Counsellor Support

DOI: 10.3390/ijerph17165679

Article Number: 5679

Accession Number: WOS:000565054400001

Abstract: The effectiveness of counsellor support in addition to physical activity on prescription (PAP) from health care professionals has rarely been evaluated. This observational follow-up study investigated differences in physical activity levels and health-related quality of life (HRQoL) one year after PAP regarding patients' use of counsellor support in addition to PAP in routine care. The study was conducted in a Swedish health care region in which all patients receiving PAP from health care professionals were offered counsellor support. Data were collected from medical records and questionnaires (baseline and follow-up). Of the 400 study participants, 37% used counsellor support. The group of counsellor users attained a higher level of physical activity one year after receiving PAP compared to the group of non-users ($p < 0.001$). The level of physical activity was measured by a validated index (score 3-19) calculated from weekly everyday activity and exercise training. Comparison of the change in scores between baseline and follow-up showed a significant difference between the two groups, ($p < 0.001$). The median difference in the PAP + C group was 2.0 (interquartile range, 7.0) and 0.0 among non-users (interquartile range, 4.0). Significant differences in HRQoL were due to positive improvements among counsellor users, with the main improvement in general health. The conclusion is that patients using counsellor support after receiving PAP from health care professionals had higher physical activity and better HRQoL one year after compared with patients who did not use this support.

DOI: 10.1186/s12889-022-12940-4

Article Number: 509

Accession Number: WOS:000769445200007

Abstract: Background The study addresses knowledge gaps in research regarding influences of routine health care delivery of physical activity on prescription (PAP). The aim was to investigate if patient and health care characteristics are associated with increased physical activity 1 year after prescription among patients offered counselor support in addition to health care professionals' prescription. The study was conducted in primary and secondary care in a Swedish health care region. Methods All PAP recipients during 1 year were invited (N = 1503) to participate in this observational prospective study. Data were collected from medical records and questionnaires (baseline and follow-up). Descriptive statistics and multiple logistic regression analysis were used. The outcome variable was increased physical activity after 1 year. Study variables were patient and health care characteristics. Results Three hundred and fifty-five patients with complete follow-up data were included. The mean age was 62 years (SD = 14; range, 18–90) and 68% were females. Almost half (47%) had increased physical activity 1 year after PAP. Multiple logistic regression analysis showed that increased physical activity at follow-up was positively associated with lower baseline activity, counselor use, and positive perception of support. Counselor users with low baseline activity had higher odds ratio for increased physical activity at follow-up than non-users (OR = 7.2, 95% CI = 2.2–23.5 vs. OR = 3.2, 95% CI = 1.4–7.5). Positive perception of support was associated with increased physical activity among counselor users but not among non-users. Conclusions An increase in physical activity after PAP was related to low baseline activity, positive perception of support, and use of counselor support after PAP. Qualified counseling support linked to PAP seems to be important for achieving increased physical activity among patients with lower baseline activity.

Short Title: Awareness of Lifestyle and Colorectal Cancer Risk: Findings from the BeWEL Study

ISSN: 2314-6133

DOI: 10.1155/2015/871613

Article Number: 871613

Accession Number: WOS:000363171800001

Abstract: It is estimated that 47% of colorectal cancers (CRC) could be prevented by appropriate lifestyles. This study aimed to identify awareness of the causes of CRC in patients who had been diagnosed with a colorectal adenoma through the Scottish Bowel Screening Programme and subsequently enrolled in an intervention trial (using diet and physical activity education and behavioural change techniques) (BeWEL). At baseline and 12-month follow-up, participants answered an open-ended question on factors influencing CRC development. Of the 329 participants at baseline, 40 (12%) reported that they did not know any risk factors and 36 (11%) failed to identify specific factors related to diet and activity. From a potential knowledge score of 1 to 6, the mean score was 1.5 (SD1.1, range 0 to 5) with no difference between intervention and control groups. At follow-up, the intervention group had a significantly greater knowledge score and better weight loss, diet, and physical activity measures than the control group. Awareness of relevant lifestyle factors for CRC remains low in people at increased risk of the disease. Opportunities within routine NHS screening to aid the capability (including knowledge of risk factors) of individuals to make behavioural changes to reduce CRC risk deserve exploration.

Short Title: A novel approach to increasing community capacity for weight management a volunteer-delivered programme (ActWELL) initiated within breast screening clinics: a randomised controlled trial

DOI: 10.1186/s12966-021-01099-7

Article Number: 34

Accession Number: WOS:000626529400002

Abstract: Background It is estimated that around 30% of breast cancers in post-menopausal women are related to lifestyle. The breast cancer-pooling project demonstrated that sustained weight loss of 2 to 4.5kg is associated with an 18% lower risk of breast cancer, highlighting the importance of small changes in body weight. Our study aimed to assess the effectiveness a volunteer-delivered, community based, weight management programme (ActWELL) for women with a BMI >25kg/m² attending NHS Scotland Breast Screening clinics. **Methods** A multicentre, 1:1 parallel group, randomised controlled trial was undertaken in 560 women aged 50 to 70 years with BMI >25kg/m². On completion of baseline measures, all participants received a breast cancer prevention leaflet. Intervention group participants received the ActWELL intervention which focussed on personalised diet advice and pedometer walking plans. The programme was delivered in leisure centres by (the charity) Breast Cancer Now volunteer coaches. **Primary outcomes** were changes between groups at 12 months in body weight (kg) and physical activity (accelerometer measured step count). **Results** Two hundred seventy-nine women were allocated to the intervention group and 281 to the comparison group. Twelve-month data were available from 240 (81%) intervention and 227 (85%) comparison group participants. Coaches delivered 523 coaching sessions and 1915 support calls to 279 intervention participants. Mean weight change was -2.5kg (95% CI -3.1 to -1.9) in the intervention group and -1.2kg (-1.8 to 0.6) in the comparison group. The adjusted mean difference was -1.3kg (95% CI -2.2 to -0.4, P=0.003). The odds ratio for losing 5% weight was 2.20 (95% CI 1.4 to 3.4, p=0.0005) in favour of the intervention. The adjusted mean difference in step counts between groups was 483 steps/day (95% CI -635 to 1602) (NS). **Conclusions** A community weight management intervention initiated at breast screening clinics and delivered by volunteer coaches doubled the likelihood of clinically significant weight loss at 12 months (compared with usual care) offering significant potential to decrease breast cancer risk. **Trial registration** Database of registration: ISCRTN. Registration number: 11057518. Date trial registered: 21.07.2017. Date of enrolment of first participant: 01.09.2017.

Article Number: 1202
Accession Number: WOS:000668566500001
Abstract: BackgroundCovid-19 triggered the rapid roll-out of mass
social distancing behavioural measures for infection control.
Pregnant women were categorised as 'at risk' requiring extra
vigilance with behavioural guidelines. Their understanding and
ability to adhere to recommendations was unknown.ObjectivesTo
complete a behavioural analysis of the determinants of recommended
social distancing behaviour in pregnant women, according to the
'capability, opportunity, motivation and behaviour' ('COM-B') model
to inform the development of recommendations/materials to support
pregnant women in understanding and adhering to behavioural
guidelines.DesignQualitative interview study with pregnant women in
the Bristol area (UK).MethodsSemi-structured telephone/
videoconference interviews were conducted following a topic guide

informed by the COM-B model, transcribed verbatim and subjected to framework analysis. Infographic materials were iteratively produced with stakeholder consultation, to support pregnant women. Results Thirty-one women participated (selected for demographic range). Women reported adhering to social distancing recommendations and intended to continue. COM-B analysis identified gaps in understanding around risk, vulnerability, and the extent of required social distancing, as well as facilitators of social distancing behaviour (e.g. social support, motivation to stay safe, home environment/resources). Additional themes around detrimental mental health effects and changes to maternity healthcare from the social distancing measures were identified. Infographic resources (plus midwife report) addressing women's key concerns were produced and disseminated. Conclusions The COM-B model provided useful details of determinants of pregnant women's adherence to social distancing behaviours. The confusion of what being 'at risk' meant and varying interpretation of what was expected indicates a need for greater clarity around categories and guidance. The loss of maternity care and negative mental health effects of social distancing suggest a growing area of unmet health needs to be addressed in future.

Short Title: Influence of Baseline User Characteristics and Early Use Patterns (24-Hour) on Long-Term Adherence and Effectiveness of a Web-Based Weight Loss Randomized Controlled Trial: Latent Profile Analysis

ISSN: 1438-8871

DOI: 10.2196/26421

Article Number: e26421

Accession Number: WOS:000847341900001

Abstract: Background: Low adherence to real-world online weight loss interventions reduces long-term efficacy. Baseline characteristics and use patterns are determinants of long-term adherence, but we lack cohesive models to guide how to adapt interventions to users' needs. We also lack information whether very early use patterns (24 hours) help describe users and predict interventions they would benefit from. Objective: We aim to understand the impact of users' baseline characteristics and early (initial 24 hours) use patterns of a web platform for weight loss on user adherence and weight loss in the long term (24 weeks). Methods: We analyzed data from the POEmaS randomized controlled trial, a study that compared the effectiveness of a weight loss platform with or without coaching and a control approach. Data included baseline behavior and use logs from the initial 24 hours after platform access. Latent profile analysis (LPA) was used to identify classes, and Kruskal-Wallis was used to test whether class membership was associated with long-term (24 weeks) adherence and weight loss. Results: Among 828 participants assigned to intervention arms, 3 classes were identified through LPA: class 1 (better baseline health habits and high 24-hour platform use); class 2 (better than average health habits, but low 24-hour platform use); class 3 (worse baseline health habits and low 24-hour platform use). Class membership was associated with long-term adherence ($P < .001$), and class 3 members had the lowest adherence. Weight loss was not associated with class membership ($P = .49$), regardless of the intervention arm (platform only or platform + coach). However, class 2 users assigned to platform + coach lost more weight than those assigned to platform only ($P = .02$). Conclusions: Baseline questionnaires and use data from the first 24 hours after log-in allowed distinguishing classes, which were associated with long-term adherence. This suggests that this classification might be a useful guide to improve adherence and assign interventions to individual users.

ISSN: 0002-9262

DOI: 10.1093/aje/kwac193

Accession Number: WOS:000920131800001

Abstract: Physical inactivity is a global public health challenge, and effective, large-scale interventions are needed. We examined the effectiveness of a population-wide mobile health (mHealth) intervention in Singapore, National Steps Challenge Season 3 (NSC3) and 2 booster challenges (Personal Pledge and Corporate Challenge). The study includes 411,528 participants. We used regression discontinuity design and difference-in-difference with fixed-effects regression to examine the association of NSC3 and the additional booster challenges on daily step counts. Participants tended to be female (58.5%), with an average age of 41.5 years (standard deviation, 13.9) and body mass index (weight (kg)/height (m)²) of 23.8 (standard deviation, 4.5). We observed that NSC3 was associated with a mean increase of 1,437 steps (95% confidence interval (CI): 1,408, 1,467) per day. Enrollments in Personal Pledge and Corporate Challenge were associated with additional mean increases of 1,172 (95% CI: 1,123, 1,222) and 896 (95% CI: 862, 930) steps per day, respectively. For NSC3, the associated mean increase in the step counts across different sex and age groups varied, with greater increases for female participants and those in the oldest age group. We provide real-world evidence suggesting that NSC3 was associated with improvements in participants' step counts. Results suggest NSC3 is an effective and appealing population-wide mHealth physical activity intervention.

Title: Eating Behaviors in Australian Military Personnel:
Constructing a System of Interest for a Social Marketing
Intervention

Journal: Social Marketing Quarterly

Volume: 26

Issue: 3

Pages: 229-243

Date: Sep

Short Title: Eating Behaviors in Australian Military Personnel:
Constructing a System of Interest for a Social Marketing
Intervention

ISSN: 1524-5004

DOI: 10.1177/1524500420948487

Article Number: 1524500420948487

Accession Number: WOS:000565266100001

Abstract: Background: Eating behaviors are complex and have particular significance for military personnel who require sound nutrition to support health and physical fitness for job performance. Policies and guidelines for the provision of nutritionally appropriate food/drink on base and in the field do exist; however, many military personnel have poor dietary habits, and these habits are evident early in their career. Social marketing could assist in changing unhealthy eating behaviors of personnel through implementation of feasible interventions co-created with stakeholders that are valued by Australian Defence Force (ADF) personnel. Focus of the article: The article reports the first phase of a systemic co-inquiry into unhealthy eating behaviors of military personnel. This study aimed to gain an initial framing of the problem situation and thus hypothesize a "system of interest" in which to conduct future work. Research questions What components (e.g., ideas, objects, attributes, activities) are perceived to be relevant for eating behaviors in military personnel? Do interrelationships and interconnections among components suggest how unhealthy eating behaviors may emerge? Are there places that suggest viable leverage points as opportunities for changing unhealthy eating behaviors through delivery of offerings that ADF personnel value? Program Design/Approach: This study was part of a systemic inquiry approach. Methods: Data for the study included document analysis and 14 semi-structured depth interviews with ADF stakeholders. Data were thematically analyzed to construct a system of interest in which to explore how eating behaviors emerge among personnel and ADF-controlled leverage points that can be used to increase healthy eating for ADF personnel through social marketing intervention. Results: The data analysis identified alternative systems of interest in which to explore how eating behaviors emerge among personnel. Demand and supply side leverage points were identified. On the supply side, the encouragement of patronage through menu innovation, investment in facilities, cooking skills training, and auditing provision were opportunities for social marketing intervention. On the demand side, education and training coupled with communications that challenge cultural and regulatory norms and link to military values were areas that programs seeking to increase

healthy eating in ADF personnel could focus on. Importance to the Social Marketing Field: As an approach for addressing "wicked" problems, the application of systems thinking in social marketing has privileged an ontological concept of system as a metaphor for reality. This approach assists in expanding the focus of change beyond the individual to include factors in social, economic, and policy environments. By using systems thinking as an epistemological device, this article offers an approach that may be applied to overcome practical and philosophical limitations in the application of systems thinking. Recommendations for Research or Practice: Research on alternative methods for applying systems thinking is recommended to strengthen the potential of system approaches in the field of social marketing. Limitations: This study is part of a broader program, and its findings on the problem of unhealthy eating behaviors in ADF are preliminary. Limitations specific to the study include the possibility of "reductionism" in stakeholder identification and self-selection bias in participation. Short Title: A 12-week multidomain intervention versus active control to reduce risk of Alzheimer's disease: study protocol for a randomized controlled trial

DOI: 10.1186/1745-6215-14-60

Article Number: 60

Accession Number: WOS:000315625000001

Abstract: Background: Disappointing results from clinical trials of disease-modifying interventions for Alzheimer's dementia (AD), along with reliable identification of modifiable risk factors in mid life from epidemiological studies, have contributed to calls to invest in risk-reduction interventions. It is also well known that AD-related pathological processes begin more than a decade before the development of clinical signs. These observations suggest that lifestyle interventions might be most effective when targeting non-symptomatic adults at risk of AD. To date, however, the few dementia risk-reduction programs available have targeted individual risk factors and/or were restricted to clinical settings. The current study describes the development of an evidence-based, theoretically-driven multidomain intervention to reduce AD risk in adults at risk.

Method: The design of Body Brain Life (BBL) is a randomized controlled trial (RCT) to evaluate a 12-week online AD risk-reduction intervention. Eligible participants with several modifiable risk factors on the Australian National University (ANU) AD Risk Index (ANU-ADRI) are randomly allocated to an online only group, an online and face-to-face group, or an active control group. We aim to recruit 180 participants, to undergo a comprehensive cognitive and physical assessment at baseline, post-intervention, and 6-month follow-up assessment. The intervention comprises seven online modules (dementia literacy, risk factor education, engagement in physical, social, and cognitive lifestyles, nutrition, and health monitoring) designed using contemporary models of health behavior change. Discussion: The BBL program is a novel online intervention to reduce the risk of AD in middle-aged adults at risk. The trial is currently under way. It is hypothesized that participants in the intervention arms will make lifestyle changes in several domains, and that this will lead to a reduction in their AD risk profile. We also expect to show that health behavior change is underpinned by changes in psychological determinants of behavior. If successful, the findings will contribute to the development of further dementia risk reduction interventions, and thus contribute to the urgent need to lower dementia risk factors in the population to alter future projections of disease prevalence. Longer follow-up of BBL participants and replications using large samples are required to examine whether reduction in AD risk factors will be associated with reduced prevalence.

Short Title: Oral health promotion in acute hospital setting: a quality improvement programme

DOI: 10.1136/bmjopen-2022-002166

Article Number: e002166

Accession Number: WOS:000984198000001

Abstract: Tooth extraction is the most common hospital procedure for children aged 6-10 years in England. Tooth decay is almost entirely

preventable and is inequitably distributed across the population: it can cause pain, infection, school absences and undermine overall health status. An oral health programme (OHP) was delivered in a hospital setting, comprising: (1) health promotion activities; (2) targeted supervised toothbrushing (STB) and (3) staff training. Outcomes were measured using three key performance indicators (KPI1: percentage of children/families seeing promotional material; KPI2: number of children receiving STB; KPI3: number of staff trained) and relevant qualitative indicators. Data were collected between November 2019 and August 2021 using surveys and data from the online booking platform. OHP delivery was impacted by COVID-19, with interventions interrupted, reduced, eliminated or delivered differently (eg, in-person training moved online). Despite these challenges, progress against all KPIs was made. 93 posters were deployed across the hospital site, along with animated video 41% (233/565) of families recalled seeing OHP materials across the hospital site (KPI1). 737 children received STB (KPI2), averaging 35 children/month during the active project. Following STB, 96% participants stated they learnt something, and 94% committed to behaviour change. Finally, 73 staff members (KPI3) received oral health training. All people providing feedback (32/32) reported learning something new from the training session, with 84% (27/32) reporting that they would do things differently in the future. Results highlight the importance of flexibility and resilience when delivering QI projects under challenging conditions or unforeseen circumstances. While results suggest that hospital-based OHP is potentially an effective and equitable way to improve patient, family and staff knowledge of good oral health practices, future work is needed to understand if and how patients and staff put into practice the desired behaviour change and what impact this may have on oral health outcomes.

Short Title: Moving from Niche to Norm: Lessons from Food Waste Initiatives

DOI: 10.3390/su13147667

Article Number: 7667

Accession Number: WOS:000677073900001

Abstract: For a transition to a circular economy to take place,

behavioural change from people who are part of the transition is a key requirement. However, this change often does not occur by itself. For systemic behavioural change, policy instruments that incentivise behaviour supporting circular food systems play a key role. These instruments need to be aligned with the environment in which the behaviour takes place. In this study, we scrutinise a case study with five initiatives on the reduction of food loss and waste (FLW) contributing to a circular food system, to understand how specific, well-targeted combinations of instruments as well as other contextual and personal factors can fuel the transition to a circular economy and the reduction of FLW. All the initiatives are taking place under the umbrella of the Dutch initiative "United against food waste" (STV). We use a behavioural change perspective to assess how initiatives that support circular food systems arise and how they can be further supported. Based on the case-study analysis, we arrive at five common success traits and barriers, and five key needs for upscaling. We conclude that motivated, inspiring frontrunners are of key importance in the initial phase of a transition process. However, once a niche initiative is ready to be scaled up, the enabling environment becomes increasingly important. Notes: Aramyan, Lusine H. Article Number: 9626

Accession Number: WOS:000839053100001

Abstract: The low rates of active commuting to/from school in Spain, especially by bike, and the wide range of cycling interventions in the literature show that this is a necessary research subject. The aims of this study were: (1) to assess the feasibility of a school-based cycling intervention program for adolescents, (2) to analyse the effectiveness of a school-based cycling intervention program on the rates of cycling and other forms of active commuting to/from school (ACS), and perceived barriers to active commuting in adolescents. A total of 122 adolescents from Granada, Jaen and Valencia (Spain) participated in the study. The cycling intervention group participated in a school-based intervention program to promote cycling to school during Physical Education (PE) sessions in order to analyse the changes in the dependent variables at baseline and follow up of the intervention. Wilcoxon, Signs and McNemar tests were undertaken. The association of the intervention program with commuting behaviour, and perceived barriers to commuting, were analysed by binary logistic regression. There were improvements in knowledge at follow-up and the cycling skill scores were medium-low. The rates of cycling to school and active commuting to/from school did not change, and only the "built environment (walk)" barrier increased in the cycling group at follow-up. School-based interventions may be feasibly effective tools to increase ACS behaviour, but it is necessary to implement a longer period and continue testing further school-based cycling interventions.

Abstract: Reproductive genetic carrier screening (RGCS) provides people with information about their chance of having children with autosomal recessive or X-linked genetic conditions, enabling informed reproductive decision-making. RGCS is recommended to be offered to all couples during preconception or in early pregnancy. However, cost and a lack of awareness may prevent access. To address this, the Australian Government funded Mackenzie's Mission—the Australian Reproductive Genetic Carrier Screening Project. Mackenzie's Mission aims to assess the acceptability and feasibility of an easily accessible RGCS program, provided free of charge to the participant. In study Phase 1, implementation needs were mapped, and key study elements were developed. In Phase 2, RGCS is being offered by healthcare providers educated by the study team. Reproductive couples who provide consent are screened for over 1200 genes associated with >750 serious, childhood-onset genetic conditions. Those with an increased chance result are provided comprehensive genetic counseling support. Reproductive couples, recruiting healthcare providers, and study team members are also invited to complete surveys and/or interviews. In Phase 3, a mixed-methods analysis will be undertaken to assess the program outcomes, psychosocial implications and implementation considerations alongside an ongoing bioethical analysis and a health economic evaluation. Findings will inform the implementation of an ethically

robust RGCS program.

Short Title: Development of an intervention to increase adherence to nebuliser treatment in adults with cystic fibrosis: CFHealthHub

DOI: 10.1186/s40814-020-00739-2

Article Number: 1

Accession Number: WOS:000704715200002

Abstract: Background Cystic fibrosis (CF) is a life-limiting genetic condition in which daily therapies to maintain lung health are critical, yet treatment adherence is low. Previous interventions to increase adherence have been largely unsuccessful and this is likely due to a lack of focus on behavioural evidence and theory alongside input from people with CF. This intervention is based on a digital platform that collects and displays objective nebuliser adherence data. The purpose of this paper is to identify the specific

components of an intervention to increase and maintain adherence to nebuliser treatments in adults with CF with a focus on reducing effort and treatment burden. Methods Intervention development was informed by the Behaviour Change Wheel (BCW) and person-based approach (PBA). A multidisciplinary team conducted qualitative research to inform a needs analysis, selected, and refined intervention components and methods of delivery, mapped adherence-related barriers and facilitators, associated intervention functions and behaviour change techniques, and utilised iterative feedback to develop and refine content and processes. Results Results indicated that people with CF need to understand their treatment, be able to monitor adherence, have treatment goals and feedback and confidence in their ability to adhere, have a treatment plan to develop habits for treatment, and be able to solve problems around treatment adherence. Behaviour change techniques were selected to address each of these needs and were incorporated into the digital intervention developed iteratively, alongside a manual and training for health professionals. Feedback from people with CF and clinicians helped to refine the intervention which could be tailored to individual patient needs. Conclusions The intervention development process is underpinned by a strong theoretical framework and evidence base and was developed by a multidisciplinary team with a range of skills and expertise integrated with substantial input from patients and clinicians. This multifaceted development strategy has ensured that the intervention is usable and acceptable to people with CF and clinicians, providing the best chance of success in supporting people with CF with different needs to increase and maintain their adherence. The intervention is being tested in a randomised controlled trial across 19 UK sites.

Short Title: Listening to the voices of adolescents for the design of strategies to promote healthy eating: an exploratory study in a Latin American country

ISSN: 1368-9800

DOI: 10.1017/s1368980021002548

Article Number: Pii s1368980021002548

Accession Number: WOS:000720784600037

Abstract: Objective: To explore adolescents' views about the foods they consume and to identify their ideas about strategies to encourage healthier eating habits. Design: Individual questionnaires based on open-ended questions and group discussions (6-8 participants) were used to address the objectives. Data were analysed using content analysis based on deductive-inductive coding. Setting: Montevideo and its metropolitan area (Uruguay, Latin America). Participants: Totally, 102 adolescents (aged between 11 and 15 years, 52 % female) recruited at two educational institutions. Results: Adolescents reported frequently consuming ultra-processed products and fast food although they were perceived as bad for their health, whereas they reported an infrequent consumption of fruits and vegetables. Multifaceted strategies to promote healthy eating habits emerged from adolescents' accounts, including public awareness campaigns, nutrition education programmes, nutrition label standards and regulations, and changes in food availability and affordability. Conclusions: Results from the present work suggest that co-creation with adolescents may be an effective way to inform the development of strategies to promote healthier eating habits. The strategies suggested by adolescents were mainly focused on behaviour change communication, who emphasised the importance of social media and the involvement of celebrities and influencers. The need for educational and communication strategies to raise awareness of the social and environmental drivers of eating patterns among adolescents was identified.

Short Title: Uruguayan Citizens' Perception of Messages to Promote Healthy Eating Through the Use of Nutritional Warnings

ISSN: 1499-4046

DOI: 10.1016/j.jneb.2020.05.012

Accession Number: WOS:000581105300004

Abstract: Objective: To explore the specific type of messages people consider most appropriate for a mass communication campaign aimed to promote healthy eating in the context of the implementation of nutritional warnings. Design: Online study including multiple-choice and open-ended questions. Setting: Uruguay, 1 of the Latin American countries with the highest prevalence of overweight and obesity.

Participants: A total of 859 participants were recruited using social media. They were diverse in terms of gender, age, educational level, socioeconomic status, and self-reported body mass index.

Phenomenon of Interest: Participants were presented with 3 series of messages and were asked to select the 1 they perceived as the most appropriate and to provide a brief explanation for their selection.

Analysis: Descriptive statistics for the multiple-choice questions and inductive coding for the responses to the open-ended questions.

Results: Participants tended to prefer messages that conveyed a cue to action for achieving changes to their perceived ability to make healthful food choices. Although messages related to the promotion of informed food choices were the most frequently preferred, messages related to negative health consequences and health benefits were also selected repetitively.

Conclusions and Implications: Communication campaigns aimed at promoting healthy eating through the use of nutritional warnings could include different contents to target specific segments with different motivations.

Article Number: 109019812111003510

Accession Number: WOS:000640813400001

Abstract: Communication campaigns are expected to contribute to

increase the efficacy of nutritional warnings. In this context, the aims of the present work were (a) to evaluate how citizens perceive different types of messages for a communication campaign and (b) to determine if personal characteristics such as gender, age, and educational level, as well socioeconomic and nutritional status, moderate how citizens perceive such campaign messages. A series of graphic pieces were designed for each of the following three types of messages: promotion of informed food choices; raising awareness of the negative health consequences of excessive consumption of sugar, fat, and sodium; and promotion of healthy food choices. An online study was conducted with 774 participants, who were randomly assigned to one of the three types of messages. The participants' self-reported perception of the graphic pieces was evaluated using 7-point Likert-type scales. After completing the evaluation task, the participants proceeded to a series of choices. This was implemented to evaluate whether exposure to different types of messages affected hypothetical food choices. Results revealed that messages related to the promotion of healthy eating were perceived as the most adequate as part of a communication campaign and had the potential to encourage more healthful hypothetical choices in the experimental task. However, gender, age, and nutritional status moderated the influence of the type of message on the participants' perception, meaning that different groups perceived different types of messages as the most adequate. The results from the present work stress the need to include different types of messages in a communication campaign to target individuals with different motivations and characteristics.

Volume: 10

Issue: 24

Date: Dec

Short Title: Family Caregivers' Experiences with Tele-Rehabilitation for Older Adults with Hip Fracture

DOI: 10.3390/jcm10245850

Article Number: 5850

Accession Number: WOS:000777189600004

Abstract: Background: There is a knowledge gap for implementing tele-rehabilitation (telerehab) after hip fracture. We recently

conducted a clinical trial (ClinicalTrials.gov Identifier: NCT02968589) to test a novel online family caregiver-supported rehabilitation program for older adults with hip fracture, called @ctivehip. In this qualitative substudy, our objective was to use semi-structured interviews to explore family caregivers experience with the telerehab program. Methods: Twenty-one family caregivers were interviewed between three and six months after the older adults completed @ctivehip. One occupational therapist with research and clinical experience, but not involved in the main trial, conducted and transcribed the interviews. We conducted a multi-step content analysis, and two authors completed one coding cycle and two recoding cycles. Results: Family caregivers who enrolled in @ctivehip were satisfied with the program, stated it was manageable to use, and perceived benefits for older adults' functional recovery after hip fracture. They also suggested improvements for the program content, such as more variety with exercises, and increased monitoring by health professionals. Conclusions: This work extends existing literature and generates research hypotheses for future studies to test telerehab content and program implementation. Title: Evaluation of a web-based resource to improve menstrual health literacy and self-management in young women

Journal: Journal of Psychosomatic Research

Volume: 162

Date: Nov

Short Title: Evaluation of a web-based resource to improve menstrual health literacy and self-management in young women

ISSN: 0022-3999

DOI: 10.1016/j.jpsychores.2022.111038

Article Number: 111038

Accession Number: WOS:000911796400005

Abstract: Objective: Menstrual cycle-related conditions, such as dysmenorrhea and heavy bleeding, are common amongst those under 25 years. Despite having significant impact on work, education, and social activities, most do not seek medical advice, preferring to self-manage their symptoms. We aimed to determine if access to a web-based resource was a feasible and acceptable method for

improving menstrual health literacy and encouraging health seeking behavior. Methods: People were eligible to participate if they were currently living in Australia, aged 14–25 years, and had menstruated for at least 12 months. Access to the resource, comprising evidence-based information on the menstrual cycle, the Period ImPact and Pain Assessment (PIPPA) tool, and guidance on self-management options, was provided for three menstrual cycles. Results: Seventy-five participants with a mean age of 20.4 years were enrolled with 56 (75%) providing pre and post measures. Recruitment rate and retention rates met pre-specified criteria for feasibility. Eighty five percent of the participants reported the web-based resource was easy to use, and 90% reported they found the information provided 'very helpful'. Just under half (48%) reported the resource changed what they thought was a 'normal' period. Forty-three percent visited their doctor regarding their menstrual symptoms during the study period, with 84% indicating that they made the appointment due to the resource; over half (56%) who visited their doctor received a referral to a gynecologist. Conclusion: Access to a web-based resource on menstrual health literacy was found to be acceptable and feasible to young people and may encourage health-seeking behavior. Title: Digital methods of social science in food regulation: case studies from the Food Standards Agency

Journal: Journal of Risk Research

Date: 2023 Mar

Short Title: Digital methods of social science in food regulation: case studies from the Food Standards Agency

ISSN: 1366-9877

DOI: 10.1080/13669877.2023.2197616

Accession Number: WOS:000975136700001

Abstract: The use of digital methods in social research has increased significantly, offering some benefits over traditional research methods, and some new challenges. The UK Food Standards Agency's social science provides several case studies of how digital methods can be effectively utilized in practice. The agency has adopted various digital methods including web push surveys, online panels, online deliberative dialogue and citizen science platforms to gather data and gain insights into citizens' attitudes and behaviours when it comes to the food system and food safety and standards. The implementation of these digital methods has allowed

for more efficient data collection, and when applied with care and creativity can offer a high level of engagement and participation from the public. Furthermore, the use of citizen science platforms such as Zooniverse has allowed for the involvement of the general public in the research process, leading to increased public understanding and engagement with the research. The broad use of digital methods in social research as demonstrated by the UK Food Standards Agency's social science highlights the utility of such methods for current and future research practices.

Title: Efficacy of behavioural interventions for transport behaviour change: systematic review, meta-analysis and intervention coding

Journal: International Journal of Behavioral Nutrition and Physical Activity

Volume: 11

Date: Nov

Short Title: Efficacy of behavioural interventions for transport behaviour change: systematic review, meta-analysis and intervention coding

DOI: 10.1186/s12966-014-0133-9

Article Number: 133

Accession Number: WOS:000347253300001

Abstract: Background: Reducing reliance on motorised transport and increasing use of more physically active modes of travel may offer an opportunity to address physical inactivity. This review evaluates the evidence for the effects of behavioural interventions to reduce car use for journeys made by adults and codes intervention development and content. Methods: The review follows the procedure stated in the registration protocol published in the PROSPERO database (registration number CRD42011001797). Controlled studies evaluating behavioural interventions to reduce car use compared with no interventions or alternative interventions on outcome measures of transport behaviours taken in adult participants are included in this review. Searches were conducted on all records in Applied Social Sciences Index and Abstracts (ASSIA), Ovid Embase, Ovid Medline, Ovid PsycInfo, Scopus, Sociological Abstracts, Transportation Research Information Service (TRIS), Transportation Research International Documentation (TRID), and Web of Science databases. Peer reviewed publications in English language meeting the inclusion criteria are eligible. Methodological quality is assessed using the Cochrane Risk of Bias Tool. Interventions are categorised in terms of behavioural frameworks, theories and

techniques. Results: 15 full text articles are included, representing 13 unique studies, with 4895 participants and 27 intervention arms. Risk of bias across the review is appraised as considerable due to the unclear methodological quality of individual studies. Heterogeneity of included studies is considerable. Meta-analyses reveal no significant effect on reduction of frequency of car use or on increasing the proportion of journeys by alternative, more active modes of transport. There is insufficient data relating to alternative outcomes such as distance and duration which may have important health implications. Interventions were top-down but could not be described as theory-based. Intervention efficacy was associated with the use of a combination of information provision and behavioural regulation techniques. There was a lack of consideration of opportunity for change and behaviour in context. Conclusions: There is no evidence for the efficacy of existing behavioural interventions to reduce car trips included in this review. The evidence for efficacy of behavioural interventions to decrease distance and duration of car journeys is limited and inconclusive. Overall the evidence is highly heterogeneous and is at considerable risk of bias. Future research should investigate alternative behavioural interventions in high quality, controlled studies informed by existing evidence, theory, and views of potential users. Future intervention studies should increase scientific rigour, include objective outcome measures, and incorporate thorough evaluations as standard.

Title: Designing integrated interventions to improve nutrition and WASH behaviors in Kenya

Journal: Pilot and Feasibility Studies

Volume: 6

Issue: 1

Short Title: Designing integrated interventions to improve nutrition and WASH behaviors in Kenya

DOI: 10.1186/s40814-020-0555-x

Article Number: 10

Accession Number: WOS:000729238200016

Abstract: BackgroundChild stunting, an indicator of chronic

malnutrition, is a global public health problem. Malnutrition during pregnancy and the first 2 years of life undermines the survival, growth, and development of children. Exposure to fecal pathogens vis-a-vis inadequate water, sanitation, and hygiene (WASH) has been implicated in the etiology of child stunting, highlighting the need to integrate WASH with nutrition-sensitive interventions to comprehensively address this complex problem. The aim of this study was to describe a systematic, theoretically informed approach (that drew from the Starr and Fornoff approach to the Theory of Change development and the Behavior Change Wheel approach) to design a multi-component and integrated social and behavior change intervention to improve WASH and nutrition-related behaviors in western Kenya. Methods This intervention was developed to be integrated into an existing project that utilized the care group model and aimed to create a culture of care and support for HIV/AIDS-affected children under two and their caregivers and was executed by local partners. We tested the newly created intervention packages in user-testing trials using an adapted Trials of Improved Practices approach to pilot acceptability and feasibility. Results Using authentic stakeholder engagement and relevant theories, we conducted an 8-step process: (1) conduct mixed methods formative research, (2) prioritize target behaviors, (3) use causal analysis to create problem trees, (4) develop solution trees and articulate assumptions and rationales for change, (5) link solution trees to intervention functions, (6) develop the intervention plan, (7) create the intervention packages, and (8) test and refine the intervention packages. Conclusions This study highlights the need to take a multi-sectorial, integrated approach that integrates contextually relevant behavior change theories with the experiential knowledge gleaned from stakeholders into the design of interventions that seek to reduce child stunting. This process resulted in the creation of intervention packages that grouped behaviors thematically to be most relevant and responsive to the population context. This work has the potential to make important contributions towards achievement of the United Nations' sustainable development goals.

Short Title: What Promotes Surgeon Practice Change? A Scoping Review of Innovation Adoption in Surgical Practice

ISSN: 0003-4932

DOI: 10.1097/sla.0000000000004355

Accession Number: WOS:000613888300031

Abstract: **Objective:** The goal of this scoping review was to summarize the literature on facilitators and barriers to surgical practice change. This information can inform research to implement best practices and evaluate new surgical innovations. **Background:** In an era of accelerated innovations, surgeons face the difficult decision to either acknowledge and implement or forgo new advances. Although changing surgical practice to align with evidence is an imperative of health systems, evidence-based guidelines have not translated into consistent change. The literature on practice change is limited and has largely focused on synthesizing information on methods and trials to evaluate innovative surgical interventions. No reviews to date have grounded their analysis within an implementation science framework. **Methods:** A systematic review of the literature on surgical practice change was performed. Abstracts and full-text articles were reviewed for relevance using inclusion and exclusion criteria and data were extracted from each article. Cited facilitators and barriers were then mapped across domains within the implementation science Theoretical Domains Framework and expanded to the Capability, Opportunity, Motivation, and Behavior model. **Results:** Components of the Capability, Opportunity, Motivation, and Behavior model were represented across the Theoretical Domains Framework domains and acted as both facilitators and barriers to practice change depending on the circumstances. Domains that most affected surgical practice change, in order, were: opportunity (environmental context and resources and social influences), capability (knowledge and skills), and motivation (beliefs about consequences and reinforcement). **Conclusions:** Practice change is predicated on a conducive environment with adequate resources, but once that is established, the surgeon's individual characteristics, including skills, motivation, and reinforcement determine the likelihood of successful change. Deficiencies in the literature underscore the need for further study of resource interventions and the role of surgical team dynamics in the adoption of innovation. A better understanding of these areas is needed to optimize our ability to disseminate and implement best practices in surgery.

DOI: 10.1016/j.jneb.2022.07.010

Accession Number: WOS:000918196700001

Abstract: It is the position of the Society for Nutrition Education and Behavior that to improve the health of individuals, communities, and food systems, it is essential that nutrition educators meet each of 6 content competencies (basic food and nutrition knowledge, nutrition across the life cycle, food science, physical activity, food and nutrition policy, and agricultural production and food systems) and 4 process competencies (behavior and education theory; nutrition education program design, implementation and evaluation; written, oral, and social media communication; and nutrition education research methods). These competencies reflect the breadth of the nutrition education field and are grounded in peer-reviewed research. The rationale and evidence base for these competencies are presented. They are designed for educational institutions to plan curricula and programs; public, private, and nonprofit organizations for training; individuals for professional development; and policymakers and advocates to inform strong, comprehensive nutrition education policy.

Short Title: Determinants of implementing reablement into research

or practice: A concept mapping study

ISSN: 1358-2267

DOI: 10.1002/pri.1949

Article Number: e1949

Accession Number: WOS:000783047400001

Abstract: Y Purpose: Reablement is a health and social model of care gaining international prominence. It is included in some publicly funded healthcare systems in Australia, Canada, United Kingdom, Norway, Sweden and other European countries. To advance reablement research and practice, we aimed to synthesize expert opinion on opportunities and challenges to delivering care with this model.

Methods: We invited authors of reablement publications and other experts from the field to take part in a three-step online concept mapping exercise: (i) brainstorming statements based on a focus prompt; followed by (ii) sorting and (iii) rating statements. We invited 63 participants, of whom 19 participants generated 114 statements. Two authors reviewed each statement independently then met three times to determine one main idea/statement and removed unrelated or duplicate ideas. The research team used concept mapping software and online and email discussion to generate clusters or groups of determinants. Results: There were 58 statements for sorting and rating; 11 and 12 participants completed the sorting and rating steps, respectively. The five clusters were person and caregiver elements for participation; key reablement components for success; reablement content and delivery; organizational factors; and provider beliefs and training. Statements rated as both highly important and feasible to implement into practice were generally captured under the domains of goal setting and pursuit and person-centred care. Conclusion: These results generate hypotheses for future research and practice in reablement for older adults.

Title: Impact and evaluation of an online culinary nutrition course for health, education and industry professionals to promote vegetable knowledge and consumption

Journal: Journal of Human Nutrition and Dietetics

Date: 2022 Nov

Short Title: Impact and evaluation of an online culinary nutrition course for health, education and industry professionals to promote vegetable knowledge and consumption

ISSN: 0952-3871

DOI: 10.1111/jhn.13109

Accession Number: WOS:000888637600001

Abstract: Background Poor diet, including inadequate vegetable intake, is a leading risk factor for noncommunicable disease. Culinary and nutrition education provided to trainee and practising health and education professionals is an emerging strategy to promote improved dietary intake, including vegetable consumption. We evaluated the impact and feasibility of an online culinary medicine and nutrition (CM/CN) short course for health, education and vegetable industry professionals. The course aimed to improve participants' skills and confidence to prepare vegetables, knowledge of evidence-based nutrition information and recommendations for improving vegetable consumption and diet quality. Methods A pre-post study consisting of two separate groups participating in two course rounds recruited practising professionals (n = 30) working in health; community, adult and/or culinary education; and the vegetable industry. Evaluation assessed diet quality, vegetable consumption barriers, cooking and food skill confidence, nutrition knowledge and process measures. Results Seventeen participants (68%) completed the programme. Pre- to postintervention statistically significant increases in vegetables (M 1.3, SD 2.2), fruit (M 1.6, SD 3.1), and breads and cereal (M 1.1, SD 1.7) intakes were observed. Statistically significant increases and large effect sizes for mean food skill confidence scores (M 8.9, SD 15.4, Cohen's d 0.56) and nutrition knowledge scores (M 6.2, SD 15.4, Cohen's d 0.83) were also observed pre- to postintervention. Conclusions The short online course was feasible and improved diet quality, food skill confidence and nutrition knowledge. Online CM/CN education for practising professionals represents a promising area of research. Future research involving a larger study sample and a more rigorous study design such as a randomised control trial is warranted.

Title: Knowledge and Attitudes about Antibiotics and Antibiotic Resistance of 2404 UK Healthcare Workers

Journal: Antibiotics-Basel

Volume: 11

Issue: 8

Date: Aug

Short Title: Knowledge and Attitudes about Antibiotics and Antibiotic Resistance of 2404 UK Healthcare Workers

ISSN: 2079-6382

DOI: 10.3390/antibiotics11081133

Article Number: 1133

Accession Number: WOS:000846339700001

Abstract: Background: Using the COM-B model as a framework, an EU-wide survey aimed to ascertain multidisciplinary healthcare workers' (HCWs') knowledge, attitudes and behaviours towards antibiotics, antibiotic use and antibiotic resistance. The UK findings are presented here. Methods: A 43-item questionnaire was developed through a two-round modified Delphi consensus process. The UK target quota was 1315 respondents. Results: In total, 2404 participants responded. The highest proportion were nursing and midwifery professionals (42%), pharmacists (23%) and medical doctors (18%). HCWs correctly answered that antibiotics are not effective against viruses (97%), they have associated side effects (97%), unnecessary use makes antibiotics ineffective (97%) and healthy people can carry antibiotic-resistant bacteria (90%). However, fewer than 80% correctly answered that using antibiotics increases a patient's risk of antimicrobial resistant infection or that resistant bacteria can spread from person to person. Whilst the majority of HCWs (81%) agreed there is a connection between their antibiotic prescribing behaviour and the spread of antibiotic-resistant bacteria, only 64% felt that they have a key role in controlling antibiotic resistance. The top three barriers to providing advice or resources were lack of resources (19%), insufficient time (11%) and the patient being uninterested in the information (7%). Approximately 35% of UK respondents who were prescribers prescribed an antibiotic at least once in the previous week to responding to the survey due to a fear of patient deterioration or complications. Conclusion: These findings highlight that a multifaceted approach to tackling the barriers to prudent antibiotic use in the UK is required and provides evidence for guiding targeted policy, intervention development and future research. Education and training should focus on patient communication, information on spreading resistant bacteria and increased risk for individuals.

ISSN: 0305-7453

DOI: 10.1093/jac/dkv297

Accession Number: WOS:000368245500001

Abstract: Antimicrobial-resistant infections claim ≥ 700000 lives each year globally. It is therefore important that both healthcare professionals and the public know the threat antimicrobial resistance poses and the individual actions they can take to combat antimicrobial resistance. Antibiotic awareness campaigns in England using posters or leaflets have had little or no impact on knowledge, behaviour or prescription rates. Centrally coordinated, multimodal campaigns in two European countries (ongoing for several years and including print and mass media, web site and guidelines, as well as academic detailing and individual feedback to prescribers) have led to reductions in antibiotic use. To change behaviour and reduce antibiotic use in England, a coordinated and comprehensive interdisciplinary and multifaceted (multimodal) approach using behavioural science and targeted at specific groups (both professional and public) is required. Such campaigns should have an integrated evaluation plan using a combination of formative, process and summative measures from the outset to completion of a campaign.

Accession Number: WOS:000634716900003

Abstract: Background: While several studies have assessed knowledge, attitudes and behaviours of the public, physicians and medical students in a number of EU/EEA countries with respect to antibiotic use and antibiotic resistance, there is a paucity of literature for other healthcare workers. This survey aimed to fill this gap.

Methods: A 43-item online questionnaire was developed, validated and pilot-tested through a modified Delphi consensus process involving

87 Project Advisory Group (PAG) members, including national representatives and members of European health professional groups. The survey was distributed by the PAG and via social media to healthcare workers in 30 EU/EEA countries. Results: Respondents (n = 18,365) from 30 EU/EEA countries participated. Knowledge of antibiotics and antibiotic use was higher (97%) than knowledge of development and spread of antibiotic resistance (75%). Sixty percent of respondents stated they had received information on avoiding unnecessary prescribing, administering or dispensing of antibiotics. Among respondents who prescribed, administered or dispensed antibiotics, 55% had provided advice on prudent antibiotic use or management of infections to patients, but only 17% had given resources (leaflets or pamphlets). For community and hospital prescribers, fear of patient deterioration or complications was the most frequent reason (43%) for prescribing antibiotics that were considered unnecessary. Community prescribers were almost twice as likely as hospital prescribers to prescribe antibiotics due to time constraints or to maintain patient relationships. Conclusion: It is important to move from raising awareness about prudent antibiotic use and antibiotic resistance among healthcare workers to designing antimicrobial stewardship interventions aimed at changing relevant behaviours.

Title: Norms and Social Network-Centric Behavior Change Intervention (Nam Nalavazhvu) for Improved Toilet Usage in Peri-Urban Communities of Tamil Nadu: Protocol for a Cluster-Randomized Controlled Trial

Journal: Jmir Research Protocols

Volume: 10

Issue: 5

Date: May

Short Title: Norms and Social Network-Centric Behavior Change Intervention (Nam Nalavazhvu) for Improved Toilet Usage in Peri-Urban Communities of Tamil Nadu: Protocol for a Cluster-Randomized Controlled Trial

ISSN: 1929-0748

DOI: 10.2196/24407

Article Number: e24407

Accession Number: WOS:000658257400017

Abstract: Background: Inconsistent toilet usage is a continuing challenge in India. Despite the impact of social expectations on toilet usage, few programs and studies have developed theoretically grounded norm-centric behavior change interventions to increase toilet use in low-income settings. Objective: The objective of this paper is to detail the rationale and design of an ex ante, parallel cluster-randomized trial evaluating the impact of a demand-side, norm-centric behavior change intervention on exclusive toilet use and maintenance in peri-urban Tamil Nadu, India. Methods: Following formative research, we developed an evidence-based norm-centric behavior change intervention called Nam Nalavazhvu (Tamil for "our well-being"). The multilevel intervention aims to improve toilet usage by shifting empirical expectations or beliefs about other relevant people's sanitation practices. It also provides action-oriented information to aid individuals to set goals and overcome barriers to own, consistently use, and maintain their toilets. This trial includes 76 wards in the Pudukkottai and Karur districts, where half were randomly assigned to receive the intervention and the remaining served as counterfactuals. Results: We enrolled wards and conducted a baseline survey among randomly selected individuals in all 76 wards. The 1-year behavior change intervention is currently ongoing. At the endline, we will collect relevant data and compare results between study arms to determine the impacts of the Nam Nalavazhvu intervention on sanitation-related behavioral, health, and well-being outcomes and potential moderators. This study is powered to detect differences in the prevalence of exclusive toilet use between study arms. We are also conducting a process evaluation to understand the extent to which the intervention was implemented as designed, given the special pandemic context. Conclusions: Findings from this trial will inform norm-centric behavior change strategies to improve exclusive toilet usage. Notes: Ashraf, Sania Bicchieri, Cristina Delea, Maryann G. Title: Applying the COM-B Model to Understand the Drivers of Mistreatment During Childbirth: A Qualitative Enquiry Care Staff

Journal: Global Health-Science and Practice

Volume: 11

Issue: 1

Date: Feb

Short Title: Applying the COM-B Model to Understand the Drivers of Mistreatment During Childbirth: A Qualitative Enquiry Care Staff

ISSN: 2169-575X

DOI: 10.9745/ghsp-d-22-00267

Article Number: e2200267

Accession Number: WOS:000941563100013

Abstract: Introduction: Respectful maternity care (RMC) during childbirth is an integral component of quality of care. However, women's experiences of mistreatment are prevalent in many low-and middle-income countries. This is a complex phenomenon that has not been well explored from a behavioral science perspective. We aimed to understand the behavioral drivers of mistreatment during childbirth among maternity care staff at public health facilities in the Sindh province of Pakistan. **Methods:** Applying the COM-B (capability-opportunity-motivation that leads to behavior change) model, we conducted semistructured in-depth interviews among clinical and nonclinical staff in public health facilities in Thatta and Sujawal, Sindh, Pakistan. Data were analyzed using thematic deductive analysis, and findings were synthesized using the COM-B model. **Results:** We identified several behavioral drivers of mistreatment during childbirth: (1) institutional guidelines on RMC and training opportunities were absent, resulting in a lack of providers' knowledge and skills; (2) facilities lacked the infrastructure to maintain patient privacy and confidentiality and did not permit males as birth companions; (3) lack of provider performance monitoring system and patient feedback mechanism contributed to providers not feeling appreciated or recognized. Staff bias against patients from lower castes contributed to patient abuse and mistreatment. The perspectives of clinical and nonclinical staff overlapped regarding potential drivers of mistreatment during childbirth. **Conclusions:** Addressing mistreatment during childbirth requires improving the knowledge and capacity of maternity staff on RMC and psychosocial support to enhance their understanding of RMC. At the health facility level, governance and accountability mechanisms in routine supervision and monitoring of staff need to be improved. Patients' feedback should be incorporated for continuous improvement in providing maternity care services that meet patients' preferences and needs.

Title: Using behaviour change science to deliver oral health practice: A commentary

Journal: Community Dentistry and Oral Epidemiology

Date: 2022 Jun

Short Title: Using behaviour change science to deliver oral health practice: A commentary

ISSN: 0301-5661

DOI: 10.1111/cdoe.12766

Accession Number: WOS:000808308400001

Abstract: The aims of this commentary are threefold; firstly, we summarize changes in oral health behaviour change research and

practice; secondly, we identify key barriers and challenges proposing practical ways to overcome them; and finally, we showcase key developments on the global and local stage outlining key opportunities for the future of oral health behaviour change. Not applicable. Advancements, including the Capability-Opportunity-Motivation (COM-B), Motivation, Action regulation-Prompts (MAP) and the Goal setting, Planning and Self-Monitoring (GPS) models have showcased a range of evidence-based opportunities to deliver oral health behaviour change. Despite their merits, oral health behaviour change still faces barriers and challenges that limit its scope, applicability and practicability for oral health professionals. Recent developments on the global and local stage have highlighted the important role oral health behaviour change has to play for the future of oral health. We provide practical examples to show how these advancements can be delivered in practice, noting that learnings from other disciplines can help shape the future of oral health behaviour change. A combination of encouraging signs and recent, positive developments have resulted in an unprecedented focus on oral health behaviour change. Through ongoing and future research, meaningful changes to the oral health of the population through applied behavioural science are in sight.

Title: The contributions of behaviour change science towards dental public health practice: a new paradigm

Journal: Community Dentistry and Oral Epidemiology

Volume: 43

Issue: 1

Pages: 2-8

Date: Feb

Short Title: The contributions of behaviour change science towards dental public health practice: a new paradigm

ISSN: 0301-5661

DOI: 10.1111/cdoe.12131

Accession Number: WOS:000348567700002

Abstract: Conventional behavioural models, such as social cognition models, to improve oral health have been proposed for a long time but have failed to consistently explain reliable amounts of variability in human behaviours relevant to oral health. This paper introduces current work from the behavioural sciences aiming to better understand the process through which behaviour change may take place. Given the shortcomings seen so far in attempts to explain behaviour through traditional models it is proposed that a new approach is adopted. This commentary outlines this new approach, grounded in current work by mainstream behaviour change experts. We

propose that attempts to use unreliable theoretical models to explain and predict oral health behaviour should now be replaced by work following this new paradigm.

Abstract: The purpose of this chapter is to present a brief overview of the implementation of STEAM education in schools in developed countries such as China, Australia, United Kingdom and United States of America and to provide a roadmap of its implementation in the context of the United Arab Emirates. The research study in this chapter adopts a qualitative approach whereby purpose sampling of secondary data is collected, compiled and analyzed. Themes are generated after coding the content: implementation of STEAM, challenges related to STEAM application and implementation and requirements for success implementation. For the purpose of ensuring proper integration of STEAM in UAE educational system, a roadmap is proposed with policy drafting recommendations, such as curriculum reform, technology integration, teacher professional development and financial funds.

Short Title: A scoping review on emotion regulation mechanisms

employed in the control of Dharaneeya vegas (emotions that should be restrained) in light of Modern psychology and Ayurveda

ISSN: 0976-5921

Accession Number: WOS:000704895800010

Abstract: Experiencing positive emotions are now becoming one among the highest virtues. It becomes important for individuals to develop emotional intelligence competencies. There are many ways through which positive emotions can be reinforced. Modern psychology also encourages cultivation of emotional regulation capacity. This article describes modern as well as Ayurvedic mechanisms for emotional regulation to cultivate healthy emotion regulation competency. After database search from PUBMED, total 14 articles, 11 from modern psychiatry and 3 Ayurveda were reviewed and following results are obtained. There are five instances in which emotion regulation may occur: Situation Selection, Situation Modification, Attention Deployment, Cognitive Change and Response Modulation. Ayurveda observes that the main reason for mental disequilibrium is taking extreme or minimal stance in mano-arthas. Ayurveda perceive that dheer, dhriti and smriti are tripods that helps a person regulate his inclination towards mano-arthas. Ayurveda advices certain conducts to be followed by every person irrespective of Manasa prakriti. Ayurveda insist to control certain urges and those urges are termed as dharaneeya vegas. It preached some conducts to strengthen dheer, dhriti and smriti and they can be collectively called sadvritam. Sadvritam advocates human to always engage in learning (education) all existing science, persuades a person with ultimate aim of salvation by following right conduct, incentivisation with incentives health and prosperity, coercion through fear of diseases, rebirths, bad offspring's, training through detachment, restriction by morality, environmental restructuring by execution in community level, modelling by showing aptas and enablement by teaching it to every one irrespective of inequality.

Short Title: Content and Mechanism of Action of National Antimicrobial Stewardship Interventions on Management of Respiratory Tract Infections in Primary and Community Care

ISSN: 2079-6382

DOI: 10.3390/antibiotics9080512

Article Number: 512

Accession Number: WOS:000564201000001

Abstract: A major modifiable factor contributing to antimicrobial resistance (AMR) is inappropriate use and overuse of antimicrobials, such as antibiotics. This study aimed to describe the content and mechanism of action of antimicrobial stewardship (AMS) interventions to improve appropriate antibiotic use for respiratory tract infections (RTI) in primary and community care. This study also aimed to describe who these interventions were aimed at and the specific behaviors targeted for change. Evidence-based guidelines, peer-review publications, and infection experts were consulted to identify behaviors relevant to AMS for RTI in primary care and interventions to target these behaviors. Behavior change tools were used to describe the content of interventions. Theoretical frameworks were used to describe mechanisms of action. A total of 32 behaviors targeting six different groups were identified (patients; prescribers; community pharmacists; providers; commissioners; providers and commissioners). Thirty-nine interventions targeting the behaviors were identified (patients = 15, prescribers = 22, community pharmacy staff = 8, providers = 18, and commissioners = 18). Interventions targeted a mean of 5.8 behaviors (range 1-27). Influences on behavior most frequently targeted by interventions were psychological capability (knowledge and skills); reflective motivation (beliefs about consequences, intentions, social/professional role and identity); and physical opportunity (environmental context and resources). Interventions were most commonly characterized as achieving change by training, enabling, or educating and were delivered mainly through guidelines, service provision, and communications & marketing. Interventions included a mean of four Behavior Change Techniques (BCTs) (range 1-14). We identified little intervention content targeting automatic motivation and social opportunity influences on behavior. The majority of interventions focussed on education and training, which target knowledge and skills though the provision of instructions on how to perform a behavior and information about health consequences. Interventions could be refined with the inclusion of relevant BCTs, such as goal-setting and action planning (identified in only a few interventions), to translate instruction on how to perform a behavior into action. This study provides a platform to refine content and plan evaluation of antimicrobial stewardship interventions.

Short Title: Factors influencing variation in physician adenoma detection rates: a theory-based approach for performance improvement

ISSN: 0016-5107

DOI: 10.1016/j.gie.2015.08.075

Accession Number: WOS:000370359000022

Abstract: Background and Aims: Interventions to improve physician adenoma detection rates for colonoscopy have generally not been successful, and there are little data on the factors contributing to variation that may be appropriate targets for intervention. We sought to identify factors that may influence variation in detection rates by using theory-based tools for understanding behavior.

Methods: We separately studied gastroenterologists and endoscopy nurses at 3 Kaiser Permanente Northern California medical centers to identify potentially modifiable factors relevant to physician adenoma detection rate variability by using structured group interviews (focus groups) and theory-based tools for understanding behavior and eliciting behavior change: the Capability, Opportunity, and Motivation behavior model; the Theoretical Domains Framework; and the Behavior Change Wheel. Results: Nine factors potentially associated with adenoma detection rate variability were identified, including 6 related to capability (uncertainty about which types of polyps to remove, style of endoscopy team leadership, compromised ability to focus during an examination due to distractions, examination technique during withdrawal, difficulty detecting certain types of adenomas, and examiner fatigue and pain), 2 related to opportunity (perceived pressure due to the number of examinations expected per shift and social pressure to finish examinations before scheduled breaks or the end of a shift), and 1 related to motivation (valuing a meticulous examination as the top priority). Examples of potential intervention strategies are provided. Conclusions: By using theory-based tools, this study identified several novel and potentially modifiable factors relating to capability, opportunity, and motivation that may contribute to adenoma detection rate variability and be appropriate targets for future intervention trials.

Abstract: Understanding and changing eating behaviours are central to the work of Nutrition Society members working in both research and applied settings. The present paper describes a recently published resource to guide the design of interventions to change behaviour, The Behaviour Change Wheel: A Guide to Designing Interventions (BCW Guide). This is a practical guide to intervention design that brings together recently-developed theory-based tools in behavioural science into a coherent step-by-step design process. It is based on the BCW, a synthesis of nineteen frameworks of behaviour change found in the research literature. The BCW has at its core a model of behaviour known as 'capability', 'opportunity', 'motivation' and 'behaviour'. The model recognises that behaviour is part of an interacting system involving all these components. The BCW identifies different intervention options that can be applied to changing each of the components and policies that can be adopted to deliver those intervention options. The book shows how the BCW links to theory-based frameworks to understand behaviour such as the Theoretical Domains Framework and the recently developed Behaviour Change Technique Taxonomy v1 for specifying intervention content. In essence, it shows how to link what is understood about a given behaviour to types of intervention likely to be effective and then translate this into a locally relevant intervention. In addition, the present paper sets out some principles of intervention design.

ISSN: 0272-4332

DOI: 10.1111/risa.14155

Accession Number: WOS:000979817100001

Abstract: Public adoption of preventative behaviors to reduce the transmission of COVID-19 is crucial to managing the pandemic, and so it is vital to determine what factors influence the uptake of those behaviors. Previous studies have identified COVID-19 risk perceptions as a key factor, but this work has typically been limited both in assuming that risk means risk to the personal self, and in being reliant on self-reported data. Drawing on the social identity approach, we conducted two online studies in which we investigated the effects of two different types of risk on preventative measure taking: risk to the personal self and risk to the collective self (i.e., members of a group with which one identifies). Both studies involved behavioral measures using innovative interactive tasks. In Study 1 (n = 199; data collected 27 May 2021), we investigated the effects of (inter)personal and collective risk on physical distancing. In Study 2 (n = 553; data collected 20 September 2021), we investigated the effects of (inter)personal and collective risk on the speed at which tests are booked as COVID-19 symptoms develop. In both studies, we find that perceptions of collective risk, but not perceptions of (inter)personal risk, influence the extent to which preventative measures are adopted. We discuss the implications both conceptually (as they relate to both the conceptualization of risk and social identity processes) and also practically (in terms of the implications for public health communications).

Short Title: Barriers and Facilitators to the Uptake of Online and Telephone Services Targeting Health Risk Behaviours among Vocational Education Students: A Qualitative Study

DOI: 10.3390/ijerph18179336

Article Number: 9336

Accession Number: WOS:000694173600001

Abstract: Uptake of online and telephone services targeting health behaviours is low among vocational education students and barriers and facilitators are unknown. This study aimed to explore barriers and facilitators to uptake of online and telephone services for smoking, nutrition, alcohol, and physical activity (SNAP) risk behaviours via semi-structured individual telephone interviews with fifteen vocational education students. Two authors independently completed thematic analysis, classified themes according to the COM-B (Capability, Opportunity, Motivation, Behaviour) framework, and discussed disagreements until consensus was reached. Facilitators to uptake of online (e.g., desire to learn something new, cost-free, accessible) and telephone services (e.g., prefer to talk to provider, complements online support) primarily related to capability and opportunity. For telephone services, difficulty understanding accent/language was a capability-related barrier. Opportunity-related barriers for online and telephone services were preference for face-to-face interaction and lack of time, while preference for apps/online programs was a barrier for telephone services. For online and telephone services, not wanting to change SNAP behaviours was a motivation-related barrier and being able to change SNAP risk behaviours themselves was a motivation-related barrier for online services. Barriers and facilitators to online and telephone services are relevant for designing interventions vocational education students are more likely to use.

Accession Number: WOS:000794916200001

Abstract: Objective: No studies have examined vocational education students' intention to change multiple health risk behaviors and whether baseline characteristics predict behavior change.

Participants: Participants were vocational education students in New South Wales, Australia. Methods: Students in the no-intervention control arm of a cluster randomized controlled trial completed an online survey at baseline and 6 months later. Results: Of 450 participants (83.3%) who reported multiple health risk behaviors at baseline, one-third (33.1%) intended to change at least two risk behaviors within 6 months. Participants experiencing symptoms of anxiety [OR = 7.43, 95% CIs 1.26-43.87; p = 0.03] and who intended to change three to four risk behaviors [OR = 23.30, 95% CIs 4.01-135.40; p = 0.001] rather than one behavior had significantly greater odds of changing at least one behavior in 6 months.

Conclusions: Interventions could support vocational education students to change behaviors they wish to as well as motivate them to address other risk behaviors.

Abstract: Background: Health care workers (HCWs) are at an increased risk of catching and spreading Coronavirus Disease 2019 (COVID-19) compared with the general community, putting health systems at risk. Several jurisdictions globally have mandated or are looking to mandate COVID-19 vaccines for this cohort, but little is known about the acceptability of this measure, especially in different contexts, and there is little qualitative data to explore nuance, depth, and the reasons behind HCWs' opinions. Methods: In-depth semi-structured qualitative interviews were undertaken with 39 HCWs in Western

Australia (WA) between February–August 2021, ascertaining their views on the prospective introduction and implementation of mandates for COVID–19 vaccines. Data were thematically analysed using NVivo 20. Results: There was broad support for COVID–19 vaccine mandates for HCWs amongst our participants, but also different views about what such a mandate would mean (redeployment versus termination) and how it would impact the rest of the workforce. One vaccine hesitant participant said that mandates would be their prompt to get vaccinated. Other participants invoked an informal code whereby HCWs have an obligation to be seen to support vaccination and to protect public health more broadly. However, they also raised concerns about implementation and procedural and policy fairness. Conclusion: Policymakers should consider how to mobilise the informal code of health promotion and public health support if introducing mandates. They should also consider whether HCWs will bring the same attitudes and approaches to mandates for additional vaccine doses.

Title: Sexual Rehabilitation After a Stroke: A Multi-site Qualitative Study About Influencing Factors and Strategies to Improve Services

Journal: Sexuality and Disability

Date: 2023 May

Short Title: Sexual Rehabilitation After a Stroke: A Multi-site Qualitative Study About Influencing Factors and Strategies to Improve Services

ISSN: 0146–1044

DOI: 10.1007/s11195–023–09795–x

Accession Number: WOS:000994067600001

Abstract: This study aimed to better understand the factors influencing the provision of sexuality-related post-stroke rehabilitation services by clinicians on different sites and to explore strategies to improve post-stroke rehabilitation services with stakeholders. A qualitative study with co-design methods was conducted with 20 clinicians from five post-stroke rehabilitation centers in Canada, 1 manager and 1 patient-partner. Participants either took part in a focus group or in sessions of an adapted version of the LEGO Serious Play method to explore influencing factors and strategies of improvement in relation to post-stroke sexual rehabilitation services. Thematic analysis was conducted semi-deductively using the Theoretical Domains Framework (TDF), the Capability, Opportunity, Motivation and Behaviour (COM–B) system and

the Behaviour Change Wheel (BCW). A total of twenty factors pertaining either to the categories of Capability (n = 8; e.g., Sexual rehabilitation procedural knowledge), Motivation (n = 4; e.g., Professional boundaries) or Opportunity (n = 8; e.g., Workload) were perceived as influencing provision of sexual rehabilitation services by participants. A theoretical model was conceptualized. Strategies (n = 10) were categorized in concordance with the BCW as Training (n = 1), Enablement (n = 5) or Environmental restructuring (n = 4). This study showed that factors influencing provision of post-stroke rehabilitation services were numerous and interrelated, and that various strategies aiming either clinicians or the rehabilitation environment would be relevant to improve services. This study will help guide the design and implementation of future interventions studies aiming at improving post-stroke sexual rehabilitation services.

Title: Social prescribing for individuals with mental health problems: a qualitative study of barriers and enablers experienced by general practitioners

Journal: BMC Family Practice

Volume: 21

Issue: 1

Date: Sep

Short Title: Social prescribing for individuals with mental health problems: a qualitative study of barriers and enablers experienced by general practitioners

DOI: 10.1186/s12875-020-01264-0

Article Number: 194

Accession Number: WOS:000574377200003

Abstract: Background There is growing evidence for the use of social prescribing as a means to improve the mental health of patients. However, there are gaps in understanding the barriers and enablers faced by General Practitioners (GPs) when engaging in social prescribing for patients with mental health problems. Methods This study uses a qualitative approach involving one-to-one interviews with GPs from across the UK. The COM-B model was used to elucidate barriers and enablers, and the Theoretical Domains Framework (TDF) and a Behaviour Change Theory and Techniques tool was used to identify interventions that could address these. Results GPs recognised the utility of social prescribing in addressing the high levels of psychosocial need they saw in their patient population, and expressed the need to de-medicalise certain patient problems. GPs were driven by a desire to help patients, and so they benefited from regular positive feedback to reinforce the value of their social prescribing referrals. They also discussed the importance of

developing more robust evidence on social prescribing, but acknowledged the challenges of conducting rigorous research in community settings. GPs lacked the capacity, and formal training, to effectively engage with community groups for patients with mental health problems. Link workers, when available to GPs, were of fundamental importance in bridging the gap between the GP and community. The formation of trusting relationships was crucial at different points of the social prescribing pathway, with patients needing to trust GPs in order for them to agree to see a link worker or attend a community activity, and GPs requiring a range of strong inter-personal skills in order to gain patients' trust and motivate them. Conclusion This study elucidates the barriers and enablers to social prescribing for patients with mental health problems, from the perspectives of GPs. Recommended interventions include a more systematic feedback structure for GPs and more formal training around social prescribing and developing the relevant inter-personal skills. This study provides insight for GPs and other practice staff, commissioners, managers, providers and community groups, to help design and deliver future social prescribing services.

Title: Experiences of COPD patients with existing smoking cessation programs and their preferences for improvement - a qualitative analysis

Journal: Tobacco Induced Diseases

Volume: 14

Date: Aug

Short Title: Experiences of COPD patients with existing smoking cessation programs and their preferences for improvement - a qualitative analysis

ISSN: 1617-9625

DOI: 10.1186/s12971-016-0097-4

Article Number: 31

Accession Number: WOS:000383418800001

Abstract: Background: Smoking is a major risk factor for chronic obstructive pulmonary disease (COPD). For current smokers who are diagnosed with COPD, their first treatment option is to stop smoking. Motivation is necessary for long-term smoking cessation; therefore, when designing smoking cessation programs, the patients' needs and preferences should be considered. We focused on COPD patients' experiences with existing smoking cessation programs and evaluated their preferences for the improvement of these programs.

Methods: We conducted 18 guideline-based interviews with COPD patients between April and June 2014 in Germany. Each patient with COPD, who was a current or past smoker and had made at least one attempt to quit smoking in the past 5 years, was included in the study. We audiotaped, verbatim transcribed, and evaluated the

interviews, using content analysis. Results: The patients had broad and different experiences with pharmaceutical, behavioral, and alternative approaches that supported or negatively influenced the smoking cessation process. Pharmaceuticals were viewed as an expensive alternative with many side effects although they helped to stop cravings for a few moments. Furthermore, the bad structure and impersonal content of the seminars for smoking cessation negatively influenced group cohesion, and therefore degrading the patients' motivation to stop smoking. Alternative methods, such as acupuncture and hypnosis were mostly ineffective in smoking cessation, but in some cases, served as motivational strategies. Conclusion: Negative experiences with smoking cessation were explained by the patients' lack of motivation or resolution. Other negative experiences, such as the structure of seminars for smoking cessation and the high price of pharmaceuticals should be addressed through policy changes to increase the patients' motivation to quit smoking.

Title: Development and Implementation of a Complex Health System Intervention Targeting Transitions of Care from Hospital to Post-acute Care

Journal: Journal of General Internal Medicine

Volume: 36

Issue: 2

Pages: 358-365

Date: Feb

Short Title: Development and Implementation of a Complex Health System Intervention Targeting Transitions of Care from Hospital to Post-acute Care

ISSN: 0884-8734

DOI: 10.1007/s11606-020-06140-2

Accession Number: WOS:000564523800018

Abstract: Background Failure of effective transitions of care following hospitalization can lead to excess days in the hospital, readmissions, and adverse events. Evidence identifies both patient and system factors that influence poor care transitions, yet health systems struggle to translate evidence into complex interventions that have a meaningful impact on care transitions. Objective We report on our experience developing, pilot testing, and evaluating a complex intervention (Addressing Complex Transitions program, or ACT program) that aims to improve care transitions for complex patients. Design Following the Medical Research Council (MRC) framework, we engaged in iterative, stakeholder-driven work to develop a complex care intervention, assess feasibility and pilot methods, evaluate the intervention in practice, and facilitate ongoing implementation monitoring and dissemination. Participants Patients receiving care

from UW Medicine's health system including 4 hospitals and 20-site Post-Acute Care network. Intervention Literature review and prospective data collection activities informed ACT program design. ACT program components include a tailored risk calculator that provides real-time scoring of transitions of care risk factors, a multidisciplinary team with the capacity to address complex barriers to safe transitions, and enhanced discharge workflows to improve care transitions for complex patients. Key Measures Program evaluation metrics included estimated hospital days saved and program acceptance by care team members. Key Results During the 6-month pilot, 565 patients were screened and 97 enrolled in the ACT program. An estimated 664 hospital days were saved for the index admission of ACT program participants. Analysis of pre/post-hospital utilization for ACT program participants showed an estimated 3227 fewer hospital days after ACT program enrollment. Conclusions Health systems need to address increasingly difficult challenges in care delivery. The use of evidence-based frameworks, such as the MRC framework, can guide systems to design complex interventions that respond to their local context and stakeholder needs.

ISSN: 1552-4825

DOI: 10.1002/ajmg.a.37289

Accession Number: WOS:000367668600006

Abstract: Encouraging individuals at risk for common complex disease like heart disease, cancer, and diabetes to adopt lifestyle changes (e.g., smoking cessation, exercise, proper nutrition, increased screening) could be powerful public health tools to decrease the enormous personal and economic burden of these conditions.

Theoretically, genetic risk information appears to be a compelling tool that could be used to provoke at-risk individuals to adopt these lifestyle changes. Unfortunately, however, numerous studies

now have shown that providing individuals with genetic test-based risk information has little to no impact on their behavior. In this article (a commentary not a systematic review), the failed trials in which genetic information has been used as a tool to induce behavior change will be critically examined in order to identify new and potentially more effective ways forward. Short Title: Inclusive, supportive and dignified maternity care (SDMC)-Development and feasibility assessment of an intervention package for public health systems: A study protocol

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0263635

Article Number: e0263635

Accession Number: WOS:000821499100039

Abstract: Introduction Mistreatment, discrimination, and poor psycho-social support during childbirth at health facilities are common in lower- and middle-income countries. Despite a policy directive from the World Health Organisation (WHO), no operational model exists that effectively demonstrates incorporation of these guidelines in routine facility-based maternity services. This early-phase implementation research aims to develop, implement, and test the feasibility of a service-delivery strategy to promote the culture of supportive and dignified maternity care (SDMC) at public health facilities. Methods Guided by human-centred design approach, the implementation of this study will be divided into two phases: development of intervention, and implementing and testing feasibility. The service-delivery intervention will be co-created along with relevant stakeholders and informed by contextual evidence that is generated through formative research. It will include capacity-building of maternity teams, and the improvement of governance and accountability mechanisms within public health facilities. The technical content will be primarily based on WHO's intrapartum care guidelines and mental health Gap Action Programme (mhGAP) materials. A mixed-method, pre-post design will be used for feasibility assessment. The intervention will be implemented at six secondary-level healthcare facilities in two districts of southern

Sindh, Pakistan. Data from multiple sources will be collected before, during and after the implementation of the intervention. We will assess the coverage of the intervention, challenges faced, and changes in maternity teams' understanding and attitude towards SDMC. Additionally, women's maternity experiences and psycho-social well-being-will inform the success of the intervention. Expected outcomes Evidence from this implementation research will enhance understanding of health systems challenges and opportunities around SDMC. A key output from this research will be the SDMC service-delivery package, comprising a comprehensive training package (on inclusive, supportive and dignified maternity care) and a field tested strategy to ensure implementation of recommended practices in routine, facility-based maternity care. Adaptation, Implementation and evaluation of SDMC package in diverse setting will be way forward. The study has been registered with clinicaltrials.gov (Registration number: NCT05146518).

Title: Involving men and boys in family planning: A systematic review of the effective components and characteristics of complex interventions in low- and middle-income countries

Journal: Campbell Systematic Reviews

Volume: 19

Issue: 1

Date: Mar

Short Title: Involving men and boys in family planning: A systematic review of the effective components and characteristics of complex interventions in low- and middle-income countries

DOI: 10.1002/cl2.1296

Article Number: e1296

Accession Number: WOS:000913029500001

Abstract: Background Involving men and boys as both users and supporters of Family Planning (FP) is now considered essential for optimising maternal and child health outcomes. Evidence on how to engage men and boys to meet FP needs is therefore important.

Objectives The main objective of this review was to assess the strength of evidence in the area and uncover the effective components and critical process- and system-level characteristics of successful interventions. Search Methods We searched nine electronic databases, seven grey literature databases, organisational websites, and the reference lists of systematic reviews relating to FP. To identify process evaluations and qualitative papers associated with the included experimental studies, we used Connected Papers and hand

searches of reference lists. Selection Criteria Experimental and quasi-experimental studies of behavioural and service-level interventions involving males aged 10 years or over in low- and middle-income countries to increase uptake of FP methods were included in this review. Data Collection and Analysis Methodology was a causal chain analysis involving the development and testing of a logic model of intervention components based on stakeholder consultation and prior research. Qualitative and quantitative data relating to the evaluation studies and interventions were extracted based on the principles of 'effectiveness-plus' reviews. Quantitative analysis was undertaken using *r* with robust variance estimation (RVE), meta-analysis and meta-regression. Qualitative analysis involved 'best fit' framework synthesis. Results We identified 8885 potentially relevant records and included 127 in the review. Fifty-nine (46%) of these were randomised trials, the remainder were quasi-experimental studies with a comparison group. Fifty-four percent of the included studies were assessed as having a high risk of bias. A meta-analysis of 72 studies ($k = 265$) showed that the included group of interventions had statistically significantly higher odds of improving contraceptive use when compared to comparison groups (odds ratio = 1.38, confidence interval = 1.21 to 1.57, prediction interval = 0.36 to 5.31, $p < 0.0001$), but there were substantial variations in the effect sizes of the studies ($Q = 40,647$, $df = 264$, $p < 0.0001$; $I^2 = 98\%$) and 73% was within cluster/study. Multi-variate meta-regression revealed several significant intervention delivery characteristics that moderate contraceptive use. These included community-based educational FP interventions, interventions delivered to women as well as men and interventions delivered by trained facilitators, professionals, or peers in community, home and community, or school settings. None of the eight identified intervention components or 33 combinations of components were significant moderators of effects on contraceptive use. Qualitative analysis highlighted some of the barriers and facilitators of effective models of FP that should be considered in future practice and research. Authors' Conclusions FP interventions that involve men and boys alongside women and girls are effective in improving uptake and use of contraceptives. The evidence suggests that policy should continue to promote the involvement of men and boys in FP in ways that also promote gender equality. Recommendations for research include the need for evaluations during conflict and disease outbreaks, and evaluation of gender transformative interventions which engage men and boys as contraceptive users and supporters in helping to achieve desired family size, fertility promotion, safe conception, as well as promoting equitable family planning decision-making for women and girls.

Title: Behavior theory for dietary interventions for cancer prevention: a systematic review of utilization and effectiveness in creating behavior change

Journal: Cancer Causes & Control

Volume: 24

Issue: 3

Pages: 409-420

Date: Mar

Short Title: Behavior theory for dietary interventions for cancer prevention: a systematic review of utilization and effectiveness in creating behavior change

ISSN: 0957-5243

DOI: 10.1007/s10552-012-9995-9

Accession Number: WOS:000314976900001

Abstract: Theory-based approaches are now recommended to design and enact dietary interventions, but their use in cancer trials is unknown. This systematic review examined application of behavior theory to dietary interventions aimed at preventing cancer to improve the design and interpretation of trials. Electronic databases were searched (inception-July 2011). Data were synthesized and a theory coding scheme (TCS) used to describe and assess how behavior theory informed interventions. Studies not reporting a dietary behavior intervention informed by a specified behavior change model(s) were excluded. Of 237 potentially eligible studies, only 40 (16.9 %) were relevant, mostly RCTs (34, 85.0 %). Twenty-one interventions targeted diet alone (52.5 %) or integrated diet into a lifestyle intervention (19, 47.5 %). Most (24, 60.0 %) invoked several behavior change models, but only 10 (25.0 %) interventions were reported as explicitly theory-informed and none comprehensively targeted or measured theoretical constructs or tested theoretical assumptions. The 10 theory-informed interventions were more effective at improving diet. Dietary interventions for cancer prevention improved diet more effectively if they were informed by behavior theory. While behavior theory was often applied to these dietary interventions, they were rarely implemented or described thoroughly. Accurate intervention reporting is essential to assess theoretical quality and facilitate implementation effective behavior change techniques. Guidelines regarding the application and reporting of behavior theory for complex interventions, for example, proposed by the National Institutes of Health and Medical Research Council, should be revised accordingly. Failure to adequately ground dietary interventions in behavior theory may hinder establishing their effectiveness and relationships between diet and cancer.

DOI: 10.1093/jamiaopen/ooz049

Accession Number: WOS:000645419800016

Abstract: Objectives: Text-messaging interventions are a promising approach to increasing physical activity in vulnerable populations. To better inform the development of a text-messaging intervention, we sought to identify barriers and facilitators to using text messaging and engaging in physical activity among patients with diabetes and comorbid depression. Materials and Methods: We conducted interviews with primary care patients at a safety-net health care system (N = 26). Data were collected at 3 stages, including a focus group (stage 1), and individual interviews (stage 2 and 3). Patients in stage 1 and 2 previously participated in a text-messaging intervention as part of depression treatment. Discussions focused on participant experience of previously using a text-messaging intervention, influences and perceptions of physical activity, and mobile phone use. We analyzed all transcripts for emerging themes. Results: Participants were 56.2 years (69.7); 69.2% were female, 65.4% identified as Hispanic/Latino(a), and 46.2% reported having less than a high school education. All had depression and 61.5% had diabetes. Specific barriers that emerged included low literacy and only basic use of mobile phones in everyday life, in combination with a high prevalence of comorbid health conditions and limited mobility. These were each addressed with a specific content or intervention delivery change in the overall intervention design. Conclusions: Conducting a focus group and individual interviews with end users of an mHealth intervention under development has implications for tailoring and modifying components of the content and format to ensure that the final intervention will engage end users most effectively.

Article Number: 33

Accession Number: WOS:000395711900001

Abstract: Background: The World Health Organization recommends routine household tuberculosis contact investigation in high-burden countries but adoption has been limited. We sought to identify barriers to and facilitators of TB contact investigation during its introduction in Kampala, Uganda. Methods: We collected cross-sectional qualitative data through focus group discussions and interviews with stakeholders, addressing three core activities of contact investigation: arranging household screening visits through index TB patients, visiting households to screen contacts and refer them to clinics, and evaluating at-risk contacts coming to clinics. We analyzed the data using a validated theory of behavior change, the Capability, Opportunity, and Motivation determine Behavior (COM-B) model, and sought to identify targeted interventions using the related Behavior Change Wheel implementation framework. Results: We led seven focus-group discussions with 61 health-care workers, two with 21 lay health workers (LHWs), and one with four household contacts of newly diagnosed TB patients. We, in addition, performed 32 interviews with household contacts from 14 households of newly diagnosed TB patients. Commonly noted barriers included stigma, limited knowledge about TB among contacts, insufficient time and space in clinics for counselling, mistrust of health-center staff among index patients and contacts, and high travel costs for LHWs and contacts. The most important facilitators identified were the personalized and enabling services provided by LHWs. We identified education, persuasion, enablement, modeling of health-positive behaviors, incentivization, and restructuring of the service environment as relevant intervention functions with potential to alleviate barriers to and enhance facilitators of TB contact investigation. Conclusions: The use of a behavioral theory and a validated implementation framework provided a comprehensive approach for systematically identifying barriers to and facilitators of TB contact investigation. The behavioral determinants identified here may be useful in tailoring interventions to improve implementation of contact investigation in Kampala and other similar urban

settings.

Article Number: 2176

Accession Number: WOS:000722998500004

Abstract: Background: Many pregnancies in the UK are either unplanned or ambivalent. This review aimed to (i) explore barriers and facilitators to women choosing and accessing a preferred method of contraception in the United Kingdom, and (ii) identify opportunities for behavioural interventions based on examination of interventions that are currently available nationally. Methods: Three databases were searched, and experts contacted to identify grey literature for studies presenting barriers and facilitators to women choosing and accessing a preferred method of contraception, conducted in the UK and published between 2009 and October 2019. Information on barriers and facilitators were coded into overarching themes, which were then coded into Mechanisms of Actions (MoAs) as listed in the Theory and Techniques Tool. National interventions were identified by consulting stakeholders and coded into the Behaviour Change Wheel. The match between barriers/facilitators and intervention content was assessed using the Behaviour Change Wheel. Results: We included 32 studies and identified 46 barrier and facilitator themes. The most cited MoA was Environmental Context and Resources, which primarily related to the services women had access to and care they received. Social Influences, Beliefs about Consequences (e.g., side effects) and Knowledge were also key. The behavioural analysis highlighted four priority intervention functions (Modelling, Enablement, Education and Environmental Restructuring) that can be targeted to support women to choose and access their preferred method of contraception. Relevant policy

categories and behaviour change techniques are also highlighted. Conclusions: This review highlights factors that influence women's choices and access to contraception and recommends opportunities that may be targeted for future interventions in order to support women to access preferred contraception.

Short Title: Barriers and enablers to consumer and community involvement in research and healthcare improvement: Perspectives from consumer organisations, health services and researchers in Melbourne, Australia

ISSN: 0966-0410

DOI: 10.1111/hsc.13515

Accession Number: WOS:000673762100001

Abstract: Partnering with consumers and patients and the community and public is a research and healthcare improvement imperative. Consumer and community involvement (CCI) requires behaviour change at the individual (researcher, health professional, manager), organisational (health service, university, medical research institute) and system level (funding policies, collaboration between organisations). To understand the barriers and enablers to meaningful CCI, a qualitative descriptive study was undertaken with researchers, health professionals, representatives from consumer organisations, and health services and ethics committees in Melbourne, Australia. Twenty-eight semi-structured interviews and one focus group were conducted in May-August 2019. Ethics approval was obtained. Thematic analysis was guided by the Capability, Opportunity and Motivation and Behaviour model (COM-B). Training of researchers and health professionals in CCI, benefits and systems and processes to undertake CCI, alongside incorporating CCI as a requirement for funding were identified as enablers. Lack of time and resources for CCI, challenges in finding consumers for projects

and a perceived lack of evidence of the impact of CCI were barriers. These identified barriers and enablers will inform strategies to build the capacity of CCI at the individual, organisation and system level within the Australian Health Research Alliance.

Accession Number: WOS:000704573700001

Abstract: Several interventions have been implemented across higher education institutions with the aim of reducing the prevalence of plagiarism internationally, yet research dedicated to understanding the situational and contextual factors that contribute to plagiarism in an Australian context has been minimal. The objectives of this study were to explore the experiences, views, and understandings of plagiarism from the perspectives of students and teaching staff, and to identify the perceived barriers and enablers of 'ethical' academic writing. The Capabilities, Opportunities, Motivations, and Behaviour (COM-B) model was used as the theoretical framework for this study. Semi-structured interviews and focus groups were conducted with 37 undergraduate students and seven university teaching staff recruited across four health-related academic disciplines within Australia's largest university to elicit their perceptions of plagiarism and the factors that contribute to its prevalence. A total of 16 themes were identified and divided across the Capabilities, Opportunities, and Motivations domains of the COM-B model. Each of the themes within these three domains were classified as either a barrier or enabler of ethical academic writing. The findings reported herein provide the basis of several recommendations for intervention through teaching practice and university policy change to reduce the prevalence of plagiarism within higher education institutions.

Title: Barriers and enablers to the implementation of the 6-PACK
falls prevention program: A pre-implementation study in hospitals
participating in a cluster randomised controlled trial

Journal: Plos One

Volume: 12

Issue: 2

Date: Feb

Short Title: Barriers and enablers to the implementation of the 6-
PACK falls prevention program: A pre-implementation study in
hospitals participating in a cluster randomised controlled trial

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0171932

Article Number: e0171932

Accession Number: WOS:000394424500062

Abstract: Evidence for effective falls prevention interventions in
acute wards is limited. One reason for this may be suboptimal
program implementation. This study aimed to identify perceived
barriers and enablers of the implementation of the 6-PACK falls
prevention program to inform the implementation in a randomised
controlled trial. Strategies to optimise successful implementation
of 6-PACK were also sought. A mixed-methods approach was applied in
24 acute wards from 6 Australian hospitals. Participants were nurses
working on participating wards and senior hospital staff including
Nurse Unit Managers; senior physicians; Directors of Nursing; and
senior personnel involved in quality and safety or falls prevention.
Information on barriers and enablers of 6-PACK implementation was
obtained through surveys, focus groups and interviews. Questions
reflected the COM-B framework that includes three behaviour change
constructs of: capability, opportunity and motivation. Focus group
and interview data were analysed thematically, and survey data
descriptively. The survey response rate was 60% (420/702), and 12
focus groups (n = 96 nurses) and 24 interviews with senior staff
were conducted. Capability barriers included beliefs that falls
could not be prevented; and limited knowledge on falls prevention in
patients with complex care needs (e.g. cognitive impairment).
Capability enablers included education and training, particularly
face to face case study based approaches. Lack of resources was
identified as an opportunity barrier. Leadership, champions and

using data to drive practice change were recognised as opportunity enablers. Motivation barriers included complacency and lack of ownership in falls prevention efforts. Motivation enablers included senior staff articulating clear goals and a commitment to falls prevention; and use of reminders, audits and feedback. The information gained from this study suggests that regular practical face-to-face education and training for nurses; provision of equipment; audit, reminders and feedback; leadership and champions; and the provision of falls data is key to successful falls prevention program implementation in acute hospitals.

Article Number: 100401

Accession Number: WOS:000788200400001

Abstract: Background: Reablement is a team-based person-centered health and social care model, most commonly available for community-dwelling older adults. Understanding the components of reablement and how it is delivered, received, and enacted facilitates best evidence and practice. Determining behavior change techniques (BCTs) or strategies is an important step to operationalize implementation of reablement. Objective: We conducted a scoping review of peer-reviewed literature to identify BCTs used within reablement studies. Methods: We registered our study with the Joanna Briggs Institute and conducted five database searches. Inclusion criteria were peer-reviewed studies focused on adults and older adults without significant cognitive impairment or dementia receiving reablement, and all study designs, years, and languages. We excluded studies focused on reablement for people with dementia or reablement

training programs. The last search was on April 8, 2021. Two authors screened independently at Level 1 (title and abstract) and 2 (full text). Two authors adjudicated BCTs for each study, and a third author confirmed the final list. Results: We identified 567 studies (591 publications) and included 21 studies (44 publications) from six global locations. We identified 27 different BCTs across all studies. The three most common BCTs for reablement were goal setting (behavior), social support (unspecified), and instruction on how to perform a behavior. Conclusions: We highlight some behavioral components of reablement and encourage detailed reporting to increase transparency and replication of the intervention. Future research should explore effective BCTs (or combinations of) to include within reablement to support health behavior adoption and maintenance. Title: Education as a tool for improving canine welfare: Evaluating the effect of an education workshop on attitudes to responsible dog ownership and canine welfare in a sample of Key Stage 2 children in the United Kingdom

Journal: Plos One

Volume: 15

Issue: 4

Date: Apr

Short Title: Education as a tool for improving canine welfare: Evaluating the effect of an education workshop on attitudes to responsible dog ownership and canine welfare in a sample of Key Stage 2 children in the United Kingdom

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0230832

Article Number: e0230832

Accession Number: WOS:000536019800008

Abstract: One of the core objectives of many animal-welfare organisations is to achieve improvements in animal welfare through school education programmes. However, whilst many charities and organisations develop and deliver these educational activities, impact relating to specific animal welfare attitudes and behaviours remains largely undescribed. This study evaluated the effects of an hour-long dog welfare workshop delivered to children aged 7-11,

evaluating 2732 learners in state primary schools across the UK. Two types of workshop were evaluated; "Be Dog Smart" (BDS) and "Responsible Dog Ownership" (RDO). This study assessed short-term impact on attitude outcomes, as a first step in developing a full education monitoring and evaluation framework. Learners within each class were randomly assigned to two groups; one completing an attitude-based questionnaire before (control) and the other after the workshop (treatment). Dog ownership status, age, gender, and social deprivation (measured as access to free school meals) were collected for all participants. Questionnaire scores were compared between treatment and control groups. Mean scores were significantly different (BDS $p < 0.001$; Cohen's D 0.65; RDO $p < 0.001$; Cohen's D 0.51) between control (BDS 13.57 +/- 3.15; RDO 22.97 +/- 4.78) and treatment groups (BDS 15.61 +/- 3.10; RDO 25.47 +/- 5.06) for both workshops, suggesting workshops effectively convey key messages and improve learner attitudes concerning dogs. Gender, age and social deprivation were found to significantly influence questionnaire responses. These findings contribute to a broader effort to improve canine welfare via childhood education while also demonstrating the feasibility of effective monitoring and evaluation during operational delivery of a schools workshop programme. Ongoing impact assessment is important in ensuring successful development, delivery and refinement of educational programmes to maximise the probability of positive changes in participants. Further work is needed to evaluate longer term impact, and ensure that desired influences on human behaviour change, and animal welfare, are achieved.

Title: Anthropause and Human Behaviour: Contributions from a Situated Educational Neuroscience

Journal: Pensando Psicologia

Volume: 18

Issue: 1

Pages: 23-37

Short Title: Anthropause and Human Behaviour: Contributions from a Situated Educational Neuroscience

ISSN: 1900-3099

DOI: 10.16925/2382-3984.2022.01.01

Accession Number: WOS:000991278000002

Abstract: Objective: We develop a theoretical discussion from our perspective of the situated educational neuroscience, based on the relational anthropology point of view, to generate ambits of discussion in which the educational neuroscience can contribute into the context of COVID-19 pandemic and pospandemic. Subject: The

context of the COVID-19 pandemic has made it possible to put in tension issues that were pending on the global agenda. Among these issues, the importance of the human being as part of the ecosystem with which they maintain co-construction relationships is not minor. Situated educational neuroscience is a tool that can bring valuable contributions to the discussion to collaborate in addressing this tension. Development: We organize the argumentation in four sections: 1. The opportunity the anthropause posts to the humankind and its relations with their environment, 2. The role that studies on behaviour and evolution have on this opportunity, 3. The contribution of a situated educational neuroscience as a framework and transdiscipline which works on translational research in this context of pandemics and anthropause, and 4. The succinct presentation of two examples where we argue that a situated educational neuroscience has tools to contribute. Conclusions: We propose conclusions open to discussion where we return to the idea of a situated educational neuroscience which is committed with its context. As an approach or as a transdiscipline with translational research functions, we consider that a situated educational neuroscience contains tools that can contribute to the conversation with other sciences and disciplines and with the empirical knowledge of communities, in order to join efforts to overcome social injustices and move forward as humankind from this current pandemic situation, having acquired strategies of resilience that can serve to deal with other persistent and future situations.

Pages: 43-60

Date: Feb

Short Title: Local politicians in action? The relationship between perceived prerequisites and actions of political committees responsible for social services in supporting the implementation of evidence-based practice

ISSN: 1744-2648

DOI: 10.1332/174426421x16178101375342

Accession Number: WOS:000755756500004

Abstract: Background: A supportive context is essential for successful implementation processes. Local politicians are delivery system actors who might both enable and hinder the implementation of

health and social policies. Aims and objectives: The study examines the relationship between perceived prerequisites and the type of actions taken by local political committees to support the implementation of evidence based practice in social services. Methods: A cross-sectional web survey targeting the chair and vice-chair of committees responsible for social services in Sweden (n=181). The data was analysed with regression analysis, cluster analysis and ANOVA. Findings: Three clusters of action were identified (passive, neutral and active), capturing the reported actions taken by the committees to support implementation of EBP. The committees' perceived prerequisites (capability, motivation, and opportunity) were highest in the active cluster and lowest in the passive cluster. The clusters also differed regarding chair/vice-chair educational level, and type of municipality in which the chair/vice-chair were active. Discussions and conclusion: The variation in reported actions among the committees to support the implementation of EBP implies that some social service organisations might lack the contextual support they need for implementing EBP. The prerequisites for the committees might need to be strengthened with regard to capability, motivation and opportunity. This study is an indication of the relationship between committees' prerequisites and their actions in the implementation of EBP, but further research is needed.

Article Number: 75

Accession Number: WOS:000390963800001

Abstract: Background: Despite national policy recommending evidence-based practice (EBP), its application in social care has been limited. While local politicians can affect the process, little is known about their knowledge, attitudes and roles regarding EBP. The aim here is twofold: to explore the role of local politicians in the implementation of EBP in social care from both their own and a management perspective; and to examine factors politicians perceive

as affecting their decisions and actions concerning the implementation of EBP policy. Methods: Local politicians (N = 13) and managers (N = 22) in social care were interviewed. Qualitative thematic analysis with both inductive and deductive codes was used. Results: Politicians were rather uninformed regarding EBP and national policy. The factors limiting their actions were, beside the lack of awareness, lack of ability to question existing working methods, and a need for support in the steering of EBP. Thus, personal interest played a significant part in what role the politicians assumed. This resulted in some politicians taking a more active role in steering EBP while others were not involved. From the managers' perspective, a more active steering by politicians was desired. Setting budget and objectives, as well as active follow-up of work processes and outcomes, were identified as means to affect the implementation of EBP. However, the politicians seemed unaware of the facilitating effects of these actions. Conclusions: Local politicians had a possibility to facilitate the implementation of EBP, but their role was unclear. Personal interest played a big part in determining what role was taken. The results imply that social care politicians might need support in the development of their steering of EBP. Moving the responsibility for EBP facilitation upwards in the political structure could be an important step in developing EBP in social care.

DOI: 10.1136/bmjopen-2020-046127

Article Number: e046127

Accession Number: WOS:000629668700006

Abstract: Introduction In the context of a highly contagious virus with only recently approved vaccines and no cure, the key to slowing the spread of the COVID-19 disease and successfully transitioning

through the phases of the pandemic, including vaccine uptake, is public adherence to rapidly evolving behaviour-based public health policies. The overall objective of the iCARE Study is to assess public awareness, attitudes, concerns and behavioural responses to COVID-19 public health policies, and their impacts, on people around the world and to link behavioural survey data with policy, mobility and case data to provide behavioural science, data-driven recommendations to governments on how to optimise current policy strategies to reduce the impact of the COVID-19 pandemic. Methods and analyses The iCARE study (www.icarestudy.com) uses a multiple cross-sectional survey design to capture self-reported information on a variety of COVID-19 related variables from individuals around the globe. Survey data are captured using two data capture methods: convenience and representative sampling. These data are then linked to open access data for policies, cases and population movement. Ethics and dissemination The primary ethical approval was obtained from the coordinating site, the Centre integre universitaire de sante et de services sociaux du Nord-de-l'Ile-de-Montreal (REB#: 2020-2099/03-25-2020). This study will provide high-quality, accelerated and real-time evidence to help us understand the effectiveness of evolving country-level policies and communication strategies to reduce the spread of the COVID-19. Due to the urgency of the pandemic, results will be disseminated in a variety of ways, including policy briefs, social media posts, press releases and through regular scientific methods.

Short Title: Transitioning from a single-site pilot project to a state-wide regional telehealth service: The experience from the Victorian Stroke Telemedicine programme

ISSN: 1357-633X

DOI: 10.1177/1357633x17734004

Accession Number: WOS:000413943900005

Abstract: Scaling of projects from inception to establishment within the healthcare system is rarely formally reported. The Victorian Stroke Telemedicine (VST) programme provided a very useful opportunity to describe how rural hospitals in Victoria were able to access a network of Melbourne-based neurologists via telemedicine. The VST programme was initially piloted at one site in 2010 and has gradually expanded as a state-wide regional service operating with 16 hospitals in 2017. The aim of this paper is to summarise the factors that facilitated the state-wide transition of the VST programme. A naturalistic case-study was used and data were obtained from programme documents, e.g. minutes of governance committees, including the steering committee, the management committee and six working groups; operational and evaluation documentation, interviews and research field-notes taken by project staff. Thematic analysis was undertaken, with results presented in narrative form to provide a summary of the lived experience of developing and scaling the VST programme. The main success factors were attaining funding from various sources, identifying a clinical need and evidence-based solution, engaging stakeholders and facilitating co-design, including embedding the programme within policy, iterative evaluation including performing financial sustainability modelling, and conducting dissemination activities of the interim results, including promotion of early successes.

Short Title: Effect of motivation, opportunity and ability on human resources information security management considering the roles of Attitudinal, behavioral and organizational factors

ISSN: 1025-2495

DOI: 10.5829/ije.2021.34.12C.07

Accession Number: WOS:000709734200012

Abstract: Information security is a vital issue currently faced by

organizations around the world. There is a huge flood of cyber-attacks and security threats due to the negligence of human agents, which doubles the importance of human resource behavior in the organization. This study provides an integrated framework of motivation opportunity-ability (MOA) that includes social psychological factors from the norm activation model (NAM) model and planned behavior (PB) theory to examine the variables that determine security behaviors in a well-founded university in Tehran. For this purpose, data were collected and analyzed by distributing 141 questionnaires among the staff of this university. The research hypotheses have been tested by structural equation modeling (SEM) using SPSS and Lisrel software. The results show that the ability has the greatest impact on information security behaviors, followed by opportunity and motivation, which have a direct and significant impact on behavior. In addition, motivation mediates the impact of opportunity and ability. Finally, recommendations are provided for designers of effective information security strategies based on the constraining factors of human resources behavior in the organization.

Title: The Frail-LESS (LEss Sitting and Sarcopenia in Frail older adults) intervention to improve sarcopenia and maintain independent living via reductions in prolonged sitting: a randomised controlled feasibility trial protocol

Journal: Pilot and Feasibility Studies

Volume: 9

Issue: 1

Date: Jan

Short Title: The Frail-LESS (LEss Sitting and Sarcopenia in Frail older adults) intervention to improve sarcopenia and maintain independent living via reductions in prolonged sitting: a randomised controlled feasibility trial protocol

DOI: 10.1186/s40814-022-01225-7

Article Number: 1

Accession Number: WOS:000910020200001

Abstract: Background Sarcopenia is a progressive and generalised loss of muscle mass and function with advancing age and is a major contributor to frailty. These conditions lead to functional disability, loss of independence, and lower quality of life. Sedentary behaviour is adversely associated with sarcopenia and frailty. Reducing and breaking up sitting should thus be explored as an intervention target for their management. The primary aim of this study, therefore, is to examine the feasibility, safety, and acceptability of conducting a randomised controlled trial (RCT) that

evaluates a remotely delivered intervention to improve sarcopenia and independent living via reducing and breaking up sitting in frail older adults. **Methods** This mixed-methods randomised controlled feasibility trial will recruit 60 community-dwelling older adults aged \geq 65 years with very mild or mild frailty. After baseline measures, participants will be randomised to receive the Frail-LESS (LEss Sitting and Sarcopenia in Frail older adults) intervention or serve as controls (usual care) for 6 months. Frail-LESS is a remotely delivered intervention comprising of tailored feedback on sitting, information on the health risks of excess sitting, supported goal setting and action planning, a wearable device that tracks inactive time and provides alerts to move, health coaching, and peer support. Feasibility will be assessed in terms of recruitment, retention and data completion rates. A process evaluation will assess intervention acceptability, safety, and fidelity of the trial. The following measures will be taken at baseline, 3 months, and 6 months: sitting, standing, and stepping using a thigh-worn activPAL4 device, sarcopenia (via hand grip strength, muscle mass, and physical function), mood, wellbeing, and quality of life. **Discussion** This study will determine the feasibility, safety, and acceptability of evaluating a remote intervention to reduce and break up sitting to support improvements in sarcopenia and independent living in frail older adults. A future definitive RCT to determine intervention effectiveness will be informed by the study findings.

Title: The Men's Safer Sex (MenSS) trial: protocol for a pilot randomised controlled trial of an interactive digital intervention to increase condom use in men

Journal: Bmj Open

Volume: 5

Issue: 2

Short Title: The Men's Safer Sex (MenSS) trial: protocol for a pilot randomised controlled trial of an interactive digital intervention to increase condom use in men

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2014-007552

Article Number: e007552

Accession Number: WOS:000363455400044

Abstract: Introduction: Sexually transmitted infections (STI) are a major public health problem. Condoms provide effective protection

but there are many barriers to use. Face-to-face health promotion interventions are resource-intensive and show mixed results. Interactive digital interventions may provide a suitable alternative, allowing private access to personally tailored behaviour change support. We have developed an interactive digital intervention (the Men's Safer Sex (MenSS) website) which aims to increase condom use in men. We describe the protocol for a pilot trial to assess the feasibility of a full-scale randomised controlled trial of the MenSS website in addition to usual sexual health clinical care. Methods and analysis: Participants: Men aged 16 or over who report female sexual partners and recent unprotected sex or suspected acute STI. Participants (N=166) will be enrolled using a tablet computer in clinic waiting rooms. All trial procedures will be online, that is, eligibility checks; study consent; trial registration; automated random allocation; and data submission. At baseline and at 3, 6 and 12 months, an online questionnaire will assess condom use, self-reported STI diagnoses, and mediators of condom use (eg, knowledge, intention). Reminders will be by email and mobile phone. The primary outcome is condom use, measured at 3 months. STI rates will be recorded from sexual health clinic medical records at 12 months. The feasibility of a cost-effectiveness analysis will be assessed, to calculate incremental cost per STI prevented (Chlamydia or Gonorrhoea), from the NHS perspective. Ethics and dissemination: Ethical approval: City and East NHS Research Ethics Committee (reference number 13 LO 1801). Findings will be made available through publication in peer-reviewed journals, and to participants and members of the public via Twitter and from the University College London eHealth Unit website. Raw data will be made available on request.

Short Title: The Men's Safer Sex project: intervention development and feasibility randomised controlled trial of an interactive digital intervention to increase condom use in men

ISSN: 1366-5278

DOI: 10.3310/hta20910

Accession Number: WOS:000390854800001

Abstract: Background: This report details the development of the Men's Safer Sex website and the results of a feasibility randomised controlled trial (RCT), health economic assessment and qualitative evaluation. Objectives: (1) Develop the Men's Safer Sex website to address barriers to condom use; (2) determine the best design for an online RCT; (3) inform the methods for collecting and analysing health economic data; (4) assess the Sexual Quality of Life (SQoL) questionnaire and European Quality of Life-5 Dimensions, threelevel version (EQ-5D-3L) to calculate quality-adjusted life-years (QALYs); and (5) explore clinic staff and men's views of online research methodology. Methods: (1) Website development: we combined evidence from research literature and the views of experts (n = 18) and male clinic users (n = 43); (2) feasibility RCT: 159 heterosexually active men were recruited from three sexual health clinics and were randomised by computer to the Men's Safer Sex website plus usual care (n = 84) or usual clinic care only (n = 75). Men were invited to complete online questionnaires at 3, 6, 9 and 12 months, and sexually transmitted infection (STI) diagnoses were recorded from clinic notes at 12 months; (3) health economic evaluation: we investigated the impact of using different questionnaires to calculate utilities and QALYs (the EQ-5D-3L and SQoL questionnaire), and compared different methods to collect resource use; and (4) qualitative evaluation: thematic analysis of interviews with 11 male trial participants and nine clinic staff, as well as free-text comments from online outcome questionnaires. Results: (1) Software errors and clinic Wi-Fi access presented significant challenges. Response rates for online questionnaires were poor but improved with larger vouchers (from 36% with (sic) 10 to 50% with (sic)30). Clinical records were located for 94% of participants for STI diagnoses. There were no group differences in condomless sex with female partners [incidence rate ratio (IRR) 1.01, 95% confidence interval (CI) 0.52 to 1.96]. New STI diagnoses were recorded for 8.8% (7/80) of the intervention group and 13.0% (9/69) of the control group (IRR 0.75, 95% CI 0.29 to 1.89). (2) Health-care resource data were more complete using patient files than questionnaires. The probability that the intervention is cost-effective is sensitive to the source of data used and whether or not data on intended pregnancies are included. (3) The pilot RCT fitted well around clinical activities but 37% of the intervention group did not see the Men's Safer Sex website and technical problems were frustrating. Men's views of the Men's Safer Sex website and research procedures were largely positive. Conclusions: It would be feasible to conduct a large-scale RCT using clinic STI diagnoses as a primary outcome; however, technical errors and a poor response rate limited the collection of online self-reported outcomes. The next steps are (1) to optimise software for online trials, (2) to find the best ways to integrate digital health promotion with clinical services,

(3) to develop more precise methods for collecting resource use data and (4) to work out how to overcome barriers to digital intervention testing and implementation in the NHS.

Abstract: There has been an increase in school mental health research aimed at producing generalizable knowledge to address longstanding science-to-practice gaps to increase children's access to evidence-based mental health services. Successful dissemination and implementation are both important pieces to address science-to-practice gaps, but there is conceptual and semantic imprecision that creates confusion regarding where dissemination ends and implementation begins, as well as an imbalanced focus in research on implementation relative to dissemination. In this paper, we provide an enhanced operational definition of dissemination; offer a conceptual model that outlines elements of effective dissemination that can produce changes in awareness, knowledge, perceptions, and motivation across different stakeholder groups; and delineate guiding principles that can inform dissemination science and practice. The overarching goal of this paper is to stimulate future research that aims to advance dissemination science and practice in school mental health.

Title: Evolution and development of methodologies in social and behavioural science research in relation to oral health

Journal: Community Dentistry and Oral Epidemiology

Volume: 51

Issue: 1

Pages: 46-57

Date: Feb

Short Title: Evolution and development of methodologies in social and behavioural science research in relation to oral health

ISSN: 0301-5661

DOI: 10.1111/cdoe.12821

Accession Number: WOS:000929382500001

Abstract: The aim of this introductory paper is to provide an overview of key methodological developments in social and behavioural research in oral health. In the first section, we provide a brief historical perspective on research in the field. In the second section, we outline key methodological issues and introduce the seven papers in the theme. Conceptual models can contextualize research findings and address the 'why' and 'how' instead of 'what' and 'how many'. Many models exist, albeit they need to be evaluated (and adapted) for use in oral health research and in specific settings. The increasing availability of big data can facilitate this with data linkage. Through data linkage, it is possible to explore and understand in a broader capacity the array of factors that influence oral health outcomes and how oral health can influence other factors. With advances in statistical approaches, it is feasible to consider causal inferences and to quantify these effects. There is a need for not only individual efforts to embrace causal inference research but also systematic and structural changes in the field to yield substantial results. The value of qualitative research in co-producing knowledge with and from human participants in addressing 'the how' and 'the why' factors is also key. There have been calls to employ more sophisticated qualitative methods together with mixed methods approaches as ways of helping to address the complex or Wicked Problems in population oral health. In the final section, we outline possible future methodological directions in social and behavioural oral health research including participatory approaches and the development of core outcome sets. Our overriding goal in the paper is to facilitate a critical debate in relation to methodological issues which can be used to improve understanding and generate knowledge in population oral health and that this, in turn, will help inform oral health policy and practices.

DOI: 10.1080/13691058.2022.2100483

Accession Number: WOS:000832512800001

Abstract: This study explores how and why young people engage with MTV Shuga, a popular mass media campaign in South Africa, to understand what makes effective HIV edutainment. Young MTV Shuga viewers from the Eastern Cape, South Africa and their parents participated in remote individual interviews and focus groups in 2020. Qualitative data were transcribed and analysed using a thematic iterative approach. Young participants engaged with MTV Shuga for relatable, tolerant and complex stories about young people navigating HIV and relationships. These stories, which made viewers aware of sexual health services, inspired young people to reflect on how they might engage with different sexual health scenarios. MTV Shuga initiated conversations among peers, partners and some families about HIV that made them feel supported and equipped to tackle problems in their own lives. Complex, relatable, non-judgemental and youth-centred storylines can make HIV edutainment engaging to youth audiences. This approach allows space for reflection and inspires discussion and debate, turning young people from passive recipients of HIV messaging to active decision-makers. Television-based interventions can disseminate resources and knowledge into communities, however, watching them with parents can expose young people to judgement. HIV edutainment should therefore be available through different mediums so young people can engage in tolerant environments

Title: Optimizing Clinical Decision Support in the Electronic Health Record Clinical Characteristics Associated with the Use of a Decision Tool for Disposition of ED Patients with Pulmonary Embolism
Journal: Applied Clinical Informatics

Volume: 7

Issue: 3

Pages: 883-898

Short Title: Optimizing Clinical Decision Support in the Electronic Health Record Clinical Characteristics Associated with the Use of a Decision Tool for Disposition of ED Patients with Pulmonary Embolism
ISSN: 1869-0327

DOI: 10.4338/aci-2016-05-ra-0073

Accession Number: WOS:000387060100004

Abstract: Objective: Adoption of clinical decision support (CDS) tools by clinicians is often limited by work-flow barriers. We sought to assess characteristics associated with clinician use of an electronic health record-embedded clinical decision support system (CDSS). Methods: In a prospective study on emergency department (ED) activation of a CDSS tool across 14 hospitals between 9/1/14 to 4/30/15, the CDSS was deployed at 10 active sites with an on-site champion, education sessions, iterative feedback, and up to 3 gift cards/clinician as an incentive. The tool was also deployed at 4 passive sites that received only an introductory educational session. Activation of the CDSS - which calculated the Pulmonary Embolism Severity Index (PESI) score and provided guidance - and associated clinical data were collected prospectively. We used multivariable logistic regression with random effects at provider/facility levels to assess the association between activation of the CDSS tool and characteristics at: 1) patient level (PESI score), 2)

provider level (demographics and clinical load at time of activation opportunity), and 3) facility level (active vs. passive site, facility ED volume, and ED acuity at time of activation opportunity). Results: Out of 662 eligible patient encounters, the CDSS was activated in 55%: active sites: 68% (346/512); passive sites 13% (20/150). In bivariate analysis, active sites had an increase in activation rates based on the number of prior gift cards the physician had received (96% if 3 prior cards versus 60% if 0, $p < 0.0001$). At passive sites, physicians < age 40 had higher rates of activation ($p = 0.03$). In multivariable analysis, active site status, low ED volume at the time of diagnosis and PESI scores I or II (compared to III or higher) were associated with higher likelihood of CDSS activation. Conclusions: Performing on-site tool promotion significantly increased odds of CDSS activation. Optimizing CDSS adoption requires active education.

Article Number: 109256

Accession Number: WOS:000691602700004

Abstract: Conservation is predominantly an exercise in trying to change human behaviour – whether that of consumers whose choices drive unsustainable resource use, of land managers clearing natural habitats, or of policymakers failing to deliver on environmental commitments. Yet conservation research and practice have made only limited use of recent advances in behavioural science, including more novel behaviour change interventions. Instead conservationists mostly still rely on traditional behaviour change interventions – education, regulation and material incentivisation – largely without applying recent insights from behavioural science about how to

improve such approaches. This paper explores how behavioural science could be more widely and powerfully applied in biodiversity conservation. We consider the diverse cast of actors involved in conservation problems and the resulting breadth of behaviour change that conservationists might want to achieve. Drawing on health research, we present a catalogue of types of interventions for changing behaviour, considering both novel, standalone interventions and the enhancement of more traditional conservation interventions. We outline a framework for setting priorities among interventions based on their likely impact, using ideas developed for climate change mitigation. We caution that, despite its promise, behavioural science is not a silver bullet for conservation. The effects of interventions aimed at changing behaviour can be modest, temporary, and context dependent in ways that are as-yet poorly understood. We therefore close with a call for interventions to be tested and the findings widely disseminated to enable researchers and practitioners to build a much-needed evidence base on the effectiveness and limitations of these tools.

Title: Intervention planning for a digital intervention for self-management of hypertension: a theory-, evidence- and person- based approach

Journal: Implementation Science

Volume: 12

Date: Feb

Short Title: Intervention planning for a digital intervention for self-management of hypertension: a theory-, evidence- and person-based approach

ISSN: 1748-5908

DOI: 10.1186/s13012-017-0553-4

Article Number: 25

Accession Number: WOS:000395710000001

Abstract: Background: This paper describes the intervention planning process for the Home and Online Management and Evaluation of Blood Pressure (HOME BP), a digital intervention to promote hypertension

self-management. It illustrates how a Person-Based Approach can be integrated with theory- and evidence-based approaches. The Person-Based Approach to intervention development emphasises the use of qualitative research to ensure that the intervention is acceptable, persuasive, engaging and easy to implement. Methods: Our intervention planning process comprised two parallel, integrated work streams, which combined theory-, evidence- and person-based elements. The first work stream involved collating evidence from a mixed methods feasibility study, a systematic review and a synthesis of qualitative research. This evidence was analysed to identify likely barriers and facilitators to uptake and implementation as well as design features that should be incorporated in the HOME BP intervention. The second work stream used three complementary approaches to theoretical modelling: developing brief guiding principles for intervention design, causal modelling to map behaviour change techniques in the intervention onto the Behaviour Change Wheel and Normalisation Process Theory frameworks, and developing a logic model. Results: The different elements of our integrated approach to intervention planning yielded important, complementary insights into how to design the intervention to maximise acceptability and ease of implementation by both patients and health professionals. From the primary and secondary evidence, we identified key barriers to overcome (such as patient and health professional concerns about side effects of escalating medication) and effective intervention ingredients (such as providing in-person support for making healthy behaviour changes). Our guiding principles highlighted unique design features that could address these issues (such as online reassurance and procedures for managing concerns). Causal modelling ensured that all relevant behavioural determinants had been addressed, and provided a complete description of the intervention. Our logic model linked the hypothesised mechanisms of action of our intervention to existing psychological theory. Conclusion: Our integrated approach to intervention development, combining theory-, evidence- and person-based approaches, increased the clarity, comprehensiveness and confidence of our theoretical modelling and enabled us to ground our intervention in an in-depth understanding of the barriers and facilitators most relevant to this specific intervention and user population.

Abstract: Behavioural public policy is increasingly interested in scaling-up experimental insights to deliver systemic changes. Recent evidence shows some forms of individual behaviour change, such as nudging, are limited in scale. We argue that we can scale-up individual behaviour change by accounting for nuanced social complexities in which human responses to behavioural public policies are situated. We introduce the idea of the 'social brain', as a construct to help practitioners and policymakers facilitate a greater social transmission of welfare-improving behaviours. The social brain is a collection of individual human brains, who are connected to other human brains through 'social cues', and who are affected by the material and immaterial properties of the physical environment in which they are situated ('social complex'). Ignoring these cues and the social complex runs the risk of fostering localised behavioural changes, through individual actors, which are neither scalable nor lasting. We identify pathways to facilitate changes in the social brain: either through path dependencies or critical mass shifts in individual behaviours, moderated by the brain's property of social cohesion and multiplicity of situational and dispositional factors. In this way, behavioural changes stimulated in one part of the social brain can reach other parts and evolve dynamically. We recommend designing public policies that

engage different parts of the social brain.

Abstract: Purpose The purpose of this study was to investigate the preconditions of a full-scale implementation of an integrated care process programme for frail older people from the staff's understanding, commitment and ability to change their work procedures with comparisons over time and between organisations. Design/methodology/approach A repeated cross-sectional study was conducted in a hospital, municipal health and social care setting. Findings Staff commitment decreased to the importance of a permanent municipal contact from baseline compared to the 12-months follow-up ($p = 0.02$) and the six- and 12-months follow-up ($p = 0.05$), to the information transfer from emergency department from the six- to the 12-months follow-up ($p = 0.04$), to discharge planning at the hospital at six- and 12-months follow-up ($p = 0.04$) and towards discharge planning at home from baseline to the six-month follow-up ($p = 0.04$). Significant differences occurred between the organisations about information transfer from the emergency department ($p = 0.01$) and discharge planning at home ($p = 0.03$). The hospital staff were the most committed. Practical implications The results can guide the implementation of complex interventions in organisations with high-employee turnover and heavy workload. Originality/value The study design, allowing the comparison of implementation results over time and between organisations in a later phase, gives this study a unique perspective.

Title: Prescriber behaviours that could be targeted for change: An analysis of behaviours demonstrated during prescription writing in children

Journal: Research in Social & Administrative Pharmacy

Volume: 17

Issue: 10

Pages: 1737-1749

Date: Oct

Short Title: Prescriber behaviours that could be targeted for change: An analysis of behaviours demonstrated during prescription writing in children

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2021.01.007

Accession Number: WOS:000688298700008

Abstract: Background: The prescribing process for children with cancer is complex, and errors can occur at any step. As a result, many interventions have been used to reduce errors. However, few of them have been designed based on an understanding of the prescriber behaviour that can lead to errors. In order to design effective behaviour change interventions, it is important first to understand the prescribing process and identify prescriber behaviours that could be targeted for change. Objectives: To describe the prescribing process in a paediatric oncology ward and to identify prescriber behaviours during prescription writing that could be targeted to reduce errors. Methods: This study employed two sequential phases. First, the prescribing process was observed and then described using the hierarchical task analysis (HTA) method. Second, prescriber tasks identified from the HTA were analysed using the behaviour change wheel (BCW) approach to identify promising behaviours for change. These identified behaviours were prioritised based on information collected from four focus groups with prescribers and chart review of errors made in the ward. Results: The prescribing process was complex and involved multiple tasks performed in varying orders. Applying the BCW identified thirty-two candidate behaviours for potentially reducing prescribing errors. However, after prioritization, only two emerged as promising candidate behaviours for intervention: writing drug indications at the time of prescribing and using a pre-written order when ordering medications through electronic prescribing. Conclusions: This research suggests that two behaviours could be promising in reducing errors. Having identified these behaviours, future work could explore what needs to change with respect to individuals and their work environments to achieve the desired change in these identified behaviours.

Short Title: Bundle interventions used to reduce prescribing and administration errors in hospitalized children: a systematic review

ISSN: 0269-4727

DOI: 10.1111/jcpt.12398

Accession Number: WOS:000379684900002

Abstract: What is known and objective: Bundle interventions are becoming increasingly used as patient safety interventions. The objective of this study was to describe and categorize which bundle interventions are used to reduce prescribing errors (PEs) and administration errors (AEs) in hospitalized children and to assess the quality of the published literature. Methods: Articles published in English and Arabic between 1985 and September 2015 were sought in MEDLINE, EMBAS and CINHALL. Bibliographies of included articles were screened for additional studies. We included any study with a comparator group reporting rates of PEs and AEs. Two authors independently extracted data, classified interventions in each bundle and assessed the studies for potential risk of bias. Constituent interventions of the bundles were categorized using both the Cochrane Effective Practice and Organization of Care Group (EPOC) taxonomy of intervention and the Behavioural Change Wheel (BCW). Results and discussion: Seventeen studies met the inclusion criteria. All bundles contained interventions that were either professional, organizational or a mixture of both. According to the BCW, studies used interventions with functions delivering environmental restructuring (17/17), education (16/17), persuasion (4/17), training (3/17), restriction (3/17), incentivization (1/17), coercion (1/17), modelling (1/17) and enablement (1/17). Nine studies had bundles with two intervention functions, and eight studies had three or more intervention functions. All studies were low quality before/after studies. Selection bias varied between studies. Performance bias was either low or unclear. Attrition bias was unclear, and detection bias was rated high in most studies. Ten studies described the interventions fairly well, and seven studies did not adequately explain the interventions used. What is new and conclusion: This novel analysis in a systematic review showed that bundle interventions delivering two or more intervention functions have been investigated but that the study quality was too poor to assess impact.

Short Title: Developing a Suite of Resources to Improve Patient Adherence to Compression Stockings: Application of Behavior Change Theory

ISSN: 1177-889X

DOI: 10.2147/ppa.S390123

Accession Number: WOS:000911565400001

Abstract: Purpose: Poor patient adherence to compression stockings remains a difficult and pervasive problem for clinicians, with costly repercussions for patients and health-care systems. The purpose of this paper was to describe the application of behavior change theory to the systematic development of a suite of resources, aimed at improving patient adherence to wearing compression stockings. Methods: Employing a non-empirical approach, behavior-change theory was used to develop an innovative intervention as part of a multi-phase project. Target behaviors, barriers and potential enablers were identified in relation to stocking adherence. An impact-likelihood matrix for behavior prioritization was used to identify possible areas for intervention within occupational therapy outpatient clinics. Selection of suitable resources and their consequent development were based on a narrative and problem-solving process by a panel of clinical experts. Results: Of 14 potential domains embedded in the Theoretical Domains Framework, the key target behaviors and barriers were associated with eight domains. Michie's Behavior Change Wheel revealed recommendations in six subdivisions and of these, four intervention functions were selected by the panel, based on their potential impact and likelihood of adoption in clinical practice. Findings led to the development of a suite of resources comprising a new questionnaire, a clinical decision tree, augmented by clinical answer sheets corresponding to each of the barriers. Conclusion: Application of behavior change theory informed the design of a behavior change intervention comprising an integrated suite of resources for novice and experienced clinicians. Practice Implications: These novel resources have potential to improve patient adherence to compression stockings and consequently generate health-care savings through reduced need for wound care products, and medical interventions with translation to other settings and conditions requiring compression stockings. Patient outcomes will likely be improved with reduced pain, improved quality of life and earlier resumption of usual occupations.

Abstract: Introduction Indigenous women have the highest smoking prevalence during pregnancy (47%) in Australia. Health professionals report lack of knowledge, skills and confidence to effectively manage smoking among pregnant women in general. We developed a behaviour change intervention aimed to improve health professionals' management of smoking in Indigenous pregnant women—the Indigenous Counselling And Nicotine (ICAN) QUIT in Pregnancy. This intervention includes webinar training for health professionals, an educational resources package for health professionals and pregnant women, free oral nicotine replacement therapy (NRT) for pregnant women, and audit and feedback on health professionals' performance. The aim of this study is to test the feasibility and acceptability of the ICAN QUIT in Pregnancy intervention to improve health professionals' provision of evidence-based culturally responsive smoking cessation care to Australian Indigenous pregnant smokers. Methods and analysis This protocol describes the design of a step-wedge cluster randomised pilot study. Six Aboriginal Medical Services (AMSs) are randomised into three clusters. Clusters receive the intervention staggered by 1 month. Health professionals report on their knowledge and skills pretraining and post-training and at the end of the study. Pregnant women are recruited and followed up for 3 months. The primary outcome is the recruitment rate of pregnant women. Secondary outcomes include feasibility of recruitment and follow-up of participating women, and webinar training of health professionals, measured using a designated log; and measures of effectiveness outcomes, including quit rates and NRT prescription rates. Ethics and dissemination In accordance with the Aboriginal Health and Medical Research Council guidelines, this study has been developed in collaboration with a Stakeholder and Consumer

Aboriginal Advisory Panel (SCAAP). The SCAAP provides cultural consultation, advice and direction to ensure that implementation is acceptable and respectful to the Aboriginal communities involved. Results will be disseminated to AMSs, Aboriginal communities and national Aboriginal bodies.

Abstract: Background Identifying healthcare workers (HCW) who have less awareness and knowledge on antibiotic use and resistance represents a challenge for public health, since it might help the development of novel educational and training initiatives tailored on specific subgroups of professionals. This work aims to compare knowledge, attitudes and behaviors on antibiotic use and resistance across different groups of Italian HCW. **Methods** We used data from the multi-country and multi-professional survey launched by the European Centre for Disease Prevention and Control between 28 January to 4 March 2019 to assess knowledge, attitude and behaviors of HCW on antibiotics, antibiotic use and resistance. We distinguished three clusters of HCW using the Two-Step Cluster analysis, based on their personal and professional characteristics (i.e. profession, role, activity as prescriber, setting, and activity as antibiotic use advisor). **Results** In general, cluster 1 consisted mostly of allied healthcare workers, while clusters 2 and 3 were made up almost completely of pharmacists and medical doctors, respectively. Interestingly, healthcare workers in cluster 3 had the highest knowledge on antibiotic use and resistance. Workers in cluster 1, instead, were those reporting the highest awareness of the importance and role of hand hygiene as an infection prevention and control measure. However, HCW in cluster 2 were those who recognized more their role of advisors on prudent antibiotic use. **Conclusions** Italian HCW exhibited different knowledge, attitudes, and behaviors on antibiotic use and resistance. These findings raised the need for educational and training interventions targeting specific professional groups.

Article Number: 730101

Accession Number: WOS:000752027800001

Abstract: To be successful and sustainable, social impact programs require individuals and groups to change aspects of their behavior. As blockchain-based tokens are increasingly adopted to target social outcomes, it is important to properly define these activities as "behavior change interventions" and assess their design and management as such—otherwise, there is significant risk of possible unintended consequences. Designing tokens as behavior change interventions requires new constructs beyond those currently in use to model the interdependence of digital and social ecosystems, and integration of token engineering, cryptoeconomics, and behavioral skill sets to test token designs within various ecosystems. New token design and testing protocols that integrate behavior measures around the targeted social outcomes are needed, to fill a critical gap in current practice. Hence, new standards, operational frameworks, and ethics are needed to guide the use of tokens at scale, as tools to achieve social impacts such as attaining the United Nations' Sustainable Development Goals. Meeting these needs requires a collaborative approach between token design actors (computer scientists, cryptoeconomists, token engineers, etc.) and social impact practitioners who will be increasingly called upon to use tokens as behavior change tools. This paper begins to identify common ground and address areas to further develop research and practice of tokens being used for social impact.

Abstract: Sustainable consumption is a growing niche with an increasing number of initiatives aimed at lowering domestic environmental consumption footprints. Third-party assured product

eco-labelling has emerged as a key governance mechanism to promote sustainable consumption. However, does the purchasing of eco-labelled products really support a transition towards more sustainable consumption? In this paper, we explore eco-labelling through the lens of the rebound literature. While theorizing of the rebound effect originated in energy economics and has long been centred on eco-efficiency, we extend its rationale to products that are associated with a price premium in return for added environmental quality attributes. Reporting on two inter-related studies into the link between purchasing of environmentally friendly products and different types of environmental resource consumption, we find that eco-labelled products flourish in more affluent economies that are characterized by higher levels of overall resource consumption; and that willingness to consume environmentally friendly products is positively related to higher individual carbon, water and material footprints. Hence, we argue that ecolabelling in its current form is inextricably linked to higher – rather than lower – levels of resource consumption. Consequently, the governance mechanism that underpins eco-labelling is associated with an indirect behavioural consumer rebound effect.

Accession Number: WOS:000381035200011

Abstract: Objectives: To introduce a psychological model of behaviour; the COM-B model and describe how this has been used in combination with the behaviour change wheel (BCW) in developing an intervention which aims to promote regular, long-term use of hearing aids by adults with acquired hearing loss. Design: Qualitative structured interview study using the COM-B model to identify the determinants of behavioural planning on the part of audiologists; a potentially important factor in encouraging long-term hearing-aid use. Study sample: Ten audiologists drawn from a random sample of five English audiology departments. Results: The analysis suggests that behavioural planning might be more likely to occur if

audiologists' psychological capability, physical and social opportunity, and reflective and automatic motivation were addressed. This analysis forms the basis of an intervention design, using the BCW, to encourage behavioural planning by audiologists and subsequent hearing-aid use by people with hearing loss. Conclusions: The COM-B model and BCW can be applied successfully in the context of audiology to analyse the behaviour of both people with hearing loss and professionals working with them, supplying information that is being used in intervention design. The effectiveness of the intervention will be tested in a clinical trial.

Article Number: e064637

Accession Number: WOS:000859769800031

Abstract: Introduction Vertebral fragility fractures affect at least 20% of the older population in the UK. Best practice guidelines recommend the use of exercise to slow the rate of bone loss, to maintain muscle strength and physical function, and to prevent falls and further fractures. However, treatment effects are often small and difficult to sustain and adherence, or the extent to which patients engage in treatment, has been identified as an important issue by many studies. Our hypothesis is that integrating adherence intervention strategies with an exercise intervention will be beneficial. We will compare physiotherapy exercise rehabilitation with adherence support versus physiotherapy exercise rehabilitation

alone in terms of effects on (A) physical function, quality of life and fear of falling and (B) exercise self-efficacy and adherence. Methods and analysis A multicentre, two-arm, parallel group, superiority randomised controlled trial with blinded assessments at baseline (0) and 4, 8 and 12 months, with a nested qualitative study and health economic analysis. 116 participants will be allocated to either (1) outpatient physiotherapy which will include a musculoskeletal assessment and treatment including balance, posture, strength training and low impact weight-bearing exercises over 16 weeks or (2) Osteoporosis Tailored exercise adherence INTERvention intervention. This includes standard physiotherapy as above plus an additional, integrated assessment interview (30 min) and 60 min of adherence support spread over the subsequent 16 weeks. Ethics and dissemination The study protocol was approved by West of Scotland Research Ethics Committee 4 (21/WS/0071). Trial registration number ISRCTN 14465704. The paper is based on Protocol V.4. Abstract: A developmental approach to public health focuses attention on better nourishing girls and young women, especially those of low socio-economic status, to improve mothers' nutrition and thereby the health of future generations. There have been significant advances in the behavioural sciences that may allow us to understand and support dietary change in young women and their children in ways that have not previously been possible. This paper describes some of these advances and aims to show how they inform this new approach to public health. The first of these has been to work out what is effective in supporting behaviour change, which has been achieved by careful and detailed analysis of behaviour change techniques used by practitioners in intervention, and of the effectiveness of these in supporting change. There is also a new understanding of the role that social and physical environments play in shaping our behaviours, and that behaviour is influenced by automatic processes and 'habits' as much as by reflective processes

and rational decisions. To be maximally effective, interventions therefore have to address both influences on behaviour. An approach developed in Southampton aims to motivate, support and empower young women to make better food choices, but also to change the culture in which those choices are being made. Empowerment is the basis of the new public health. An empowered public demand for better access to better food can go a long way towards improving maternal, infant and family nutrition, and therefore the health of generations to come.

Short Title: Preconception and pregnancy: opportunities to intervene to improve women's diets and lifestyles

ISSN: 2040-1744

DOI: 10.1017/s2040174416000064

Accession Number: WOS:000379780900015

Abstract: Recently, large-scale trials of behavioural interventions have failed to show improvements in pregnancy outcomes. They have, however, shown that lifestyle support improves maternal diet and physical activity during pregnancy, and can reduce weight gain. This suggests that pregnancy, and possibly the whole periconceptional period, represents a 'teachable moment' for changes in diet and lifestyle, an idea that was made much of in the recent report of the Chief Medical Officer for England. The greatest challenge with all trials of diet and lifestyle interventions is to engage people and to sustain this engagement. With this in mind, we propose a design of intervention that aims simultaneously to engage women through motivational conversations and to offer access to a digital platform that provides structured support for diet and lifestyle change. This intervention design therefore makes best use of learning from the trials described above and from recent advances in digital intervention design.

Short Title: Communication with Physicians: a Tool for Improving Appropriate Antibiotic Use in the Absence of Regulatory Mechanisms

DOI: 10.1007/s40506-020-00241-6

Accession Number: WOS:000590790500001

Abstract: Purpose of review The purpose of our review is to emphasize the impact of effective communication in bringing a behavioral change in prescribers' habits in absence of mandatory guidelines on usage of antibiotics. Recent findings The unceasing surge of inappropriate antimicrobial use has resulted in antimicrobial resistance (AMR). It is a fall out of injudicious use by healthcare workers, be it an empiric treatment owing to inadequate diagnosis, inappropriate prescribing behavior attributable to insufficient knowledge and training, or lack of confidence and financial incentives. Patient factors contributing to AMR are self-medication due to over-the-counter drug availability and patients' attitude. Another vital driver of AMR is the non-therapeutic abuse of food animals. Despite the existence of policies regarding licensing and sale of antibiotics, their implementation is not uniform and regulated. It is observed that conditioning strategies like trainings, audits, and feedbacks affect human behavior and can prove to be an important tool in antimicrobial stewardship program. It has been perceived that mere presence of regulatory framework is not enough but a productive communication with physicians can drive a behavioral change in prescribing antibiotics.

Title: A pilot randomised controlled trial of a web-based implementation intervention to increase child intake of fruit and vegetables within childcare centres

Journal: Pilot and Feasibility Studies

Volume: 6

Issue: 1

Short Title: A pilot randomised controlled trial of a web-based implementation intervention to increase child intake of fruit and vegetables within childcare centres

DOI: 10.1186/s40814-020-00707-w

Article Number: 163

Accession Number: WOS:000729238200168

Abstract: BackgroundAs dietary behaviours developed during early childhood are known to track into adulthood, interventions that aim to improve child nutrition at a population level are recommended. Whilst early childhood education and care (ECEC) is a promising setting for interventions targeting children's nutrition behaviours, previous interventions have largely used high intensity, face-to-face approaches, limiting their reach, implementation and potential impact at a population level. Web-based modalities represent a promising means of supporting the delivery of childcare-based interventions whilst overcoming challenges of previous approaches; however, the feasibility of using such modalities to support implementation is largely unknown. As such, this study sought to collect feasibility and pilot data to inform the design of a web-based intervention together with health promotion officer support within childcare centres. Child dietary intake will also be assessed to provide an estimate of the impact of the implementation intervention.**Methods**A superiority cluster randomised controlled trial with repeat cross-sectional data collection employing an effectiveness-implementation type-II hybrid design will be conducted with childcare centres within the Hunter New England region of New South Wales, Australia. Type-II hybrid designs provide the opportunity to assess intervention efficacy whilst piloting the feasibility of the implementation strategies. Centres allocated to the intervention group will receive access to a web-based program together with health promotion officer support to implement targeted healthy eating practices to improve child diet in care. A number of outcomes will be assessed to inform the feasibility to conduct a larger trial, including childcare centre and parent recruitment and consent rates for each component of data collection, uptake of the implementation strategies, acceptability of the intervention and implementation strategies, appropriateness of the implementation strategies and the contextual factors influencing implementation.**Discussion**This study will provide high-quality evidence regarding the potential feasibility of a web-based intervention and the impact of healthy eating practices on child diet in care. Web-based modalities provide a promising approach for population-wide implementation support to childcare centres given their potential reach and consistency with existing infrastructure.**Trial registration** Prospectively registered with Australian New Zealand Clinical Trial Registry (ACTRN12619001158156).

Short Title: Feasibility of a Web-Based Implementation Intervention to Improve Child Dietary Intake in Early Childhood Education and Care: Pilot Randomized Controlled Trial

ISSN: 1438-8871

DOI: 10.2196/25902

Article Number: e25902

Accession Number: WOS:000740354600004

Abstract: Background: Internationally, the implementation of evidence-based healthy eating policies and practices within early childhood education and care (ECEC) settings that encourage children's healthy diet is recommended. Despite the existence of evidence-based healthy eating practices, research indicates that current implementation rates are inadequate. Web-based approaches provide a potentially effective and less costly approach to support ECEC staff with implementing nutrition policies and practices.

Objective: The broad aim of this pilot randomized controlled trial is to assess the feasibility of assessing the impact of a web-based program together with health promotion officer (HPO) support on ECEC center implementation of healthy eating policies and practices. Specifically, we seek to describe the completion rate of study evaluation processes (participant consent and data collection rates); examine ECEC center uptake, acceptability, and appropriateness of the intervention and implementation strategies; understand the potential cost of delivering and receiving implementation support strategies; and describe the potential impact of the web-based intervention on the implementation of targeted healthy eating practices among centers in the intervention group.

Methods: A 6-month pilot implementation trial using a cluster-randomized controlled trial design was conducted in 22 ECEC centers within the Hunter New England region of New South Wales, Australia. Potentially eligible centers were distributed a recruitment package and telephoned by the research team to assess eligibility and obtain consent. Centers randomly allocated to the intervention group

received access to a web-based program, together with HPO support (eg, educational outreach visit and local technical assistance) to implement 5 healthy eating practices. The web based program incorporated audit with feedback, development of formal implementation blueprints, and educational materials to facilitate improvement in implementation. The centers allocated to the control group received the usual care. Results: Of the 57 centers approached for the study, 22 (47%) provided consent to participate. Data collection components were completed by 100% (22/22) of the centers. High uptake for implementation strategies provided by HPOs (10/11, 91% to 11/11, 100%) and the web-based program (11/11, 100%) was observed. At follow-up, intervention centers had logged on to the program at an average of 5.18 (SD 2.52) times. The web-based program and implementation support strategies were highly acceptable (10/11, 91% to 11/11, 100%). Implementation of 4 healthy eating practices improved in the intervention group, ranging from 19% (2/11) to 64% (7/11). Conclusions: This study provides promising pilot data to warrant the conduct of a fully powered implementation trial to assess the impact of the program on ECEC healthy eating practice implementation.

Short Title: Medical interns' reflections on their training in use of personal protective equipment

DOI: 10.1186/s12909-020-02238-7

Article Number: 328

Accession Number: WOS:000574650400003

Abstract: Background The current COVID-19 pandemic has demonstrated that personal protective equipment (PPE) is essential, to prevent the acquisition and transmission of infectious diseases, yet its use is often sub-optimal in the clinical setting. Training and education are important to ensure and sustain the safe and effective use of PPE by medical interns, but current methods are often inadequate in providing the relevant knowledge and skills. The purpose of this study was to explore medical graduates' experiences of the use of PPE and identify opportunities for improvement in education and training programmes, to improve occupational and patient safety.

Methods This study was undertaken in 2018 in a large tertiary-care

teaching hospital in Sydney, Australia, to explore medical interns' self-reported experiences of PPE use, at the beginning of their internship. Reflexive groups were conducted immediately after theoretical and practical PPE training, during hospital orientation. Transcripts of recorded discussions were analysed, using a thematic approach that drew on the COM-B (capability, opportunity, motivation – behaviour) framework for behaviour. Results 80% of 90 eligible graduates participated. Many interns had not previously received formal training in the specific skills required for optimal PPE use and had developed potentially unsafe habits. Their experiences as medical students in clinical areas contrasted sharply with recommended practice taught at hospital orientation and impacted on their ability to cultivate correct PPE use. Conclusions Undergraduate teaching should be consistent with best practice PPE use, and include practical training that embeds correct and safe practices.

Short Title: The effect of behaviour change interventions on changes in physical activity and anthropometrics in ambulatory hospital settings: a systematic review and meta-analysis

DOI: 10.1186/s12966-020-01076-6

Article Number: 7

Accession Number: WOS:000608242800003

Abstract: BackgroundThe aim of this systematic review and meta-analysis was to investigate whether behaviour change interventions promote changes in physical activity and anthropometrics (body mass, body mass index and waist circumference) in ambulatory hospital populations.MethodsRandomised controlled trials were collected from five bibliographic databases (MEDLINE, Embase, CINAHL, The Cochrane Central Register of Controlled Trials (CENTRAL) and PsycINFO). Meta-analyses were conducted using change scores from baseline to determine mean differences (MD), standardised mean differences (SMD) and 95% confidence intervals (95% CI). The Grades of Recommendation, Assessment, Development and Evaluation approach was used to evaluate

the quality of the evidence. Results A total of 29 studies met the eligibility criteria and 21 were included in meta-analyses. Behaviour change interventions significantly increased physical activity (SMD: 1.30; 95% CI: 0.53 to 2.07, $p < 0.01$), and resulted in significant reductions in body mass (MD: -2.74; 95% CI: -4.42 to -1.07, $p < 0.01$), body mass index (MD: -0.99; 95% CI: -1.48 to -0.50, $p < 0.01$) and waist circumference (MD: -2.21; 95% CI: -4.01 to -0.42, $p = 0.02$). The GRADE assessment indicated that the evidence is very uncertain about the effect of behaviour change interventions on changes in physical activity and anthropometrics in ambulatory hospital patients. Conclusions Behaviour change interventions initiated in the ambulatory hospital setting significantly increased physical activity and significantly reduced body mass, body mass index and waist circumference. Increased clarity in interventions definitions and assessments of treatment fidelity are factors that need attention in future research. PROSPERO registration number: CRD42020172140.

Short Title: Qualitative inquiry into perceptions of HIV pre-exposure prophylaxis among people who inject drugs living with hepatitis C in Seattle, WA, USA

DOI: 10.1186/s12954-022-00706-5

Article Number: 121

Accession Number: WOS:000877687100001

Abstract: Background The incidence of HIV among persons who inject drugs (PWID) in the USA has been increasing since 2014, signaling the need to identify effective ways to engage PWID in HIV prevention services, namely pre-exposure prophylaxis (PrEP). Yet, the uptake of PrEP in this population is minimal compared to other populations at risk of HIV acquisition. In this work, we sought to explore knowledge, attitudes, and perspectives of PrEP acceptability among PWID. Methods In the context of a pilot study to explore the acceptability of pharmacy-based hepatitis C virus (HCV) treatment,

we conducted semi-structured interviews (n = 24) and focus groups (n = 4, 16 participants) with people who were living with HCV and reported active injection drug use (\leq 90 days since last use). Participants were asked open-ended questions about their familiarity with and motivation to use PrEP. As part of a sub-analysis focused on PrEP, qualitative data were analyzed using a Rapid Assessment Process, where three coders used structured templates to summarize qualitative data and iteratively reviewed coded templates to identify themes. Participants also completed short quantitative questionnaires regarding drug use history and attitudes toward health concerns. Results Forty-seven percent of participants expressed having little or no concern regarding HIV acquisition. Targeted analyses focused on HIV prevention identified three themes, which help characterize behavioral determinants of nonadoption. First, knowledge of PrEP was limited among PWID and influenced by infrequent open community discussions around HIV risk. Second, PWID perceived sexual behaviors-but not injection drug use-as a motivator for HIV risk prevention. Finally, PWID identified many individual and environmental barriers that hinder PrEP uptake. Conclusion Among PWID, PrEP is rarely discussed and concerns about the feasibility of using daily PrEP are common. Taken with the prevalent perception that drug use is not a high risk for HIV acquisition, our findings point to opportunities for public health work to target PrEP education to PWID and to leverage other successful interventions for PWID as an opportunity to provide PrEP to this vulnerable population.

DOI: 10.1016/j.thromres.2017.12.021

Accession Number: WOS:000425999400010

Abstract: Background: Current UK and European guidelines recommend anticoagulated patients prescribed warfarin with time in therapeutic range (TTR) < 65% be considered for DOAC therapy. There has been considerable concern that adherence with DOACs may be poor compared with warfarin. Little is known about the patient experience of switching from warfarin to DOAC and how patients manage their DOAC long term. Our aim was to conduct focus groups exploring patient's previous experiences with warfarin, their current experience with DOACs, their adherence to DOACs and the long-term service provision they envisage. Methods: Patients enrolled on the Switching Study who had been switched from warfarin to a DOAC > 1 year previously were invited to participate in focus groups. Two focus groups for atrial fibrillation (AF) and two for secondary prevention of venous thromboembolism (VTE) patients were held at anticoagulation clinics in South London, UK. Data was analysed using framework analysis to extract dominant themes. Results: Five VTE patients and 15 AF patients attended the focus groups. Dominant themes that emerged were: indication specific anticoagulation prioritisation, warfarin as a necessary inconvenience, DOACs as the anticoagulant of choice, concerns regarding DOAC monitoring, high adherence to DOACs and desire for long-term access to specialist anticoagulation services. Discussion: VTE patients prioritised anticoagulation over other therapies whereas AF patients did not. All participants reported high levels of adherence to DOACs. Patients derived confidence from long-term management in specialist anticoagulation clinics stating a preference to be managed in such a service.

Short Title: Associations between illness beliefs, medication beliefs, anticoagulation-related quality of life, and INR control:

Insights from the Switching Study

DOI: 10.1002/rth2.12116

Accession Number: WOS:000452488100010

Abstract: Background: Anticoagulation control with vitamin--K antagonists (VKAs) in patients with atrial fibrillation (AF) or venous thromboembolism (VTE) can be measured using time in therapeutic range (TTR), where TTR >65% is considered good and low TTR may be associated with low adherence. Methods: This cross--sectional observational study compared illness beliefs, treatment beliefs, and treatment satisfaction of patients with TTR >75% and TTR<50% using validated tools to determine their association with TTR. Adults requiring chronic VKA therapy were recruited from 2 hospital anticoagulation clinics in London, UK. Results: 311 patients with TTR >75% and 214 with TTR<50% were recruited. TTR >75% patients had been taking warfarin on average over 2 years longer than TTR <50% patients (P<.001). Statistically significant differences in beliefs were found in all subscales other than in treatment control, general harm, and general overuse. Cluster analysis determined there were 4 distinct clusters of beliefs among patients. Multivariate binary logistic regression found VTE patients were least likely to have poor TTR (OR = 0.49; 95% CI 0.29, 0.77). Patients in the "cautious of therapy and fearful of illness" cluster were most likely to have low TTR (OR = 4.75; 95% CI 2.75, 8.77). Conclusion: Illness perceptions, medication beliefs and treatment satisfaction were associated with INR control. VTE patients and those who were accepting of both illness and treatment were most likely to have optimal INR control.

Abstract: Background: Physical therapists play a key role in providing first-line knee osteoarthritis treatments, including patient education and exercise therapy. Objectives: Describe Australian physical therapists' awareness of guidelines; reported practices; and beliefs about capability, opportunity, motivation, and evidence. Methods: An online cross-sectional survey was completed by physical therapists prior to attending the Good Living with osteoArthritis from Denmark (GLA:D (R)) Australia training courses (March 2017 to December 2019). The survey instrument was developed by an expert panel and was informed by the Theoretical Domains Framework. Results: 1064 physical therapists from all Australian states and territories participated. 11% (n = 121) could name an accepted guideline, 98% agreed it was their job to deliver patient education and exercise therapy, and 92% agreed this would optimise outcomes. Most reported providing strength exercise (99%), written exercise instructions (95%), treatment goal discussion (88%), and physical activity advice (83%) all or most of the time. Fewer provided aerobic exercise (66%), neuromuscular exercise (54%), and weight management discussion (56%) all or most of the time. Approximately one quarter (23-24%) believed they did not have the skills, knowledge, or confidence to provide education and exercise therapy recommended by guidelines, and just 48% agreed they had been trained to do so. Conclusion: Australian physical therapists treating knee osteoarthritis typically provide strength-based home exercise with written instructions, alongside goal setting and physical activity advice. Just one in nine could name a guideline. Education and training activities are needed to support physical therapists to access, read and implement guidelines, especially for aerobic and neuromuscular exercise, and weight management. DOI: 10.1007/s00103-022-03491-5

Accession Number: WOS:000752748000001

Abstract: Clinical risk management supports healthcare workers in recognizing, reducing, and managing risks in patient care. It is mandatory for all outpatient and inpatient facilities in the German healthcare system. The contents of the clinical risk management are regulated in the Social Code (Title 5), the guidelines of the Federal Joint Committee, the Patients' Rights Act, and the norms and recommendations of the Patient Safety Alliance. The Federal Joint Committee explicitly points out that minimum standards of risk management, error management, error reporting systems, complaint management in hospitals, and the use of checklists for surgical interventions must be implemented. The legislator requires that the effectiveness of the clinical risk management be checked regularly. Questionnaire surveys on clinical risk management in Germany show an overall positive development. However, the data are not sufficient for a comprehensive assessment. Methodologically reliable procedures should therefore be developed that check the status of the clinical risk management much more frequently and regularly. The data measuring structure, process, and outcome should be collected systematically and presented in a comparative manner in relation to the facilities. Opportunities for clinical risk management arise from the World Health Organization's Global Action Safety Plan, advances in digitization, the integration of clinical risk management into organizational risk management, and the improvement of structural quality. Clinical risk management must be given even more space in the daily routine of doctors and nurses. This requires competence and human resources in this area. These are not sufficiently available in German hospitals.

Title: Behavioural change interventions encouraging clinicians to reduce carbon emissions in clinical activity: a systematic review

Journal: BMC Health Services Research

Volume: 23

Issue: 1

Date: Apr

Short Title: Behavioural change interventions encouraging clinicians

to reduce carbon emissions in clinical activity: a systematic review
DOI: 10.1186/s12913-023-09370-2

Article Number: 384

Accession Number: WOS:000982959200004

Abstract: Background Clinical activity accounts for 70–80% of the carbon footprint of healthcare. A critical component of reducing emissions is shifting clinical behaviour towards reducing, avoiding, or replacing carbon-intensive healthcare. The objective of this systematic review was to find, map and assess behaviour change interventions that have been implemented in healthcare settings to encourage clinicians to reduce greenhouse gas emissions from their clinical activity. **Methods** Studies eligible for inclusion were those reporting on a behaviour change intervention to reduce carbon emissions via changes in healthcare workplace behaviour. Six databases were searched in November 2021 (updated February 2022). A pre-determined template was used to extract data from the studies, and risk of bias was assessed. The behaviour change techniques (BCTs) used in the interventions were coded using the BCT Taxonomy. **Results** Six full-text studies were included in this review, and 14 conference abstracts. All studies used a before–after intervention design. The majority were UK studies (n = 15), followed by US (n = 3) and Australia (n = 2). Of the full-text studies, four focused on reducing the emissions associated with anaesthesia, and two aimed at reducing unnecessary test ordering. Of the conference abstracts, 13 focused on anaesthetic gas usage, and one on respiratory inhalers. The most common BCTs used were social support, salience of consequences, restructuring the physical environment, prompts and cues, feedback on outcome of behaviour, and information about environmental consequences. All studies reported success of their interventions in reducing carbon emissions, prescribing, ordering, and financial costs; however, only two studies reported the magnitude and significance of their intervention's success. All studies scored at least one item as unclear or at risk of bias. **Conclusion** Most interventions to date have targeted anaesthesia or pathology test ordering in hospital settings. Due to the diverse study outcomes and consequent inability to pool the results, this review is descriptive only, limiting our ability to conclude the effectiveness of interventions. Multiple BCTs were used in each study but these were not compared, evaluated, or used systematically. All studies lacked rigour in study design and measurement of outcomes. **Review registration** The study was registered on Prospero (ID number CRD42021272526) (Breth-Petersen et al., Prospero 2021: CRD42021272526).

Short Title: Comparing an optimised physiotherapy treatment package with usual physiotherapy care for people with tennis elbow – protocol for the OPTimisE pilot and feasibility randomised controlled trial

DOI: 10.1186/s40814-022-01132-x

Article Number: 178

Accession Number: WOS:000839636300001

Abstract: Background: Physiotherapy is recommended for people with tennis elbow, but whilst a wide array of treatments is available, the optimal approach remains uncertain. We have therefore recently developed an optimised physiotherapy treatment package for tennis elbow based on a synthesis of the evidence, patient input and clinical consensus. It consists of detailed advice and education, a structured progressive exercise programme and provision of a counter-force elbow brace. Here, we report the protocol for our multicentre pilot and feasibility randomised controlled trial (RCT) designed to (a) examine the feasibility of our optimised physiotherapy treatment package and (b) to pilot trial processes for a future fully powered RCT to test clinical and cost-effectiveness compared with usual physiotherapy treatment. Methods: A multicentre pilot and feasibility RCT will be conducted across three sites in England, recruiting up to 50 patients (or for a maximum of 12 months). Participants with tennis elbow, identified from physiotherapy clinic waiting lists and general practice surgeries, will be randomly allocated to receive the optimised physiotherapy treatment package or usual physiotherapy care. Analysis will focus on feasibility measures including consent rate, intervention fidelity, follow-up rate and outcome completion rate. A nested qualitative study will explore the acceptability of the study processes and patient and physiotherapist experiences of the new optimised intervention. Discussion: This study will determine the feasibility of a new optimised physiotherapy treatment package for people with tennis elbow and pilot the processes for a future fully powered RCT. In the longer term, this treatment package may provide superior clinical outcomes for patients, in terms of pain and quality of life, and be more cost-effective for the health service.

Accession Number: WOS:000884914500005

Abstract: Objectives To explore ways to enhance the design of risk factor management and weight-loss services for people with overweight/obesity and atrial fibrillation (AF). Background AF is the most common cardiac arrhythmia, with serious consequences for health and quality of life. Some evidence indicates weight reduction in people with AF and overweight/obesity may improve symptoms. This population may require additional support with weight management due to factors associated with ageing and health. Design Qualitative investigation based on semi-structured interviews. Methods 12 adult participants (4 female, 8 male) with diagnosed AF and a current or previous body mass index >27 kg/m² were recruited at a large tertiary cardiac referral centre in southern England between September 2020 and January 2021. Participants completed quality of life and AF symptom questionnaires using Think-Aloud technique and semi-structured interviews relating to their weight management experiences, needs and preferences. Interviews were audio recorded and analysed thematically using the Capability, Opportunity and Motivation-Behaviour model as a theoretical framework. Results Three main themes were identified. Being out of rhythm explores the psychological and physical impact of AF on weight management; doing the right thing discusses participants' weight management experiences and broaching the subject explores participants' perspectives on weight management conversations with clinicians. Conclusions There was dissatisfaction with the weight management advice received from healthcare professionals including cardiologists. Participants wanted open, non-judgemental discussion of cardiac health implications of overweight/obesity supported by referral to weight management services. Improved communication including research findings regarding the benefits of weight loss as a factor in AF management might increase motivation to adhere to weight-loss advice in this population.

Short Title: Reducing Antimicrobial Use and Dependence in Livestock Production Systems: A Social and Economic Sciences Perspective on an Interdisciplinary Approach

DOI: 10.3389/fvets.2021.584593

Article Number: 584593

Accession Number: WOS:000635376000001

Abstract: Objective: In livestock production, antimicrobial resistance (AMR) is considered an externality as it is the undesired result of preventive and curative antimicrobial use. To address this biosocial issue, our objective is to present an approach based on interdisciplinary research to develop strategies and policies that aim to contain AMR. Method: To do so, we addressed three fundamental questions on which control policies and strategies for agricultural pollution problems are centered in the light of AMR. To ensure the technical, economic, behavioral and political feasibility of the developed measures, we demonstrated the usefulness of systemic approaches to define who, what and how to target by considering the complexity in which the ultimate decision-maker is embedded. We then define how voluntary or compulsory behavioral change can be achieved via five routes, introducing a clear taxonomy for AMR Interventions. Finally, we present three criteria for ex-ante analysis and ex-post evaluation of policies and strategies. Conclusion: Interdisciplinary systemic approaches enable the development of AMR policies and strategies that are technically, politically, economically and, last but not least, behaviorally feasible by allowing the identification of (a) all actors influencing AMU in livestock production, (b) power relations between these actors, (c) adequate regulatory and intervention bases, (d) what behavioral change strategy to use, (e) whom should implement this, as well as the cost-effective assessment of combinations of interventions. Unfortunately, AMR policies and strategies are often investigated within different disciplines and not in a holistic and systemic way, which is why we advocate for more interdisciplinary work and discuss opportunities for further research.

Short Title: Towards a Program Theory for Family-Focused Practice in Adult Mental Health Care Settings: An International Interview Study With Program Leaders

ISSN: 1664-0640

DOI: 10.3389/fpsyt.2021.741225

Article Number: 741225

Accession Number: WOS:000716103800001

Abstract: Objectives: In several high-income countries, family-focused practice programs have been introduced in adult mental health care settings to identify and support children whose parents live with mental health problems. Whilst their common goal is to reduce the impact of parental mental illness on children, the mechanisms by which they improve outcomes in different systems and settings are less well known. This kind of knowledge can importantly contribute to ensuring that practice programs achieve pre-defined impacts.

Methods: The aim of this study was to develop knowledge about relationships between contextual factors, mechanisms and impact that could inform a program theory for developing, implementing, and evaluating family-focused practice. Principles of a realist evaluation approach and complex system thinking were used to conceptualize the design of semi-structured in-depth interviews with individuals who led the implementation of programs. Seventeen individuals from eight countries participated in the study.

Results: Interviewees provided rich accounts of the components that programs should include, contextual factors in which they operated, as well as the behavior changes in practitioners that programs needed to achieve. Together with information from the literature, we developed an initial program theory, which illustrates the interconnectedness between changes that need to co-occur in practitioners, parents, and children, many of which related to a more open communication about parental mental health problems.

Stigma, risk-focused and fragmented health systems, and a lack of management commitment were the root causes explaining, for example, why conversations about parents' mental illness did not take place, or not in a way that they could help children. Enabling practitioners to focus on parents' strengths was assumed to trigger changes in knowledge, emotions and behaviors in parents that would subsequently benefit children, by reducing feelings of guilt and improving self-esteem.

Conclusion: To our knowledge, this is the first research, which synthesizes knowledge about how family-focused practice programs works in a way that it can inform the design, implementation, and evaluation of programs. Stakeholder, who fund, design, implement or evaluate programs should start co-developing and using program theories like the one presented in this paper to strengthen the design and delivery of family-focused practice.

Accession Number: WOS:000404293800001

Abstract: This monograph reports the findings of the 'Barriers to and facilitators of smoking cessation in pregnancy and following childbirth' study. The study was funded to conduct evidence syntheses and primary qualitative research to enhance understanding of how these barriers and facilitators are perceived and experienced from the perspectives of women, their partners, family and friends, and health-care professionals (HPs). Through this enhanced understanding, the study provides a platform to inform recommendations for current practice and provide pointers for the design of future interventions with promise for improving smoking cessation in pregnancy and in the postpartum period.

Short Title: A scoping review of frameworks in empirical studies and a review of dissemination frameworks

ISSN: 1748-5908

DOI: 10.1186/s13012-022-01225-4

Article Number: 53

Accession Number: WOS:000838078800001

Abstract: Background The field of dissemination and implementation (D&I) research has grown immensely in recent years. However, the field of dissemination research has not coalesced to the same degree as the field of implementation research. To advance the field of dissemination research, this review aimed to (1) identify the extent to which dissemination frameworks are used in dissemination empirical studies, (2) examine how scholars define dissemination, and (3) identify key constructs from dissemination frameworks.

Methods To achieve aims 1 and 2, we conducted a scoping review of dissemination studies published in D&I science journals. The search strategy included manuscripts published from 1985 to 2020. Articles were included if they were empirical quantitative or mixed methods studies about the dissemination of information to a professional audience. Studies were excluded if they were systematic reviews, commentaries or conceptual papers, scale-up or scale-out studies, qualitative or case studies, or descriptions of programs. To achieve aim 1, we compiled the frameworks identified in the empirical studies. To achieve aim 2, we compiled the definitions from dissemination from frameworks identified in aim 1 and from dissemination frameworks identified in a 2021 review (Tabak RG, Am J Prev Med 43:337-350, 2012). To achieve aim 3, we compile the constructs and their definitions from the frameworks. Findings Out of 6017 studies, 89 studies were included for full-text extraction. Of these, 45 (51%) used a framework to guide the study. Across the 45 studies, 34 distinct frameworks were identified, out of which 13 (38%) defined dissemination. There is a lack of consensus on the definition of dissemination. Altogether, we identified 48 constructs, divided into 4 categories: process, determinants, strategies, and outcomes. Constructs in the frameworks are not well defined. Implication for D&I research This study provides a critical step in the dissemination research literature by offering suggestions on how to define dissemination research and by cataloging and defining dissemination constructs. Strengthening these definitions and distinctions between D&I research could enhance scientific reproducibility and advance the field of dissemination research.

Short Title: Water, Sanitation, and Hygiene Practices and Challenges during the COVID-19 Pandemic: A Cross-Sectional Study in Rural Odisha, India

ISSN: 0002-9637

DOI: 10.4269/ajtmh.21-0087

Accession Number: WOS:000657411500052

Abstract: Water, sanitation, and hygiene (WASH) practices emerged as a critical component to controlling and preventing the spread of the COVID-19 pandemic. We conducted 131 semistructured phone interviews with households in rural Odisha, India, to understand behavior changes made in WASH practices as a result of the pandemic and challenges that would prevent best practices. Interviews were conducted from May through July 2020 with 73 heads of household, 37 caregivers of children < 5 years old, and 21 members of village water and sanitation committees in villages with community-level piped water and high levels of latrine ownership. The majority of respondents (86%, N = 104) reported a change in their handwashing practice due to COVID-19, typically describing an increase in handwashing frequency, more thorough washing method, and/or use of soap. These improved handwashing practices remained in place a few months after the pandemic began and were often described as a new consistent practice after additional daily actions (such as returning home), suggesting new habit formation. Few participants (13%) reported barriers to handwashing. Some respondents also detailed improvements in other WASH behaviors, including village-level cleaning of water tanks and/or treatment of piped water (48% of villages), household water treatment and storage (17% of respondents), and household cleaning (41% of respondents). However, there was minimal change in latrine use and child feces management practices as a result of the pandemic. We provide detailed thematic summaries of qualitative responses to allow for richer insights into these WASH behavior changes during the pandemic. The results also highlight the importance of ensuring communities have adequate WASH infrastructure to enable the practice of safe behaviors and strengthen resilience during a large-scale health crisis.

Short Title: Community and cultural engagement for people with lived experience of mental health conditions: what are the barriers and enablers?

DOI: 10.1186/s40359-022-00775-y

Article Number: 71

Accession Number: WOS:000769949600002

Abstract: Background Community and cultural engagement can support recovery, help symptom management and increase social connections for people with lived experience of mental health conditions. However, research suggests that people with mental health conditions experience significant barriers to participation. The aim of this study was to explore barriers and enablers of participation in community and cultural activities among people with mental health conditions. Methods A qualitative interview study with 23 people with mild-to-moderate mental health conditions was undertaken. Data were analysed thematically, and themes were mapped to domains of the Capability, Opportunity and Motivation Model of Behaviour (COM-B). Results Eleven themes were identified from the analysis. Three themes involved participant Capability: physical skills, psychological traits and physical health limitations and three themes related to Opportunity: affordability and accessibility, structure and nature of the group, and support from others to attend. Five themes mapped to Motivation: creative identity, recovery and coping, enjoyment and fun, connecting with others, and information and planning. Participants were motivated to engage with community and cultural activities through "a creative identity", belief that engagement would help recovery from mental illness, and a desire to connect with others and make friends. Motivation to participate was sustained by the enjoyable nature of activities. However, participants' ability to engage was hampered by the expense, inaccessibility and sometimes unstructured nature of activities, and social anxiety associated with attending. Some participants had physical limitations such as fatigue or physical health problems to overcome. Interventions that could address these barriers include peer support, training for social prescribers to account for identity and previous experiences of participation, training for community organisations in providing a welcoming and structured environment, and provision of long-term sustainable funding to community organisations to subsidise attendance,

transport or equipment costs. Conclusion People with mental health conditions may be at risk of experiencing barriers to community and cultural engagement due to existing social inequalities and social anxiety, however believing that involvement will support mental health was an enabler to participation. Future studies are needed to test the effectiveness of potential interventions to address the barriers and harness the facilitators identified here, to enable a more socially inclusive community and voluntary sector, and a potentially more responsive and effective social prescribing service in the UK for people experiencing mental health problems.

Short Title: Improving the safety and experience of transitions from hospital to home: a cluster randomised controlled feasibility trial of the 'Your Care Needs You' intervention versus usual care

DOI: 10.1186/s40814-022-01180-3

Article Number: 222

Accession Number: WOS:000862564800002

Abstract: Background The 'Your Care Needs You' (YCNy) intervention aims to increase the safety and experience of transitions for older people through greater patient involvement during the hospital stay. Methods A cluster randomised controlled feasibility trial was conducted on NHS inpatient wards (clusters) where $\geq 40\%$ of patients were routinely ≥ 75 years. Wards were randomised to YCNy or usual care using an unequal allocation ratio (3:2). We aimed to recruit up to 20 patients per ward. Follow-up included routine data collection and questionnaires at 5-, 30-, and 90-days post-discharge. Eligible patients were ≥ 75 years, discharged home, stayed overnight on participating wards, and could read and understand English. The trial assessed the feasibility of delivering YCNy and the trial methodology through recruitment rates, outcome completion rates, and a qualitative evaluation. The accuracy of using routinely coded data for the primary outcome in the definitive trial was assessed by extracting discharge information for up to ten nonindividual consenting patients per ward. Results Ten wards were randomised (6 intervention, 4 control). One ward withdrew, and two wards were unable to deliver the intervention. Seven-hundred twenty-one patients were successfully screened, and 161 were recruited (95

intervention, 66 control). The patient post-discharge attrition rate was 17.4% (n = 28). Primary outcome data were gathered for 91.9% of participants with 75.2% and 59.0% providing secondary outcome data at 5 and 30 days post-discharge respectively. Item completion within questionnaires was generally high. Post-discharge follow-up was terminated early due to the COVID-19 pandemic affecting 90-day response rates (16.8%). Data from 88 nonindividual consenting patients identified an error rate of 15% when using routinely coded data for the primary outcome. No unexpected serious adverse events were identified. Most patients viewed YCNY favourably. Staff agreed with it in principle, but ward pressures and organisational contexts hampered implementation. There was a need to sustain engagement, provide clarity on roles and responsibilities, and account for fluctuations in patients' health, capacity, and preferences. Conclusions If implementation challenges can be overcome, YCNY represents a step towards involving older people as partners in their care to improve the safety and experience of their transitions from hospital to home.

Abstract: Scholars have long documented unequal access to the benefits of science among different groups in the United States. Particular populations, such as low-income, non-white people, and Indigenous people, fare worse when it comes to health care, infectious diseases, climate change, and access to technology. These types of inequities can be partially addressed with targeted interventions aimed at facilitating access to scientific information. Doing so requires knowledge about what different groups think when it comes to relevant scientific topics. Yet data collection efforts for the study of most science-based issues do not

include enough respondents from these populations. We discuss this gap and offer an overview of pertinent sampling and administrative considerations in studying underserved populations. A sustained effort to study diverse populations, including through community partnerships, can help to address extant inequities.

Issue: 7

Pages: 614-618

Date: Jul

Short Title: Reliability and Validity of a Carbohydrate-Counting Knowledge Questionnaire for Young Australians With Type 1 Diabetes

ISSN: 1499-4046

DOI: 10.1016/j.jneb.2021.01.003

Accession Number: WOS:000675508200010

Abstract: Objective: To test the reliability and validity of a carbohydrate-counting knowledge questionnaire in young Australians with type 1 diabetes mellitus (T1DM). Methods: Children or young adults (<20 years) with T1DM, or their parents, completed the 72-item Australian PedCarbQuiz (AusPCQ), adapted from the American PedCarbQuiz, and an expert assessment of carbohydrate-counting knowledge. Responses were scored and summed (0-72, higher scores = greater knowledge). Internal reliability was assessed using Cronbach alpha, and relative validity using Spearman correlations (with HbA1c) and Bland-Altman analysis (with the expert assessment).

Results: Australian PedCarbQuiz reliability (n = 44, mean score = 59.7 +/- 5.6) was acceptable (alpha = 0.83). There was a lack of agreement (mean bias = 10.7, P = 0.008) and significant proportional bias between AusPCQ scores and expert assessments (beta = -0.73 [95% confidence interval, -1.82 to -0.79]; P < 0.001). Conclusions and Implications: The AusPCQ was shown to be reliable but not valid in a small sample. Testing in a larger sample is warranted.

Title: Applying behaviour change theory to understand the barriers to implementing routine outcome monitoring

Journal: British Journal of Clinical Psychology

Volume: 61

Issue: 3

Pages: 557-578

Date: Sep

Short Title: Applying behaviour change theory to understand the barriers to implementing routine outcome monitoring

ISSN: 0144-6657

DOI: 10.1111/bjc.12322

Accession Number: WOS:000678156700001

Abstract: Background Routine outcome monitoring (ROM) is a valuable tool for monitoring client progress and pre-empting deterioration, however, there is considerable variation in how data are collected and recorded and uptake in clinical practice remains low. The aim of this study was to develop a self-report measure of practitioner attitudes to ROM in order to better understand the barriers to successful implementation in Child and Adolescent Mental Health Services (CAMHS). Methods An anonymous survey was completed by 184 CAMHS practitioners in the United Kingdom. The survey was designed using the Capability, Opportunity, and Motivation Model of Behaviour (COM-B). Practitioners who reported using ROM frequently in their clinical work (53%) were compared to those who used ROM infrequently (47%) across dimensions of the COM-B survey subscales. Results Confirmatory factor analysis confirmed the proposed four-factor structure, showing acceptable model fit, with high factor loadings and good reliability for all subscales. Frequent users of ROM exhibited significantly higher psychological capability, physical opportunity, social opportunity, and motivation, compared to infrequent users $F(4, 140) = 14.76, p < .0001$; Pillai's Trace = .297, partial $\eta^2 = .30$. Results highlight several barriers to ROM, including the belief that there is not a strong evidence base for ROM, not receiving external training, and not discussing feedback and outcome data in supervision. Implications In the hope of improving the successful implementation of ROM, this research provides an evidence-based tool for assessing practitioners' attitudes to ROM, which map on to intervention functions and represent targets for future implementation efforts. Practitioner Points The value of routine outcome monitoring (ROM) as a means to measure client progress and to elevate the efficiency and quality of mental health care is well-documented in the research literature, however, uptake in practice remains relatively low. This study applied behaviour change theory to develop a psychometrically sound self-report measure of practitioners' perspectives and practices to understand the barriers to implementation in child and adolescent mental health services in the United Kingdom. The complex and multifaceted nature of the barriers to implementation requires multilevel behaviour change strategies at the client, clinician, and organisational level. Recommendations for practice include the need for integrated, multilevel strategies aimed at improving practitioners' capabilities and motivations, strong organisational

leadership and a culture of data gathering and sharing, and implementation interventions, which are tailored to target local barriers.

Title: Implementing the Smile4life intervention for people experiencing homelessness: a path analytical evaluation

Journal: BMC Oral Health

Volume: 21

Issue: 1

Date: Aug

Short Title: Implementing the Smile4life intervention for people experiencing homelessness: a path analytical evaluation

ISSN: 1472-6831

DOI: 10.1186/s12903-021-01747-1

Article Number: 383

Accession Number: WOS:000684415200001

Abstract: Background People experiencing homelessness have high levels of dental decay, oral cancer and poor oral health-related quality of life. The Scottish Government sought to address these issues by developing a national oral health improvement programme for people experiencing homelessness, named Smile4life. The aim was to investigate implementation behaviours and the role of work-related beliefs upon the delivery of the Smile4life programme across NHS Board areas in Scotland. Methods Non-probability convenience sampling, supplemented by snowball sampling, was used to recruit practitioners working across the homelessness sector. The overall evaluation of the implementation of the Smile4life programme was theoretically informed by the Behaviour Change Wheel. The questionnaire was informed by the Theoretical Domains Framework and was divided into three sections, demography and Smile4life Awareness; Smile4life Activities; and Smile4life work-related beliefs. A psychometric assessment was used to develop Smile4life Awareness, Smile4life Activities, Ability to Deliver and Positive Beliefs and Outcomes subscales. The data were subjected to K-R20, exploratory factor analysis, Cronbach's alpha, t-tests, ANOVA, Pearson's correlation analysis and a multivariate path analysis. Results One hundred participants completed the questionnaire. The majority were female (79%) and worked in NHS Boards across Scotland (55%). Implementation behaviour, constructed from the Delivering Smile4life scale and the summated Smile4life activities variable, was predicted using a linear model a latent variable. The independent variables were two raw variables Positive Beliefs and Outcomes, and Ability to deliver Smile4life. Results

showed relatively good model fit (chi-square (1.96; $p > 0.15$), SRMR (< 0.08) and R² (0.62) values). Positive and highly significant loadings were found describing the Implementation Behaviour latent variable (0.87 and 0.56). The two independent variables were associated ($p < 0.05$) with Implementation Behaviour. Conclusions Work-related factors, such as positive beliefs and outcomes and ability to deliver are required for implementation behaviours associated with the delivery of the Smile4life programme. Future work should include training centred on the specific needs of those involved in the homelessness sector and the development of accessible training resources, thereby promoting implementation behaviours to assist the progression and sustainability of the Smile4life programme.

Title: Active transport research priorities for Australia

Journal: Journal of Transport & Health

Volume: 24

Date: Mar

Short Title: Active transport research priorities for Australia

ISSN: 2214-1405

DOI: 10.1016/j.jth.2021.101288

Article Number: 101288

Accession Number: WOS:000911801400003

Abstract: Background: To advance active transport, robust policy-relevant evidence is needed to understand how to change behaviour and to support decision-making by policy makers and practitioners. Currently, however, priority research questions that are most critical for advancing active transport have not been identified. To this end, we aimed to inform an active transport research priority agenda for Australia to guide research, funding, policy making and practice to enhance active transport. Methods: We designed and conducted a novel priority setting exercise to identify and set research priorities for the advancement of active transport in Australia. The process consisted of three phases: 1) generation and collection of research questions from a diverse reference group consisting of experts and key members representing academia, government, private and not-for-profit organisations (n = 259 respondents); 2) thematic analysis and consolidation of research questions to a final list of 50 questions; and 3) prioritisation of research questions by the reference group (n = 140 respondents). Results: The top ranked questions included the evidence to support

policy changes to increase active transport, identifying and overcoming community resistance to active transport infrastructure, road space re-allocation and lower urban speed limits, evidence on the needs of children, enhanced governance and funding, and improving how the benefits of active transport are best measured and communicated. Conclusions: To our knowledge, this is the first priority setting exercise in active transport globally. The identified research priorities can be used to identify new policy-relevant areas of research, contribute to the active transport research agenda in Australia and guide research funding. Focusing on these research priorities will address stakeholder and academic priorities and provide the evidence required to support the advancement of active transport in Australia. Future research could use the same approach to identify research priorities in other countries.

DOI: 10.1080/08870446.2015.1132718

Accession Number: WOS:000379690200008

Abstract: Objective: This study explored the utility of using behaviour change taxonomies and checklists to systematically assess the content and delivery of behavioural support for physical activity delivered through an established exercise-referral scheme. Design: An observation study was conducted whereby 22% of initial consultations were observed and audio-recorded, using quota sampling stratified by exercise-referral advisor. Main outcome measures: Content was independently coded by two researchers, to assess; (i)

completeness in delivering the programme protocol, (ii) behaviour change techniques delivered (defined using the CALO-RE taxonomy) and (iii) delivery style according to the Behaviour Change Counselling Index (BECCI). Results: Protocol completeness was 63.6% (range 35.6-74.6%). The behaviour change techniques delivered most consistently were 'providing information about where and when to perform the behavior' (86%) and 'setting outcome goals' (82%). Other evidence-based techniques such as selfmonitoring were infrequently observed. Variation in BECCI scores indicated that advisors could, but did not consistently, provide a client-centred service. Conclusion: This study highlights how theoretically informed taxonomies can be useful in evaluating service delivery within applied practice, providing a meaningful way of assessing the completeness of protocol delivery relative to evidence. The provision of feedback to practitioners based on such objective criteria also facilitated positive academic-practitioner communication.

Title: Delivering communication strategy training for people with aphasia: what is current clinical practice?

Journal: International Journal of Language & Communication Disorders

Volume: 52

Issue: 2

Pages: 197-213

Date: Mar-Apr

Short Title: Delivering communication strategy training for people with aphasia: what is current clinical practice?

ISSN: 1368-2822

DOI: 10.1111/1460-6984.12265

Accession Number: WOS:000398060600007

Abstract: Background: Communication strategy training (CST) is a recognized part of UK speech and language therapists' (SLTs) role when working with a person with aphasia. Multiple CST interventions have been published but, to date, there are no published studies exploring clinical practice in this area. Aims: To investigate UK SLTs' current CST practices. Methods & Procedures: Thirty-seven UK SLTs completed an online questionnaire, eight of whom attended a follow-up focus group. A clinical consistency scale was applied to the questionnaire data and tasks that were most consistently used were explored in the focus group and analyzed using a primarily deductive thematic data analysis approach. Outcomes & Results: Three key CST findings arose: (1) the rarity with which SLTs focus

equally and explicitly on both communication partners' strategies; (2) SLTs' differing understandings of CST terminologies and concepts and underuse of formal assessment; and (3) the absence of video feedback. Conclusion & Implications: This study's survey findings suggest that conversation partners not only receive half the amount of CST given to people with aphasia but also play a more passive learning role when they are present. This is an interesting point to consider when the current evidence base contains stronger evidence for the effectiveness of conversation partner CST over other CST approaches, it being described as an effective method that may be maintained over time.

Article Number: 10256

Accession Number: WOS:000822648900001

Abstract: Weight gain after liver transplantation (LTx) contributes to new-onset obesity. We explored patients' experiences with gaining weight after LTx. Individual interviews were guided by open-ended questions. We analyzed transcripts with the reflexive thematic analysis approach by Braun and Clarke. The 12 participants gained 11.5 kg weight (median) over a median of 23 months after LTx. The constitutive theme "The main thing is to be alive" was a recurrent insight, captured in three facets: "The arduous path back to living" was the emotional expression of the ups and downs during a life-threatening illness to finally being grateful for the new life. "A pleasurable new phase of life" was the legitimation, reflecting the appreciation of gaining weight and returning to a healthy appearance. "I am allowed to look like this now" was the consoling facet after a time of burden due to the increased weight and frustration of being unsuccessful in losing weight. Finally, the awareness of being a LTx survivor outplayed the burden of the excess weight. Early interventions are crucial because the comforting insight "I am allowed to look like this now" may hinder further engagement in weight loss activities. Our recommendations on education and self-management support may guide clinical practice.

Accession Number: WOS:000340398400007
Abstract: This article reports an intervention in the conversations between a man with chronic aphasia, Barry, and his wife, Louise (both names are pseudonyms). Preintervention analysis revealed the potential of writing as a resource for turn construction. Intervention consisted of enabling Barry to use writing to produce more complete turns at talk, thereby increasing the likelihood of mutual understanding, and encouraging Louise to modify her responses to Barry's turns and thus enhance his interactional potential. Quantitative analysis revealed that Barry significantly increased his use of writing after intervention, but there was no change in other trained strategies. Louise eradicated correct production sequences (designed to elicit the correct production of a word despite her knowing the target) but did not implement trained strategies. In conclusion, individually tailored input underpinned by Conversation Analysis principles can alter the conversational behavior of a person with aphasia. It appears easier for a conversation partner to reduce unhelpful behaviors than to adopt facilitatory strategies. Data are in British English.

Title: A brief intervention for weight control based on habit-

formation theory delivered through primary care: results from a randomised controlled trial

Journal: International Journal of Obesity

Volume: 41

Issue: 2

Pages: 246-254

Date: Feb

Short Title: A brief intervention for weight control based on habit-formation theory delivered through primary care: results from a randomised controlled trial

ISSN: 0307-0565

DOI: 10.1038/ijo.2016.206

Accession Number: WOS:000394143700007

Abstract: BACKGROUND: Primary care is the 'first port of call' for weight control advice, creating a need for simple, effective interventions that can be delivered without specialist skills. Ten Top Tips (10TT) is a leaflet based on habit-formation theory that could fill this gap. The aim of the current study was to test the hypothesis that 10TT can achieve significantly greater weight loss over 3 months than 'usual care'. METHODS: A two-arm, individually randomised, controlled trial in primary care. Adults with obesity were identified from 14 primary care providers across England. Patients were randomised to either 10TT or 'usual care' and followed up at 3, 6, 12, 18 and 24 months. The primary outcome was weight loss at 3 months, assessed by a health professional blinded to group allocation. Difference between arms was assessed using a mixed-effect linear model taking into account the health professionals delivering 10TT, and adjusted for baseline weight. Secondary outcomes included body mass index, waist circumference, the number achieving a 5% weight reduction, clinical markers for potential comorbidities, weight loss over 24 months and basic costs. RESULTS: Five-hundred and thirty-seven participants were randomised to 10TT (n = 267) or to 'usual care' (n = 270). Data were available for 389 (72%) participants at 3 months and for 312 (58%) at 24 months. Participants receiving 10TT lost significantly more weight over 3 months than those receiving usual care (mean difference = -0.87kg; 95% confidence interval: -1.47 to -0.27; P = 0.004). At 24 months, the 10TT group had maintained their weight loss, but the 'usual care' group had lost a similar amount. The basic cost of 10TT was low, that is, around sic23 (\$32) per participant. CONCLUSIONS: The 10TT leaflet delivered through primary care is effective in the short-term and a low-cost option over the longer term. It is the first habit-based intervention to be used in a health service setting and offers a low-intensity alternative to 'usual care'.

Title: Barriers and Facilitators to Successful Intensive Adherence Counseling in Rural Northern Uganda: An Exploratory Interview with HIV-Positive Clients Using the COM-B Framework

Journal: Hiv Aids-Research and Palliative Care

Volume: 14

Pages: 553-563

Short Title: Barriers and Facilitators to Successful Intensive Adherence Counseling in Rural Northern Uganda: An Exploratory Interview with HIV-Positive Clients Using the COM-B Framework

ISSN: 1179-1373

DOI: 10.2147/hiv.S393093

Accession Number: WOS:000890443200001

Abstract: Purpose: Intensive adherence counseling (IAC) was introduced as a strategy to enhance adherence to antiretroviral therapy (ART) among HIV clients with non-suppressed viral loads. There has been sub-optimal viral load suppression among HIV clients in Uganda enrolled in IAC. However, there is a scarcity of literature on the barriers and facilitators of successful IAC. We aim to explore the barriers and facilitators to successful IAC among HIV-positive clients seeking care in public health facilities in rural northern Uganda. Patients and Methods: This was an exploratory qualitative study conducted among 15 purposively sampled HIV-positive clients enrolled in IAC in public health facilities offering ART services in northern Uganda. We conducted in-depth interviews using semi-structured interview guides based on the capability, opportunity, motivation, and behavior (COM-B) framework for behaviour change. Data were analyzed using the deductive thematic approach of Braun and Clarke following the COM-B framework. Results: The majority of the participants were females (60%), married (53%), and attained primary education (47%). Barriers to successful IAC were Capability - alcoholism and promiscuity, Opportunity - stigma and discrimination, delayed viral load result, shortage of food, and heavy workload; and Motivation - deteriorating health and lack of incentives. Facilitators to successful IAC were Capability - good knowledge of ART, good memory, and reminder alerts; Opportunity - availability of ART, social support, availability of ART, prolonged ART refill, and good counseling; and Motivation - desire to live longer and healthy and the desire to fulfill dreams and goals. Conclusion: Successful implementation of IAC needs to consider the context of the person in care thus the need to strengthen individualized IAC sessions. HIV care providers can adopt the COM-B framework to perform individualized IACs and use the information to strengthen the counseling sessions.

Short Title: The influence of social norms in the context of reducing sugar-sweetened beverages consumption

ISSN: 0033-3506

DOI: 10.1016/j.puhe.2022.09.016

Accession Number: WOS:000917956600001

Abstract: Objectives: This study aimed to examine the factors associated with low sugar-sweetened beverage (SSB) consumption and intention to avoid these products as well as investigate the role of different types of social norms in the adoption of this behaviour. Study design: This study reports the results of a secondary data analysis from a cross-sectional telephone survey. Methods: A total of 1000 adults were randomly recruited in the province of Quebec, Canada, using a random-digit dialling procedure. Eligibility criteria were to be aged between 18 and 64 years; able to answer a questionnaire in French or English; and to reside in the province of Quebec. SSB consumption, social norms and variables from the theory of planned behaviour were assessed by means of a questionnaire. Logistic regression analyses were conducted to examine factors associated with behaviour and intention. Results: Consuming <1 SSB per day was significantly associated with intention, perceived behavioural control, and risk perception about tooth decay. Descriptive (perceived prevalence in the close surroundings of one person) and perceived societal norms (perceived broad societal approval/disapproval of the behaviour) were associated with behaviour. All theory of planned behaviour variables (including injunctive norm) and risk perception pertaining to chronic diseases predicted intention to avoid the consumption of >1 SSB per day. Sex, age, income, and risk perception pertaining to chronic diseases were associated with perceived societal disapproval of SSB consumption. Conclusions: This study confirms the importance of social norms in the prediction of SSB consumption but also highlights the need to address motivation and capacities in public health interventions to reduce SSB consumption. ISSN: 0167-5877

DOI: 10.1016/j.prevetmed.2015.07.008

Accession Number: WOS:000366779300002

Abstract: Recent independent UK government reports and studies have highlighted the importance, but lack, of flock health services provided by veterinarians. Qualitative interviews were analysed by thematic analysis to construct belief statements to understand veterinarians' opinions on preventative advice and drivers for current services to sheep farmers. A postal questionnaire was sent to 515 sheep practices registered with the Royal College of Veterinary Surgeon (RCVS) in England and Wales in 2012 to gather quantitative data on these belief statements and to gather demographic information and current services provided by the veterinarian. Exploratory factor analysis with heuristic approaches was conducted on the respondents' belief statements to identify common factors of veterinarian beliefs. Three main factors were identified: motivation for proactiveness, perceived capability to offer preventative services and perceived opportunity to deliver these services. A beta regression model was built to identify the factors significantly associated with the time veterinarians spent in an advisory role. The relative proportion of time increased by 10% (1.01-1.19), 16% (1.03-1.30) and 29% (CI: 1.09-1.53) for each unit increase in score for factor 1 motivation, factor 2 capability and factor 3 opportunity respectively, indicating that these latent factors explained time veterinarians spent in an advisory role with sheep clients. There was a significant correlation between these factors suggesting influence of the associated beliefs between factors. This study provides insight into the nature and drivers of veterinarians' current behaviour and beliefs. These results could be further tested in behaviour intervention studies and help in designing efficient strategies aiming at promoting proactive health services offered by veterinarians on sheep farms in England and Wales. Abstract: The Chapter examines latest messages on 2011 influenza epidemics in Serbia that were found on 10 February 2011 on the websites of 24 Serbian Public Health Institutes. It adopts four of the STARCC criteria of the Center for Disease Control and Prevention: simplicity, timeliness, relevance and consistency. The variables used for the comparison of messages on influenza epidemics are: word count, the percentage of less known foreign words, last update and the percentage of words on preventive measures. Near half of the analyzed websites (11) had no information on influenza in previous 12 months. High variation coefficients of the investigated variables indicate a low consistency in internet based health communication within the network of Serbian public health institutions. Centralization and coordination in internet public health informing in Serbia is needed, as an effective preparatory measure for pandemics.

Title: Technology-based nutrition interventions using the Mediterranean diet: a systematic review
Journal: Nutrition Reviews
Volume: 80
Issue: 6
Pages: 1419-1433
Date: May
Short Title: Technology-based nutrition interventions using the Mediterranean diet: a systematic review
ISSN: 0029-6643
DOI: 10.1093/nutrit/nuab076
Accession Number: WOS:000763971900001
Abstract: Context Over the past 2 decades, overweight and obesity rates have increased exponentially, along with related comorbidities including type 2 diabetes, hypertension, cardiovascular disease, and some cancers. The Mediterranean Diet (MDiet) has been suggested as a potential way to mitigate the health burdens related to overweight and obesity. Objective For this review, the literature on MDiet-focused digital interventions was examined to determine efficacy, best practices, and potential limitations. Data Sources The search was conducted across 15 databases for relevant publications published through April 2020 in English, French, Spanish, Arabic, or Italian. Data Extraction Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines were followed using a combination of keywords and phrases and evaluated independently for relevance, merit, and inclusion and exclusion criteria. Data Analysis The systematic literature review resulted in 15 articles that met the search criteria. Ten interventions were delivered online, and 5 were delivered via smartphone using an app. The majority of online MDiet-focused interventions were effective, particularly when modeled after evidence-based and best-practice online nutrition education interventions. Such interventions also are effective for promoting positive health behaviors and health outcomes, such as increased physical activity, increased levels of high-density lipoprotein cholesterol, and a lower total high-density lipoprotein cholesterol ratio. Conclusion Technology-based interventions to educate and promote adherence to the MDiet are successful in helping individuals achieve the stated outcomes. More research is needed to determine the efficacy of MDiet interventions delivered via smartphone apps.

Abstract: Objective: Impairment in physical function and physical performance leads to decreased independence and health-related quality of life in people living with chronic kidney disease and end-stage kidney disease. Physical activity and exercise in kidney care are not priorities in policy development. We aimed to identify global policy-related enablers, barriers, and strategies to increase exercise participation and physical activity behavior for people living with kidney disease. Design and Methods: Guided by the Behavior Change Wheel theoretical framework, 50 global renal exercise experts developed policy barriers and enablers to exercise program implementation and physical activity promotion in kidney care. The consensus process consisted of developing themes from renal experts from North America, South America, Continental Europe, United Kingdom, Asia, and Oceania. Strategies to address enablers and barriers were identified by the group, and consensus was achieved. Results: We found that policies addressing funding, service provision, legislation, regulations, guidelines, the environment, communication, and marketing are required to support people with kidney disease to be physically active, participate in exercise, and improve health-related quality of life. We provide a global perspective and highlight Japanese, Canadian, and other regional examples where policies have been developed to increase renal physical activity and rehabilitation. We present recommendations targeting multiple stakeholders including nephrologists, nurses, allied health clinicians, organizations providing renal care and education, and renal program funders. Conclusions: We strongly recommend the nephrology community and people living with kidney disease take action to change policy now, rather than idly waiting for indisputable clinical trial evidence that increasing physical activity, strength, fitness, and function improves the lives of people living with kidney disease. DOI: 10.1080/09638288.2021.1933618

Accession Number: WOS:000658918400001

Abstract: Purpose Hypermobility Spectrum Disorders (HSD) and Hypermobile Ehlers-Danlos Syndrome (hEDS) are heritable connective tissue disorders associated with joint instability and pain, but with scant guidance for supporting patients. The aim was to determine recommendations for an HSD/hEDS self-management intervention. Materials and methods Barriers to self-management were mapped onto the Theoretical Domains Framework (TDF) and Capability, Opportunity, Motivation-Behaviour (COM-B) model in a behavioural analysis. A modified Nominal Group Technique was used to prioritise behaviour change technique (BCT) interventions (n = 9 women). Results Possible BCTs incorporated: Education Incorporating self-help strategies, education to improve their knowledge of HSD/hEDS, and how to judge information about HSD/hEDS. Training In activity pacing, assertiveness and communication skills, plus what to expect during pregnancy, when symptoms can worsen. Environmental restructuring and enablement Support from occupational therapists to maintain independence at work and home. Modelled behaviour That illustrates how other people with HSD/hEDS have coped with the psychosocial impact. Conclusions This study is the first to apply theoretically-informed approaches to the management of HSD/hEDS.

Participants indicated poor access to psychological support, occupational therapy and a lack of knowledge about HSD/hEDS. Future research should evaluate which intervention options would be most acceptable and feasible.

Short Title: Codevelopment of Implementation Interventions to Support Parent-Led Care for Pain in Infants: Protocol for a Qualitative Descriptive Study

ISSN: 1929-0748

DOI: 10.2196/33770

Article Number: e33770

Accession Number: WOS:000863913700002

Abstract: Background: Untreated pain in infants is associated with adverse health outcomes. Despite strong evidence for accessible, effective, and low-cost parent-led pain-relieving interventions such as breastfeeding or chestfeeding and skin-to-skin contact, these interventions are not routinely used. Objective: The objective of this study is to support the implementation of parent-led pain interventions by identifying barriers to and facilitators of parent-led, evidence-informed pain care in infants during acute procedures. In addition, this study aims to develop theory-informed, contextually relevant implementation interventions for supporting the use of parent-led pain care for infants in hospital and community contexts. Methods: This study will consist of 2 phases that follow a systematic, theoretically informed approach guided by the Theoretical Domains Framework and Behavior Change Wheel. In phase 1, we will use a qualitative descriptive design to explore barriers and facilitators to using parent-led pain care in infants from the perspectives of hospital and community-based clinicians, clinical leaders, and families. In phase 2, we will use the Behavior Change Wheel to design tailored implementation interventions that

have evidence for effectively addressing identified barriers in collaboration with an advisory committee of administrative, clinical, and family leaders. Results: Ethics approval for this study was obtained in December 2020. As of May 2022, a total of 15 participants have been enrolled in phase 1. The results from all phases will be reported in 2023. Conclusions: Following the completion of this study, we will have co-designed theoretically informed implementation interventions that can be pilot-tested and experimentally applied. The findings will be used to implement parent-led interventions that improve patient safety and health outcomes for diverse families. Short Title: Measure what we want: a taxonomy of short generic person-reported outcome and experience measures (PROMs and PREMs)

DOI: 10.1136/bmjopen-2019-000789

Article Number: e000789

Accession Number: WOS:000672549600028

Abstract: Introduction Health and care systems are complex and multifaceted, but most person-reported outcome and experience measures (PROMs and PREMs) address just one aspect. Multiple aspects need measuring to understand how what we do impacts patients, staff and services, and how these are affected by external factors. This needs survey tools that measure what people want, are valid, sensitive, quick and easy to use, and suitable for people with multiple conditions. Methods We have developed a coherent family of short generic PROMs and PREMs that can be used in combination in a pick-and-mix way. Each measure has evolved iteratively over several years, based on literature review, user inputs and field testing. Each has a common format with four items with four response options and is designed for digital data collection with standardised analytics and data visualisation tools. We focused on brevity and low reading age. Results The results are presented in tabular format and as a taxonomy. The taxonomy is categorised by respondent type (patient or staff) and measure type. PROMs have subdomains: quality of life, individual care and community; PREMs

have subdomains: service provided, provider culture and innovation. We show 22 patient-reported measures and 17 staff-reported measures. Previously published measures have been validated. Others are described for the first time. Discussion and conclusions This family of measures is broad in scope but is not claimed to be comprehensive. Measures share a common look and feel, which enables common methods of data collection, reporting and data visualisation. They are used in service evaluation, quality improvement and as key performance indicators. The taxonomy helps to organise the whole, explain what each measure does and identify gaps and overlaps.

Short Title: Development and initial testing of a Health Confidence Score (HCS)

DOI: 10.1136/bmjopen-2018-000411

Article Number: e000411

Accession Number: WOS:000672549100015

Abstract: Introduction Patients need to feel confident about looking after their own health. This is needed to improve patient outcomes and clinical support. With few suitable tools available to measure self-care health confidence, we developed and validated a short, generic survey instrument for use in evaluation and quality improvement. Methods The Health Confidence Score (HCS) was developed through literature review, patient and expert focus groups and discussions. This paper reports an initial survey (n = 1031, study 1) which identified some issues and a further face-to-face survey (n = 378, study 2) to test the construct and concurrent validity of the final version. Scores were correlated against the My Health Confidence (MHC) rating scale, howRu (health status measure) and relevant demographics. Results The HCS is short (50 words) with good readability (reading age 8). It has four items covering health knowledge, capability to self-manage, access to help and shared decision-making; each has four response options (strongly agree, agree, neutral disagree). Items are reported independently and as a summary score. The mean summary score was 76.7 (SD 20.4) on 0-100 scale. Cronbach's alpha = 0.82. Exploratory factor analysis suggested that the four items relate to a single dimension. Correlation of the HCS summary score with MHC was high (Spearman r = 0.76). It was also associated with health status (Spearman r =

0.49), negatively with number of medications taken ($r=-0.29$) and age ($r=-0.22$) and not with ethnicity, having children or education level. Conclusions The HCS is short, easy to use, with good psychometric properties and construct validity. Each item is meaningful independently and the summary score gives an overall picture of health confidence.

Article Number: 101831

Accession Number: WOS:000600452200022

Abstract: Objectives: Poor adherence to nutritional guidance by athletes may compromise their health and performance. Enhancing adherence is therefore an important performance and welfare strategy. The aim of this study was to qualitatively explore the barriers and enablers of elite athletes' adherence to nutritional guidelines. Design: Underpinned by our constructionist epistemological position and our relativist ontology, we conducted a qualitative study using focus groups. Methods: We used the Capability, Opportunity, and Motivation Behaviour (COM-B) model and the Theoretical Domains Framework (TDF) to conduct focus group discussions with a purposive sample of 39 UK-based funded athletes (mean age = 23 +/- 3.81), participating in either Olympic and Paralympic sport (n = 30) or professional sport (n = 9), who had access to a nutritionist. Data were analysed using reflexive thematic analysis. Results: Athlete adherence to nutritional guidance was seasonal and included inadequate energy intakes and episodes of binge eating. Underpinning these behaviours, athletes' emotional barriers (motivation) are reinforced through their social interactions within the high-performance environment (opportunity) and athletes' training environment limits developmental opportunities for food planning (capability). However, a holistic developmental approach by the sports nutritionists (opportunity) supports athlete wellbeing and nutritional adherence. Conclusion: These findings advance theoretical understanding of the barriers and enablers of nutritional adherence amongst elite-level athletes in

high-performance sport and present a number of significant implications for athlete support personnel seeking to enhance performance in demanding sporting contexts. Drawing on the Behaviour Change Wheel (BCW), recommendations include the need to 1) train and educate sports nutritionists in human behaviour, 2) update regulations for sports nutrition profession practice to acknowledge the skills required to support athletes' emotional wellbeing, 3), educate coaches on the sensitivity of body weight and composition and develop guidelines for monitoring athletes' body weight and composition in sport, 4) persuade influential leaders to develop culture guidelines that shift the performance-narrative of high-performance (i.e., environmental restructuring).

DOI: 10.1136/sextrans-2020-054853

Accession Number: WOS:000643739100006

Abstract: Background The use of mobile technologies to prevent STIs is recognised as a promising approach worldwide; however, evidence has been inconclusive, and the field has developed rapidly. With about 1 million new STIs a day globally, up-to-date evidence is urgently needed. Objective To assess the effectiveness of mobile health interventions delivered to participants for preventing STIs and promoting preventive behaviour. Methods We searched seven databases and reference lists of 49 related reviews (January 1990-February 2020) and contacted experts in the field. We included randomised controlled trials of mobile interventions delivered to adolescents and adults to prevent sexual transmission of STIs. We conducted meta-analyses and assessed risk of bias and certainty of evidence following Cochrane guidance. Results After double screening 6683 records, we included 22 trials into the systematic review and

20 into meta-analyses; 18 trials used text messages, 3 used smartphone applications and 1 used Facebook messages as delivery modes. The certainty of evidence regarding intervention effects on STI/HIV occurrence and adverse events was low or very low. There was moderate certainty of evidence that in the short/medium-term text messaging interventions had little or no effect on condom use (standardised mean differences (SMD) 0.02, 95% CI -0.09 to 0.14, nine trials), but increased STI/HIV testing (OR 1.83, 95% CI 1.41 to 2.36, seven trials), although not if the standard-of-care control already contained an active text messaging component (OR 1.00, 95% CI 0.68 to 1.47, two trials). Smartphone application messages also increased STI/HIV testing (risk ratio 1.40, 95% CI 1.22 to 1.60, subgroup analysis, two trials). The effects on other outcomes or of social media or blended interventions is uncertain due to low or very low certainty evidence. Conclusions Text messaging interventions probably increase STI/HIV testing but not condom use in the short/medium term. Ongoing trials will report the effects on biological and other outcomes.

Accession Number: WOS:000564222300001

Abstract: Purpose This study aimed to determine the effect of patient navigation on health-related quality of life, distress, self-care knowledge, self-efficacy, satisfaction, and healthcare usage. Methods Patients newly diagnosed with ovarian, vulvar, endometrial, melanoma stage III/IV, lung, or renal cancer were randomly assigned to either care as usual or care as usual plus consultations with a patient navigator (i.e., specially trained oncology nurse who monitors, advises, and refers patients to supportive cancer care). Measures included the EORTC-QLQ-C30, distress thermometer, and study-specific questions inspired by the Symptom-Management Self-Efficacy Scale Breast Cancer, Patient

Satisfaction with Cancer Care Scale, and the Medical Consumption Questionnaire. Measures were completed before randomization (baseline) and at 1 month, 3 months, and 5 months after baseline. Results In the case of health-related quality of life, no significant difference was observed between the intervention (n = 42) and the control group (n = 47). Consumption of supportive cancer care was low for both the intervention and the control group but relatively lower for the intervention group. Also, participants who consulted the patient navigator seemed to have higher levels of self-efficacy and satisfaction. Conclusion Although the intervention sorted no relevant effects on health-related quality of life, it did affect patients' experience of cancer care and self-efficacy. We recommend that patient navigators monitor and advise on unmet supportive care needs, but only in the case of high-risk patients. Furthermore, considering current and prior research, it is wise to study patient navigation using more sensitive outcome measures than health-related quality of life.

Title: Factors Associated With Specialists' Intention to Adopt New Behaviors After Taking Web-Based Continuing Professional Development Courses: Cross-sectional Study

Journal: Jmir Medical Education

Volume: 8

Issue: 2

Date: Apr-Jun

Short Title: Factors Associated With Specialists' Intention to Adopt New Behaviors After Taking Web-Based Continuing Professional Development Courses: Cross-sectional Study

ISSN: 2369-3762

DOI: 10.2196/34299

Article Number: e34299

Accession Number: WOS:000848716700012

Abstract: Background: Web-based continuing professional development (CPD) is a convenient and low-cost way for physicians to update their knowledge. However, little is known about the factors that influence their intention to put this new knowledge into practice.

Objective: We aimed to identify sociocognitive factors associated with physicians' intention to adopt new behaviors as well as indications of Bloom's learning levels following their participation in 5 web-based CPD courses. Methods: We performed a cross-sectional study of specialist physicians who had completed 1 of 5 web-based CPD courses offered by the Federation of Medical Specialists of Quebec. The participants then completed CPD-Reaction, a questionnaire based on Godin's integrated model for health professional behavior change and with evidence of validity that

measures behavioral intention (dependent variable) and psychosocial factors influencing intention (n=4). We also assessed variables related to sociodemographics (n=5), course content (n=9), and course format (eg, graphic features and duration) (n=8). Content variables were derived from CanMEDS competencies, Bloom's learning levels, and Godin's integrated model. We conducted ANOVA single-factor analysis, calculated the intraclass correlation coefficient (ICC), and performed bivariate and multivariate analyses. Results: A total of 400 physicians participated in the courses (range: 38-135 physicians per course). Average age was 50 (SD 12) years; 56% (n=223) were female, and 44% (n=177) were male. Among the 259 who completed CPD- Reaction, behavioral intention scores ranged from 5.37 (SD 1.17) to 6.60 (SD 0.88) out of 7 and differed significantly from one course to another (P<.001). The ICC indicated that 17% of the total variation in the outcome of interest, the behavioral intention of physicians, could be explained at the level of the CPD course (ICC=0.17). In bivariate analyses, social influences (P<.001), beliefs about capabilities (P<.001), moral norm (P<.001), beliefs about consequences (P<.001), and psychomotor learning (P=.04) were significantly correlated with physicians' intention to adopt new behaviors. Multivariate analysis showed the same factors, except for social influences and psychomotor learning, as significantly correlated with intention. Conclusions: We observed average to high behavioral intention scores after all 5 web-based courses, with some variations by course taken. Factors affecting physicians' intention were beliefs about their capabilities and about the consequences of adopting new clinical behaviors, as well as doubts about whether the new behavior aligned with their moral values. Our results will inform design of future web-based CPD courses to ensure they contribute to clinical behavior change.

Short Title: A Tailored App for the Self-management of Musculoskeletal Conditions: Evidencing a Logic Model of Behavior Change

DOI: 10.2196/32669

Article Number: e32669

Accession Number: WOS:000854073700017

Abstract: Background: Musculoskeletal conditions such as joint pain are a growing problem, affecting 18.8 million people in the United Kingdom. Digital health interventions (DHIs) are a potentially effective way of delivering information and supporting self-management. It is vital that the development of such interventions is transparent and can illustrate how individual components work, how they link back to the theoretical constructs they are attempting to change, and how this might influence outcomes. getUBetter is a DHI developed to address the lack of personalized, supported self-management tools available to patients with musculoskeletal conditions by providing knowledge, skills, and confidence to navigate through a self-management journey. Objective: The aim of this study was to map a logic model of behavior change for getUBetter to illustrate how the content and functionality of the DHI are aligned with recognized behavioral theory, effective behavior change techniques, and clinical guidelines. Methods: A range of behavior change models and frameworks were used, including the behavior change wheel and persuasive systems design framework, to map the logic model of behavior change underpinning getUBetter. The three main stages included understanding the behavior the intervention is attempting to change, identifying which elements of the intervention might bring about the desired change in behavior, and describing intervention content and how this can be optimally implemented. Results: The content was mapped to 25 behavior change techniques, including information about health consequences, instruction on how to perform a behavior, reducing negative emotions, and verbal persuasion about capability. Mapping to the persuasive system design framework illustrated the use of a number of persuasive design principles, including tailoring, personalization, simulation, and reminders. Conclusions: This process enabled the proposed mechanisms of action and theoretical foundations of getUBetter to be comprehensively described, highlighting the key techniques used to support patients to self-manage their condition. These findings provide guidance for the ongoing evaluation of the effectiveness (including quality of engagement) of the intervention and highlight areas that might be strengthened in future iterations.

Title: Facilitators and barriers to social distancing for young people during the COVID-19 pandemic

Journal: BMC Public Health

Volume: 22

Issue: 1

Date: May

Short Title: Facilitators and barriers to social distancing for young people during the COVID-19 pandemic

DOI: 10.1186/s12889-022-13325-3

Article Number: 891

Accession Number: WOS:000790782100011

Abstract: Background Social (or physical) distancing is an important transmission-prevention behaviour that has been endorsed to minimize COVID-19 transmission. This qualitative study explores the facilitators of and barriers to social distancing for young people during the COVID-19 pandemic, with recognition that young people represent a unique demographic group, with differing psychosocial needs and experiences to other age cohorts. **Methods** Qualitative data was collected as part of a larger Qualtrics survey between July 28th 2020 and August 24th 2020. Eligible participants were young people living on the Island of Ireland, aged 16-25 years. The survey design was underpinned by the Capability, Opportunity, and Motivation model of behaviour change (COM-B). Semi-inductive thematic analysis was used to analyse comments collected via three free-text survey items. The COM-B model provided a thematic framework to organise subthemes extracted. **Results** A total of N = 477 young people completed the survey, of which N = 347 provided comments for at least one of three free-text survey items. The majority of respondents lived in Northern Ireland (96%), the average age was 21 years, and most respondents were female (73%) and were students (81%). Key barriers identified included lack of environmental support for social distancing (lack of physical Opportunity to social distance), observing other people not social distancing (lack of social Opportunities supporting social distancing), and missing physical interaction from others (relating to the dissuading influence of automatic Motivational factors i.e. the influence of loneliness). Key facilitators included presence of clear and consistent environmental cues and availability of space to support social distancing (increasing physical Opportunity to social distance), increasing awareness and perceived consequences of risk of transmission (enhancing reflective Motivational factors i.e. perceived benefits (versus costs) of social distancing), and increasing opportunities to observe others' adhering to guidelines (increasing social Opportunities supporting social distancing). **Conclusions** These findings suggest that the actions and endorsement of peers and the physical design of environments have a key role in influencing social distancing behaviour among young people living in NI. The COM-B factors identified in this study can inform the development of tailored interventions using models such as the Behaviour Change Wheel. The findings of this study suggest that intervention functions based on peer modelling and physical environmental restructuring and enablement should be prioritised, however it is imperative that interventions are co-designed with young people to foster collaboration and empowerment.

ISSN: 1356-1294

DOI: 10.1111/jep.12342

Accession Number: WOS:000371414500031

Abstract: Rationale Optimal, early management following a spinal cord injury (SCI) can limit individuals' disabilities and costs related to their care. Several knowledge syntheses were recently published to guide health care professionals with regard to early interventions in SCI patients. However, no knowledge translation (KT) intervention, selected according to a behaviour change theory, has been proposed to facilitate the use of SCI guidelines in an acute care setting. Objectives To develop theory-informed KT interventions to promote the application of evidence-based recommendations on the acute care management of SCI patients. Methods The first four phases of the knowledge-to-action model were used to establish the study design. Knowledge selection was based on the Grading of Recommendations Assessment, Development and Evaluation system. Knowledge adaptation to the local context was sourced from the ADAPTE process. The theoretical domains framework oriented the selection and development of the interventions based on an assessment of barriers and enablers to knowledge application. Results Twenty-nine recommendations were chosen and operationalized in measurable clinical indicators. Barriers related to knowledge, skills, perceived capacities, beliefs about consequences, social influences, and the environmental context and resources theoretical domains were identified. The mapping of behaviour change techniques associated with those barriers led to the development of an online educational curriculum, interdisciplinary clinical pathways as well as policies and procedures. Conclusions This research project allowed us developing KT interventions according to a thorough behavioural change methodology. Exposure to the generated interventions will support health care professionals in providing the best care to SCI patients.

Abstract: Background: While Patient and Public Involvement (PPI) is encouraged throughout the research process, engagement is typically limited to intervention design and post-analysis stages. There are few approaches to participatory data analyses within complex health interventions. Methods: Using qualitative data from a feasibility randomised controlled trial (RCT), this proof-of-concept study tests the value of a new approach to participatory data analysis called Participatory Theme Elicitation (PTE). Forty excerpts were given to eight members of a youth advisory PPI panel to sort into piles based on their perception of related thematic content. Using algorithms to detect communities in networks, excerpts were then assigned to a thematic cluster that combined the panel members' perspectives. Network analysis techniques were also used to identify key excerpts in each grouping that were then further explored qualitatively. Results: While PTE analysis was, for the most part, consistent with the researcher-led analysis, young people also identified new emerging thematic content. Conclusions: PTE appears promising for encouraging user led identification of themes arising from qualitative data collected during complex interventions. Further work is required to validate and extend this method.

Title: Supporting healthcare professionals to offer reproductive genetic carrier screening: a behaviour change theory approach

Journal: Australian Journal of Primary Health

Date: 2023 May

Short Title: Supporting healthcare professionals to offer reproductive genetic carrier screening: a behaviour change theory approach

ISSN: 1448-7527

DOI: 10.1071/py23022

Accession Number: WOS:000984701600001

Abstract: Background. As reproductive genetic carrier screening (RGCS) becomes more widely accessible, ensuring uptake by primary healthcare professionals (HCPs) is essential to equitable service provision. This study aimed to identify and prioritise implementation strategies to reduce barriers and support HCPs to routinely offer RGCS in Australia. Methods. HCPs (n = 990) involved in a large national research study, offering couples-based RGCS, were surveyed at three time points: prior to offering RGCS through the study (Survey 1: Barriers); 8+ weeks after offering to their patients (Survey 2: Possible supports); and towards the end of the study (Survey 3: Prioritised supports). HCPs were from primary care (e.g. general practice, midwifery) and tertiary care (e.g. fertility, genetics) settings. Results were analysed via a novel approach of using behaviour change theory (Capability, Opportunity and Motivation - COM.B) to align theory to practice. Results. Survey 1 (n = 599) identified four barrier themes: time constraints, lack of HCP knowledge and skill, patient receptivity, and HCP's perceived value of RGCS. Survey 2 (n = 358) identified 31 supports that could facilitate HCPs offering RGCS. Survey 3 (n = 390) was analysed separately by speciality and clinic location. Prioritised supports for primary care HCPs were 'regular continuing professional development activities' and 'a comprehensive website to direct patients for information'. There was general accord with the perceived importance of the supports, although some difference in relation to funding between professional groups and clinic locations. Conclusion. This study identified a range of supports acceptable to HCPs across specialties and geographic locations that policymakers may use to direct efforts to ensure the roll out of RGCS is equitable across Australia.

Abstract: Recent advances in genomic sequencing have improved the accessibility of reproductive genetic carrier screening (RGCS). As awareness and interest grows, non-genetic health care professionals are increasingly offering RGCS to consumers. We conducted a qualitative interview study informed by behaviour change theory to identify influences on health care professionals considered as 'early adopters' offering RGCS through Mackenzie's Mission, an Australian national research study investigating the implementation of free RGCS to couple's preconception or in early pregnancy. Interviews were deductively analysed using the Theoretical Domains Framework to examine barriers and enabling factors. In total, we interviewed 31 health care professionals, who were primarily general practitioners (n = 23) offering RGCS through Mackenzie's Mission. Upon analysis, 15 barriers and 44 enablers to implementation were identified and categorised across three health care professional target behaviours 1. Engaging with RGCS, 2. Identifying eligible patients, and 3. Offering RGCS. Whilst all Theoretical Domains Framework domains were present, barriers were predominantly categorised as 'Environmental Context and Resources' e.g., lack of time, followed by 'Knowledge' e.g., lack of understanding about genetics and 'Beliefs about Capabilities' e.g., concern about giving high risk results to patients. Although health care professionals expressed a preference for offering RGCS through a comprehensive and supported model of care, such as Mackenzie's Mission, barriers remain. By understanding what drives current health care professionals' behaviour towards offering RGCS, behaviour change theory provides an avenue to direct future efforts based on evidence and improve service delivery.

Abstract: Healthcare Systems are transforming from focusing on acute care to focusing on managing chronic conditions. In this process they are becoming highly distributed and specialized. Innovative approaches are needed to fully support the design and deployment of new eHealth interventions. Design should be based on theory and evidence, and deployment should be supported by a sustainable ICT platform, that enables interoperability and reusability by focusing on open standards, open data, open source technology and knowledge modeling. We tested one such method that focuses on using behavior change techniques for the design phase, and tested OpenEHR and BPMN2 as the basis for the ICT platform to support the deployment phase.

Article Number: e0208601
Accession Number: WOS:000452640900025
Abstract: Background Monitoring the reasons why a considerable

number of people do not receive recommended vaccinations allows identification of important trends over time, and designing and evaluating strategies to address vaccine hesitancy and increase vaccine uptake. Existing validated measures assessing vaccine hesitancy focus primarily on confidence in vaccines and the system that delivers them. However, empirical and theoretical work has stated that complacency (not perceiving diseases as high risk), constraints (structural and psychological barriers), calculation (engagement in extensive information searching), and aspects pertaining to collective responsibility (willingness to protect others) also play a role in explaining vaccination behavior. The objective was therefore to develop a validated measure of these 5C psychological antecedents of vaccination. Methods and findings Three cross-sectional studies were conducted. Study 1 uses factor analysis to develop an initial scale and assesses the sub-scales' convergent, discriminant, and concurrent validity (N = 1,445, two German convenience-samples). In Study 2, a sample representative regarding age and gender for the German population (N = 1,003) completed the measure for vaccination in general and for specific vaccinations to assess the potential need for a vaccine-specific wording of items. Study 3 compared the novel scale's performance with six existing measures of vaccine hesitancy (N= 350, US convenience-sample). As an outcome, a long (15-item) and short (5-item) 5C scale were developed as reliable and valid indicators of confidence, complacency, constraints, calculation, and collective responsibility. The 5C subscales correlated with relevant psychological concepts, such as attitude (confidence), perceived personal health status and invulnerability (complacency), self-control (constraints), preference for deliberation (calculation), and communal orientation (collective responsibility), among others. The new scale provided similar results when formulated in a general vs. vaccine-specific way (study 2). In a comparison of seven measures the 5C scale was constantly among the scales that explained the highest amounts of variance in analyses predicting single vaccinations (between 20% and 40%; study 2). The present studies are limited to the concurrent validity of the scales. Conclusions The 5C scale provides a novel tool to monitor psychological antecedents of vaccination and facilitates diagnosis, intervention design and evaluation. Its short version is suitable for field settings and regular global monitoring of relevant antecedents of vaccination.

Accession Number: WOS:000661853300002
Abstract: Marine litter is claimed to be one of the most meaningful environmental crises of the century. Education that supports behavior change is a tool to tackle this problem. However, there is a lack of research linking educational initiatives and marine litter issues. A literature review was conducted through a bibliometric and content analysis to explore the state of knowledge regarding educational actions. The results revealed that 2019 was the year with the highest number of publications and that 83.4% of the documents were collaborative efforts. Concerning educational approaches, hands-on and technological activities are being explored to raise awareness and stimulate behavior change. Students and questionnaires represent, respectively, the most common audience and evaluating method. More integrative actions and respective long-term methodological triangulation evaluation were identified as necessary in future studies. This paper is expected to contribute to innovative knowledge in the area by identifying the main gaps in the literature.

Date: Jun
Short Title: Application of the Behavior Change Wheel Within the Context of Internet-Based Cognitive Behavioral Therapy for Tinnitus Management
ISSN: 1059-0889
DOI: 10.1044/2022_aja-21-00160
Accession Number: WOS:000810501000016
Abstract: Purpose: Although experiencing tinnitus can lead to many difficulties, these can be reduced by using techniques derived from

cognitive behavioral therapy. Internet-based cognitive behavioral therapy (ICBT) has been developed to provide an accessible intervention. The aim of this study was to describe how ICBT can facilitate tinnitus management by identifying the active ingredients of the intervention from the perspective of health behavior change. Method: The ICBT intervention was evaluated using the Behavior Change Wheel in eight steps across the following three stages: (1) understanding the behavior, (2) identifying intervention options, and (3) identifying content and implementation options. Results: Target behaviors identified to reduce tinnitus distress, as well as additional problems associated with tinnitus, included goal setting, an increased understanding of tinnitus, encouraging deep breathing and progressive muscle relaxation, identifying and restructuring unhelpful thoughts, engaging in positive imagery, and reducing avoidance behaviors. ICBT provided the required components for individuals to be physically and psychologically capable of adapting to tinnitus, providing social and environmental opportunities to manage hearing loss through practice and training, and facilitated automatic and reflective motivation. Conclusion: Understanding ICBT in the context of the Behavior Change Wheel has helped identify how its effectiveness can be improved and can be used for future tinnitus intervention planning.

Title: The Feasibility of a Web-Based Educational Lifestyle Program for People With Multiple Sclerosis: A Randomized Controlled Trial

Journal: Frontiers in Public Health

Volume: 10

Date: Apr

Short Title: The Feasibility of a Web-Based Educational Lifestyle Program for People With Multiple Sclerosis: A Randomized Controlled Trial

DOI: 10.3389/fpubh.2022.852214

Article Number: 852214

Accession Number: WOS:000887923500001

Abstract: Background: Modifiable lifestyle factors are important to aid people with multiple sclerosis in the self-management of their disease. Current self-management programs are limited by their face-to-face mode of delivery but there is immense potential with the internet to deliver these programs effectively. Objective: The aims of this study are to assess the feasibility of a digitalized educational lifestyle self-management program for people with MS.

Methods: In this randomized controlled trial, people with MS were randomly allocated to participate in a 6-week tailored web-based educational lifestyle program or 6-week generic standard-care educational course, and were blinded to their allocation. Participants were recruited through multiple sclerosis (MS) Societies in four countries: Australia, New Zealand, Canada, and the United States. The primary outcome was to assess acceptability of the program defined as percentage completion of all modules at 6-weeks post-course commencement. Secondary outcomes included evaluating participant responses to the follow-up survey across three domains: accessibility, learnability, and desirability. Results: Thirty-five participants from Australia, Canada, New Zealand, and the US completed the baseline survey and were randomized. Four participants were deemed ineligible due to incomplete baseline data; therefore, nine out of 15 and eight out of 16 participants completed 100% of the course in the intervention and standard-care arm courses, respectively. Conclusions: This study found that this web-based educational lifestyle program is a feasible means of delivering educational content to people with MS via the internet according to our a priori targets of >40% of participants in the intervention arm, and >25% in the control arm to completing 100% of the course. It is therefore appropriate to evaluate this intervention further in a large, randomized controlled trial.

Title: Effectiveness and Acceptability of a Mobile Phone Text Messaging Intervention to Improve Blood Pressure Control (TEXT4BP) among Patients with Hypertension in Nepal: A Feasibility Randomised Controlled Trial

Journal: Global Heart

Volume: 17

Issue: 1

Short Title: Effectiveness and Acceptability of a Mobile Phone Text Messaging Intervention to Improve Blood Pressure Control (TEXT4BP) among Patients with Hypertension in Nepal: A Feasibility Randomised Controlled Trial

ISSN: 2211-8160

DOI: 10.5334/gh.1103

Article Number: 13

Accession Number: WOS:000761162000001

Abstract: Background: Uncontrolled blood pressure (BP) is the

leading cause of preventable deaths in low-and middle-income countries. mHealth interventions, such as mobile phone text messaging, are a promising tool to improve BP control, but research on feasibility and effectiveness in resource-limited settings remains limited. Objective: This feasibility study assessed the effectiveness and acceptability of a mobile phone text messaging intervention (TEXT4BP) to improve BP control and treatment adherence among patients with hypertension in Nepal. Methods: The TEXT4BP study was a two-arm, parallel-group, unblinded, randomised controlled pilot trial that included 200 participants (1:1) (mean age: 50.5 years, 44.5% women) with hypertension at a tertiary referral hospital in Kathmandu, Nepal. Patients in the intervention arm (n = 100) received text messages three times per week for three months. The control arm (n = 100) received standard care. The COM-B model informed contextual co-designed text messages. Primary outcomes were change in BP and medication adherence at three months. Secondary outcomes included BP control, medication adherence self-efficacy and knowledge of hypertension. A nested qualitative study assessed the acceptability of the intervention. Results: At three months, the intervention group had greater reductions in systolic and diastolic BP vs usual care [-7.09/-5.86 (p <= 0.003) vs -0.77/-1.35 (p >= 0.28) mmHg] [adjusted difference: systolic beta = -6.50 (95% CI, -12.6; -0.33) and diastolic BP beta = -4.60 (95% CI, -8.16; -1.04)], coupled with a greater proportion achieving target BP (70% vs 48%, p = 0.006). The intervention arm showed an improvement in compliance to antihypertensive therapy (p < 0.001), medication adherence (p < 0.001), medication adherence self-efficacy (p = 0.023) and knowledge on hypertension and its treatment (p = 0.013). Participants expressed a high rate of acceptability and desire to continue the TEXT4BP intervention. Conclusion: The TEXT4BP study provides promising evidence that text messaging intervention is feasible, acceptable, and effective to improve BP control in low-resource settings.

Short Title: A process evaluation of the UK-wide Antibiotic Guardian campaign: developing engagement on antimicrobial resistance

ISSN: 1741-3842

DOI: 10.1093/pubmed/fdw059

Accession Number: WOS:000404544500006

Abstract: Public Health England developed and led a new UK-wide pledge campaign aiming to improve behaviours around the prudent use and prescription of antibiotics. This paper presents a process evaluation for the first season of the campaign to determine the impact of the campaign and inform future campaigns. Data were collected from AntibioticGuardian.com and Google analytics between August 2014 and January 2015. The primary outcome was the decision to pledge and was assessed according to target audience, location, source and route of referral to the website. There were 47 158 unique visits to the website and 12 509 visitors made a pledge (26.5%) to become Antibiotic Guardians (AGs); 69% were healthcare professionals. Social media directed the most traffic to the website (24% of the public that signed up cited social media as how they discovered the campaign), other acquisition routes such as self-directed, email or website referral, were more effective at encouraging visitors to pledge. The campaign completed its goal of 10 000 AGs in the first year. Further work is required to improve engagement with target audiences and determine whether this campaign has an impact on antibiotic consumption and prescribing behaviour among the public and healthcare professionals.

Abstract: Many health care providers, with a variety of trainings, counsel clients on quitting smoking on a day-to-day basis. In their clinical practice, they draw from and adapt guidelines and research-based strategies to fit individual client situations and challenges. Designers of technologies to support quitting smoking can learn from these real world practices to create tools that better adapt to individual differences. We present findings from interviews with 28 providers with diverse experiences in smoking cessation counselling. Through analysis of their individualization strategies, challenges, and perceptions of technology, we find that providers: (1) individualize context appropriate coping strategies by involving clients in brainstorming, (2) emphasize the need to support nicotine withdrawal in clients, (3) mitigate social triggers and mediate social support for clients, and (4) need to navigate dependencies with other providers for managing medications and comorbid health conditions of clients. With this empirical understanding, we extend the discussion on the design of technology to support quitting smoking, highlight current barriers to individualization, and suggest future opportunities to address these barriers.

Title: Exploring challenges to nutrition intervention adherence using COM-B model among patients with wet age-related macular degeneration: a qualitative study

Journal: Bmj Open

Volume: 12

Issue: 11

Date: Nov

Short Title: Exploring challenges to nutrition intervention adherence using COM-B model among patients with wet age-related macular degeneration: a qualitative study

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-064892

Accession Number: WOS:000892973900015

Abstract: ObjectivesTo explore challenges to nutrition intervention adherence using the Capability, Opportunity and Motivation-Behaviour (COM-B) model among wet age-related macular degeneration (AMD) patients. These factors should be considered in the development of potential support and intervention programmes to address these problems.DesignA qualitative study was conducted with one-to-one and

face-to-face interviews with wet AMD patients using a semi-structured question guide. Data were analysed based on COM-B model: capability (physical and psychological), opportunity (physical and social) and motivation (reflective and automatic). Setting Southwest Hospital of Chongqing Province in China. Participants A convenient and purposive sample of 24 wet AMD patients were recruited. Results The themes and subthemes were identified: psychological capability: (1) insufficient knowledge of nutrition; (2) misconceptions about the disease and treatment; (3) knowledge conflict; physical capability: (1) physical restriction; (2) limited access to nutrition knowledge; physical opportunity: (1) communication between providers and patients; (2) health insurance and extra charges; (3) food environment; social opportunity: (1) stigma of disease; (2) family influence; reflective motivation: (1) self-efficacy; (2) attitude; (3) outcome expectancies; (4) lack of professional support; automatic motivation: (1) difficulties in changing eating habits; (2) mindset. Conclusion Medical staff should pay much attention to the process of patients' nutrition intervention. In addition, it is also necessary to develop professional and internet-based intervention to modify the dietary behaviour and improve the management skills of the patients.

Short Title: Replacing meat with alternative plant-based products (RE-MAP): a randomized controlled trial of a multicomponent behavioral intervention to reduce meat consumption

ISSN: 0002-9165

DOI: 10.1093/ajcn/nqab414

Accession Number: WOS:000768343000001

Abstract: Background Reducing meat consumption could protect the environment and human health. Objectives We tested the impact of a behavioral intervention to reduce meat consumption. Methods Adult volunteers who regularly consumed meat were recruited from the general public and randomized 1:1 to an intervention or control condition. The intervention comprised free meat substitutes for 4 weeks, information about the benefits of eating less meat, success stories, and recipes. The control group received no intervention or advice on dietary change. The primary outcome was daily meat

consumption after 4 weeks, assessed by a 7-day food diary, and repeated after 8 weeks as a secondary outcome. Other secondary and exploratory outcomes included the consumption of meat substitutes, cardiovascular risk factors, psychosocial variables related to meat consumption, and the nutritional composition of the diet. We also estimated the intervention's environmental impact. We evaluated the intervention using generalized linear mixed-effects models. Results Between June 2018 and October 2019, 115 participants were randomized. The baseline meat consumption values were 134 g/d in the control group and 130 g/d in the intervention group. Relative to the control condition, the intervention reduced meat consumption at 4 weeks by 63 g/d (95% CI: 44–82; $P < 0.0001$; $n = 114$) and at 8 weeks by 39 g/d (95% CI: 16–62; $P = 0.0009$; $n = 113$), adjusting for sex and baseline consumption. The intervention significantly increased the consumption of meat substitutes without changing the intakes of other principal food groups. The intervention increased intentions, positive attitudes, perceived control, and subjective norms of eating a low-meat diet and using meat substitutes, and decreased attachment to meat. At 8 weeks, 55% of intervention recipients identified as meat eaters, compared to 89% of participants in the control group. Conclusions A behavioral program involving free meat substitutes can reduce meat intake and change psychosocial constructs consistent with a sustained reduction in meat intake.

Article Number: 856730

Accession Number: WOS:000815029800001

Abstract: Background: Exercise programs have shown anxiolytic effects in psychiatric patients. Adherence to exercise programs and subsequent long-term lifestyle change is influenced by acute

affective responses of the exercise programs. This research aimed to assess acute affective responses of two different exercise modalities compared to a non-exercise control program and its effects on persisting physical activity behavior change. Methods: Sixty-six outpatients diagnosed with an anxiety disorder or posttraumatic stress disorder were randomly allocated to one of three groups in a randomized longitudinal controlled clinical pilot trial: climbing (n = 26), nordic walking (n = 19), social contact control (n = 21). Affective responses were assessed pre, during, and post activity. General physical activity behavior was recorded prior to participation in the program, post program, and at follow-ups three and six months after the program. Results: Multilevel modeling analyzes of 1,066 individual data points revealed increases in affective valence in the exercise sessions compared to the social contact sessions. State anxiety decreased in the climbing group compared to the social contact group. Physical activity behavior was increased immediately following the program as well as at six months follow-up in both exercise groups. A larger increase in affective valence during and after the sessions was associated with higher physical activity post program. Conclusions: Climbing and conventional nordic walking exercise sessions revealed positive affective changes in outpatients indicating therapeutic potential of both modalities for acute emotion regulation. In accordance with theoretical models of human behavior change, it was judged that the experience of a more pleasant affective state following the exercise sessions induced more persisting effects on physical activity behavior after the exercise programs.

Title: Antenatal preventative pelvic floor muscle exercise intervention led by midwives to reduce postnatal urinary incontinence (APPEAL): protocol for a feasibility and pilot cluster randomised controlled trial

Journal: Pilot and Feasibility Studies

Volume: 8

Issue: 1

Date: Oct

Short Title: Antenatal preventative pelvic floor muscle exercise intervention led by midwives to reduce postnatal urinary incontinence (APPEAL): protocol for a feasibility and pilot cluster randomised controlled trial

DOI: 10.1186/s40814-022-01185-y

Article Number: 231

Accession Number: WOS:000871188500003

Abstract: Background: Antenatal pelvic floor muscle exercises (PFME) in women without prior urinary incontinence (UI) are effective in reducing postnatal UI; however, UK midwives often do not provide advice and information to women on undertaking PFME, with evidence that among women who do receive advice, many do not perform PFME. Methods: The primary aim of this feasibility and pilot cluster randomised controlled trial is to provide a potential assessment of the feasibility of undertaking a future definitive trial of a midwifery-led antenatal intervention to support women to perform PFME in pregnancy and reduce UI postnatally. Community midwifery teams in participating NHS sites comprise trial clusters (n = 17). Midwives in teams randomised to the intervention will be trained on how to teach PFME to women and how to support them in undertaking PFME in pregnancy. Women whose community midwifery teams are allocated to control will receive standard antenatal care only. All pregnant women who give birth over a pre-selected sample month who receive antenatal care from participating community midwifery teams (clusters) will be sent a questionnaire at 10–12 weeks postpartum (around 1400–1500 women). Process evaluation data will include interviews with midwives to assess if the intervention could be implemented as planned. Interviews with women in both trial arms will explore their experiences of support from midwives to perform PFME during pregnancy. Data will be stored securely at the Universities of Birmingham and Exeter. Results will be disseminated through publications aimed at maternity service users, clinicians, and academics and inform a potential definitive trial of effectiveness. The West Midlands–Edgbaston Research Ethics Committee approved the study protocol. Discussion: Trial outcomes will determine if criteria to progress to a definitive cluster trial are met. These include women's questionnaire return rates, prevalence of UI, and other health outcomes as reported by women at 10–12 weeks postpartum. Progress to a definitive trial however is likely to be prevented in the UK context by new perinatal pelvic health service, although this may be possible elsewhere.

DOI: 10.1186/s40814-019-0497-3

Article Number: 117

Accession Number: WOS:000704682200001

Abstract: Introduction A high BMI during and after pregnancy is linked to poor pregnancy outcomes and contributes to long-term maternal obesity, hypertension, and diabetes. Evidence of feasible, effective postnatal interventions is lacking. This randomised controlled trial will assess the feasibility of conducting a future definitive trial to determine effectiveness and cost-effectiveness of lifestyle information and access to Slimming World (R) (Alfreton, UK) groups for 12 weeks commencing from 8 to 16 weeks postnatally, in relation to supporting longer-term postnatal weight management in women in an ethnically diverse inner city population. Methods/analysis Women will be recruited from one maternity unit in London. To be eligible, women will be overweight (BMI 25–29.9 kg/m²) or obese (BMI ≥ 30 kg/m²) as identified at their first antenatal contact, or have a normal BMI (18.5–24.9 kg/m²) at booking but gain excessive gestational weight as assessed at 36 weeks gestation. Women will be aged 18 and over, can speak and read English, expecting a single baby, and will not have accessed weight management groups in this pregnancy. Women will be randomly allocated to standard care plus lifestyle information and access to Slimming World (R) (Alfreton, UK) groups or standard care only. A sample of 130 women is required. Feasibility trial objectives reflect those considered most important inform a decision about undertaking a definitive future trial. These include estimation of impact of lifestyle information and postnatal access to Slimming World (R) (Alfreton, UK) on maternal weight change between antenatal booking weight and weight at 12 months postbirth, recruitment rate and time to recruitment, retention rate, influence of lifestyle information and Slimming World (R) (Alfreton, UK) groups on weight management, diet, physical activity, breastfeeding, smoking cessation, alcohol intake, physical and mental health, infant health, and health-related quality of life 6 and 12 months postnatally. An embedded process evaluation will assess acceptability of study processes and procedures to women. Ethics/dissemination London-Camberwell St Giles Research Ethics Committee, reference: 16/L0/1422. Outcomes will be disseminated in peer-reviewed journals and presentations at national and international conferences.

Accession Number: WOS:000912315500013

Abstract: Objectives To examine the recruitment, retention, and
preliminary effects of a Christmas themed physical activity
intervention designed to increase participation in physical activity
and decrease sedentary behaviour in inactive adults. Design Pilot
randomised controlled trial. Setting Recruitment from social medial
platforms, workplaces, and community groups in the UK. Participants
107 inactive adults (who did not meet the UK guidelines for physical
activity) aged 18-75 years. Interventions The intervention consisted
of an email sent to participants each day of Advent (1-24 December
2021), which contained a Christmas themed physical activity idea to
be completed that day. Each physical activity idea was presented in
three intensity formats, including Easy Elf (light intensity),
Moderate Mrs Claus (moderate intensity), and Strenuous Santa
(vigorous intensity). The comparator group received a leaflet about
healthy living on the 1 December. Main outcome measures Participants
were randomly assigned (2:1) to either the intervention or control
and were masked to group allocation before randomisation. Primary
outcomes were recruitment rate, retention, and weekly minutes of
participation in self-reported moderate-to-vigorous intensity
physical activity by use of the exercise vital signs questionnaire.
Primary analysis compared change in minutes of moderate-to-vigorous
intensity physical activity from baseline to weeks one, two, and
three during the Active Advent intervention. Secondary outcomes were
participation in muscle strengthening based physical activity (days
per week), accelerometer measured moderate-to-vigorous intensity
physical activity, light intensity physical activity, total physical

activity, and sedentary time (minutes per day), and enjoyment of and adherence to the intervention. Results 323 individuals expressed interest in participating in the trial and 107 were randomly assigned to the intervention (n=71) or the comparator (n=36) group. The recruitment target (n=105) was reached within 19 days of starting recruitment. 23 (21%) of 107 participants were lost to follow-up. On average, the groups reported participation in similar minutes of moderate-to-vigorous intensity physical activity in weeks one and two. At week three, the adjusted mean difference between groups was 20.6 minutes of participation in moderate-to-vigorous intensity physical activity per week (95% confidence interval -29.7 to 70.9) in favour of the intervention group. Accelerometer data showed that the intervention group spent fewer minutes sedentary per day than comparators (mean difference -58.6 (-113.5 to -3.8)). Overall, 42 (70%) of 60 participants in the intervention group reported that they liked the intervention and 41 (69%) of 59 reported that they completed the Active Advent intervention ideas each day. Conclusions The public were interested to participate in a Christmas themed physical activity intervention during Advent, which might increase physical activity and reduce time sedentary. Enjoyment of, and adherence to the intervention shows the potential benefit that Christmas themed physical activity campaigns/ initiatives might have for improving public health.

Abstract: Sedentary behaviour is highly frequent in individuals, and this chapter focusses on sedentary behaviour at the individual level of analysis. Using the behavioural epidemiology framework, the chapter summarizes issues concerning individual-level knowledge and approaches. It focusses mainly on correlates and behaviour change. Correlates discussed include whether sedentary behaviour and

physical activity are associated and the coexistence of other health behaviours. Barriers to sedentary behaviour change are considered. A number of psychological theories are covered that have been popular in physical activity research, and their application to sedentary behaviour is commented upon. Moreover, alternative perspectives are covered, including notions of behavioural economics, habit, and nudging. Coverage is given to sedentary behaviour interventions, including those involving education, prompting, and wearable technology. Behaviour change techniques that seem to be useful for successful behaviour change are covered.

Title: High-intensity interval exercise training for public health: a big HIT or shall we HIT it on the head?

Journal: International Journal of Behavioral Nutrition and Physical Activity

Volume: 12

Date: Jul

Short Title: High-intensity interval exercise training for public health: a big HIT or shall we HIT it on the head?

DOI: 10.1186/s12966-015-0254-9

Article Number: 95

Accession Number: WOS:000358030100001

Abstract: Background: The efficacy of high-intensity interval training for a broad spectrum of cardio-metabolic health outcomes is not in question. Rather, the effectiveness of this form of exercise is at stake. In this paper we debate the issues concerning the likely success or failure of high-intensity interval training interventions for population-level health promotion. Discussion: Biddle maintains that high-intensity interval training cannot be a viable public health strategy as it will not be adopted or maintained by many people. This conclusion is based on an analysis of perceptions of competence, the psychologically aversive nature of high-intensity exercise, the affective component of attitudes, the less conscious elements of motivated behaviour that reflect our likes and dislikes, and analysis using the RE-AIM framework.

Batterham argues that this appraisal is based on a constrained and outmoded definition of high-intensity interval training and that truly practical and scalable protocols have been – and continue to be – developed. He contends that the purported displeasure associated with this type of exercise has been overstated. Biddle suggests that the way forward is to help the least active become more active rather than the already active to do more. Batterham claims that traditional physical activity promotion has been a spectacular failure. He proposes that, within an evolutionary health promotion framework, high-intensity interval training could be a successful population strategy for producing rapid physiological

adaptations benefiting public health, independent of changes in total physical activity energy expenditure. Summary: Biddle recommends that we focus our attention elsewhere if we want population-level gains in physical activity impacting public health. His conclusion is based on his belief that high-intensity interval training interventions will have limited reach, effectiveness, and adoption, and poor implementation and maintenance. In contrast, Batterham maintains that there is genuine potential for scalable, enjoyable high-intensity interval exercise interventions to contribute substantially to addressing areas of public health priority, including prevention and treatment of Type 2 diabetes and cardiovascular disease.

Accession Number: WOS:000365891600027

Abstract: Aims Type 2 diabetes mellitus (T2DM), a serious and prevalent chronic disease, is traditionally associated with older age. However, due to the rising rates of obesity and sedentary life-styles, it is increasingly being diagnosed in the younger population. Sedentary (sitting) behaviour has been shown to be associated with greater risk of cardio-metabolic health outcomes, including T2DM. Little is known about effective interventions to reduce sedentary behaviour in younger adults at risk of T2DM. We aimed to investigate, through a randomised controlled trial (RCT) design, whether a group-based structured education workshop focused on sitting reduction, with self-monitoring, reduced sitting time. Methods Adults aged 18-40 years who were either overweight (with an additional risk factor for T2DM) or obese were recruited for the Sedentary Time ANd Diabetes (STAND) RCT. The intervention programme

comprised of a 3-hour group-based structured education workshop, use of a self-monitoring tool, and follow-up motivational phone call. Data were collected at three time points: baseline, 3 and 12 months after baseline. The primary outcome measure was accelerometer-assessed sedentary behaviour after 12 months. Secondary outcomes included other objective (activPAL) and self-reported measures of sedentary behaviour and physical activity, and biochemical, anthropometric, and psycho-social variables. Results 187 individuals (69% female; mean age 33 years; mean BMI 35 kg/m²) were randomised to intervention and control groups. 12 month data, when analysed using intention-to-treat analysis (ITT) and per-protocol analyses, showed no significant difference in the primary outcome variable, nor in the majority of the secondary outcome measures. Conclusions A structured education intervention designed to reduce sitting in young adults at risk of T2DM was not successful in changing behaviour at 12 months. Lack of change may be due to the brief nature of such an intervention and lack of focus on environmental change. Moreover, some participants reported a focus on physical activity rather than reductions in sitting per se. The habitual nature of sedentary behaviour means that behaviour change is challenging.

Short Title: Effectiveness of promotion and support for physical activity maintenance post total hip arthroplasty—study protocol for a pragmatic, assessor-blinded, randomized controlled trial (the PANORAMA trial)

DOI: 10.1186/s13063-022-06610-4

Article Number: 647

Accession Number: WOS:000840314800001

Abstract: Background: Total hip arthroplasty is considered an efficacious procedure for relieving pain and disability, but despite that objectively measured physical activity level remains unchanged compared to pre-surgery and is still considerably lower than that of a healthy age- and sex-matched population 6–12 months post-surgery. Since there is a graded relationship between physical activity level and functional performance, increasing physical activity may enhance the outcome of the procedure. This study aims to investigate whether promotion and support of physical activity initiated 3 months after total hip arthroplasty complementary to usual rehabilitation care can increase objective measured physical activity 6 months post-surgery. Methods: The trial is designed as a pragmatic, parallel group, two-arm, assessor-blinded, superiority, randomized (1:1), controlled trial with post intervention follow-up 6 and 12 months after total hip arthroplasty. Home-dwelling, independent, and self-reliant patients with hip osteoarthritis are provisionally enrolled prior to surgery and rescreened about 2–3 months post-surgery to confirm eligibility. Baseline assessment is conducted 3 months post-surgery. Subsequently, patients (n=200) are randomized to either a 3-month, multimodal physical activity promotion/education intervention or control (no further attention). The intervention consists of face-to-face and telephone counselling, patient education material, pedometer, and step-counting journal. The primary outcome is objectively measured physical activity, specifically the proportion of patients that complete on average ≥ 8000 steps per day 6 months post-surgery. Secondary outcomes include core outcomes (i.e., physical function, pain, and patient global

assessment) and health-related quality of life. Furthermore, we will explore the effect of the intervention on self-efficacy and outcome expectations (i.e., tertiary outcomes). Discussion: By investigating the effectiveness of a pedometer-driven, face-to-face, and telephone-assisted counselling, behavior change intervention in complementary to usual rehabilitation, we hope to deliver applicable and generalizable knowledge to support physical activity after total hip arthroplasty and potentially enhance the outcome of the procedure.

DOI: 10.1136/bmjopen-2021-055347

Article Number: e055347

Accession Number: WOS:000798799500016

Abstract: Introduction Despite the potential benefits of advance care planning, uptake in older adults is low. In general, there is a lack of guidance as to how to initiate advance care planning conversations and encourage individuals to take action in planning their future care, including after emergency hospitalisation. Participatory action research methods are harnessed in health services research to design interventions that are relevant to end-users and stakeholders. This study aims to involve older persons, carers and healthcare professionals in co-designing an intervention to increase uptake of advance care planning in later life, which can be used by social contacts and healthcare professionals, particularly in the context of a recent emergency hospitalisation. Methods and analysis The theory-driven participatory design research method integrates and adapts accelerated experience-based co-design with the behaviour change wheel, in the form of a collaborative

multi-stakeholder co-design workshop. In total, 12 participants, comprising 4 lay persons aged 70+, 4 carers and 4 healthcare professionals with experience in elder care, will be recruited to participate in two online half-day sessions, together comprising one online workshop. There will be a maximum of two workshops. First, in the discovery phase, participants will reflect on findings from earlier qualitative research on views and experiences of advance care planning from three workstreams: patients, carers and healthcare professionals. Second, in the co-design phase, participants will explore practical mechanisms in which older persons aged 70+ can be encouraged to adopt advance care planning behaviours based on the behaviour change wheel, in order to co-design a behavioural intervention to increase uptake of advance care planning in older adults after an emergency hospitalisation. Ethics and dissemination Ethical approval has been obtained from the Science Engineering Technology Research Ethics Committee at Imperial College London (Reference: 19IC5538). The findings from this study will be disseminated through publications, conferences and meetings. Short Title: Understanding Farmers' Behavior and Their Decision-Making Process in the Context of Cattle Diseases: A Review of Theories and Approaches

DOI: 10.3389/fvets.2021.687699

Article Number: 687699

Accession Number: WOS:000730746400001

Abstract: Understanding farmers' behavior regarding disease control is essential to successfully implement behavior change interventions that improve uptake of best practices. A literature review was conducted to identify theoretical underpinnings, analytical methodologies, and key behavioral determinants that have been described to understand farmers' behavior in disease control and prevention on cattle farms. Overall, 166 peer-reviewed manuscripts from studies conducted in 27 countries were identified. In the past decade, there were increasing reports on farmers' motivators and barriers, but no indication of application of appropriate social science methods. Furthermore, the majority (58%) of reviewed studies lacked a theoretical framework in their study design. However, when a theoretical underpinning was applied, the Theory of Planned

Behavior was most commonly used (14% of total). The complexity of factors impacting farmers' behavior was illustrated when mapping all described key constructs of the reviewed papers in behavior change frameworks, such as the socioecological framework and the Capability, Opportunity and Motivation Behavior (COM-B) model. Constructs related to personal influences and relationships between farmers and veterinarians were overrepresented, whereas constructs related to other interpersonal and contextual environments were not extensively studied. There was a general lack of use of validated scales to measure constructs and empirically validated theoretical frameworks to understand and predict farmers' behavior. Furthermore, studies mainly focused on measurements of intention of stakeholder behavior rather than actual behavior, although the former is a poor predictor of the latter. Finally, there is still a lack of robust evidence of behavior change interventions or techniques that result in a successful change in farmers' behavior. We concluded that for a sustainable behavior change, studies should include wider constructs at individual, interpersonal, and contextual levels. Furthermore, the use of empirically validated constructs and theoretical frameworks is encouraged. By using coherent frameworks, researchers could link constructs to design interventions, and thereby take the first step toward theory-driven, evidence-based interventions to influence farmers' behavior for disease control.

Journal: Npj Primary Care Respiratory Medicine

Volume: 27

Date: Mar

Short Title: Management of respiratory tract infections in young
children—A qualitative study of primary care providers' perspectives

DOI: 10.1038/s41533-017-0018-x

Article Number: 15

Accession Number: WOS:000396287400001

Abstract: Respiratory tract infections in young children are the most common cause of general practice visits in Australia. Despite the availability of clinical practice guidelines, the treatment and management of respiratory tract infections in young children is inconsistent. The aim of the study was to explore the management of respiratory tract infections in young children from a multidisciplinary perspective using across-sectional qualitative

research design based on the theoretical domains framework and the Capability, Opportunity and Motivation-B model. In-depth interviews were conducted with 30 primary care providers to explore their knowledge, views and management of respiratory tract infections in young children. Interviews focused on symptomatic management, over-the-counter medications and antibiotic use, and data were thematically analysed. Our findings showed that factors such as primary care providers' time constraints, parental anxiety, general practitioners' perception of what parents want, perceived parental pressure, and fear of losing patients were some of the reasons why primary care providers did not always adhere to guideline recommendations. Primary care providers also provided conflicting advice to parents concerning over-the-counter medications and when children should resume normal activities. Overall, this study showed that complex interactions involving emotional and psychological factors influenced the decision making process of primary care providers' management of respiratory tract infections in young children. A team care approach with consistent advice, and improved communication between primary care providers and parents is vital to overcome some of these barriers and improve guideline adherence. The findings of this research will inform the development of interventions to better manage respiratory tract infections in young children.

Short Title: Quittr: The Design of a Video Game to Support Smoking Cessation

ISSN: 2291-9279

DOI: 10.2196/games.6258

Article Number: e19

Accession Number: WOS:000390935000002

Abstract: Background: Smoking is recognized as the largest, single, preventable cause of death and disease in the developed world. While the majority of smokers report wanting to quit, and many try each year, smokers find it difficult to maintain long-term abstinence. Behavioral support, such as education, advice, goal-setting, and

encouragement, is known to be beneficial in improving the likelihood of succeeding in a quit attempt, but it remains difficult to effectively deliver this behavioral support and keep the patient engaged with the process for a sufficient duration. In an attempt to solve this, there have been numerous mobile apps developed, yet engagement and retention have remained key challenges that limit the potential effectiveness of these interventions. Video games have been clearly linked with the effective delivery of health interventions, due to their capacity to increase motivation and engagement of players. Objective: The objective of this study is to describe the design and development of a smartphone app that is theory-driven, and which incorporates gaming characteristics in order to promote engagement with content, and thereby help smokers to quit. Methods: Game design and development was informed by a taxonomy of motivational affordances for meaningful gamified and persuasive technologies. This taxonomy describes a set of design components that is grounded in well-established psychological theories on motivation. Results: This paper reports on the design and development process of Quittr, a mobile app, describing how game design principles, game mechanics, and game elements can be used to embed education and support content, such that the app actually requires the user to access and engage with relevant educational content. The next stage of this research is to conduct a randomized controlled trial to determine whether the additional incentivization game features offer any value in terms of the key metrics of engagement—how much content users are consuming, how many days users are persisting with using the app, and what proportion of users successfully abstain from smoking for 28 days, based on user-reported data and verified against a biochemical baseline using cotinine tests. Conclusions: We describe a novel, and theoretically-informed mobile app design approach that has a broad range of potential applications. By using the virtual currency approach, we remove the need for the game to comprehensively integrate the healthy activity as part of its actual play mechanics. This opens up the potential for a wide variety of health problems to be tackled through games where no obvious play mechanic presents itself. The implications of this app are that similar approaches may be of benefit in areas such as managing chronic conditions (diabetes, heart disease, etc), treating substance abuse (alcohol, illicit drugs, etc), diet and exercise, eating disorders (anorexia, bulimia, and binge eating), and various phobias.

Short Title: Rock fisher behaviours and perceptions regarding drowning risk assessed by direct observation and self-report: A public awareness campaign evaluation

ISSN: 1036-1073

DOI: 10.1002/hpja.583

Accession Number: WOS:000760035200001

Abstract: Issue addressed Participants engaged in rock fishing are at risk of drowning. Following coronial investigation of fatalities, a 3-year safety campaign targeting rock fishers was developed in Victoria, Australia. Key campaign messages were wearing lifejackets, not fishing alone, and checking sea and weather conditions. The reported study provides results from a campaign evaluation. Methods Evaluation by self-report and direct observation of safety attitudes and behaviours was undertaken pre- and during campaign. Data collections were as follows: (a) online survey of rock fishers recruited from panels, social media and rock fishing networks (n = 350) and (b) rock fisher direct observation and self-report at selected Victorian rock fishing platforms (n = 282; n = 58, respectively). Results Safety message recall was reported by 51.7% of rock fishers surveyed online though far fewer recalled campaign key messages. No effect on key safety behaviours or attitudes were detected for fishers on platforms during campaign. Never wearing a lifejacket was reported by 31.8% online, 60.3% at platforms and observed for 97.4%. From direct observation, most participants did

not fish alone and checked conditions on arrival. Conclusion Campaign evaluation measures showed mixed outcomes. Irrespective, most rock fishers carry high drowning risk through failure to wear lifejackets. Legal mandating of lifejackets for identified high-risk platform is being introduced for Victoria, although careful evaluation is required to detect unanticipated outcomes. Informing future campaign evaluation, complementary methods highlight likely bias in self-reporting through faulty recall or social desirability. So what? Future campaigns require innovative or novel design, over longer duration, to capture attention and change rock fisher behaviours.

Title: Effects of a multimedia campaign on HIV self-testing and PrEP outcomes among young people in South Africa: a mixed-methods impact evaluation of 'MTV Shuga Down South'

Journal: Bmj Global Health

Volume: 7

Issue: 4

Date: Apr

Short Title: Effects of a multimedia campaign on HIV self-testing and PrEP outcomes among young people in South Africa: a mixed-methods impact evaluation of 'MTV Shuga Down South'

ISSN: 2059-7908

DOI: 10.1136/bmjgh-2021-007641

Article Number: e007641

Accession Number: WOS:000778185000002

Abstract: Introduction Innovative HIV technologies can help to reduce HIV incidence, yet uptake of such tools is relatively low among young people. To create awareness and demand among adolescents and young adults, a new campaign of the pan-African MTV Shuga series ('Down South 2'; DS2), featured storylines and messages about HIV self-testing (HIVST) and pre-exposure prophylaxis (PrEP) through television, radio and accompanying multimedia activities in 2019-2020. Methods We conducted a mixed-methods evaluation of the new MTV Shuga series among 15-24 years old in Eastern Cape, South Africa, in 2020. Quantitative and qualitative methods were used to investigate complementary evaluations questions, namely, whether and how the DS2 campaign works. A web-based survey, promoted via social media platforms of schools, universities and communities, assessed

exposure to MTV Shuga and knowledge of HIV status; secondary outcomes included awareness and uptake of HIVST and PrEP. We used multivariable logistic regression to estimate associations between exposure to DS2 and each outcome, adjusting for sociodemographic factors, media assets and exposure to other media campaigns. An embedded qualitative evaluation explored mechanisms of DS2's impact through deductive and inductive thematic analysis of in-depth individual and group interviews. Results Among 3431 online survey participants, 43% had engaged with MTV Shuga and 24% with DS2 specifically. Knowledge of HIV status was higher among those exposed to DS2 (71%) vs those who were not (39%; adjusted OR=2.26 (95% CI 1.78 to 2.87)). Exposure was also associated with increased awareness of HIVST (60% vs 28%; aOR=1.99 (1.61 to 2.47)) and use of HIVST (29% vs 10%; aOR=2.49 (1.95 to 3.19)). One-third of respondents were aware of PrEP, with higher proportions among those exposed versus non-exposed to DS2 (52% vs 27%; aOR=1.90 (1.53 to 2.35)). Qualitative insights identified mechanisms by which DS2 increased awareness, confidence and motivation to use HIVST and PrEP, but had less influence on service access. Conclusions We found evidence consistent with a positive causal impact of the MTV Shuga DS2 campaign on HIV prevention outcomes among young people in a high-prevalence setting. As diverse testing and PrEP technologies become accessible, an immersive edutainment campaign can help to expand HIV prevention choices and close age and gender gaps in HIV testing and prevention goals.

Short Title: Using organization theory to position middle-level managers as agents of evidence-based practice implementation

ISSN: 1748-5908

DOI: 10.1186/s13012-021-01106-2

Article Number: 37

Accession Number: WOS:000638585900001

Abstract: Middle-level managers (MLMs; i.e., healthcare professionals who may fill roles including obtaining and diffusing information, adapting information and the intervention, mediating between strategy and day-to-day activities, and selling intervention implementation) have been identified as having significant influence

on evidence-based practice (EBP) implementation. We argue that understanding whether and how MLMs influence EBP implementation is aided by drawing upon organization theory. Organization theories propose strategies for increasing MLMs' opportunities to facilitate implementation by optimizing their appreciation of constructs which we argue have heretofore been treated separately to the detriment of understanding and facilitating implementation: EBPs, context, and implementation strategies. Specifically, organization theory encourages us to delineate different types of MLMs and consider how generalist and hybrid MLMs make different contributions to EBP implementation. Organization theories also suggest that MLMs' understanding of context allows them to adapt EBPs to promote implementation and effectiveness; MLMs' potential vertical linking pin role may be supported by increasing MLMs' interactions with external environment, helping them to understand strategic pressures and opportunities; and how lateral connections among MLMs have the potential to optimize their contribution to EBP implementation as a collective force. We end with recommendations for practice and future research.

Date: Nov

Short Title: Potential determinants of health-care professionals' use of survivorship care plans: a qualitative study using the theoretical domains framework

ISSN: 1748-5908

DOI: 10.1186/s13012-014-0167-z

Article Number: 167

Accession Number: WOS:000347431900002

Abstract: Background: Survivorship care plans are intended to improve coordination of care for the nearly 14 million cancer survivors in the United States. Evidence suggests that survivorship care plans (SCPs) have positive outcomes for survivors, health-care professionals, and cancer programs, and several high-profile organizations now recommend SCP use. Nevertheless, SCP use remains limited among health-care professionals in United States cancer programs. Knowledge of barriers to SCP use is limited in part because extant studies have used anecdotal evidence to identify determinants. This study uses the theoretical domains framework to identify relevant constructs that are potential determinants of SCP use among United States health-care professionals. Methods: We

conducted semi-structured interviews to assess the relevance of 12 theoretical domains in predicting SCP use among 13 health-care professionals in 7 cancer programs throughout the United States with diverse characteristics. Relevant theoretical domains were identified through thematic coding of interview transcripts, identification of specific beliefs within coded text units, and mapping of specific beliefs onto theoretical constructs. Results: We found the following theoretical domains (based on specific beliefs) to be potential determinants of SCP use: health-care professionals' beliefs about the consequences of SCP use (benefit to survivors, health-care professionals, and the system as a whole); motivation and goals regarding SCP use (advocating SCP use; extent to which using SCPs competed for health-care professionals' time); environmental context and resources (whether SCPs were delivered at a dedicated visit and whether a system, information technology, and funding facilitated SCP use); and social influences (whether using SCPs is an organizational priority, influential people support SCP use, and people who could assist with SCP use buy into using SCPs). Specific beliefs mapped onto the following psychological constructs: outcome expectancies, intrinsic motivation, goal priority, resources, leadership, and team working. Conclusions: Previous studies have explored a limited range of determinants of SCP use. Our findings suggest a more comprehensive list of potential determinants that could be leveraged to promote SCP use. These results are particularly timely as cancer programs face impending SCP use requirements. Future work should develop instruments to measure the potential determinants and assess their relative influence on SCP use.

Short Title: Relationships between Child Development at School Entry and Adolescent Health—A Participatory Systematic Review

DOI: 10.3390/ijerph182111613

Article Number: 11613

Accession Number: WOS:000719000300001

Abstract: The relationship between child development and adolescent health, and how this may be modified by socio-economic conditions, is poorly understood. This limits cross-sector interventions to address adolescent health inequality. This review summarises evidence on the associations between child development at school starting age and subsequent health in adolescence and identifies factors affecting associations. We undertook a participatory systematic review, searching electronic databases (MEDLINE, PsycINFO, ASSIA and ERIC) for articles published between November 1990 and November 2020. Observational, intervention and review studies reporting a measure of child development and subsequent health outcomes, specifically weight and mental health, were included. Studies were individually and collectively assessed for quality using a comparative rating system of stronger, weaker, inconsistent or limited evidence. Associations between child development and adolescent health outcomes were assessed and reported by four domains of child development (socio-emotional, cognitive, language and communication, and physical development). A conceptual diagram, produced with stakeholders at the outset of the study, acted as a framework for narrative synthesis of factors that modify or mediate associations. Thirty-four studies were included. Analysis indicated stronger evidence of associations between measures of socio-emotional development and subsequent mental health and weight outcomes; in particular, positive associations between early externalising behaviours and later internalising and externalising, and negative associations between emotional wellbeing and later internalising and unhealthy weight. For all other domains of child development, although associations with subsequent health were positive, the evidence was either weaker, inconsistent or limited. There was limited evidence on factors that altered associations. Positive socio-emotional development at school starting age appears particularly important for subsequent mental health and weight in adolescence. More collaborative research across health and education is needed on other domains of development and on the mechanisms that link development and later health, and on how any relationship is modified by socio-economic context.

Short Title: Raising the topic of weight in general practice: perspectives of GPs and primary care nurses

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2015-008546

Article Number: e008546

Accession Number: WOS:000359164800016

Abstract: Objective: To explore general practitioners' (GPs) and primary care nurses' perceived barriers to raising the topic of weight in general practice. Design: A qualitative study using the Theoretical Domains Framework (TDF). 34 semistructured interviews were conducted to explore views, opinions and experiences of initiating a discussion about weight. Content and thematic analyses were used to analyse the interview transcripts. Setting: General practices located in one primary care trust in the South West of England. Participants: 17 GPs and 17 nurses aged between 32 and 66 years. The modal age range for GPs was 30-39 years and for nurses, 40-49 years. Results: Barriers were synthesised into three main themes: (1) limited understanding about obesity care, (2) concern about negative consequences, and (3) having time and resources to raise a sensitive topic. Most barriers were related to raising the topic in more routine settings, rather than when dealing with an associated medical condition. GPs were particularly worried about damaging their relationship with patients and emphasised the need to follow their patient's agenda. Conclusions: Uncertainty about obesity, concerns about alienating patients and feeling unable to raise the topic within the constraints of a 10 min consultation, is adding to the reluctance of GPs and nurses to broach the topic of weight. Addressing these concerns through training or by providing evidence of effective interventions that are feasible to deliver within consultations may lead to greater practitioner engagement and willingness to raise the topic.

Short Title: Impact of Contextual Factors on the Effect of Interventions to Improve Health Worker Performance in Sub-Saharan Africa: Review of Randomised Clinical Trials

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0145206

Article Number: e0145206

Accession Number: WOS:000367801400026

Abstract: Background Africa bears 24% of the global burden of disease but has only 3% of the world's health workers. Substantial variation in health worker performance adds to the negative impact of this significant shortfall. We therefore sought to identify interventions implemented in sub-Saharan Africa aiming to improve health worker performance and the contextual factors likely to influence local effectiveness. **Methods and Findings** A systematic search for randomised controlled trials of interventions to improve health worker performance undertaken in sub-Saharan Africa identified 41 eligible trials. Data were extracted to define the interventions' components, calculate the absolute improvement in performance achieved, and document the likelihood of bias. Within-study variability in effect was extracted where reported. Statements about contextual factors likely to have modified effect were subjected to thematic analysis. Interventions to improve health worker performance can be very effective. Two of the three trials assessing mortality impact showed significant reductions in death rates (age<5 case fatality 5% versus 10%, $p<0.01$; maternal in-hospital mortality 6.8/1000 versus 10.3/1000; $p<0.05$). Eight of twelve trials focusing on prescribing had a statistically significant positive effect, achieving an absolute improvement varying from 9% to 48%. However, reported range of improvement between centres within trials varied substantially, in many cases exceeding the mean effect. Nine contextual themes were identified as modifiers of intervention effect across studies; most frequently cited were supply-line failures, inadequate supervision or management, and failure to follow-up training interventions with ongoing support, in addition to staff turnover. **Conclusions** Interventions to improve performance of existing staff and service quality have the potential to improve patient care in underserved settings. But in order to implement interventions effectively, policy makers need to understand and address the contextual factors which can contribute to differences in local effect. Researchers therefore must recognise the importance of reporting how context may modify effect size.

Accession Number: WOS:000797348600001
Abstract: Objectives The social ties people have with one another
are known to influence behaviour, and how information is accessed
and interpreted. It is unclear, however, how the social networks
that exist in multi-professional health care workplaces might be
used to improve quality in hospitals. This paper develops
explanatory theory using realist synthesis to illuminate the details
and significance of the social ties between health care workers.
Specifically we ask: How, why, for whom, to what extent and in what
context, do the social ties of staff within a hospital influence
quality of service delivery, including quality improvement? Methods
From a total of 75 included documents identified through an
extensive systematic literature search, data were extracted and
analysed to identify emergent explanatory statements. Results The
synthesis found that within the hospital workforce, an individual's
place in the social whole can be understood across four identified
domains: (1) social group, (2) hierarchy, (3) bridging distance and
(4) discourse. Thirty-five context-mechanism-outcome configurations
were developed across these domains. Conclusions The relative
position of individual health care workers within the overall social
network in hospitals is associated with influence and agency. As
such, power to bring about change is inequitably and socially
situated, and subject to specific contexts. The findings of this
realist synthesis offer a lens through which to understand social
ties in hospitals. The findings can help identify possible
strategies for intervention to improve communication and
distribution of power, for individual, team and wider multi-
professional behavioural change in hospitals.

ISSN: 0039-3665

DOI: 10.1111/sifp.12001

Accession Number: WOS:000393290700002

Abstract: Paying for performance is a strategy to meet the unmet need for family planning in low and middle income countries; however, rigorous evidence on effectiveness is lacking. Scientific databases and grey literature were searched from 1994 to May 2016. Thirteen studies were included. Payments were linked to units of targeted services, usually modified by quality indicators. Ancillary components and payment indicators differed between studies. Results were mixed for family planning outcome measures. Paying for performance was associated with improved modern family planning use in one study, and increased user and coverage rates in two more. Paying for performance with conditional cash transfers increased family planning use in another. One study found increased use in the upper wealth group only. However, eight studies reported no impact on modern family planning use or prevalence. Secondary outcomes of equity, financial risk protection, satisfaction, quality, and service organization were mixed. Available evidence is inconclusive and limited by the scarcity of studies and by variation in intervention, study design, and outcome measures. Further studies are warranted.

Title: Introducing and integrating perinatal mental health screening: Development of an equity-informed evidence-based approach

Journal: Health Expectations

Volume: 25

Issue: 5

Pages: 2287-2298

Date: Oct

Short Title: Introducing and integrating perinatal mental health screening: Development of an equity-informed evidence-based approach

ISSN: 1369-6513

DOI: 10.1111/hex.13526

Accession Number: WOS:000799220900001

Abstract: Background Pregnancy is a time of increased risk for developing or re-experiencing mental illness. Perinatal mental health screening for all women is recommended in many national guidelines, but a number of systems-level and individual barriers often hinder policy implementation. These barriers result in missed opportunities for detection and early intervention and are likely to be experienced disproportionately by women from culturally and linguistically diverse backgrounds, including women of refugee backgrounds. The objectives of this study were to develop a theory-informed, evidence-based guide for introducing and integrating perinatal mental health screening across health settings and to synthesize the learnings from an implementation initiative and multisectoral partnership between the Centre of Perinatal Excellence (COPE), and a university-based research centre. COPE is a nongovernmental organization (NGO) commissioned to update the Australian perinatal mental health guidelines, train health professionals and implement digital screening. Methods In this case study, barriers to implementation were prospectively identified and strategies to overcome them were developed. A pilot perinatal screening programme for depression and anxiety with a strong health equity focus was implemented and evaluated at a large public maternity service delivering care to a culturally diverse population of women in metropolitan Melbourne, Australia, including women of refugee background. Strategies that were identified preimplementation and postevaluation were mapped to theoretical frameworks. An implementation guide was developed to support future policy, planning and decision-making by healthcare organizations. Results Using a behavioural change framework (Capability, Opportunity, Motivation-Behaviour Model), the key barriers, processes and outcomes are described for a real-world example designed to maximize accessibility, feasibility and acceptability. A Programme Logic Model was developed to demonstrate the relationships of the inputs, which included stakeholder consultation, resource development and a digital screening platform, with the outcomes of the programme. A seven-stage implementation guide is presented for use in a range of healthcare settings. Conclusions These findings describe an equity-informed, evidence-based approach that can be used by healthcare organizations to address common systems and individual-level barriers to implement perinatal depression and anxiety screening guidelines. Patient or Public Contribution These results present strategies that were informed by prior research involving patients and staff from a large public antenatal clinic in Melbourne, Australia. This involved interviews with health professionals from the clinic such as midwives, obstetricians, perinatal mental health and refugee health experts and interpreters. Interviews were also conducted with women of refugee background who were attending the clinic for antenatal care. A steering committee was formed to facilitate the implementation of the perinatal mental health screening programme comprising staff from key hospital departments, GP liaison, refugee health and well-being, the NGO COPE and academic experts in psychology, midwifery, obstetrics and public

health. This committee met fortnightly for 2 years to devise strategies to address the barriers, implement and evaluate the programme. A community advisory group was also formed that involved women from eight different countries, some of refugee background, who had recently given birth at the health service. This committee met bimonthly and was instrumental in planning the implementation and evaluation such as recruitment strategies, resources and facilitating an understanding of the cultural complexity of the women participating in the study.

Article Number: 100435

Accession Number: WOS:000981169400043

Abstract: An estimated 15 million people in the UK menstruate over the span of approximately 37.5 years, using every year around 3.3 billion units of single-use menstrual management products (MMPs) (i.e. pads and tampons). A more circular design and sustainable management of these products could greatly reduce their waste and environmental impacts. This research is an exploratory study into the current menstrual products, waste and systems in the UK. The study found that an estimated 28,114 tonnes of waste is generated annually from menstrual products, 26,903 tonnes from disposable products of which about 4% (3,363 tonnes) is lost in the environment by flushing. The less sustainable products within those studied are disposable pads, which are the main contributors to menstrual waste volumes in the UK (21,094 t/y) and produce around 6,600 tCO₂ eq. of GHG. Replacing disposable MMPs with reusable would reduce waste production by 22,907 t/y and avoid about 7,900 tCO₂ eq. of GHG. In addition, even a simple better waste management process, such replacing landfill with thermal treatment, would further reduce emissions by around 5,000 tCO₂ eq. of GHG and produce every year approximately 5,500 MKh with incineration and 18,000 MKh with gasification.

Short Title: Intrinsic mode choice determinants based on a descriptive analysis of the perceptions of Abuja commuters: towards refocusing the societal mind-set on environmentally sustainable modes choice

ISSN: 2046-6099

DOI: 10.1108/sasbe-03-2021-0041

Accession Number: WOS:000677574500001

Abstract: Purpose This paper sought to uncover the intrinsic determinants of the choice of transport modes in Nigeria's capital city, Abuja, based on commuters' perceptions on different modes of transport. The ultimate goal of the study was to come up with suitable multifaceted measures to deter private car usage, while refocusing society's mind-set towards alternative forms of transport, thereby keying into some transport-related sustainable development goals (SDG) goals. Design/methodology/approach The study adopted qualitative methods: 320 commuters were surveyed at bus stops and car parks around the city, and respondents were identified using multistage sampling, aided by purposive/convenience sampling, and this number was reached by saturation of themes. Focus group discussions were held with eight screened public officials from relevant (transportation and environment related) agencies/unions in the city. NVivo 10 software was used to thematically analyse the data gathered from a relativist and an interpretive stand point. Findings The study found transport mode choice to be intrinsically more motivated by socio-economic forces serving as a basis for other socio-psychological factors. Multifaceted measures, including spatial, socio-economic, environmental and public relation measures, were found suitable to break car-use motives in the study area towards adopting alternative modes of transport, thereby achieving some transport-related SDG targets. Originality/value The study was unique as it looked at the intrinsic mode choice determinants from a Sub-Saharan African capital city perspective and provided suitable multifaceted best practiced measures that deemphasised car use while emphasising alternative modes, thereby shifting commuters' mind-set towards environmentally sustainable modes of transport.

Title: CoachMS, an innovative closed-loop, interdisciplinary platform to monitor and proactively treat MS symptoms: A pilot study
Journal: Multiple Sclerosis Journal-Experimental Translational and Clinical
Volume: 7
Issue: 1
Date: Jan
Short Title: CoachMS, an innovative closed-loop, interdisciplinary platform to monitor and proactively treat MS symptoms: A pilot study
DOI: 10.1177/2055217321988937
Accession Number: WOS:000840097500004
Abstract: Background: There are numerous challenges to treating co-occurring symptoms in multiple sclerosis (MS). Objective: To pilot the feasibility of a novel symptom management platform, CoachMS, to monitor MS symptoms (bladder function, ambulation, and mood: BAM) and respond to changes in real-time. Methods: In this 12-week randomized controlled pilot trial, participants' symptoms were monitored using weekly questionnaires and remote ambulatory monitoring (Fitbit Flex2 (R)). Behavioral change principles used included shared goal setting at 2 weeks. Between weeks 2-12, the CoachMS group received targeted contact and interventions if symptoms worsened; the control group were treated through usual clinic practice. Our outcomes were feasibility (retention, adherence and acceptability; primary) and proportion of recommended treatments pursued (secondary); efficacy was explored. Results: Of 21 participants enrolled, 13 (62%) completed the study; protocol adherence was excellent. CoachMS participants demonstrated greater follow-through with clinical recommendations than controls (OR 9.3, 95% CI (0.9, 97.6)). As a cohort, each BAM symptom tended to improve. Suicidality was detected in one control participant, resulting in urgent evaluation and hospitalization. Conclusions: The innovative CoachMS platform was feasible and acceptable in this cohort with baseline BAM symptoms. It could represent an accessible, cost-effective tool to monitor MS symptoms in real-time; a larger trial is planned.

Title: Psychological aspects of sport-related concussion: An evidence-based position paper

Journal: Journal of Applied Sport Psychology

Volume: 34

Issue: 3

Pages: 495-517

Date: May

Short Title: Psychological aspects of sport-related concussion: An evidence-based position paper

ISSN: 1041-3200

DOI: 10.1080/10413200.2020.1843200

Accession Number: WOS:000588171700001

Abstract: The field of sport-related concussion (SRC) is evolving quickly, and psychological aspects affecting athletes' recovery and well-being are now recognized as an important component for research and clinical practice. There has been considerable recent emphasis on empirical research into the psychological implications of SRC. This emphasis reflects trends from clinical research that indicate anxiety and mood-related issues may represent the primary symptoms in nearly 30% of concussions. In short, SRC and its psychological aspects is a major issue that influences not only athletes' performance, but also their physical and mental health. The purpose of this position paper is to provide a concise yet comprehensive review of the current state of research and evidence-based practice as it relates to the psychological aspects of SRC. More specifically, we present five postulates that are intended to stimulate discussion among researchers and allied health professionals who are interested in psychological aspects of SRC. Our intent in writing this position paper is to advance this subdiscipline within the area of SRC by discussing areas for growth in theory, research, and practice. Lay Summary: Sport-related concussions (SRC) have become a public health issue, however little research has focused on the the psychological aspects of this injury. This position paper identifies five postulates that are intended to stimulate research and practice on psychological aspects of SRC. Implications for Practice Multidisciplinary concussion care teams should include a sport psychology professional to assist with psychosocial recovery and well-being. Identify psychological factors that detract athletes from feeling ready to return to sport following a concussion (e.g., confidence, fear), and work with them to develop coping strategies to assist their return. Appropriately trained sport psychology professionals could deliver effective concussion education interventions that involve behavior change techniques.

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2017-019878

Article Number: e019878

Accession Number: WOS:000433881200165

Abstract: Introduction Tuberculosis (TB) remains a significant public health problem in South Asia. Tobacco use increases the risks of TB infection and TB progression. The TB&Tobacco placebo-controlled randomised trial aims to (1) assess the effectiveness of the tobacco cessation medication cytisine versus placebo when combined with behavioural support and (2) implement tobacco cessation medication and behavioural support as part of general TB care in Bangladeshi and Pakistan. This paper summarises the process arid context evaluation protocol embedded in the effectiveness implementation hybrid design. Methods and analysis We are conducting a mixed methods process arid context evaluation informed by an intervention logic model that draws on the UK Medical Research Council's Process Evaluation Guidance. Our approach includes quantitative and qualitative data collection on context, recruitment, reach, dose delivered, dose received and fidelity. Quantitative data include patient characteristics, reach of recruitment among eligible patients, routine trial data on dose delivered and dose received, and a COM-B ('capability', 'opportunity', 'motivation' and 'behaviour') questionnaire filled in by participating health workers. Qualitative data include semistructured interviews with TB health workers and patients, and with policy-makers at district and central levels in each country. Interviews will be analysed using the framework approach. The behavioural intervention delivery is audio recorded and assessed using a predefined fidelity coding index based on behavioural change technique taxonomy. Ethics and dissemination The study complies with the guidelines of the Declaration of Helsinki. Ethics approval for the study and process evaluation was granted by the University of Leeds (qualitative components), University of York (trial data arid fidelity assessment), Bangladesh Medical Research Council and Bangladesh Drug Administration (trial data and qualitative components) and Pakistan Medical Research Council (trial data and qualitative components). Results of this research will be disseminated through reports to stakeholders arid peer reviewed

publications and conference presentations.

Title: Data visualization as an intervention for pediatric chronic pain: a pilot feasibility study protocol for a randomized controlled crossover trial

Journal: Pilot and Feasibility Studies

Volume: 8

Issue: 1

Date: Oct

Short Title: Data visualization as an intervention for pediatric chronic pain: a pilot feasibility study protocol for a randomized controlled crossover trial

DOI: 10.1186/s40814-022-01170-5

Article Number: 223

Accession Number: WOS:000865243400001

Abstract: Background: Chronic pain is a common and costly condition in youth, associated with negative implications that reach far beyond the pain experience itself (e.g., interference with recreational, social, and academic activities, mental health sequelae). As a self-appraised condition, pain experience is influenced by patient's biases and meaning-making in relation to their symptoms and triggers. We propose that interacting with self-reported data will impact the experience of pain by altering understanding and expectations of symptom experience and how pain interacts with other factors (e.g., sleep, emotions, social interactions). In this study, we aim to establish the feasibility and acceptability of using a data visualization platform to track and monitor symptoms and their relationship with other factors, versus simply daily reporting of symptoms using a smartphone-based Ecological Momentary Assessment (EMA). Methods: This protocol is for a randomized, single-center, open-label crossover trial. We aim to recruit 50 typically developing youth aged 12-18 years with chronic pain to take part in two phases of data collection. The trial will utilize an A-B counterbalanced design in which participants will be randomly assigned to receive either Part A (EMA alone for 7 days) or Part B (EMA plus visualization platform for 7 days) first and then

receive the opposite phase after a 7-day break (washout period). Key outcomes will be participant reports of acceptability and feasibility, EMA completion rates, barriers, and perceptions of the benefits or risks of participation. Secondary exploratory analyses will examine the relationship between EMA-reported symptoms over time and in relation to baseline measures, as well as pilot data on any improvements in symptoms related to engaging with the data visualization platform. Discussion: This protocol describes the feasibility and pilot testing of a novel approach to promoting self-management and facilitating symptom appraisal using visualized data. We aim to determine whether there is a sufficient rationale, both from the perspective of feasibility and patient satisfaction/acceptability, to conduct a larger randomized controlled trial of this intervention. This intervention has the potential to support clinical care for youth with chronic pain and other conditions where self-appraisal and understanding of symptom patterns are a critical component of functional recovery.

Short Title: Formative research to design an implementation strategy for a postpartum hemorrhage initial response treatment bundle (E-MOTIVE): study protocol

DOI: 10.1186/s12978-021-01162-3

Article Number: 149

Accession Number: WOS:000673516800001

Abstract: Background Postpartum hemorrhage (PPH) is the leading cause of maternal death worldwide. When PPH occurs, early identification of bleeding and prompt management using evidence-based guidelines, can avert most PPH-related severe morbidities and deaths. However, adherence to the World Health Organization recommended practices remains a critical challenge. A potential solution to inefficient and inconsistent implementation of evidence-

based practices is the application of a 'clinical care bundle' for PPH management. A clinical care bundle is a set of discrete, evidence-based interventions, administered concurrently, or in rapid succession, to every eligible person, along with teamwork, communication, and cooperation. Once triggered, all bundle components must be delivered. The E-MOTIVE project aims to improve the detection and first response management of PPH through the implementation of the "E-MOTIVE" bundle, which consists of (1) Early PPH detection using a calibrated drape, (2) uterine Massage, (3) Oxytocic drugs, (4) Tranexamic acid, (5) Intra Venous fluids, and (6) genital tract Examination and escalation when necessary. The objective of this paper is to describe the protocol for the formative phase of the E-MOTIVE project, which aims to design an implementation strategy to support the uptake of this bundle into practice. Methods We will use behavior change and implementation science frameworks [e.g. capability, opportunity, motivation and behavior (COM-B) and theoretical domains framework (TDF)] to guide data collection and analysis, in Kenya, Nigeria, South Africa, Sri Lanka, and Tanzania. There are four methodological components: qualitative interviews; surveys; systematic reviews; and design workshops. We will triangulate findings across data sources, participant groups, and countries to explore factors influencing current PPH detection and management, and potentially influencing E-MOTIVE bundle implementation. We will use these findings to develop potential strategies to improve implementation, which will be discussed and agreed with key stakeholders from each country in intervention design workshops. Discussion This formative protocol outlines our strategy for the systematic development of the E-MOTIVE implementation strategy. This focus on implementation considers what it would take to support roll-out and implementation of the E-MOTIVE bundle. Our approach therefore aims to maximize internal validity in the trial alongside future scalability, and implementation of the E-MOTIVE bundle in routine practice, if proven to be effective. Trial registration: ClinicalTrials.gov: NCT04341662 Plain language summary Excessive bleeding after birth is the leading cause of maternal death globally. The World Health Organization (WHO) has recommended several treatment options for bleeding after birth. However, these treatments are not used regularly, or consistently for all women. A key underlying issue is that it is challenging for health workers to identify when women are bleeding too much, because measuring the amount of blood loss is difficult. Maternal health experts have proposed a new clinical 'care bundle' for caring for women with excessive bleeding after birth. A care bundle is a way to group together multiple treatments (e.g. 3-5 treatments). These treatments are then given to the woman at the same time, or one after another in quick succession, and supported by strategies to improve teamwork, communication, and cooperation. This is a research protocol for the preliminary phase of our study ("E-MOTIVE"), which means that it is a description of what we plan to do and how we plan to do it. The aim of our study is to develop a strategy for how we will test whether the E-MOTIVE bundle works through collaborative activities with midwives and doctors in five countries (Kenya, Nigeria, South Africa, Sri Lanka, and Tanzania) to develop a strategy for how we will test whether the E-MOTIVE bundle works. We

plan to do this by conducting interviews and surveys with midwives and doctors, and reviewing other research conducted on PPH to understand what works in different settings. We will discuss our research findings in a workshop, with midwives and doctors in the study countries to co-create a strategy that will work for them, based on their needs and preferences.

Short Title: Post-training Shared Decision Making Barriers and Facilitators for Pediatric Healthcare Providers: updates A Mixed-Methods Study

ISSN: 1876-2859

DOI: 10.1016/j.acap.2018.05.010

Accession Number: WOS:000455422100017

Abstract: OBJECTIVE: To assess barriers to and facilitators of shared decision making (SDM) for pediatric healthcare providers (HCPs) after they have been trained in SDM. METHODS: A mixed methods study using triangulation of data sources. Pediatric HCPs with SDM training who worked at a Canadian tertiary care pediatric hospital were eligible. Participants completed a validated SDM barriers survey (n = 60) and a semi-structured interview (n = 11). We calculated descriptive statistics, Univariate and multivariable

ordinary least squares linear regression models determined predictors of HCPs' intention to use SDM. Interviews were audiotaped and transcribed verbatim. We analyzed qualitative data using deductive and inductive content analyses and organized categories according to the Ottawa Model of Research Use. RESULTS: Intention to use SDM was high (mean score = 5.6/7, SD = 0.78) and positively correlated with SDM use (RR = 1.46, 95% CI 1.18–1.81). However, 52% of survey respondents reported not using SDM after training. HCPs identified factors influencing SDM at the levels of innovation, adopter, environment, and training. Insufficient time (barrier) and buy-in and agreement with SDM (facilitators) were most commonly cited. To improve SDM use, HCPs want a more team-based approach to SDM training, continuing education, and implementation. CONCLUSIONS: Despite training and positive intentions, many HCPs report not subsequently using SDM and identified numerous post-training barriers to its use. To overcome SDM barriers and improve uptake, HCPs recommend creating a socially supportive environment through a team-based approach to SDM training and implementation. These findings can inform SDM training and implementation interventions at pediatric health care centers.

Short Title: Measurement and assessment of fidelity and competence in nonspecialist-delivered, evidence-based behavioral and mental health interventions: A systematic review

ISSN: 2352-8273

DOI: 10.1016/j.ssmph.2022.101249

Article Number: 101249

Accession Number: WOS:000876456000003

Abstract: Nonspecialists have increasingly been used to deliver evidence-based, mental health and behavioral interventions in lower resource settings where there is a dearth of specialized providers and a corresponding gap in service delivery. Recent literature acknowledges that nonspecialist-delivered interventions are shown to be effective. However, few studies report on the fidelity (the degree to which an intervention was implemented as intended) and/or

competence (general skills of nonspecialists), key concepts that measure quality of evidence –based intervention delivery. This study seeks to understand how both fidelity and competence have been assessed in nonspecialist-delivered, evidence-based interventions with an intended social or psychological behavior-change outcome. Our search results originally yielded 2317 studies, and ultimately, 16 were included in our final analysis. Generally, results from a narrative synthesis indicated that tools used in the studies demonstrated sufficient inter-rater reliability and intra-class correlation components. Included studies used and described a range of fidelity and competence tools. However, the ENhancing Assessment of Common Therapeutic factors tool was the most commonly used tool that measures competence of nonspecialists, and has been adapted to several other settings. The roles of supervisors in mentoring, monitoring, and supervising nonspecialists emerged as a key ingredient for ensuring fidelity. Most studies assessing fidelity were limited by small sample sizes due to low numbers of nonspecialists implementing interventions, however, more advanced statistical methods may not be needed and may actually impede community-based organizations from assessing fidelity data. Our results suggest interventions can share resources, tools, and compare findings regardless with proper supervision. While the two terms "fidelity" and "competence" are often used interchangeably, their differences are noteworthy. Ultimately, both competency and fidelity are critical for delivering evidence-based in-terventions, and nonspecialists are most effective when they can be evaluated and mentored on both throughout the course of the intervention.

Title: Barriers to and Facilitators of the Use of Digital Tools in Primary Care to Deliver Physical Activity Advice: Semistructured Interviews and Thematic Analysis

Journal: Jmir Human Factors

Volume: 9

Issue: 3

Date: Jul-Sep

Short Title: Barriers to and Facilitators of the Use of Digital Tools in Primary Care to Deliver Physical Activity Advice: Semistructured Interviews and Thematic Analysis

ISSN: 2292-9495

DOI: 10.2196/35070

Article Number: e35070

Accession Number: WOS:000908436900012

Abstract: Background: Physical inactivity is a leading risk factor for many health conditions, including cardiovascular disease, diabetes, and cancer; therefore, increasing physical activity (PA)

is a public health priority. Health care professionals (HCPs) in primary care are pivotal in addressing physical inactivity; however, few HCPs provide PA advice to patients. There can be obstacles to delivering PA advice, including lack of time, confidence, or knowledge. Digital technology has the potential to overcome obstacles and facilitate delivering PA advice. However, it is unknown if and how digital tools are used to deliver PA advice in primary care consultations and what factors influence their use. Objective: We aimed to understand the use of digital tools to support primary care consultations and to identify the barriers to and facilitators of using these systems. Methods: Overall, 25 semistructured interviews were conducted with primary care HCPs. Professionals were sampled based on profession (general practitioners, practice nurses, and health care assistants), prevalence of long-term conditions within their practice area, and rural-urban classification. The data were analyzed thematically to identify the influences on the use of digital tools. Themes were categorized using the COM-B (capability, opportunity, and motivation-behavior) model and the Theoretical Domains Framework to identify the barriers to and facilitators of using digital tools to support the delivery of PA advice in primary care consultations. Results: The identified themes fell within 8 domains of the Theoretical Domains Framework. The most prominent influence (barrier or facilitator) within psychological capability was having the skills to use digital tools. Training in the use of digital tools was also mentioned several times. The most notable influences within physical opportunity were limited digital tools to prompt/support the provision of PA advice, time constraints, efficiency of digital tools, simplicity and ease of use of digital tools, and integration with existing systems. Other physical opportunity influences included lack of access to digital tools and technical support in the use of digital tools. Within social opportunity, a notable barrier was that digital tools reduce interpersonal communication with patients. Patient preference was also identified. Several important influences were within reflective motivation, including confidence to use digital tools, beliefs about the usefulness of digital tools, the belief that digital tools "are the way forward," beliefs related to data privacy and security concerns, and perceptions about patient capabilities. About automatic motivation, influences included familiarity and availability regarding digital tools and the fact that digital tools prompt behavior. Conclusions: A variety of influences were identified on the use of digital tools to support primary care consultations. These findings provide a foundation for designing a digital tool addressing barriers and leverages the facilitators to support PA advice provision within primary care to elicit patient behavior change and increase PA. Abstract: Schools have closed worldwide as part of measures to prevent SARS-CoV-2 transmission but are beginning to reopen in some countries. Various measures are being pursued to minimise transmission but existing guidance has not developed a comprehensive framework or theory of change. We present a framework informed by the occupational health hierarchy of control and a theory of change informed by realist approaches. We present measures focused on elimination, substitution, engineering, administration, education and personal protective equipment. We theorise that such measures offer a means of disrupting SARS-CoV-2 transmission via routes involving fomites, faeco-oral routes, droplets and aerosols.

Short Title: Influences on Dietary Choices during Day versus Night Shift in Shift Workers: A Mixed Methods Study

DOI: 10.3390/nu9030193

Article Number: 193

Accession Number: WOS:000397023600012

Abstract: Shift work is associated with diet-related chronic conditions such as obesity and cardiovascular disease. This study aimed to explore factors influencing food choice and dietary intake in shift workers. A fixed mixed method study design was undertaken on a convenience sample of firefighters who continually work a rotating roster. Six focus groups (n = 41) were conducted to establish factors affecting dietary intake whilst at work. Dietary intake was assessed using repeated 24 h dietary recalls (n = 19). Interviews were audio recorded, transcribed verbatim, and interpreted using thematic analysis. Dietary data were entered into Food Works and analysed using Wilcoxon signed-rank test; $p < 0.05$ was considered significant. Thematic analysis highlighted four key themes influencing dietary intake: shift schedule; attitudes and decisions of co-workers; time and accessibility; and knowledge of the relationship between food and health. Participants reported consuming more discretionary foods and limited availability of healthy food choices on night shift. Energy intakes (kJ/day) did not differ between days that included a day or night shift but greater energy density (EDenergy, kJ/g/day) of the diet was observed on night shift compared with day shift. This study has identified a number of dietary-specific shift-related factors that may contribute to an increase in unhealthy behaviours in a shift-working population. Given the increased risk of developing chronic diseases, organisational change to support workers in this environment is warranted.

ISSN: 0025-729X

DOI: 10.5694/mja13.10133

Accession Number: WOS:000326127500032

Abstract: Objectives: To identify factors that influence the extent to which general practitioners use absolute risk (AR) assessment in cardiovascular disease (CVD) risk assessment. Design, setting and

participants: Semi-structured interviews with 25 currently practising GPs from eight Divisions of General Practice in New South Wales, Australia, between October 2011 and May 2012. Data were analysed using framework analysis. Results: The study identified five strategies that GPs use with patients in different situations, defined in terms of the extent to which AR was used and the reasons given for this: the AR-focused strategy, used when AR assessment was considered useful for the patient; the AR-adjusted strategy, used to account for additional risk factors such as family history; the clinical judgement strategy, used when GPs considered that their judgement took multiple risk factors into account as effectively as AR; the passive disregard strategy, used when GPs lacked sufficient time, access or experience to use AR; and the active disregard strategy, used when AR was considered to be inappropriate for the patient. The strategies were linked with different opportunity, capability and motivation barriers to the use of AR. Conclusions: This study provides an in-depth insight into the factors that influence GPs' use of AR in CVD risk assessment. The results suggest that GPs use a range of strategies in different situations, so different approaches may be required to improve the use of AR guidelines in practice.

Short Title: Health Issues Due to the Global Prevalence of Sedentariness and Recommendations towards Achieving a Healthier Behaviour

DOI: 10.3390/healthcare9080995

Article Number: 995

Accession Number: WOS:000690603900001

Abstract: Sedentariness has progressed in recent years. Here, we summarize the high prevalence of objectively measured sedentariness and the list of health problems associated with sedentariness. According to the literature, a minimum sedentary time of 8 h/d may avoid the harmful effects of sedentariness. Our review of the

literature shows that many countries worldwide exceed this threshold. The coronavirus disease 2019 pandemic has increased the proportion of time spent seated in chairs and/or other types of furniture. Furthermore, prolonged sedentariness will continue to increase because it is assumed that people, at least those in desk jobs, perform their work better when sitting than when standing. Many practical solutions should be implemented to help people reduce their sedentary time. People need to be aware that prolonged sedentariness causes health problems. They need to measure the amount of time spent being sedentary to self-guide their behaviour. They should adopt a new lifestyle to avoid prolonged sedentariness and prolonged standing. In addition, we point out that they should frequently change their posture to avoid fatigue and health issues. For global public health, there is an urgent need to adopt an intermediate healthy/healthier behaviour between too much time spent in the sitting and standing positions.

Short Title: Sitting vs. standing: an urgent need to rebalance our world

ISSN: 1743-7199

DOI: 10.1080/17437199.2022.2150673

Accession Number: WOS:000910235100001

Abstract: During their activities of daily living, humans run, walk, stand, sit and lie down. Recent changes in our environment have favored sedentary behavior over more physically active behavior to such a degree that our health is in danger. Here, we sought to address the problem of excessive time spent seated from various theoretical viewpoints, including postural control, human factors engineering, human history and health psychology. If nothing is done now, the high prevalence of sitting will continue to increase. We make a case for the standing position by demonstrating that spending more time upright can mitigate the physiological and psychological problems associated with excessive sitting without lowering task performance and productivity. The psychological literature even highlights potential benefits of performing certain tasks in the standing position. We propose a number of recommendations on spending more time (but not too much) in the standing position and on more active, nonambulatory behaviors. There is a need to inform people about (i) harmful consequences of excessive sitting and (ii) benefits of spending more time performing active, nonambulatory

behaviors. One clear benefit is to reduce detrimental health consequences of excessive sitting and to provide potential additional benefits in terms of productivity and performance.

ISSN: 0952-3871

DOI: 10.1111/jhn.12875

Accession Number: WOS:000632142300001

Abstract: Background Dietary management of type 2 diabetes is considered as a key remission and management strategy. This review explored clinicians' perceived barriers and enablers to the dietary management of adults with type 2 diabetes in primary care. Methods MEDLINE, EMBASE, CINAHL, PsycINFO and ASSIA were searched from 1980 to 26 June 2020. Results Of 2021 records, 14 studies met the inclusion criteria, describing the 14 domains of the refined Theoretical Domains Framework. The data synthesised to the domains of environmental context and resources, intentions and beliefs about capabilities were considered most trustworthy, closely followed by knowledge, behavioural regulation and beliefs about consequences. Two-thirds of studies cited time for staff training or patient education as major constraints to type 2 diabetes management. Clinicians also identified lack of patient engagement and poor dietary adherence as issues. Despite this, clinician confidence about giving dietary advice to patients was high. With further exploration, knowledge gaps were apparent and feelings of despondency as a result of poor outcomes were visible. Conclusions This review revealed four clinician behaviours: (2) the perception of the dietitian; (2) the definition of a clinician qualified to give dietary advice; (3) clinician belief in dietary management as a treatment; and (4) clinician belief in a patient's capability to change dietary behaviour. These behaviours, if challenged and changed, have the potential to improve dietary management and outcomes for people with type 2 diabetes in primary care.

Short Title: Moving Beyond Breastfeeding Initiation: A Qualitative Study Unpacking Factors That Influence Infant Feeding at Hospital Discharge Among Urban, Socioeconomically Disadvantaged Women

ISSN: 2212-2672

DOI: 10.1016/j.jand.2021.02.005

Accession Number: WOS:000692130100006

Abstract: Background Factors that influence breastfeeding initiation and duration have been well established; however, there is limited understanding of in-hospital exclusive breastfeeding (EBF), which is critical for establishing breastfeeding. Grady Memorial Hospital, which serves a high proportion of participants receiving Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) and racial/ethnic minorities, had an in-hospital EBF rate in 2018 by the Joint Commission's definition of 29% and sought contextualized evidence on how to best support breastfeeding mothers. Objective The objectives were to (1) identify facilitators and barriers to in-hospital EBF and (2) explore breastfeeding support available from key stakeholders across the social ecological model. Design In-depth, semistructured interviews were conducted and analyzed using thematic analysis. Participants The sample included a total of 38 purposively sampled participants from Grady Memorial Hospital (10 EBF mothers, 10 non-EBF, and 18 key stakeholders such as clinicians, community organizations' staff, and administrators). Results Key themes included that maternal perception of inadequate milk supply was a barrier to in-hospital EBF at the intrapersonal level. At the interpersonal level, a personable and individualized approach to breastfeeding counseling may be most effective in supporting EBF. At the institutional level, key determinants of EBF were gaps in prenatal breastfeeding education, limited time to provide comprehensive prenatal education to high-risk patients, and practical help with latching and positioning. Community-level WIC services were perceived as a facilitator due to the additional benefits provided for EBF mothers; however, the distribution of WIC vouchers for formula to mothers while they are in the hospital

undermines the promotion of EBF. Cultural norms and a diverse patient population were reported as barriers to providing support at the macrosystem level. Conclusion Multipronged approaches that span the social-ecological model may be required to support early EBF in hospital settings. J Acad Nutr Diet. 2021;121(9):1704-1720.

ISSN: 0733-4648

DOI: 10.1177/0733464815606799

Accession Number: WOS:000395401700007

Abstract: Fall among older adults is a concern in Thailand. The challenge for primary care physicians is to deliver effective interventions potentially adhered to by older people. This research employed a mixed-methods design to understand factors leading to fall reporting by community-dwelling Thai elders and their expectations regarding fall prevention education. Participants (N = 305) who had fallen in the last year completed a questionnaire in the quantitative phase, and 50 of these were interviewed in-depth in the qualitative phase. Results revealed that only 39% reported their fall. Participants with comorbidities were 1.6 times more likely to report falling than those without (odds ratio = 1.61, confidence interval = [1.01, 2.58]). Post-fall pain (84%) was the strongest reason for reporting. Some participants believed that falling is an inevitable life event. It is crucial to encourage older adults to report falling, to provide targeted education, and to focus on improving the overall health status of older adults.

Short Title: The effectiveness of clinical guideline implementation strategies in oncology—a systematic review

DOI: 10.1186/s12913-023-09189-x

Article Number: 347

Accession Number: WOS:000963484400004

Abstract: Importance Guideline recommendations do not necessarily translate into changes in clinical practice behaviour or better patient outcomes. **Objective** This systematic review aims to identify recent clinical guideline implementation strategies in oncology and to determine their effect primarily on patient-relevant outcomes and secondarily on healthcare professionals' adherence. **Methods** A systematic search of five electronic databases (PubMed, Web of Science, GIN, CENTRAL, CINAHL) was conducted on 16 December 2022. Randomized controlled trials (RCTs) and non-randomized studies of interventions (NRSIs) assessing the effectiveness of guideline implementation strategies on patient-relevant outcomes (overall survival, quality of life, adverse events) and healthcare professionals' adherence outcomes (screening, referral, prescribing, attitudes, knowledge) in the oncological setting were targeted. The Cochrane risk-of-bias tool and the ROBINS-I tool were used for assessing the risk of bias. Certainty in the evidence was evaluated according to GRADE recommendations. This review was prospectively registered in the International Prospective Register of Systematic Reviews (PROSPERO) with the identification number CRD42021268593. **Findings** Of 1326 records identified, nine studies, five cluster RCTs and four controlled before-and after studies, were included in the narrative synthesis. All nine studies assess the effect of multi-component interventions in 3577 cancer patients and more than 450 oncologists, nurses and medical staff. **Patient-level** Educational meetings combined with materials, opinion leaders, audit and feedback, a tailored intervention or academic detailing may have little to no effect on overall survival, quality of life and adverse events of cancer patients compared to no intervention, however, the evidence is either uncertain or very uncertain. **Provider-level** Multi-component interventions may increase or slightly increase guideline adherence regarding screening, referral and prescribing behaviour of healthcare professionals according to guidelines, but the certainty in evidence is low. The interventions may have little to no effect on attitudes and knowledge of healthcare professionals, still, the evidence is very uncertain. **Conclusions and relevance** Knowledge and skill accumulation through team-oriented or online educational training and dissemination of materials embedded in multi-component interventions seem to be the most frequently researched guideline implementation

strategies in oncology recently. This systematic review provides an overview of recent guideline implementation strategies in oncology, encourages future implementation research in this area and informs policymakers and professional organisations on the development and adoption of implementation strategies.

DOI: 10.1177/1403494815604080

Accession Number: WOS:000369969000010

Abstract: Introduction: We examined the socio-demographic and behavioral determinants of perceived barriers to leisure-time physical activity (LTPA) in a population-based sample of working-aged adults. Methods: Data comprised the National FINRISK 2002 Study, a population-based health examination study. Analyses were restricted to those aged 25-64 years and who perceived that their amount of LTPA did not reach sufficient levels. They reported barriers to LTPA, defined as a lack of time, motivation and lack of companionship to be active with, as well as high expenses. Age, education, household income, employment status, family type, physical activity, smoking and body mass index (BMI) were included as explanatory variables. Results: Lack of time was the most frequent barrier. Each barrier was explained by a different set of factors that also varied between genders. The strongest and most systematic associations with the barriers were found for age, employment status and family type. Lack of time was less often reported as a barrier among the unemployed, singles without children and older people. Lacking motivation as a barrier was most common among singles without children. High expenses as a barrier was more often reported by the unemployed, and less often reported in the highest income group. Conclusions: When considering actions to promote LTPA, there is not one single solution, because the perceived barriers vary by population subgroups.

Title: Patient factors that influence clinicians' decision making in self-management support: A clinical vignette study

Journal: Plos One

Volume: 12

Issue: 2

Date: Feb

Short Title: Patient factors that influence clinicians' decision making in self-management support: A clinical vignette study

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0171251

Article Number: e0171251

Accession Number: WOS:000393700100030

Abstract: Background and aim Self-management support is an integral part of current chronic care guidelines. The success of self-management interventions varies between individual patients, suggesting a need for tailored self-management support. Understanding the role of patient factors in the current decision making of health professionals can support future tailoring of self-management interventions. The aim of this study is to identify the relative importance of patient factors in health professionals' decision making regarding self-management support. Method A factorial survey was presented to primary care physicians and nurses. The survey consisted of clinical vignettes (case descriptions), in which 11 patient factors were systematically varied. Each care provider received a set of 12 vignettes. For each vignette, they decided whether they would give this patient self-management support and whether they expected this support to be successful. The associations between respondent decisions and patient factors were explored using ordered logit regression. Results The survey was completed by 60 general practitioners and 80 nurses. Self-management support was unlikely to be provided in a third of the vignettes. The most important patient factor in the decision to provide self-management support as well as in the expectation that self-management support would be successful was motivation, followed by patient-provider relationship and illness perception. Other factors, such as depression or anxiety, education level, self-efficacy and social support, had a small impact on decisions. Disease, disease severity, knowledge of disease, and age were relatively unimportant factors. Conclusion This is the first study to explore the relative importance of patient factors in decision making and the expectations regarding the provision of self-management support to chronic disease patients. By far, the

most important factor considered was patient's motivation; unmotivated patients were less likely to receive self-management support. Future tailored interventions should incorporate strategies to enhance motivation in unmotivated patients. Furthermore, care providers should be better equipped to promote motivational change in their patients.

Title: Factors associated with direct support professionals' behaviour in the physical activity support provided to people with intellectual disabilities

Journal: Journal of Intellectual Disability Research

Volume: 63

Issue: 8

Pages: 981-991

Date: Aug

Short Title: Factors associated with direct support professionals' behaviour in the physical activity support provided to people with intellectual disabilities

ISSN: 0964-2633

DOI: 10.1111/jir.12616

Accession Number: WOS:000475966900008

Abstract: Background Direct support professionals play an important role in facilitating physical activity support for people with intellectual disabilities (ID). This study examined how the characteristics of people with ID and the characteristics of direct support professionals are related to the professionals' behaviour when supporting people with ID in physical activity. Methods A cross-sectional approach was used. Direct support professionals (n = 217) who support people with ID completed a self-report questionnaire, which aimed to measure the components that produced behaviour when providing physical activity support for people with ID. Associations with the characteristics of people with ID and the characteristics of the professionals were analysed using multivariate linear regression models. Results The results demonstrate that the professionals' characteristics – such as age, workplace and training – were related to the variance in the components that theoretically produced the direct support professionals' behaviour. The characteristics of the people with ID did not contribute to the variance in the direct support professionals' behaviour. Conclusions The findings suggest that professional characteristics are the dominant reasons for the differences observed in the capability, opportunity and motivation of direct support professionals to provide physical activity support. This study also underscores the need for integrated

training programmes to help direct support professionals promote physical activity in people with ID.

Article Number: e0277520

Accession Number: WOS:000925006300048

Abstract: Gambling is an international phenomenon, posing a serious threat to adolescents who begin gambling at a young age. This study aims, to explore gambling behavior in adolescents and interpret its risk factors. We conducted a three-waves cohort longitudinal study assessing gambling and associated risk factors in south-eastern Spain. Data were analyzed using the Capabilities, Opportunities, Motivations, Behavior (COM-B) model and the partial least squares path modelling (PLS-PM) technique. Gambling was measured by frequency and money spent; associated factors were knowledge about gambling, parental attitude towards gambling, risk perception, normative perception, and intention to gamble. These items were assigned as indicators of each construct of the COM-B model- capability, opportunity, motivation, and behavior-using the theoretical domains framework. Once the behavior was performed, feedback on future capability, opportunity, and motivation was observed. Results show that capability, determined by past experience, and opportunity, determined by parental attitudes, motivates adolescents to seek gambling experiences in the future. Identifying such factors that affect gambling behavior in adolescents and establishing relationships between them through a robust theoretical model is essential for designing effective interventions.

Title: Barriers and Facilitators for the Implementation of a Concept to Promote Evidence-based Practice in Physiotherapy – A Mixed-methods Study

Journal: Physioscience

Date: 2023 Jan

Short Title: Barriers and Facilitators for the Implementation of a Concept to Promote Evidence-based Practice in Physiotherapy – A Mixed-methods Study

ISSN: 1860-3092

DOI: 10.1055/a-1720-8262

Accession Number: WOS:000920480200001

Abstract: Background There is a need for theoretically and scientifically sound implementation strategies to promote evidence-based practice (EBP) in physiotherapy in Germany. It is necessary to identify and address context-specific determinants for implementation, when designing such strategies. To this end, the "science4practice " concept was developed; a concept designed to promote EBP in physiotherapy facilities. Aim To examine barriers and facilitators for the implementation of the "science4practice " concept. Methods In this mixed-methods study qualitative semi-structured interviews and a quantitative survey using an online and a paper-based questionnaire were conducted. Managing directors, physiotherapy practice leaders and physiotherapists without management responsibility were interviewed. Physiotherapists without management responsibility participated in the quantitative survey. Data of the interviews were analyzed using thematic content analysis. Data of the quantitative survey were analyzed descriptively. Results Fifteen interviews were conducted. A lack of skills in literature search and critical appraisal, negative experiences with change processes and insufficient access to scientific literature were identified as barriers. Support from supervisors and the availability of resources were identified as facilitating factors for the implementation of the concept. In total 47 physiotherapists without management responsibility participated in the survey. The results showed cumulative agreement values ("fully agree " and "rather agree ") between 83 % and 91 % for the willingness to implement the "science4practice " concept. Integrating quantitative and qualitative results, the team's willingness to implement the concept was classified as a facilitator for implementation. Conclusions The study revealed barriers and facilitators from the perspective of participants with and without management responsibility. the results underline barriers identified nationally and internationally such as the lack of scientific competences or insufficient access to scientific literature. However, the results also point towards the potential of the concept as an implementation project for physiotherapy in Germany. In the

next step, studies should be conducted to examine the concept's feasibility.

Title: In-vivo design feedback and perceived utility of a genetically-informed smoking risk tool among current smokers in the community

Journal: BMC Medical Genomics

Volume: 14

Issue: 1

Date: May

Short Title: In-vivo design feedback and perceived utility of a genetically-informed smoking risk tool among current smokers in the community

DOI: 10.1186/s12920-021-00976-1

Article Number: 139

Accession Number: WOS:000657692900001

Abstract: Background The use of genetically-informed personalized risk information for behavioral disorders, namely smoking and smoking-related behaviors, is a promising yet understudied area. The Genetics and Smoking Risk Profile, or RiskProfile, leverages genetic and environmental information to communicate one's risk for smoking-related diseases. Although prior studies have examined attitudes toward genetic results, little research has investigated these perceptions through a lens of in-vivo testing; that is, user-centered design feedback in response to personalized genetic results being returned contemporaneously. This qualitative study engaged current smokers in usability testing of the RiskProfile within the context of concurrently receiving this personalized, genetically-informed smoking cessation intervention. Methods Eighty-nine participants who were current smokers responded to open-ended interview questions on perceptions of smoking-related genetic information and the content and format of the RiskProfile intervention that they had received moments before. Data were analyzed via the conventional content analysis approach in which themes were allowed to emerge throughout the analysis. Results Participants were able to reference and offer design input on specific elements of the RiskProfile. Overall, current smokers perceived the RiskProfile to have high potential utility.

Constructive feedback that current smokers offered about the tool centered around suggested improvements to optimize its usability and technical content. Conclusions The detailed and constructive feedback from participants highlights that in-vivo feedback offers a useful design approach that addresses concerns of rigor and relevance when returning genetic results. This unique method

demonstrated perceived utility and constructive design feedback for the RiskProfile among current smokers and can play an important role in optimizing the design and implementation of personalized genetic risk interventions moving forward.

Year: 2022

Title: Use of Behavior Change Techniques Alongside Exercise in the Management of Rotator Cuff-Related Shoulder Pain: A Scoping Review

Journal: Physical Therapy

Volume: 102

Issue: 4

Date: Apr

Short Title: Use of Behavior Change Techniques Alongside Exercise in the Management of Rotator Cuff-Related Shoulder Pain: A Scoping Review

ISSN: 0031-9023

DOI: 10.1093/ptj/pzab290

Article Number: pzab290

Accession Number: WOS:000789029800001

Abstract: Objectives The aims of this scoping review were to: (1) determine the frequency and types of behavior change techniques (BCTs) and education utilized in trials investigating exercise interventions for rotator cuff related shoulder pain (RCRSP); (2) subcategorize the BCTs and education found in the trials to summarize all behavior change approaches reported by trials; and (3) compare the frequency, types, and subcategories of BCTs and education utilized in the clinical guidelines for managing RCRSP between the trials. Methods Data sources included Cochrane Central Register of Controlled Trials, Ovid MEDLINE, Ovid EMBASE, CINAHL Plus, Google Scholar and PubMed, which were searched from inception to June 2020. Trials assessing exercise interventions for RCRSP were included. Three authors independently determined eligibility and extracted data. The frequency and types of BCTs and education in the trials and clinical practice guidelines were reported and compared descriptively. Two authors assessed the content of the BCTs to develop subcategories. Results Most trials reported including at least 1 type of BCT (89.2%), which was most commonly feedback and monitoring (78.5%). There were many different approaches to the BCTs and education; for example, feedback and monitoring was subcategorized into supervised exercise, exercise monitoring, and feedback through external aids, such as mirrors. Clinical guidelines recommend supervision, goal setting, activity modification, pain management recommendations, information about the condition, and

exercise education. Conclusion Although over two-thirds of trials reported including a BCT alongside exercise interventions for RCRSP, the breadth of these interventions is limited (supervision is the only common one). Future trialists should consider using any type of BCT that may improve exercise adherence and outcomes. Impact The findings of this review have: (1) identified gaps in the literature; and (2) contributed to the design of future exercise interventions for RCRSP.

Title: A Digital Intervention for Primary Care Practitioners to Support Antidepressant Discontinuation (Advisor for Health Professionals): Development Study

Journal: Journal of Medical Internet Research

Volume: 23

Issue: 7

Date: Jul

Short Title: A Digital Intervention for Primary Care Practitioners to Support Antidepressant Discontinuation (Advisor for Health Professionals): Development Study

ISSN: 1438-8871

DOI: 10.2196/25537

Article Number: e25537

Accession Number: WOS:000675386300004

Abstract: Background: The number of people receiving antidepressants has increased in the past 3 decades, mainly because of people staying on them longer. However, in many cases long-term treatment is not evidence based and risks increasing side effects.

Additionally, prompting general practitioners (GPs) to review medication does not improve the rate of appropriate discontinuation. Therefore, GPs and other health professionals may need help to support patients discontinuing antidepressants in primary care.

Objective: This study aims to develop a digital intervention to support practitioners in helping patients discontinue inappropriate long-term antidepressants (as part of a wider intervention package including a patient digital intervention and patient telephone support). Methods: A prototype digital intervention called Advisor for Health Professionals (ADvisor HP) was planned and developed using theory, evidence, and a person-based approach. The following elements informed development: a literature review and qualitative synthesis, an in-depth qualitative study, the development of guiding principles for design elements, and theoretical behavioral analyses.

The intervention was then optimized through think-aloud qualitative interviews with health professionals while they were using the prototype intervention. Results: Think-aloud qualitative interviews with 19 health professionals suggested that the digital intervention contained useful information and was readily accessible to practitioners. The development work highlighted a need for further guidance on drug tapering schedules for practitioners and clarity about who is responsible for broaching the subject of discontinuation. Practitioners highlighted the need to have information in easily and quickly accessible formats because of time constraints in day-to-day practice. Some GPs felt that some information was already known to them but understood why this was included. Practitioners differed in their ideas about how they would use ADvisor HP in practice, with some preferring to read the resource in its entirety and others wanting to dip in and out as needed. Changes were made to the wording and structure of the intervention in response to the feedback provided. Conclusions: ADvisor HP is a digital intervention that has been developed using theory, evidence, and a person-based approach. The optimization work suggests that practitioners may find this tool to be useful in supporting the reduction of long-term antidepressant use. Further quantitative and qualitative evaluation through a randomized controlled trial is needed to examine the feasibility, effectiveness, and cost-effectiveness of the intervention.

Abstract: Pain management can be challenging to achieve in practice due to the participation of many different stakeholders and the complex behaviours involved in decision-making. Here, Guen Bradbury and Katie Morton suggest that a better understanding of behavioural science can lead to improved pain management in animals.

Title: Exploring an Artificial Intelligence-Based, Gamified Phone App Prototype to Track and Improve Food Choices of Adolescent Girls in Vietnam: Acceptability, Usability, and Likeability Study

Journal: Jmir Formative Research

Volume: 6

Issue: 7

Date: Jul

Short Title: Exploring an Artificial Intelligence-Based, Gamified Phone App Prototype to Track and Improve Food Choices of Adolescent Girls in Vietnam: Acceptability, Usability, and Likeability Study

DOI: 10.2196/35197

Article Number: e35197

Accession Number: WOS:000854081500030

Abstract: Background: Adolescents' consumption of healthy foods is suboptimal in low- and middle-income countries. Adolescents' fondness for games and social media and the increasing access to smartphones make apps suitable for collecting dietary data and influencing their food choices. Little is known about how adolescents use phones to track and shape their food choices.

Objective: This study aimed to examine the acceptability, usability, and likability of a mobile phone app prototype developed to collect dietary data using artificial intelligence-based image recognition of foods, provide feedback, and motivate users to make healthier food choices. The findings were used to improve the design of the app. Methods: A total of 4 focus group discussions (n=32 girls, aged 15-17 years) were conducted in Vietnam. Qualitative data were collected and analyzed by grouping ideas into common themes based on content analysis and ground theory. Results: Adolescents accepted most of the individual- and team-based dietary goals presented in the app prototype to help them make healthier food choices. They deemed the overall app wireframes, interface, and graphic design as acceptable, likable, and usable but suggested the following modifications: tailored feedback based on users' medical history, anthropometric characteristics, and fitness goals; new language on dietary goals; provision of information about each of the food group dietary goals; wider camera frame to fit the whole family food tray, as meals are shared in Vietnam; possibility of digitally separating food consumption on shared meals; and more appealing graphic design,

including unique badge designs for each food group. Participants also liked the app's feedback on food choices in the form of badges, notifications, and statistics. A new version of the app was designed incorporating adolescent's feedback to improve its acceptability, usability, and likability. Conclusions: A phone app prototype designed to track food choice and help adolescent girls from low- and middle-income countries make healthier food choices was found to be acceptable, likable, and usable. Further research is needed to examine the feasibility of using this technology at scale.

Short Title: AIMD - a validated, simplified framework of interventions to promote and integrate evidence into health practices, systems, and policies

DOI: 10.1186/s12874-017-0314-8

Article Number: 38

Accession Number: WOS:000395468600001

Abstract: Background: Proliferation of terms describing the science of effectively promoting and supporting the use of research evidence in healthcare policy and practice has hampered understanding and development of the field. To address this, an international Terminology Working Group developed and published a simplified framework of interventions to promote and integrate evidence into health practices, systems, and policies. This paper presents results of validation work and a second international workgroup meeting, culminating in the updated AIMD framework [Aims, Ingredients, Mechanism, Delivery]. Methods: Framework validity was evaluated against terminology schemas (n = 51); primary studies (n = 37); and reporting guidelines (n = 10). Framework components were independently categorized as fully represented, partly represented, or absent by two researchers. Opportunities to refine the framework were systematically recorded. A meeting of the expanded international Terminology Working Group updated the framework by reviewing and deliberating upon validation findings and refinement proposals. Results: There was variation in representativeness of the

components across the three types of literature, in particular for the component 'causal mechanisms'. Analysis of primary studies revealed that representativeness of this concept lowered from 92 to 68% if only explicit, rather than explicit and non-explicit references to causal mechanisms were included. All components were very well represented in reporting guidelines, however the level of description of these was lower than in other types of literature. Twelve opportunities were identified to improve the framework, 9 of which were operationalized at the meeting. The updated AIMD framework comprises four components: (1) Aims: what do you want your intervention to achieve and for whom? (2) Ingredients: what comprises the intervention? (3) Mechanisms: how do you propose the intervention will work? and (4) Delivery: how will you deliver the intervention? Conclusions: The draft simplified framework was validated with reference to a wide range of relevant literature and improvements have enhanced useability. The AIMD framework could aid in the promotion of evidence into practice, remove barriers to understanding how interventions work, enhance communication of interventions and support knowledge synthesis. Future work needs to focus on developing and testing resources and educational initiatives to optimize use of the AIMD framework in collaboration with relevant end-user groups.

Abstract: Nutrition plays an important role in pain management. Healthy eating patterns are associated with reduced systemic inflammation, as well as lower risk and severity of chronic non-cancer pain and associated comorbidities. The role of nutrition in chronic non-cancer pain management is an emerging field with increasing interest from clinicians and patients. Evidence from a number of recent systematic reviews shows that optimising diet quality and incorporating foods containing anti-inflammatory nutrients such as fruits, vegetables, long chain and monounsaturated fats, antioxidants, and fibre leads to reduction in pain severity and interference. This review describes the current state of the art and highlights why nutrition is critical within a person-centred approach to pain management. Recommendations are made to guide clinicians and highlight areas for future research.

Abstract: Background: Internationally, several initiatives exist to describe standards for post-disaster psychosocial care. Objective: This study explored the level of consensus of experts within Europe on a set of recommendations on early psychosocial intervention after shocking events (Dutch guidelines), and to what degree these standards are implemented into mental health care practice. Methods: Two hundred and six (mental) health care professionals filled out a questionnaire to assess the extent to which they consider the guidelines' scope and recommendations relevant and part of the regular practice in their own country. Forty-five European experts from 24 EU countries discussed the guidelines at an international seminar. Results: The data suggest overall agreement on the standards although many of the recommendations appear not (yet) to be embedded in everyday practice. Conclusions: Although large

consensus exists on standards for early psychosocial care, a chasm between norms and practice appears to exist throughout the EU, stressing the general need for investments in guideline development and implementation.

Short Title: Sitting less and moving more for improved metabolic and brain health in type 2 diabetes: 'OPTIMISE your health' trial protocol

DOI: 10.1186/s12889-022-13123-x

Article Number: 929

Accession Number: WOS:000793191200008

Abstract: Background: Clinical practice guidelines recommend that adults with type 2 diabetes (T2D) sit less and move more throughout the day. The 18-month OPTIMISE Your Health Clinical Trial was developed to support desk-based workers with T2D achieve these recommendations. The two-arm protocol consists of an intervention and control arms. The intervention arm receives 6 months health coaching, a sit-stand desktop workstation and an activity tracker, followed by 6 months of text message support, then 6 months maintenance. The control arm receives a delayed modified intervention after 12 months of usual care. This paper describes the methods of a randomised controlled trial (RCT) evaluating the effectiveness and cost-effectiveness of the intervention, compared to a delayed intervention control. Methods: This is a two-arm RCT being conducted in Melbourne, Australia. Desk-based workers (>0.8 full-time equivalent) aged 35-65 years, ambulatory, and with T2D and managed glycaemic control (6.5-10.0% HbA1c), are randomised to the multicomponent intervention (target n = 125) or delayed-intervention control (target n = 125) conditions. All intervention participants receive 6 months of tailored health coaching assisting them to "sit less" and "move more" at work and throughout the day, supported by a sit-stand desktop workstation and an activity tracker (Fitbit).

Participants receive text message-based extended care for a further 6-months (6-12 months) followed by 6-months of non-contact (12-18 months: maintenance). Delayed intervention occurs at 12-18 months

for the control arm. Assessments are undertaken at baseline, 3, 6, 12, 15 and 18-months. Primary outcomes are activPAL-measured sitting time (h/16 h day), glycosylated haemoglobin (HbA1c; %, mmol/mol) and, cognitive function measures (visual learning and new memory; Paired Associates Learning Total Errors [adjusted]). Secondary, exploratory, and process outcomes will also be collected throughout the trial. Discussion: The OPTIMISE Your Health trial will provide unique insights into the benefits of an intervention aimed at sitting less and moving more in desk-bound office workers with T2D, with outcomes relevant to glycaemic control, and to cardiometabolic and brain health. Findings will contribute new insights to add to the evidence base on initiating and maintaining behaviour change with clinical populations and inform practice in diabetes management.

Short Title: Translating qualitative data into intervention content using the Theoretical Domains Framework and stakeholder co-design: a worked example from a study of cervical screening attendance in older women

DOI: 10.1186/s12913-022-07926-2

Article Number: 610

Accession Number: WOS:000791791100001

Abstract: Background Previous screening interventions have demonstrated a series of features related to social determinants which have increased uptake in targeted populations, including the assessment of health beliefs and barriers to screening attendance as part of intervention development. Many studies cite the use of theory to identify methods of behaviour change, but fail to describe in detail how theoretical constructs are transformed into intervention content. The aim of this study was to use data from a qualitative exploration of cervical screening in women over 50 in the UK as the basis of intervention co-design with stakeholders using behavioural change frameworks. We describe the identification of behavioural mechanisms from qualitative data, and how these were used to develop content for a service-user leaflet and a video animation for practitioner training. The interventions aimed to encourage sustained commitment to cervical screening among women over 50, and to increase sensitivity to age-related problems in screening among primary care practitioners. Methods Secondary coding of a qualitative data set to extract barriers and facilitators of cervical screening attendance. Barrier and facilitator statements were categorised using the Theoretical Domains Framework (TDF) to identify relevant behaviour change techniques (BCTs). Key TDF domains and associated BCTs were presented in stakeholder focus groups to guide the design of intervention content and mode of delivery. Results Behavioural determinants relating to attendance clustered under three domains: beliefs about consequences, emotion and social influences, which mapped to three BCTs respectively: (1) persuasive communication/information provision; (2) stress management; (3) role modelling and encouragement. Service-user stakeholders translated these into three pragmatic intervention components: (i) addressing unanswered questions, (ii) problem-solving practitioner challenges and (iii) peer group communication. Based on (ii), practitioner stakeholders developed a call to action in three areas - clinical networking, history-taking, and flexibility in screening processes. APEASE informed modes of delivery (a service-user leaflet and a cartoon animation for practitioners). Conclusion The application of the TDF to qualitative data can provide an auditable protocol for the translation of qualitative data into intervention content.

Short Title: Practice Feedback Interventions: 15 Suggestions for Optimizing Effectiveness

ISSN: 0003-4819

DOI: 10.7326/m15-2248

Accession Number: WOS:000372207200017

Abstract: Electronic practice data are increasingly being used to provide feedback to encourage practice improvement. However, evidence suggests that despite decades of experience, the effects of such interventions vary greatly and are not improving over time. Guidance on providing more effective feedback does exist, but it is distributed across a wide range of disciplines and theoretical perspectives. Through expert interviews; systematic reviews; and experience with providing, evaluating, and receiving practice feedback, 15 suggestions that are believed to be associated with effective feedback interventions have been identified. These suggestions are intended to provide practical guidance to quality improvement professionals, information technology developers, educators, administrators, and practitioners who receive such interventions. Designing interventions with these suggestions in mind should improve their effect, and studying the mechanisms underlying these suggestions will advance a stagnant literature.

Title: Building theories of knowledge translation interventions: Use the entire menu of constructs

Journal: Implementation Science

Volume: 7

Date: Nov

Short Title: Building theories of knowledge translation interventions: Use the entire menu of constructs

ISSN: 1748-5908

DOI: 10.1186/1748-5908-7-114

Article Number: 114

Accession Number: WOS:000313207200001

Abstract: Background: In the ongoing effort to develop and advance the science of knowledge translation (KT), an important question has

emerged around how theory should inform the development of KT interventions. Discussion: Efforts to employ theory to better understand and improve KT interventions have until recently mostly involved examining whether existing theories can be usefully applied to the KT context in question. In contrast to this general theory application approach, we propose a 'menu of constructs' approach, where individual constructs from any number of theories may be used to construct a new theory. By considering the entire menu of available constructs, rather than limiting choice to the broader level of theories, we can leverage knowledge from theories that would never on their own provide a complete picture of a KT intervention, but that nevertheless describe components or mechanisms relevant to it. We can also avoid being forced to adopt every construct from a particular theory in a one-size-fits-all manner, and instead tailor theory application efforts to the specifics of the situation. Using audit and feedback as an example KT intervention strategy, we describe a variety of constructs (two modes of reasoning, cognitive dissonance, feed forward, desirable difficulties and cognitive load, communities of practice, and adaptive expertise) from cognitive and educational psychology that make concrete suggestions about ways to improve this class of intervention. Summary: The 'menu of constructs' notion suggests an approach whereby a wider range of theoretical constructs, including constructs from cognitive theories with scope that makes the immediate application to the new context challenging, may be employed to facilitate development of more effective KT interventions.

Title: Children With Medical Complexity in the Canadian Maritimes: Protocol for a Mixed Methods Study

Journal: Jmir Research Protocols

Volume: 11

Issue: 4

Date: Apr

Short Title: Children With Medical Complexity in the Canadian Maritimes: Protocol for a Mixed Methods Study

ISSN: 1929-0748

DOI: 10.2196/33426

Article Number: e33426

Accession Number: WOS:000832961700017

Abstract: Background: Ongoing developments in the medical field have improved survival rates and long-term management of children with complex chronic health conditions. While the number of children with medical complexity is small, they use a significant amount of health resources across various health settings and sectors. Research to date exploring this pediatric population has relied primarily on

quantitative or qualitative data alone, leaving significant gaps in our understanding of this population. Objective: The objective of this research is to use health administrative and family-reported data to gain an in-depth understanding of patterns of health resource use and health care needs of children with medical complexity and their families in the Canadian Maritimes. Methods: An explanatory sequential mixed methods design will be used to achieve our research objective. Phase 1 of this research will leverage the use of health administrative data to examine the prevalence and health service use of children with medical complexity. Phase 2 will use case study methods to collect multiple sources of family-reported data to generate a greater understanding of their experiences, health resource use, and health care needs. Two cases will be developed in each of the 3 provinces. Cases will be developed through semistructured interviews with families and their health care providers and health resource journaling. Findings will be triangulated from phase 1 and 2 using a joint display table to visually depict the convergence and divergence between the quantitative and qualitative findings. This triangulation will result in a comprehensive and in-depth understanding into the population of children with medical complexity. Results: This study will be completed in May 2022. Findings from each phase of the research and integration of the two will be reported in full in 2022. Conclusions: There is a current disconnect between the Canadian health care system and the needs of children with medical complexity and their families. By combining health administrative and family-reported data, this study will unveil critical information about children with medical complexity and their families to more efficiently and effectively meet their health care needs. Results from this research will be the first step in designing patient-oriented health policies and programs to improve the health care experiences, health system use, and health outcomes of children with medical complexity and their families. Article Number: 106764

Accession Number: WOS:000703571900035

Abstract: Growing gender disparities in levels of physical inactivity put women and female youths at a greater risk of associated health problems. Mother-daughter interventions have been proposed as means to promote physical activity in this at-risk cohort. However, there is a lack of clarity as to if and why these types of interventions might be effective. This systematic review examined the intervention characteristics, and behavior change theory and techniques used in these interventions to promote physical activity for mothers and daughters. PubMed, EMBASE, PsycINFO, CINAHL and Cochrane Library (Wiley) databases were searched for English language studies from inception to 13th May 2020. Interventions of any design that targeted daughters and mothers' physical activity were included. Data was extracted using the Template for Intervention Description and Replication (TIDieR) checklist, and the Behavior Change Technique (BCT) Taxonomy v1. 4962 articles were screened and 11 unique studies met the inclusion criteria. The risk of bias in studies was generally high. Narrative summary highlighted that many studies used social cognitive theory as a theoretical foundation, were based in the community and less than three months in duration with multiple sessions per week. Thirty-seven behavior change techniques were identified across studies. Some techniques were deemed potentially effective including credible source, information on the health consequences of the behavior and the self-regulatory techniques of goal-setting, selfmonitoring and problem-solving. Future research should consider the use of the TIDieR guidelines and BCT Taxonomy v1 to improve the quality of information for intervention development, implementation, and reporting phases.

Title: A systematic review of educational interventions to change behaviour of prescribers in hospital settings, with a particular emphasis on new prescribers
Journal: British Journal of Clinical Pharmacology
Volume: 75
Issue: 2
Pages: 359-372
Date: Feb
Short Title: A systematic review of educational interventions to change behaviour of prescribers in hospital settings, with a particular emphasis on new prescribers
ISSN: 0306-5251
DOI: 10.1111/j.1365-2125.2012.04397.x
Accession Number: WOS:000313554200007
Abstract: Aims Prescribing is a complex task and a high risk area of clinical practice. Poor prescribing occurs across staff grades and settings but new prescribers are attributed much of the blame. New prescribers may not be confident or even competent to prescribe and probably have different support and development needs than their more experienced colleagues. Unfortunately, little is known about what interventions are effective in this group. Previous systematic reviews have not distinguished between different grades of staff, have been narrow in scope and are now out of date. Therefore, to inform the design of educational interventions to change prescribing behaviour, particularly that of new prescribers, we conducted a systematic review of existing hospital-based interventions. Methods Embase, Medline, SIGLE, Cinahl and PsychINFO were searched for relevant studies published 1994-2010. Studies describing interventions to change the behaviour of prescribers in hospital settings were included, with an emphasis on new prescribers. The bibliographies of included papers were also searched for relevant studies. Interventions and effectiveness were classified using existing frameworks and the quality of studies was assessed using a validated instrument. Results Sixty-four studies were included in the review. Only 13% of interventions specifically targeted new prescribers. Most interventions (72%) were deemed effective in changing behaviour but no particular type stood out as most

effective. Conclusion Very few studies have tailored educational interventions to meet needs of new prescribers, or distinguished between new and experienced prescribers. Educational development and research will be required to improve this important aspect of early clinical practice.

Article Number: e037637

Accession Number: WOS:000645002700006

Abstract: Objectives To explore UK clinicians' beliefs and behaviours around recommending e-cigarettes as a smoking cessation aid for patients with cancer. Design Cross-sectional online survey. Setting England, Wales, Scotland and Northern Ireland. Participants Clinicians involved in the care of patients with cancer. Primary and secondary outcomes Behavioural Change Wheel capability, opportunity and motivation to perform a behaviour, knowledge, beliefs, current practice around e-cigarettes and other smoking cessation practices. Method Clinicians (n=506) completed an online survey to assess beliefs and behaviours around e-cigarettes and other smoking cessation practices for patients with cancer. Behavioural factors associated with recommending e-cigarettes in practice were assessed. Results 29% of clinicians would not recommend e-cigarettes to patients with cancer who continue to smoke. Factors associated with recommendation include smoking cessation knowledge (OR 1.56, 95% CI 1.01 to 2.44) and e-cigarette knowledge (OR 1.64, 95% CI 1.06 to 2.55), engagement with patients regarding smoking cessation (OR 2.12, 95% CI 1.12 to 4.03), belief in the effectiveness of e-cigarettes (OR 2.36 95% CI 1.61 to 3.47) and belief in sufficient evidence on e-cigarettes (OR 2.08 95% CI 1.10 to 4.00) and how comfortable they felt discussing e-cigarettes with patients (OR 1.57 95% CI 1.04 to 2.36). Conclusion Many clinicians providing cancer care to patients who smoke do not recommend e-cigarettes as a smoking cessation aid and were unaware of national guidance supporting recommendation of e-cigarettes as a smoking

cessation aid.

Abstract: Healthcare interventions are complex, but have the potential to deliver more efficient, cost-effective care and improved health outcomes. Careful attention must be paid to their early planning and development to minimise research waste or interventions that fail to deliver what they set out to achieve. The Medical Research Council provides guidance to help intervention developers, encouraging an explicit and iterative approach. This article describes the Medical Research Council's guidance and introduces two frequently used tools that further support the process of intervention design.

Title: Effect of In-Person Delivered Behavioural Interventions in People with Multimorbidity: Systematic Review and Meta-analysis

Journal: International Journal of Behavioral Medicine

Volume: 30

Issue: 2

Pages: 167-189

Date: Apr

Short Title: Effect of In-Person Delivered Behavioural Interventions in People with Multimorbidity: Systematic Review and Meta-analysis

ISSN: 1070-5503

DOI: 10.1007/s12529-022-10092-8

Accession Number: WOS:000788457300001

Abstract: Background To investigate the effect of in-person delivered behavioural interventions in people with multimorbidity and which behaviour change techniques (BCTs), targeting lifestyle behaviours, are associated with better outcomes. Methods Systematic review of randomised controlled trials. We searched MEDLINE, EMBASE, CENTRAL, and CINAHL and screened reference list of reviews including people with multimorbidity, registries, and citation tracking of included studies. Meta-analyses using random-effects model to assess the effect of behavioural interventions and meta-regression analyses and effectiveness ratios to investigate the impact of mediators on effect estimates. Cochrane 'Risk of Bias Tool' 2.0 and the GRADE assessment to evaluate the overall quality of evidence. Results Fourteen studies involving 1,378 people. Behavioural interventions had little to no effect on physical activity (standardised mean difference 0.38, 95% CI -0.12-0.87) and the effect on weight loss was uncertain (BMI mean difference -0.17, 95% CI -1.1-0.83) at the end-treatment follow-up. Small improvements were seen in health-related quality of life (SMD 0.29, 95% CI 0.17-0.42) and physical function (SMD 0.42, 95% CI 0.12-0.73), and moderate improvements were seen for depression symptoms (SMD -0.70, 95% CI -0.97-0.42). Studies using the BCTs 'action planning' and 'social support (practical)' reported greater physical activity and weight loss. Conclusions Behavioural interventions targeting lifestyle behaviours may improve health-related quality of life and physical function, and reduce depression, whereas little to no effect was achieved on physical activity and weight loss in people with multimorbidity. However, the evidence for physical activity and weight loss were of low quality and the end-treatment benefits diminished over time.

Article Number: 2126

Accession Number: WOS:000720639300002

Abstract: Background Workplace interventions have shown promise for reducing sitting in office workers. Police office staff remain an understudied population group that work within a disciplined organisation with distinctive work tasks around public safety, potentially affecting their capability, opportunity, and motivation to change sitting behaviour. This study aimed to assess the perceived influences on reducing workplace sitting in non-operational, desk-based police staff in order to derive theoretical determinants for behaviour change. Methods Ten police staff from a single police force in Bedfordshire, England [eight female; 39.5 +/- 11.5 years] took part in face-to-face semi-structured interviews lasting 46 +/- 11 min on average. Thematic analysis identified key themes which were then mapped onto the Theoretical Domains Framework (TDF) and linked to the Capability, Opportunity, Motivation-Behaviour (COM-B) model. Results Seven themes were identified: 'Work tasks are seated', 'Social norm is to sit', 'Belief in ability to regulate behaviour', 'Knowledge of health risks', 'Organisational support', 'Impact on productivity', and 'Perceived autonomy for sitting reduction'. Conclusions Awareness of behaviour and health impacts (Capability), social and physical support to sit less (Opportunity), and habit formation techniques (Motivation) are recommended considerations in sitting reduction workplace interventions for police staff.

Short Title: How are behavioural interventions delivered to children (5–11 years old): a systematic mapping review

DOI: 10.1136/bmjpo-2019-000543

Article Number: e000543

Accession Number: WOS:000655592900055

Abstract: Context Behavioural interventions are used to prevent, manage and treat a wide variety of conditions including obesity, diabetes, chronic pain, asthma and emotional difficulties. There has been inadequate attention to the delivery of behavioural interventions to younger children (5–11 years old). Objective Our objectives were to describe the characteristics of behavioural interventions for children aged 5–11 years. Data sources We searched five databases: CINAHL, EMBASE, PsycINFO, MEDLINE and Cochrane Library, from January 2005 to August 2019. Study selection The inclusion criteria were (1) children aged 5–11, (2) cognitive and/or behavioural interventions, (3) randomised controlled trials and (4) 2005 onward. Two researchers independently identified studies for inclusion. Data extraction Two researchers independently extracted data from eligible papers. Results The search identified 10541 papers. We extracted information on 117 interventions (from 152 papers). Many of the interventions were categorised as complex. This was particularly true for clinical populations; 78.7% were delivered to both the child and parent, and 33.9% took place across multiple settings, typically health and school settings. Most (70.9%) were 'First Wave' (behavioural) interventions, and few (4.3%) were 'Third Wave' (characterised by metacognition, acceptance and mindfulness). Thirty-nine per cent used interactive techniques (play, arts, story and/or games). Purely digital and paper-based interventions were rare, but around a third used these tools as supplements to face-face delivery. There were differences in interventions for younger (5–7 years) and older (8–11 years) children. Conclusions Interventions designed and delivered to children should be developmentally sensitive. This review highlights characteristics of interventions delivered to children 5–11 years old: the involvement of the child's parent, using behavioural (rather than cognitive) modalities, using interactive techniques and some interventions were delivered across multiple settings.

Title: Supporting the Evaluation and Implementation of Musculoskeletal Models of Care: A Globally Informed Framework for Judging Readiness and Success

Journal: Arthritis Care & Research

Volume: 69

Issue: 4

Pages: 567-577

Date: Apr

Short Title: Supporting the Evaluation and Implementation of Musculoskeletal Models of Care: A Globally Informed Framework for Judging Readiness and Success

ISSN: 2151-464X

DOI: 10.1002/acr.22948

Accession Number: WOS:000397988800015

Abstract: Objective. To develop a globally informed framework to evaluate readiness for implementation and success after implementation of musculoskeletal models of care (MOCs). Methods. Three phases were undertaken: 1) a qualitative study with 27 Australian subject matter experts (SMEs) to develop a draft framework; 2) an eDelphi study with an international panel of 93 SMEs across 30 nations to evaluate face validity, and refine and establish consensus on the framework components; and 3) translation of the framework into a user-focused resource and evaluation of its acceptability with the eDelphi panel. Results. A comprehensive evaluation framework was developed for judging the readiness and success of musculoskeletal MOCs. The framework consists of 9 domains, with each domain containing a number of themes underpinned by detailed elements. In the first Delphi round, scores of "partly agree" or "completely agree" with the draft framework ranged 96.7%-100%. In the second round, "essential" scores ranged 58.6%-98.9%, resulting in 14 of 34 themes being classified as essential. SMEs strongly agreed or agreed that the final framework was useful (98.8%), usable (95.1%), credible (100%) and appealing (93.9%). Overall, 96.3% strongly supported or supported the final structure of the framework as it was presented, while 100%, 96.3%, and 100% strongly supported or supported the content within the readiness, initiating implementation, and success streams, respectively. Conclusion. An empirically derived framework to evaluate the readiness and success of musculoskeletal MOCs was strongly supported by an international panel of SMEs. The framework provides an important internationally applicable benchmark for the development, implementation, and evaluation of musculoskeletal MOCs. Notes: Briggs, Andrew M. Jordan, Joanne E. Title: Factors influencing initiation of health behaviour conversations with patients: Cross-sectional study of nurses, midwives, and healthcare support workers in Wales

Journal: Journal of Advanced Nursing

Volume: 77

Issue: 11

Pages: 4427-4438

Date: Nov

Short Title: Factors influencing initiation of health behaviour conversations with patients: Cross-sectional study of nurses, midwives, and healthcare support workers in Wales

ISSN: 0309-2402

DOI: 10.1111/jan.14926

Accession Number: WOS:000670444300001

Abstract: Aim To identify factors influencing healthcare professionals' engagement in health behaviour conversations with patients. Design Cross-sectional survey. Methods Between April and June 2019, an online survey of 1338 nurses, midwives and healthcare support workers was conducted. The survey assessed whether staff felt comfortable initiating health behaviour conversations with patients about five behaviours (reducing alcohol intake; stop smoking; being more active; reducing their weight; and improving their diet) and barriers to conversation initiation. Health professionals' own health-related behaviours, self-rated health and mental wellbeing, and socio-demographic characteristics were recorded. Logistic regression models were built to assess factors associated with feeling comfortable initiating health behaviour conversations for each topic. Result Less than 50% of respondents reported feeling comfortable initiating health behaviour conversations with patients. Female staff, young professionals (18 to 29 years), those in lower staff grades and those with poorer health and low mental wellbeing were less likely to report feeling comfortable having health behaviour conversations across all topics. Those who did not adhere to physical activity and dietary guidelines were less likely to initiate a conversation about being more active and having a healthy diet, respectively. Not having time to discuss the topic, suitable space to hold a conversation, and feeling worried about offending/upsetting patients were the main barriers reported. Conclusion Around 6 in 10 members of the nursing, midwifery and healthcare support workforce in Wales potentially do not feel comfortable to initiate a health behaviour conversation with patients about health and wellbeing. Feeling less comfortable to initiate a conversation was associated with staff demographics and organizational factors. Impact We identified those less likely to initiate health behaviour conversations as well as personal and organizational barriers to initiation. This will help to target and tailor interventions to ensure staff are equipped and enabled to hold health behaviour conversations with patients.

Title: Implementation of a food retail intervention to reduce
purchase of unhealthy food and beverages in remote Australia: mixed-
method evaluation using the consolidated framework for
implementation research

Journal: International Journal of Behavioral Nutrition and Physical
Activity

Volume: 20

Issue: 1

Date: Feb

Short Title: Implementation of a food retail intervention to reduce
purchase of unhealthy food and beverages in remote Australia: mixed-
method evaluation using the consolidated framework for
implementation research

DOI: 10.1186/s12966-022-01377-y

Article Number: 20

Accession Number: WOS:000935886500001

Abstract: BackgroundAdoption of health-enabling food retail
interventions in food retail will require effective implementation
strategies. To inform this, we applied an implementation framework
to a novel real-world food retail intervention, the Healthy Stores
2020 strategy, to identify factors salient to intervention
implementation from the perspective of the food retailer.MethodsA
convergent mixed-method design was used and data were interpreted
using the Consolidated Framework for Implementation Research (CFIR).
The study was conducted alongside a randomised controlled trial in
partnership with the Arnhem Land Progress Aboriginal Corporation
(ALPA). Adherence data were collected for the 20 consenting Healthy
Stores 2020 study stores (ten intervention /ten control) in 19
communities in remote Northern Australia using photographic material
and an adherence checklist. Retailer implementation experience data
were collected through interviews with the primary Store Manager for
each of the ten intervention stores at baseline, mid- and end-
strategy. Deductive thematic analysis of interview data was
conducted and informed by the CFIR. Intervention adherence scores
derived for each store assisted interview data
interpretation.ResultsHealthy Stores 2020 strategy was, for the most
part, adhered to. Analysis of the 30 interviews revealed that
implementation climate of the ALPA organisation, its readiness for
implementation including a strong sense of social purpose, and the

networks and communication between the Store Managers and other parts of ALPA, were CFIR inner and outer domains most frequently referred to as positive to strategy implementation. Store Managers were a 'make-or-break' touchstone of implementation success. The co-designed intervention and strategy characteristics and its perceived cost-benefit, combined with the inner and outer setting factors, galvanised the individual characteristics of Store Managers (e.g., optimism, adaptability and retail competency) to champion implementation. Where there was less perceived cost-benefit, Store Managers seemed less enthusiastic for the strategy.

Conclusions Factors critical to implementation (a strong sense of social purpose; structures and processes within and external to the food retail organisation and their alignment with intervention characteristics (low complexity, cost advantage); and Store Manager characteristics) can inform the design of implementation strategies for the adoption of this health-enabling food retail initiative in the remote setting. This research can help inform a shift in research focus to identify, develop and test implementation strategies for the wide adoption of health-enabling food retail initiatives into practice.

Article Number: 19

Accession Number: WOS:000953145500001

Abstract: Objectives This study aimed to identify barriers to the proper use of antibiotics by healthcare professionals and to help the hospital Antimicrobial Stewardship develop suitable actions for the staff. **Methods** In a Belgian teaching hospital, a survey was

conducted among physicians, pharmacists, and nurses involved in antibiotic therapy. Questions from the 2019 European Center for Disease Prevention and Control (ECDC) survey were analyzed based on components of the COM-B model (capabilities, opportunities, and motivations). First, collected data were reviewed with the Ethnos software to analyze the different COM-B model components. For statistical analyses, responses were grouped into three clear-cut answers in a Fisher's exact test. Results Overall, 400 staff members were included. We found that our professions, combined, have a good perception of antibiotic resistance (97.8%). For capabilities, however, only 77.2% state that they have sufficient knowledge, with 91.3%, 71.5%, and 63.0% for physicians, nurses, and pharmacists, respectively. For opportunities (access to resources, information, and training), it is observed that 72.2% report having easy access to the guidelines they need to manage infections. In comparison, for 64.2% of the respondents, this information changed their opinion on the useless or inappropriate prescription, administration, and delivery of antibiotics. For 55.0%, this information has enabled them to change their practices. Finally, for motivations, 92.8% of respondents state that they know about the link between their practices and the emergence and spread of antibiotic resistance. However, only 65.0% of participants say they have a role in managing antibiotic resistance. We found that 5 out of 8 questions are significantly dependent on the profession: 2 inquiries related to capability, 1 to opportunity, and 2 to motivation. Conclusion We found that responses to the ECDC questionnaire are related to the profession. While some topics are universal/cross-functional, others must be explicitly tailored to each professional category. Information is useless if not accessible. Communication and provision of documents are thus paramount.

Short Title: A Web-Based Self-help Intervention for Coping With the Loss of a Partner: Protocol for Randomized Controlled Trials in 3 Countries

ISSN: 1929-0748

DOI: 10.2196/37827

Accession Number: WOS:000917774000010

Abstract: Background: The death of a partner is a critical life event in later life, which requires grief work as well as the development of a new perspective for the future. Cognitive behavioral web-based self-help interventions for coping with prolonged grief have established their efficacy in decreasing symptoms of grief, depression, and loneliness. However, no study has tested the efficacy for reducing grief after losses occurring less than 6 months ago and the role of self-tailoring of the content. Objective: This study aims to evaluate the clinical efficacy and acceptance of a web-based self-help intervention to support the grief process of older adults who have lost their partner. It will compare the outcomes, adherence, and working alliance in a standardized format with those in a self-tailored delivery format and investigate the effects of age, time since loss, and severity of grief at baseline as predictors. Focus groups to understand user experience and a cost-effectiveness analysis will complement the study. Methods: The study includes 3 different randomized control trials. The trial in Switzerland comprises a waitlist control group and 2 active arms consisting of 2 delivery formats, standardized and self-tailored. In the Netherlands and in Portugal, the trials follow a 2-arm design that will be, respectively, complemented with focus groups on technology acceptance and cost-effectiveness analysis. The main target group will consist of adults aged >60 years from the general population in Switzerland (n >= 85), the Netherlands (n >= 40), and Portugal (n >= 80) who lost their partner and seek help for coping with grief symptoms, psychological outcome) and depression symptoms and loneliness (secondary outcomes) after the intervention. Measurements will take place at baseline (week 0), after the intervention (week 10), and at follow-up (week 20). Results: The trials started in March 2022 and are expected to end in December 2022 or when the needed sample size is achieved. Conclusions: The

trials will provide insights into the efficacy and acceptance of a web-based self-help intervention among older adults who have recently lost a partner. Results will extend the knowledge on the role of self-tailoring, working alliance, and satisfaction in the effects of the intervention. Finally, the study will suggest adaptations to improve the acceptance of web-based self-help interventions for older mourners and explore the cost-effectiveness of this intervention. Limitations include a self-selective International Registered Report Identifier (IRRID): PRR1-10.2196/37827

Short Title: Optimizing Outcomes After Out-of-Hospital Cardiac Arrest With Innovative Approaches to Public-Access Defibrillation: A Scientific Statement From the International Liaison Committee on Resuscitation

ISSN: 0009-7322

DOI: 10.1161/cir.0000000000001013

Accession Number: WOS:000771959800001

Abstract: Out-of-hospital cardiac arrest is a global public health issue experienced by approximate to 3.8 million people annually. Only 8% to 12% survive to hospital discharge. Early defibrillation of shockable rhythms is associated with improved survival, but ensuring timely access to defibrillators has been a significant challenge. To date, the development of public-access defibrillation programs, involving the deployment of automated external defibrillators into the public space, has been the main strategy to address this challenge. Public-access defibrillator programs have

been associated with improved outcomes for out-of-hospital cardiac arrest; however, the devices are used in <3% of episodes of out-of-hospital cardiac arrest. This scientific statement was commissioned by the International Liaison Committee on Resuscitation with 3 objectives: (1) identify known barriers to public-access defibrillator use and early defibrillation, (2) discuss established and novel strategies to address those barriers, and (3) identify high-priority knowledge gaps for future research to address. The writing group undertook systematic searches of the literature to inform this statement. Innovative strategies were identified that relate to enhanced public outreach, behavior change approaches, optimization of static public-access defibrillator deployment and housing, evolved automated external defibrillator technology and functionality, improved integration of public-access defibrillation with existing emergency dispatch protocols, and exploration of novel automated external defibrillator delivery vectors. We provide evidence- and consensus-based policy suggestions to enhance public-access defibrillation and guidance for future research in this area. Notes: Brooks, Steven C. Clegg, Gareth R. Short Title: Treatment manuals, training and successful provision of stop smoking behavioural support

ISSN: 0005-7967

DOI: 10.1016/j.brat.2015.05.013

Accession Number: WOS:000358391400005

Abstract: Objective: Translating evidence-based behaviour change interventions into practice is aided by use of treatment manuals specifying the recommended content and format of interventions, and evidence-based training. This study examined whether outcomes of stop smoking behavioural support differed with practitioner's use and evaluation of treatment manuals, or practitioner's training. Methods: English stop smoking practitioners were invited to complete an online survey including questions on: practitioners' training, availability, use and perceived utility of manuals, and annual

biochemically-validated success rates of quit attempts supported (practitioner-reported). Mean success rates were compared between practitioners with/without access to manuals, those using/not using manuals, perceived utility ratings of manuals, and consecutive levels of training completed. Results: Success rates were higher if practitioners had a manual (Mean (SD) = 54.0 (24.0) versus 48.0 (25.3), $t(838) = 2.48$, $p = 0.013$; $n = 840$), used a manual ($F(2,8237) = 4.78$, $p = 0.009$, $n = 840$), perceived manuals as more useful ($F(3,834) = 2.90$, $p = 0.034$, $n = 840$), and had completed training ($F(3,709) = 4.81$, $p = 0.002$, $n = 713$). Differences were diminished when adjusting for professional and demographic characteristics and no longer reached statistical significance using a conventional alpha for perceived utility of manuals and training status (both $p = 0.1$). Conclusions: Practitioners' performance in supporting smokers to quit varied with availability and use of treatment manuals. Evidence was weaker for perceived utility of manuals and practitioners' evidence-based training. Ensuring practitioners have access to treatment manuals within their service, promoting manual use, and training practitioners to competently apply manuals is likely to contribute to higher success rates in clinical practice. Short Title: 'Interpreted space' as a mediator between physical environment and situated substance use: outline of a socio-spatial theory for substance use prevention

ISSN: 0968-7637

DOI: 10.1080/09687637.2022.2061918

Accession Number: WOS:000784410600001

Abstract: Environmental approaches to substance use prevention currently rely on a behaviorist paradigm. On this theoretical foundation, useful intervention strategies may be overlooked, and effectiveness may be limited. To address these issues, this study drew on Low's 'sociology of space' to develop a socio-spatial theory for prevention research. Salient dimensions of everyday settings (e.g. home, bar) were identified through mixed-methods research with 24 female university students who were current users of alcohol or cigarettes. Situational pathways explored the event-level interplay of these dimensions with other factors in relation to situational substance use and abstinence. On this basis, the article proposes a visual theory which outlines three mediating steps between physical environment and situated substance use outcomes: perceived space (construal of manifest aspects); interpreted space (construal of latent aspects); and momentary thoughts and feelings. Personal and cultural factors moderate this process. The theory is illustrated using three pathways in smoking ban contexts. The findings can inform intervention design and research into contextual factors of substance use by outlining a mechanism with specified variables, highlighting the role of subjective meaning-making, and suggesting specific environmental aspects for future consideration.

Title: 'We're Not Providing the Best Care If We Are Not on the Cutting Edge of Research': A Research Impact Evaluation at a Regional Australian Hospital and Health Service

Journal: International Journal of Health Policy and Management

Date: 2022 May

Short Title: 'We're Not Providing the Best Care If We Are Not on the Cutting Edge of Research': A Research Impact Evaluation at a

Regional Australian Hospital and Health Service

DOI: 10.34172/ijhpm.2022.6529

Accession Number: WOS:000804381900001

Abstract: Background: Research is central to high functioning health services alongside clinical care and health professional training. The impact of embedded research includes delivery of high-quality care and improved patient outcomes. Evaluations of research impact help health service leadership ensure investments lead to the greatest healthcare benefits for patients. This study aimed to retrospectively evaluate the impact of research investment from 2008 to 2018 at Townsville Hospital and Health Service (THHS), a regional Hospital and Health Service (HHS) in Queensland, Australia. The evaluation also sought to identify contextual conditions that enable or hinder intended impacts. Methods: A mixed-methods realist-informed evaluation was conducted using documentation, interviews with 15 staff and available databases to identify and measure research investments, impacts and contextual conditions influencing impact outcomes. Results: Between 2008 and 2018, THHS increased resources for research by funding research projects, employing research personnel, building research-enabling facilities, hosting research events, and providing research education and training. Clinical practice, policy and workforce impacts were successful in isolated pockets, championed by individual researchers and facilitated by their policy and community-of-practice networks. However, there was little organisational level support for continuity of research and implementation into practice and policy. Availability of research supports varied geographically across THHS, and across disciplines. Conclusion: Definitive steps in the development of THHS as a credible and productive research centre and leading hospital research centre in Northern Australia are evident. Continuing investments should address support for the research continuum through to translation and establish ongoing, systematic processes for evaluating research investment and impact.

Title: Enhancing the potential effects of text messages delivered via an m-health intervention to improve packing of healthy school lunchboxes

Journal: Public Health Nutrition

Volume: 24

Issue: 10

Pages: 2867-2876

Date: Jul

Short Title: Enhancing the potential effects of text messages delivered via an m-health intervention to improve packing of healthy school lunchboxes

ISSN: 1368-9800

DOI: 10.1017/s1368980020003997

Article Number: Pii s1368980020003997

Accession Number: WOS:000662703500009

Abstract: Objective: The aim of the study was to assess the impact of different lunchbox messages on parents' intention to pack a healthy lunchbox. Design: This study employed an experimental design. Setting: A series of messages were developed to align with the six constructs of the Health Belief Model. Messages were also developed that were (and were not) personalised and varied based on the source of the information provided (university, school, dietitian and health promotion service). During a telephone survey, participants were read the content of each message and asked about their intention to pack a healthy lunchbox. Participants: Parents of primary school-aged children were randomised to receive different messages to encourage the packing of healthy lunchboxes. Results: The study was completed by 511 parents. Linear mixed regression analyses identified significant differences ($P < 0.05$) in intention scores between variant messages targeting the same behavioural constructs for 'susceptibility', 'severity', 'benefits' and 'barriers' but not 'cues to action' or 'self-efficacy'. The highest mean behavioural intention score was for 'benefits', whilst the lowest mean score was for 'barriers'. There were no significant differences in intention scores of parents receiving messages from a dietitian, university, health promotion team or school ($P = 0.37$). Intention scores did not differ in which messages were personalised based on child's name ($P = 0.84$) or grade level ($P = 0.54$). Conclusions: The findings suggest that messages that focus on the benefits of packing healthy lunchboxes may be particularly useful in improving intentions of parents to pack healthy foods for their children to consume at school.

Title: Cost and Cost Effectiveness of a Pilot m-Health Intervention

Targeting Parents of School-Aged Children to Improve the Nutritional Quality of Foods Packed in the Lunchbox

Journal: *Nutrients*

Volume: 13

Issue: 11

Date: Nov

Short Title: Cost and Cost Effectiveness of a Pilot m-Health Intervention Targeting Parents of School-Aged Children to Improve the Nutritional Quality of Foods Packed in the Lunchbox

DOI: 10.3390/nu13114136

Article Number: 4136

Accession Number: WOS:000727285600001

Abstract: The SWAP IT program aims to improve the nutritional quality of school lunchboxes via a multicomponent m-health intervention, involving: weekly support messages to parents; physical resources; school nutrition guidelines and lunchbox lessons. SWAP IT has been reported to be effective. This study aims to determine the cost and cost effectiveness of the SWAP IT m-health intervention. The retrospective trial-based economic evaluation was conducted in 12 Catholic primary schools in New South Wales, Australia. Schools were randomised to intervention or usual care. The costs (AUD, 2019) were evaluated from societal perspectives. The direct cost to uptake the intervention and the incremental cost-effectiveness ratios (ICER) were calculated. ICERS were calculated for two outcomes: reduction in total kJ and reduction in discretionary kJ from the lunchbox. The total cost was calculated to be AUD 55, 467. The mean incremental cost per student to receive the intervention was calculated to be AUD 31/student. The cost per reduction in total lunchbox energy was AUD 0.54. The ICER for the reduction in energy from discretionary foods in the lunchbox was AUD 0.24. These findings suggest that this m-health intervention has potential to be cost effective in reducing the kilojoules from discretionary foods packed in school lunchboxes.

Short Title: Clinician-led improvement in cancer care (CLICC) –

testing a multifaceted implementation strategy to increase evidence-based prostate cancer care: phased randomised controlled trial - study protocol

ISSN: 1748-5908

DOI: 10.1186/1748-5908-9-64

Article Number: 64

Accession Number: WOS:000338370900001

Abstract: Background: Clinical practice guidelines have been widely developed and disseminated with the aim of improving healthcare processes and patient outcomes but the uptake of evidence-based practice remains haphazard. There is a need to develop effective implementation methods to achieve large-scale adoption of proven innovations and recommended care. Clinical networks are increasingly being viewed as a vehicle through which evidence-based care can be embedded into healthcare systems using a collegial approach to agree on and implement a range of strategies within hospitals. In Australia, the provision of evidence-based care for men with prostate cancer has been identified as a high priority. Clinical audits have shown that fewer than 10% of patients in New South Wales (NSW) Australia at high risk of recurrence after radical prostatectomy receive guideline recommended radiation treatment following surgery. This trial will test a clinical network-based intervention to improve uptake of guideline recommended care for men with high-risk prostate cancer. Methods/Design: In Phase I, a phased randomised cluster trial will test a multifaceted intervention that harnesses the NSW Agency for Clinical Innovation (ACI) Urology Clinical Network to increase evidence-based care for men with high-risk prostate cancer following surgery. The intervention will be introduced in nine NSW hospitals over 10 months using a stepped wedge design. Outcome data (referral to radiation oncology for discussion of adjuvant radiotherapy in line with guideline recommended care or referral to a clinical trial of adjuvant versus salvage radiotherapy) will be collected through review of patient medical records. In Phase II, mixed methods will be used to identify mechanisms of provider and organisational change. Clinicians' knowledge and attitudes will be assessed through surveys. Process outcome measures will be assessed through document review. Semi-structured interviews will be conducted to elucidate mechanisms of change. Discussion: The study will be one of the first randomised controlled trials to test the effectiveness of clinical networks to lead changes in clinical practice in hospitals treating patients with high-risk cancer. It will additionally provide direction regarding implementation strategies that can be effectively employed to encourage widespread adoption of clinical practice guidelines.

Title: How effective and cost-effective was the national mass media smoking cessation campaign 'Stoptober'?

Journal: Drug and Alcohol Dependence

Volume: 135

Pages: 52-58

Date: Feb

Short Title: How effective and cost-effective was the national mass media smoking cessation campaign 'Stoptober'?

ISSN: 0376-8716

DOI: 10.1016/j.drugalcdep.2013.11.003

Accession Number: WOS:000332749700007

Abstract: Background: A national smoking cessation campaign based on behaviour change theory and operating through both traditional and new media was launched across England during late 2012

('Stoptober'). In addition to attempting to start a movement in which smokers would quit at the same time in response to a positive mass quitting trigger, the campaign set smokers the goal of being smoke-free for October and embodied other psychological principles in a range of tools and communications. Methods: Data on quit attempts were obtained from 31,566 past-year smokers during nationally representative household surveys conducted monthly between 2007 and 2012. The effectiveness of the campaign was assessed by the increase in national quit attempt rate in October relative to other months in 2012 vs. 2007-2011. Results: Relative to other months in the year, more people tried to quit in October in 2012 compared with 2007-2011 (OR= 1.79, 95%CI= 1.20-2.68). In 2012 there was an approximately 50% increase in quitting during October compared with other months of the same year (9.6% vs. 6.6%; OR 1.50, 95%CI = 1.05-2.15), whereas in 2007-2011 the rate in October was non-significantly less than in other months of the same period (6.4% vs. 7.5%; OR= 0.84, 95%CI = 0.70-1.00). Stoptober is estimated to have generated an additional 350,000 quit attempts and saved 10,400 discounted life years (DLY) at less than 415 per DLY in the modal age group. Conclusions: Designing a national public health campaign with a clear behavioural target (making a serious quit attempt) using key psychological principles can yield substantial behaviour change and public health impact. Title: Improving identity leadership through a novel targeted reflective practice intervention

Journal: Journal of Applied Sport Psychology

Date: 2022 Jul

Short Title: Improving identity leadership through a novel targeted reflective practice intervention

ISSN: 1041-3200

DOI: 10.1080/10413200.2022.2098877

Accession Number: WOS:000827567700001

Abstract: The purpose of this study was to investigate the effectiveness of a novel identity leadership-framed reflective practice intervention for developing sport coach leadership skills. We adopted an eight-week randomized control intervention design, including five experimental group coaches and their associated athletes (n = 47) and four control group coaches and their athletes (n = 32). Athletes' perceptions of their coach engaging in identity leadership behaviors were measured at Weeks 0 and 8 for both groups. The experimental group coaches completed three specifically designed social identity-framed reflective practice tasks in Weeks 1, 3, and 5. Results showed that when controlling for baseline scores and compared to the control condition, the experimental condition reported significantly greater advancement, entrepreneurship, and impresarioship, but not prototypicality at post-intervention. The results provide support for the use of tailored reflective practice interventions to elicit desirable identity leadership behaviors as perceived by athletes. Lay summary: Leadership is a key aspect of team sport performance. Reflective practice is a core component of coach development. The present study shows the potential to develop leadership through social identity-framed reflective practice activities. Implications for practice Investigation of new ways for developing leadership In-direct development of Identity Leadership Multi-faceted and innovative approach to reflective practice

Abstract: This chapter illustrates the application of an Intervention Mapping approach to the development and design of a Serious Game addressing relationships and sex education (RSE) needs in British adolescents. Needs assessment identified experience of pressure/coercion in sexual relationships as the topic for a Serious Game-based RSE session. The process of applying intervention mapping including evidence review, identification of a programme goal, performance objectives and associated determinants, and change objectives are explicated. The way that these were translated into a concept and content for a Serious Game is explained. Evaluation plans grounded in the planning process, and commentary on challenges experienced, are also provided. The chapter provides an important contribution to approaches that can ensure efficacy of Serious Games applied to healthcare issues.

Short Title: Childhood cancer survivors' perceptions of the barriers and facilitators to physical activity: a systematic review and thematic synthesis of qualitative evidence using the theoretical domains framework

ISSN: 1743-7199

DOI: 10.1080/17437199.2022.2032795

Accession Number: WOS:000755019900001

Abstract: Physical activity (PA) is recommended for childhood cancer survivors (CCSs). However, many CCSs have low levels of activity. This review aimed to systematically identify, appraise and synthesise qualitative research evidence on the barriers and facilitators to PA from the perspective of CCSs. Six databases (MEDLINE, Embase, PsycINFO, CINAHL, SPORTDiscus, and Scopus) were searched to identify qualitative data on PA gathered from CCSs diagnosed \leq 18 years of age and who had completed active treatment. An inductive thematic synthesis was undertaken to identify descriptive themes relating to barriers and facilitators to PA, before mapping these onto the Theoretical Domains Framework (TDF). Methodological quality was assessed using CASP, and confidence in review findings was assessed using the GRADE-CERQual approach. Eight original studies were eligible. A total of 45 descriptive themes (29

facilitators and 16 barriers) were mapped onto nine domains of the TDF; they were most commonly mapped onto the Environmental Context and Resources (n = 13 descriptive themes) and the Social Influences (n = 13) domains. Study quality was variable and overall confidence in review findings was low. Conclusive/strong evidence for the barriers and facilitators to PA is lacking, highlighting the need for further research on the perceived influences on PA in CCSs. PROSPERO Registration: CRD42019147829.

Title: Community pharmacy-delivered interventions for public health priorities: a systematic review of interventions for alcohol reduction, smoking cessation and weight management, including meta-analysis for smoking cessation

Journal: Bmj Open

Volume: 6

Issue: 2

Short Title: Community pharmacy-delivered interventions for public health priorities: a systematic review of interventions for alcohol reduction, smoking cessation and weight management, including meta-analysis for smoking cessation

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2015-009828

Article Number: e009828

Accession Number: WOS:000381514500072

Abstract: Objectives: To systematically review the effectiveness of community pharmacy-delivered interventions for alcohol reduction, smoking cessation and weight management. Design: Systematic review and meta-analyses. 10 electronic databases were searched from inception to May 2014. Eligibility criteria for selecting studies: Study design: randomised and non-randomised controlled trials; controlled before/after studies, interrupted times

series. Intervention: any relevant intervention set in a community pharmacy, delivered by the pharmacy team. No restrictions on duration, country, age, or language. Results: 19 studies were included: 2 alcohol reduction, 12 smoking cessation and 5 weight management. Study quality rating: 6 'strong', 4 'moderate' and 9 'weak'. 8 studies were conducted in the UK, 4 in the USA, 2 in Australia, 1 each in 5 other countries. Evidence from 2 alcohol-reduction interventions was limited. Behavioural support and/or

nicotine replacement therapy are effective and cost-effective for smoking cessation: pooled OR was 2.56 (95% CI 1.45 to 4.53) for active intervention vs usual care. Pharmacy-based interventions produced similar weight loss compared with active interventions in other primary care settings; however, weight loss was not sustained longer term in a range of primary care and commercial settings compared with control. Pharmacy-based weight management interventions have similar provider costs to those delivered in other primary care settings, which are greater than those delivered by commercial organisations. Very few studies explored if and how sociodemographic or socioeconomic variables moderated intervention effects. Insufficient information was available to examine relationships between effectiveness and behaviour change strategies, implementation factors, or organisation and delivery of interventions. Conclusions: Community pharmacy-delivered interventions are effective for smoking cessation, and demonstrate that the pharmacy is a feasible option for weight management interventions. Given the potential reach, effectiveness and associated costs of these interventions, commissioners should consider using community pharmacies to help deliver public health services.

Title: Professional interventions for general practitioners on the management of musculoskeletal conditions

Journal: Cochrane Database of Systematic Reviews

Issue: 5

Short Title: Professional interventions for general practitioners on the management of musculoskeletal conditions

ISSN: 1469-493X

DOI: 10.1002/14651858.CD007495.pub2

Article Number: Cd007495

Accession Number: WOS:000377961800051

Abstract: Background Musculoskeletal conditions require particular management skills. Identification of interventions which are effective in equipping general practitioners (GPs) with such necessary skills could translate to improved health outcomes for patients and reduced healthcare and societal costs. Objectives To determine the effectiveness of professional interventions for GPs that aim to improve the management of musculoskeletal conditions in primary care. Search methods We searched the Cochrane Central Register of Controlled Trials (CENTRAL), 2010, Issue 2; MEDLINE, Ovid (1950 – October 2013); EMBASE, Ovid (1980 – October 2013); CINAHL, EbscoHost (1980 – November 2013), and the EPOC Specialised Register. We conducted cited reference searches using ISI Web of Knowledge and Google Scholar; and handsearched selected issues of Arthritis and Rheumatism and Primary Care–Clinics in Office Practice. The latest search was conducted in November 2013. Selection criteria We included randomised controlled trials (RCTs), non-randomised controlled trials (NRCTs), controlled before-and-after studies (CBAs) and interrupted time series (ITS) studies of professional interventions for GPs, taking place in a community setting, aiming to improve the management (including diagnosis and treatment) of musculoskeletal conditions and reporting any objective measure of GP behaviour, patient or economic outcomes. We considered professional interventions of any length, duration, intensity and complexity compared with active or inactive controls. Data collection and analysis Two review authors independently abstracted all data. We calculated the risk difference (RD) and risk ratio (RR) of compliance with desired practice for dichotomous outcomes, and the mean difference (MD) and standardised mean difference (SMD) for continuous outcomes. We investigated whether the direction of the targeted behavioural change affects the effectiveness of interventions. Main results Thirty studies met our inclusion criteria. From 11 studies on osteoporosis, meta-analysis of five studies (high-certainty evidence) showed that a combination of a GP alerting system on a patient's increased risk of osteoporosis and a patient-directed intervention (including patient education and a reminder to see their GP) improves GP behaviour with regard to diagnostic bone mineral density (BMD) testing and osteoporosis medication prescribing (RR 4.44; (95% confidence interval (CI) 3.54 to 5.55; 3 studies; 3,386 participants)) for BMD and RR 1.71 (95% CI 1.50 to 1.94; 5 studies; 4,223 participants) for osteoporosis medication. Meta-analysis of two studies showed that GP alerting on its own also probably improves osteoporosis guideline-consistent GP behaviour (RR 4.75 (95% CI 3.62 to 6.24; 3,047 participants)) for BMD and RR 1.52 (95% CI 1.26 to 1.84; 3,047 participants) for osteoporosis medication) and that adding the patient-directed component probably does not lead to a greater effect (RR 0.94 (95% CI 0.81 to 1.09; 2,995 participants)) for BMD and RR 0.93 (95% CI 0.79 to 1.10; 2,995 participants) for osteoporosis medication. Of the 10 studies on low back pain, seven showed that guideline dissemination and educational opportunities for GPs may lead to little or no improvement with regard to guideline-consistent GP behaviour. Two studies showed that the combination of guidelines and GP feedback on the total number of investigations requested may have an effect on GP behaviour and result in a slight reduction in the

number of tests, while one of these studies showed that the combination of guidelines and GP reminders attached to radiology reports may result in a small but sustained reduction in the number of investigation requests. Of the four studies on osteoarthritis, one study showed that using educationally influential physicians may result in improvement in guideline-consistent GP behaviour. Another study showed slight improvements in patient outcomes (pain control) after training GPs on pain management. Of three studies on shoulder pain, one study reported that there may be little or no improvement in patient outcomes (functional capacity) after GP education on shoulder pain and injection training. Of two studies on other musculoskeletal conditions, one study on pain management showed that there may be worse patient outcomes (pain control) after GP training on the use of validated assessment scales. The 12 remaining studies across all musculoskeletal conditions showed little or no improvement in GP behaviour and patient outcomes. The direction of the targeted behaviour (i.e. increasing or decreasing a behaviour) does not seem to affect the effectiveness of an intervention. The majority of the studies did not investigate the potential adverse effects of the interventions and only three studies included a cost-effectiveness analysis. Overall, there were important methodological limitations in the body of evidence, with just a third of the studies reporting adequate allocation concealment and blinded outcome assessments. While our confidence in the pooled effect estimate of interventions for improving diagnostic testing and medication prescribing in osteoporosis is high, our confidence in the reported effect estimates in the remaining studies is low.

Authors' conclusions There is good-quality evidence that a GP alerting system with or without patient-directed education on osteoporosis improves guideline-consistent GP behaviour, resulting in better diagnosis and treatment rates. Interventions such as GP reminder messages and GP feedback on performance combined with guideline dissemination may lead to small improvements in guideline-consistent GP behaviour with regard to low back pain, while GP education on osteoarthritis pain and the use of educationally influential physicians may lead to slight improvement in patient outcomes and guideline-consistent behaviour respectively. However, further studies are needed to ascertain the effectiveness of such interventions in improving GP behaviour and patient outcomes.

Title: Midwives' perspectives of intravenous fluid management and fluid balance documentation in labour: A qualitative reflexive

thematic analysis study

Journal: Journal of Advanced Nursing

Volume: 79

Issue: 2

Pages: 749-761

Date: Feb

Short Title: Midwives' perspectives of intravenous fluid management and fluid balance documentation in labour: A qualitative reflexive thematic analysis study

ISSN: 0309-2402

DOI: 10.1111/jan.15518

Accession Number: WOS:000892169800001

Abstract: Aim: To describe current practice, examine the influences and explore barriers and facilitators to accurate documentation, for the administration of intravenous fluids during labour. Design: A descriptive qualitative study was performed. Methods: Qualitative semi-structured interviews were conducted with Registered Midwives working across Australia. Midwives were recruited via email and social media advertisements. A maximum variation sampling strategy was used to identify potential participants. Interview questions explored four main areas: (i) understanding of indications for IV fluids in labour; (ii) identification of current practice; (iii) barriers to documentation and (iv) benefits and complications of IV fluid administration. Reflexive thematic analysis of recorded-transcribed interviews was conducted. Results: Eleven midwives were interviewed. Clinical practice variation across Australia was recognized. Midwives reported a potential risk of harm for women and babies and a current lack of evidence, education and clinical guidance contributing to uncertainty around the use of IV fluids in labour. Overall, eight major themes were identified: (i) A variable clinical practice; (ii) Triggers and habits; (iii) Workplace and professional culture; (iv) Foundational knowledge; (v) Perception of risk; (vi) Professional standards and regulations; (vii) The importance of monitoring maternal fluid balance and (viii) barriers and facilitators to fluid balance documentation. Conclusion: There was widespread clinical variation identified and midwives reported a potential risk of harm. The major themes identified will inform future quantitative research examining the impact of IV fluids in labour. Impact: The implications of this research are important and potentially far-reaching. The administration of IV fluids to women in labour is a common clinical intervention. However, there is limited evidence available to guide practice. This study highlights the need for greater education and evidence examining maternal and neonatal outcomes to provide improved clinical guidance.

Title: Interventions to Improve Hydration in Older Adults: A Systematic Review and Meta-Analysis
Journal: Nutrients
Volume: 13
Issue: 10
Date: Oct
Short Title: Interventions to Improve Hydration in Older Adults: A Systematic Review and Meta-Analysis
DOI: 10.3390/nu13103640
Article Number: 3640
Accession Number: WOS:000714465400001
Abstract: Dehydration is common in the elderly, especially when hospitalised. This study investigated the impact of interventions to improve hydration in acutely unwell or institutionalised older adults for hydration and hydration linked events (constipation, falls, urinary tract infections) as well as patient satisfaction. Four databases were searched from inception to 13 May 2020 for studies of interventions to improve hydration. Nineteen studies (978 participants) were included and two studies (165 participants) were meta-analysed. Behavioural interventions were associated with a significant improvement in hydration. Environmental, multifaceted and nutritional interventions had mixed success. Meta-analysis indicated that groups receiving interventions to improve hydration consumed 300.93 mL more fluid per day than those in the usual care groups (95% CI: 289.27 mL, 312.59 mL; I² = 0%, p < 0.00001). Overall, there is limited evidence describing interventions to improve hydration in acutely unwell or institutionalised older adults. Behavioural interventions appear promising. High-quality studies using validated rather than subjective methods of assessing hydration are needed to determine effective interventions.

Short Title: Going through changes: A longitudinal study of meat reduction over time in the UK
ISSN: 0950-3293
DOI: 10.1016/j.foodqual.2023.104854

Article Number: 104854

Accession Number: WOS:000965594900001

Abstract: There are increasing moral, environmental and public health imperatives to curb meat consumption. While research on meat reduction has proliferated in recent years, the majority of empirical work has taken cross-sectional and/or experimental approaches. Therefore, this study sought to understand the process of dietary change through an observational longitudinal survey of 1,529 UK residents over the course of one year. An online questionnaire was used to take measures of diet, exposure to animal advocacy, exposure to animals and animal-lovers, the transtheoretical model of change, the COM-B model (capability, opportunity, motivation -> behaviour), and demographics at 0, 6, and 12 months. While no support was found for predictions made on the COM-B model, some support was found for hypotheses made on the transtheoretical model -in particular, there was some evidence that those at later stages who still ate meat were more likely to give it up, and those at earlier stages who had given up meat were more likely to start eating it again. There were also generally stronger measures of decisional balance (i.e. conviction in the decision to give up meat) and self-efficacy for those at more advanced stages. Analyses also indicate that increases in consumption of animal product alternatives were significantly correlated with decreases in animal products in the same category. Ordinal regression models yielded low predictive ability, meaning that information on the interventions which may influence animal product consumption was limited. Findings are discussed in the context of previous literature and recommendations for future research.

Title: Effectiveness of an implementation optimisation intervention aimed at increasing parent engagement in HENRY, a childhood obesity prevention programme the Optimising Family Engagement in HENRY (OFTEN) trial: study protocol for a randomised controlled trial

Journal: Trials

Volume: 18

Date: Jan

Short Title: Effectiveness of an implementation optimisation intervention aimed at increasing parent engagement in HENRY, a childhood obesity prevention programme the Optimising Family Engagement in HENRY (OFTEN) trial: study protocol for a randomised controlled trial

DOI: 10.1186/s13063-016-1732-3

Article Number: 40

Accession Number: WOS:000392760200001

Abstract: Background: Family-based interventions to prevent childhood obesity depend upon parents' taking action to improve diet and other lifestyle behaviours in their families. Programmes that attract and retain high numbers of parents provide an enhanced opportunity to improve public health and are also likely to be more cost-effective than those that do not. We have developed a theory-informed optimisation intervention to promote parent engagement within an existing childhood obesity prevention group programme, HENRY (Health Exercise Nutrition for the Really Young). Here, we describe a proposal to evaluate the effectiveness of this optimisation intervention in regard to the engagement of parents and cost-effectiveness. Methods/design: The Optimising Family Engagement in HENRY (OFTEN) trial is a cluster randomised controlled trial being conducted across 24 local authorities (approximately 144 children's centres) which currently deliver HENRY programmes. The primary outcome will be parental enrolment and attendance at the HENRY programme, assessed using routinely collected process data. Cost-effectiveness will be presented in terms of primary outcomes using acceptability curves and through eliciting the willingness to pay for the optimisation from HENRY commissioners. Secondary outcomes include the longitudinal impact of the optimisation, parent-reported infant intake of fruits and vegetables (as a proxy to compliance) and other parent-reported family habits and lifestyle. Discussion: This innovative trial will provide evidence on the implementation of a theory-informed optimisation intervention to promote parent engagement in HENRY, a community-based childhood obesity prevention programme. The findings will be generalisable to other interventions delivered to parents in other community-based environments. This research meets the expressed needs of commissioners, children's centres and parents to optimise the potential impact that HENRY has on obesity prevention. A subsequent cluster randomised controlled pilot trial is planned to determine the practicality of undertaking a definitive trial to robustly evaluate the effectiveness and cost-effectiveness of the optimised intervention on childhood obesity prevention.

Title: Adopting the COM-B model and TDF framework in oral and dental research: A narrative review

Journal: Community Dentistry and Oral Epidemiology

Volume: 49

Issue: 5

Pages: 385-393

Date: Oct

Short Title: Adopting the COM-B model and TDF framework in oral and dental research: A narrative review

ISSN: 0301-5661

DOI: 10.1111/cdoe.12677

Accession Number: WOS:000673991000001

Abstract: Background Recent advances in the psychological understanding of health-related behaviour have focused on producing a comprehensive framework to model such behaviour. The Capability-Opportunity-Motivation-Behaviour (COM-B) and its associated Theoretical Domains Framework (TDF) allow researchers to classify psychological and behavioural constructs in a consistent and transferable manner across studies. Aim To identify oral and dental health-related studies that have used the TDF and/or COM-B as frameworks to guide research and examine the ways in which these concepts have been practically used in such research. Method Narrative review of published literature. To be included, the paper had to (1) state that the TDF or COM-B had been used and to have targeted at least one construct identified in either framework, (2) include primary empirical data, (3) focus on a behaviour directly related to oral or dental-related health (eg brushing, applying fluoride varnish, flossing) and/or attitudes, intentions and beliefs related to the behaviour. Studies could include any research design, and participants of any age or gender and include patients, parents or dental health professionals. Findings Nine studies were identified that had drawn on the COM-B and/or TDF as the framework for their research. Seven of the studies were based on the TDF only, with one employing both the COM-B and Health Belief Model, and one using the TDF with COM-B. The nine studies covered a broad range of oral health-related behaviours including child tooth brushing, fluoride varnish application and non- or micro-invasive management of proximal caries lesions. The populations in the studies included dentists, dental teams and parents of children. All studies adopted only a subset of the constructs within the TDF, often without justification. Conclusions It is encouraging that oral health researchers are adopting standardized psychological frameworks to develop their research and oral health interventions. Future work should build on the small number of studies identified in this review and consider using standardized tools to do so.

Title: Feasibility of a Reinforcement Learning-Enabled Digital Health Intervention to Promote Mammograms: Retrospective, Single-Arm, Observational Study

Journal: Jmir Formative Research

Volume: 6

Issue: 11

Date: Nov

Short Title: Feasibility of a Reinforcement Learning-Enabled Digital Health Intervention to Promote Mammograms: Retrospective, Single-Arm, Observational Study

DOI: 10.2196/42343

Article Number: e42343

Accession Number: WOS:000904521800056

Abstract: Background: Preventive screenings such as mammograms promote health and detect disease. However, mammogram attendance lags clinical guidelines, with roughly one-quarter of women not completing their recommended mammograms. A scalable digital health intervention leveraging behavioral science and reinforcement learning and delivered via email was implemented in a US health system to promote uptake of recommended mammograms among patients who were 1 or more years overdue for the screening (ie, 2 or more years from last mammogram). Objective: The aim of this study was to establish the feasibility of a reinforcement learning-enabled mammography digital health intervention delivered via email. The research aims included understanding the intervention's reach and ability to elicit behavioral outcomes of scheduling and attending mammograms, as well as understanding reach and behavioral outcomes for women of different ages, races, educational attainment levels, and household incomes. Methods: The digital health intervention was implemented in a large Catholic health system in the Midwestern United States and targeted the system's existing patients who had not received a recommended mammogram in 2 or more years. From August 2020 to July 2022, 139,164 eligible women received behavioral science-based email messages assembled and delivered by a reinforcement learning model to encourage clinically recommended mammograms. Target outcome behaviors included scheduling and ultimately attending the mammogram appointment. Results: In total, 139,164 women received at least one intervention email during the study period, and 81.52% engaged with at least one email. Deliverability of emails exceeded 98%. Among message recipients, 24.99% scheduled mammograms and 22.02% attended mammograms (88.08% attendance rate among women who scheduled appointments). Results indicate no practical differences in the frequency at which people engage with the intervention or take action following a message based on their age, race, educational attainment, or household income, suggesting the intervention may equitably drive mammography across diverse populations. Conclusions: The reinforcement learning-enabled email intervention is feasible to implement in a health system to engage patients who are overdue for their mammograms to

schedule and attend a recommended screening. In this feasibility study, the intervention was associated with scheduling and attending mammograms for patients who were significantly overdue for recommended screening. Moreover, the intervention showed proportionate reach across demographic subpopulations. This suggests that the intervention may be effective at engaging patients of many different backgrounds who are overdue for screening. Future research will establish the effectiveness of this type of intervention compared to typical health system outreach to patients who have not had recommended screenings as well as identify ways to enhance its reach and impact.

Short Title: 'Language is the source of misunderstandings'-impact of terminology on public perceptions of health promotion messages

DOI: 10.1186/s12889-015-1884-1

Article Number: 579

Accession Number: WOS:000356571800001

Abstract: Background: The high level of premature death due to non-communicable diseases has been associated with unhealthy lifestyles, including poor diet. The effectiveness of public health strategies designed to promote health via messages focusing on food and diets depends largely on the perception of the messages by the public. The aim of this study was to explore public perceptions of language commonly used to communicate concepts linking health, food and the diet. Methods: This study is a qualitative and semi-quantitative cross-sectional survey exploring public perceptions of terms used to improve eating habits within public health strategies. We recruited adults with no background in nutrition or health-care, from May to July 2013, from urban areas of varying deprivation (n = 12) in Glasgow and Edinburgh, UK. Four key prompt-terms used to convey the idea of improving health through diet were selected for testing: Healthy Eating, Eating for Health, Balanced Diet and Nutritional Balance. Consumer understanding of these terms was explored using mixed-methods, including qualitative focus groups (n = 17) and an interviewer-led word-association exercise (n = 270). Results: The word-association exercise produced 1,386 individual responses from the four prompt-terms, with 130 unique responses associated with a single term. Cluster analysis revealed 16 key themes, with responses affected by prompt-term used, age, gender and

socio-economic status. Healthy Eating was associated with foods considered 'healthy' ($p < 0.05$); Eating for Health and Balanced Diet with negative connotations of foods to avoid (both $p < 0.001$) and Nutritional Balance with the benefits of eating healthily ($p < 0.01$). Focus groups revealed clear differences in perceptions: Eating for Health = positive action one takes to manage existing medical conditions, Healthy Eating = passive aspirational term associated with weight management, Balanced Diet = old fashioned, also dieting for weight loss, Nutritional Balance = maximising physical performance. Food suppliers use Healthy Eating terminology to promote weight management products. Focus group participants welcomed product reformulation to enhance food health properties as a strategy to overcome desensitisation to health-messages.

Conclusions: Public perceptions of messages communicating concepts linking health, food and the diet are influenced by terminology, resulting in confusion. To increase individual commitment to change eating habits in the long term, public health campaigns need strengthening, potentially by investing in tailored approaches to meet the needs of defined groups of consumers.

Title: Motivation states to move, be physically active and sedentary vary like circadian rhythms and are associated with affect and arousal

Journal: Frontiers in Sports and Active Living

Volume: 5

Date: Apr

Short Title: Motivation states to move, be physically active and sedentary vary like circadian rhythms and are associated with affect and arousal

DOI: 10.3389/fspor.2023.1094288

Article Number: 1094288

Accession Number: WOS:000979758000001

Abstract: Introduction Motivation to be physically active and sedentary is a transient state that varies in response to previous behavior. It is not known: (a) if motivational states vary from morning to evening, (b) if they are related to feeling states (arousal/hedonic tone), and (c) whether they predict current behavior and intentions. The primary purpose of this study was to determine if motivation states vary across the day and in what pattern. Thirty adults from the United States were recruited from Amazon MTurk. Methods Participants completed 6 identical online surveys each day for 8 days beginning after waking and every 2-3 h

thereafter until bedtime. Participants completed: (a) the CRAVE scale (Right now version) to measure motivation states for Move and Rest, (b) Feeling Scale, (c) Felt Arousal Scale, and (d) surveys about current movement behavior (e.g., currently sitting, standing, laying down) and intentions for exercise and sleep. Of these, 21 participants (mean age 37.7 y; 52.4% female) had complete and valid data. Results Visual inspection of data determined that: a) motivation states varied widely across the day, and b) most participants had a single wave cycle each day. Hierarchical linear modelling revealed that there were significant linear and quadratic time trends for both Move and Rest. Move peaked near 1500 h when Rest was at its nadir. Cosinor analysis determined that the functional waveform was circadian for Move for 81% of participants and 62% for Rest. Pleasure/displeasure and arousal independently predicted motivation states (all p's < .001), but arousal had an association twice as large. Eating, exercise and sleep behaviors, especially those over 2 h before assessment, predicted current motivation states. Move-motivation predicted current body position (e.g., laying down, sitting, walking) and intentions for exercise and sleep more consistently than rest, with the strongest prediction of behaviors planned for the next 30 min. Discussion While these data must be replicated with a larger sample, results suggest that motivation states to be active or sedentary have a circadian waveform for most people and influence future behavioral intentions. These novel results highlight the need to rethink the traditional approaches typically utilized to increase physical activity levels. Notes: Budnick, Christopher J. J. Short Title: An adaptive human sensor framework for human-robot collaboration

ISSN: 0268-3768

DOI: 10.1007/s00170-021-08299-2

Accession Number: WOS:000721651700002

Abstract: Manufacturing challenges are increasing the demands for more agile and dexterous means of production. At the same time, these systems aim to maintain or even increase productivity. The challenges risen from these developments can be tackled through

human-robot collaboration (HRC). HRC requires effective task distribution according to each party's distinctive strengths, which is envisioned to generate synergetic effects. To enable a seamless collaboration, the human and robot require a mutual awareness, which is challenging, due to the human and robot "speaking" different languages as in analogue and digital. This challenge can be addressed by equipping the robot with a model of the human. Despite a range of models being available, data-driven models of the human are still at an early stage. For this purpose, this paper proposes an adaptive human sensor framework, which incorporates objective, subjective, and physiological metrics, as well as associated machine learning. Thus, it is envisioned to adapt to the uniqueness and dynamic nature of human behavior. To test the framework, a validation experiment was performed, including 18 participants, which aims to predict perceived workload during two scenarios, namely a manual and an HRC assembly task. Perceived workloads are described to have a substantial impact on a human operator's task performance. Throughout the experiment, physiological data from an electroencephalogram (EEG), an electrocardiogram (ECG), and respiration sensor was collected and interpreted. For subjective metrics, the standardized NASA Task Load Index was used. Objective metrics included task completion time and number of errors/assistance requests. Overall, the framework revealed a promising potential towards an adaptive behavior, which is ultimately envisioned to enable a more effective HRC.

Title: Developing nurse medication safety training in a health partnership in Mozambique using behavioural science

Journal: Globalization and Health

Volume: 13

Date: Jul

Short Title: Developing nurse medication safety training in a health partnership in Mozambique using behavioural science

DOI: 10.1186/s12992-017-0265-1

Article Number: 45

Accession Number: WOS:000404960000001

Abstract: Background: Globally, safe and effective medication administration relies on nurses being able to apply strong drug calculation skills in their real-life practice, in the face of stressors and distractions. These may be especially prevalent for nurses in low-income countries such as Mozambique and Continuing

Professional Development post-registration may be important. This study aimed to 1) explore the initial impact of an international health partnership's work to develop a drug calculation workshop for nurses in Beira, Mozambique and 2) reflect upon the role of health psychologists in helping educators apply behavioural science to the training content and evaluation. Methods: In phase one, partners developed a training package, which was delivered to 87 Portuguese-speaking nurses. The partnership's health psychologists coded the training's behaviour change content and recommended enhancements to content and delivery. In phase two, the refined training, including an educational game, was delivered to 36 nurses in Mozambique and recoded by the health psychologists. Measures of participant confidence and intentions to make changes to healthcare practice were collected, as well as qualitative data through post-training questions and 12 short follow-up participant interviews. Results: In phase one six BCTs were used during the didactic presentation. Most techniques targeted participants' capability to calculate drug doses accurately; recommendations aimed to increase participants' motivation and perceived opportunity, two other drivers of practice change. Phase two training included an extra seven BCTs, such as action planning and further skills practice. Participants reported high confidence before and after the training ($p = 0.25$); intentions to use calculators to check drug calculations significantly increased ($p = 0.031$). Qualitative data suggested the training was acceptable, enjoyable and led to practice changes, through improved capability, opportunity and motivation. Opportunity barriers to medication safety were highlighted. Conclusions: Reporting and measuring medication errors and related outcomes is a complex challenge affecting global efforts to improve medication safety. Through strong partnership working, a multi-disciplinary team of health professionals including health psychologists developed, refined and begin to evaluate a locally-led drug calculation CPD workshop for nurses in a low-resource setting. Applying behavioural science helped to collect feasible evaluation data and hopefully improved impact and sustainability.

Short Title: Understanding the implementation of evidence-informed policies and practices from a policy perspective: a critical interpretive synthesis

ISSN: 1748-5908

DOI: 10.1186/s13012-021-01082-7

Article Number: 18

Accession Number: WOS:000618197700001

Abstract: Background The fields of implementation science and knowledge translation have evolved somewhat independently from the field of policy implementation research, despite calls for better integration. As a result, implementation theory and empirical work do not often reflect the implementation experience from a policy lens nor benefit from the scholarship in all three fields. This means policymakers, researchers, and practitioners may find it challenging to draw from theory that adequately reflects their implementation efforts. Methods We developed an integrated theoretical framework of the implementation process from a policy perspective by combining findings from these fields using the critical interpretive synthesis method. We began with the compass question: How is policy currently described in implementation theory and processes and what aspects of policy are important for implementation success? We then searched 12 databases as well as gray literature and supplemented these documents with other sources to fill conceptual gaps. Using a grounded and interpretive approach to analysis, we built the framework constructs, drawing largely from the theoretical literature and then tested and refined the framework using empirical literature. Results A total of 11,434 documents were retrieved and assessed for eligibility and 35 additional documents were identified through other sources. Eighty-six unique documents were ultimately included in the analysis. Our findings indicate that policy is described as (1) the context, (2) a focusing lens, (3) the innovation itself, (4) a lever of influence, (5) an enabler/facilitator or barrier, or (6) an outcome. Policy actors were also identified as important participants or leaders of implementation. Our analysis led to the development of a two-part conceptual framework, including process and determinant components. Conclusions This framework begins to bridge the divide between disciplines and provides a new perspective about implementation processes at the systems level. It offers researchers, policymakers, and implementers a new way of thinking about implementation that better integrates policy considerations and can be used for planning or evaluating implementation efforts.

Short Title: HIV testing in secondary care: a multicentre longitudinal mixed methods electronic survey of non-HIV specialist hospital physicians in South-East Scotland and Northern England

ISSN: 1478-2715

DOI: 10.4997/jrcpe.2021.305

Accession Number: WOS:000694717500005

Abstract: Background Increasing the uptake of HIV testing in people who may have undiagnosed HIV is essential to reduce the morbidity associated with late HIV diagnosis. Methods We conducted a multicentre, longitudinal, mixed-methods study, surveying the attitudes, knowledge and practice of non-HIV specialist hospital physicians in South-East Scotland and North-East England with respect to HIV testing. Results We found that although awareness of indications for HIV testing had improved over time, only 13% of clinicians recognised all of the surveyed HIV indicator conditions. Physicians were better at recognising the indicator conditions relevant to their specialty. The perception of working with a low-risk patient population was the most frequently cited barrier to offering an HIV test. Only a third of study respondents had requested more than 10 HIV tests in the preceding year. Conclusions Our study supports a need for targeted and sustained educational initiatives to increase rates of HIV testing in secondary care.

Article Number: 104987

Accession Number: WOS:000619410100006

Abstract: Children's packed lunches contain more sugar than school-provided meals. Interventions to improve the provision of healthier packed lunches have modest effects on lunch contents. This cluster randomised controlled trial tested an intervention to encourage healthier provision of packed lunches by parents of primary school children in Derby. Schools were randomised to intervention (n = 8) or control (n = 9) using blocked random allocation. In the intervention group, parents of children who brought packed lunches to school in years 3-6 (age 7-11 years) received three bundles of materials (including packed lunch planner, shopping list, information on sugar content of popular lunchbox items and suggestions for healthier swap alternatives) in bookbags/lunchboxes over a 4-week period. Control parents received no materials. Photos of lunchbox contents were taken at baseline, immediately post-intervention and at three-month follow-up. A parental survey aimed to assess capability, opportunity and motivation for packing a healthier lunchbox. No intervention effects were observed for primary outcomes (presence and number of sugary snacks or chilled sugary desserts). The intervention had a significant impact on one secondary outcome (increased number of healthier "swap" items suggested in intervention materials) immediately post-intervention, but this effect had disappeared at three-month follow-up. No intervention effects were found on survey variables. Parent comments revealed that materials were either received positively (as they reinforced existing behaviours) or negatively (as they were not perceived to be helpful or appropriate). The results of this study suggest that providing educational materials and resources to parents of primary school children in Derby was not sufficient to increase provision of healthier packed lunches. Future research should investigate how behavioural science can support families to improve the nutritional content of primary school children's lunchboxes.YY

Short Title: A randomised experiment of health, cost and social norm message frames to encourage acceptance of swaps in a simulation online supermarket

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0246455

Article Number: e0246455

Accession Number: WOS:000620633200004

Abstract: Offering lower-energy food swaps to customers of online supermarkets could help to decrease energy (kcal) purchased and consumed. However, acceptance rates of such food swaps tend to be low. This study aimed to see whether framing lower-energy food swaps in terms of cost savings or social norms could improve likelihood of acceptance relative to framing swaps in terms of health benefits. Participants (n = 900) were asked to shop from a 12-item shopping list in a simulation online supermarket. When a target high-energy food was identified in the shopping basket at check-out, one or two lower-energy foods would be suggested as an alternative (a "swap"). Participants were randomised to only see messages emphasising health benefits (fewer calories), cost benefits (lower price) or social norms (others preferred this product). Data were analysed for 713 participants after exclusions. Participants were offered a mean of 3.17 swaps (SD = 1.50), and 12.91% of swaps were accepted (health = 14.31%, cost = 11.49%, social norms = 13.18%). Swap acceptance was not influenced by the specific swap frame used (all $p > .170$). Age was significantly and positively associated with swap acceptance ($b = 0.02$, $SE = 0.00$, $p < .001$), but was also associated with smaller decreases in energy change ($b = 0.46$, $SE = .19$, $p = .014$). Overall, offering swaps reduced both energy (kcal) per product ($b = -9.69$, $SE = 4.07$, $p = .017$) and energy (kcal) per shopping basket ($t(712) = 11.09$, $p < .001$) from pre- to post-intervention. Offering lower-energy food swaps could be a successful strategy for reducing energy purchased by customers of online supermarkets. Future research should explore alternative solutions for increasing acceptance rates of such swaps.

Short Title: Developing strategies to address barriers for tuberculosis case finding and retention in care among refugees in slums in Kampala, Uganda: a qualitative study using the COM-B model

DOI: 10.1186/s12879-022-07283-9

Article Number: 301

Accession Number: WOS:000773973700002

Abstract: Background Globally, displaced populations face an increased burden of tuberculosis (TB). Uganda is currently hosting unprecedented big numbers of refugees from the East African region. Recent evidence shows increased spread of multi-drug resistant TB (MDR-TB) across East Africa as a result of migrants from Somalia- a high MDR-TB prevalent country, calling for urgent identification and management of cases for the countries in the region. One of the strategies recommended is optimization of diagnosis, treatment and prevention of TB in refugees. This study aimed at exploring the barriers to and facilitators for TB case finding and retention in care among urban slum refugees and suggestions on how to improve. This was to guide the development of interventions to improve TB case finding and retention in care among the said population.

Methods A cross-sectional study utilizing qualitative methods was conducted among refugees in an urban slum in Kampala City, Uganda. Key informant interviews with health care workers and community leaders and in-depths interviews with refugee TB patients and care takers of TB patients were conducted (30 interviews in total). Interview questions were based on constructs from the COMB-B model (Capability, Opportunity and Motivation Model of Behaviour change). Manual content analysis was performed and identified targeted intervention strategies guided by the related Behavior Change Wheel implementation framework. Results Key barriers included; physical capability (availability of and easily accessible private facilities in the community with no capacity to diagnose and treat TB), psychological capability (lack of knowledge about TB among refugees), social opportunity (wide spread TB stigma and language barrier), physical opportunity (poor living conditions, mobility of refugees), reflective motivation (lack of facilitation for health workers), automatic motivation (discrimination and rejection of TB patients). Facilitators were; physical capability (availability of free TB services in the public health facilities), social opportunity (availability of translators). We identified education, incentivization, training, enablement, and restructuring of the service environment as relevant intervention functions with potential to address barriers to and enhance facilitators of TB case finding and retention among refugees in urban slums. Conclusion The key barriers to TB control among refugees living urban slums in Kampala- Uganda, included; poor access to health services, limited knowledge about TB, TB stigma, language barrier and lack of

facilitation of community health workers. Identified intervention strategies included; education, training, enablement, environmental restructuring and persuasion. The findings could serve as a guide for the design and implementation of interventions for improving the same.

DOI: 10.1093/pm/pnaa337

Accession Number: WOS:000606051800006

Abstract: Background. Mindfulness-based interventions (MBIs) are evidence-based nonpharmacological treatments for treating chronic pain. However, the predominant MBI, mindfulness-based stress reduction, has features that pose significant implementation barriers. Objectives. This study will test two approaches to delivering MBIs for improving Veterans' chronic pain and mental health comorbidities. These two approaches address key implementation barriers. Methods. We will conduct a four-site, three-arm pragmatic randomized controlled trial, Learning to Apply Mindfulness to Pain (LAMP), to test the effectiveness of two MBIs at improving pain and mental health comorbidities. Mobile+Group LAMP consists of prerecorded modules presented by a mindfulness instructor that are viewed in an online group setting and interspersed with discussions led by a facilitator. Mobile LAMP consists of the same prerecorded modules but does not include a group component. We will test whether either of these MBIs will be more effective than usual care at improving chronic pain and whether the Mobile+Group LAMP will be more effective than Mobile LAMP at improving chronic pain. Comparisons for the primary hypotheses will be conducted with continuous outcomes (Brief Pain Inventory interference score) repeated at 10 weeks, 6 months, and 12 months. The secondary hypotheses are that Mobile+Group LAMP and Mobile LAMP will be more effective than usual care at improving secondary

outcomes (e.g., post-traumatic stress disorder, depression). We will also confirm the comparisons for the primary and secondary hypotheses in gender-specific strata. Implications. This trial is expected to result in two approaches for delivering MBIs that will optimize engagement, adherence, and sustainability and be able to reach large numbers of Veterans.

Short Title: How Effective are Mindfulness-Based Interventions for Reducing Stress Among Healthcare Professionals? A Systematic Review and Meta-Analysis

ISSN: 1532-3005

DOI: 10.1002/smi.2673

Accession Number: WOS:000397035200001

Abstract: Workplace stress is high among healthcare professionals (HCPs) and is associated with reduced psychological health, quality of care and patient satisfaction. This systematic review and meta-analysis reviews evidence on the effectiveness of mindfulness-based interventions (MBIs) for reducing stress in HCPs. A systematic literature search was conducted. Papers were screened for suitability using inclusion criteria and nine papers were subjected to review and quality assessment. Seven papers, for which full statistical findings could be obtained, were also subjected to meta-analysis. Results of the meta-analysis suggest that MBIs have the potential to significantly improve stress among HCPs; however, there was evidence of a file drawer problem. The quality of the studies was high in relation to the clarity of aims, data collection and analysis, but weaker in terms of sample size and the use of theoretical frameworks. MBIs have the potential to reduce stress among HCPs; however, more high-quality research is needed before this finding can be confirmed. Future studies would benefit from long-term follow-up measures to determine any continuing effects of mindfulness training on stress outcomes. Copyright (C) 2016 John Wiley & Sons, Ltd.

DOI: 10.1080/09638237.2021.1952953

Accession Number: WOS:000679367500001

Abstract: Background People with mental health conditions have been identified as particularly vulnerable to poor mental health during the coronavirus disease 2019 (COVID-19) pandemic. However, why this population have faced these adverse effects, how they have experienced them and how they have coped remains under-explored. Aims To explore how the COVID-19 pandemic affected the mental health of people with existing mental health conditions, and to identify coping strategies for positive mental health. Methods Semi-structured qualitative interviews with 22 people with mental health conditions. Participants were purposively recruited via social media, study newsletters and third sector mental health organisations. Data were analysed using reflexive thematic analysis. Results Participants were aged 23-70 (mean age 43), predominantly female (59.1%) and of white ethnicity (68.2%). Fifty percent were unable to work due to illness and the most frequently reported mental health condition was depression. Five pandemic-related factors contributed to deteriorating mental health: (i) feeling safe but isolated at home; (ii) disruption to mental health services; (iii) cancelled plans and changed routines; (iv) uncertainty and lack of control; (v) rolling media coverage. Five coping strategies were identified for maintaining mental health: (i) previous experience of adversity; (ii) social comparison and accountability; (iii) engaging in hobbies and activities; (iv) staying connected with others; (v) perceived social support. Conclusions Challenges were identified as a direct result of the pandemic and people with severe mental illnesses were particularly negatively affected. However, some found this period a time of respite, drew upon reserves of resilience and adapted their coping strategies to maintain positive well-being.

Accession Number: WOS:000772679700001

Abstract: When followed, there is evidence that social distancing measures play a major role in reducing the transmission of viruses such as COVID-19. However, not all individuals follow the guidance. We explored barriers and facilitators to compliance with UK social distancing guidelines during the COVID-19 pandemic through semi-structured interviews with 116 adults. Data were analysed using reflexive thematic analysis and themes mapped to the Capability, Opportunity and Motivation Model of Behaviour (COM-B). Barriers to compliance included inconsistent rules, caring responsibilities, fatigue, unintended consequences of control measures, and the need for emotional support. Facilitators were informational support and social responsibility. Six themes were both a barrier and a facilitator: lived environment, beliefs about consequences of non-compliance, influence of others, practical support, and trust in government. Reflective motivation, psychological capability, and social opportunity were important drivers for compliance. Measures that enable social support alongside strategies to maintain motivation to comply, provide clear guidance and optimise social cohesion should be promoted.

DOI: 10.1136/bmjopen-2014-005650

Article Number: e005650

Accession Number: WOS:000339720900127

Abstract: Introduction: Little is understood about the role of quality improvement in enabling health organisations to survive and thrive in the contemporary context of financial and economic challenges. We will draw on the theoretical foundations of the 'Resource Based View of the Firm' (RBV) to develop insights into why health organisations engage in improvement work, how impacts are conceptualised, and 'what works' in delivering these impacts. Specifically, RBV theorises that the mix and use of resources across different organisations may explain differences in performance. Whether improvement work influences these resources is unclear. Methods and analysis: Case study research will be conducted across health organisations participating in four approaches to improvement, including: a national improvement programme; a multiorganisational partnership around implementation; an organisational strategy for quality improvement; and a coproduction project designed to enhance the experience of a clinical service from the perspective of patients. Data will comprise in-depth interviews with key informants, observation of key events and documents; analysed within and then across cases. Adopting a realist perspective, the core tenets of RBV will be evaluated as a programme theory, focusing on the interplay between organisational conditions and behavioural or resource responses that are reported through engagement in improvement. Ethics and dissemination: The study has been approved by Bangor University Ethics Committee. The investigation will not judge the relative merits of different approaches to healthcare quality improvement. Rather, we will develop unique insights into the organisational consequences, and dependencies of quality improvement, providing an opportunity to add to the explanatory potential of RBV in this and other contexts. In addition to scientific and lay reports of the study findings, research outputs will include a framework for constructing the economic impacts of quality improvement and practical guidance for health service managers that maximises the impacts of investment in quality improvement.

DOI: 10.1007/s11096-022-01381-z

Accession Number: WOS:000751721600001

Abstract: Background The protected or restricted supply of certain antimicrobials such as linezolid, caspofungin, aztreonam, in the acute hospital setting is an important element of Antimicrobial Stewardship (AMS) programmes to address the growing problem of antimicrobial resistance. This process involves submitting an application for use to be reviewed typically by a Consultant Microbiologist, Infectious Disease Consultant or Antimicrobial Pharmacist. Aim To investigate healthcare professionals' knowledge, experiences, and attitudes towards the protected/restricted antimicrobials process in order to identify possible methods of optimisation and improvement. Method Semi-structured interviews with stakeholders involved in the protected/restricted antimicrobial prescribing, dispensing and administration process were conducted in September-October 2019 in a 350-bed voluntary, general, acute hospital in Ireland. Interviews were analysed by the Framework method and mapped to the Theoretical Domains Framework (TDF). Results Interviews were conducted with 8 Doctors, 4 Pharmacists and 3 Nurses. TDF domains identified included: 'Knowledge'; 'Social/professional role and identity'; 'Social influences'; 'Memory, attention and decision processes'; 'Beliefs about consequences'; 'Environmental contexts and resources'. The relationship between prescribers and the AMS Team was reported as a facilitator of the process, whereas the inconsistency of the filing and versions of forms on the wards were seen as challenges. Conclusion The results of this study have shown that the existing protected/restricted antimicrobial process is a multi-disciplinary effort with barriers that require attention in order to make future improvements. Standardization of the form across all wards, an electronic version of the form, and structured education around AMS were suggested to optimize the process.

Pages: 345-356

Date: Apr

Short Title: The Development of a Multilevel Intervention to Optimise Participant Engagement with an Obesity Prevention Programme Delivered in UK children's Centres

ISSN: 1389-4986

DOI: 10.1007/s11121-021-01205-y

Accession Number: WOS:000613575000001

Abstract: Poor participant engagement threatens the potential impact and cost-effectiveness of public health programmes preventing meaningful evaluation and wider application. Although barriers and levers to engagement with public health programmes are well documented, there is a lack of proven strategies in the literature addressing these. This paper details the development of a participant engagement intervention aimed at promoting enrolment and attendance to a community-based pre-school obesity prevention programme delivered in UK children's centres; HENRY (Health, Exercise, Nutrition for the Really Young). The Behaviour Change Wheel framework was used to guide the development of the intervention. The findings of a coinciding focused ethnography study identified barriers and levers to engagement with HENRY that informed which behaviours should be targeted within the intervention to promote engagement. A COM-B behavioural analysis was undertaken to identify whether capability, opportunity or motivation would need to be influenced for the target behaviours to occur. APEASE criteria were used to agree on appropriate intervention functions and behaviour change techniques. A multi-level participant engagement intervention was developed to promote adoption of target behaviours that were proposed to promote engagement with HENRY, e.g. ensuring the programme is accurately portrayed when approaching individuals to attend and providing 'taster' sessions prior to each programme. At the local authority level, the intervention aimed to increase buy-in with HENRY to increase the level of resource dedicated to engagement efforts. At the centre level, managers were encouraged to widen promotion of the programme and ensure that staff promoted the programme accurately. HENRY facilitators received training to increase engagement during sessions, and parents that had attended HENRY were encouraged to recruit their peers. This paper describes one of the first attempts to develop a theory-based multi-level participant engagement intervention specifically designed to promote recruitment and retention to a community-based obesity prevention programme. Given the challenges to implementing public health programmes with sufficient reach, the process used to develop the

intervention serves as an example of how programmes that are already widely commissioned could be optimised to enable greater impact.

Short Title: Supporting physical activity engagement in people with Huntington's disease (ENGAGE-HD): study protocol for a randomized controlled feasibility trial

DOI: 10.1186/1745-6215-15-487

Article Number: 487

Accession Number: WOS:000346877600001

Abstract: Background: Huntington's disease (HD) is a complex, single-gene inherited neurodegenerative condition resulting in symptoms that occur across a wide range of neurological domains, including cognitive, behavioral and motor. The benefits of regular

physical activity for people with HD are widely recognized. However, a number of factors can prohibit sustained exercise and activity. The purpose of this trial is to explore the feasibility, acceptability and effectiveness of a physical activity intervention program targeted for people with early-to mid-stage HD. Methods/ Design: The proposed trial is a single blind, multisite, exploratory, randomized controlled feasibility trial of a physical activity intervention. A total of 62 participants with genetically confirmed HD will be recruited. Each participant will be involved in the trial for 26 weeks. Participants will be randomized immediately following the baseline assessment into either a physical activity intervention or a social contact control intervention. The physical activity intervention is framed around self-determination theory placed within a broader behaviour change wheel framework. An HD-specific workbook and individual goal setting will be utilized over six 1:1 sessions, with interim telephone calls. All participants will be reassessed at 16 weeks following the baseline assessment, and then again at a final follow-up assessment 26 weeks later. At the end of the study, all participants will be offered a brief version of the alternative intervention, with one home visit and one follow-up telephone call. Discussion: Engaging and supporting people with HD in a regular physical activity program raises a number of challenges. The physical activity intervention and the comparator social interaction intervention have been developed following consultation with people with HD and their families. Each are individually tailored and determined on individual needs and goals. The results from this trial will provide guidance for the development of definitive trials.

ISSN: 0146-8693

DOI: 10.1093/jpepsy/jsz103

Accession Number: WOS:000593091300013

Abstract: Objective This study aimed to describe parents' perceptions of the factors that facilitate or are barriers to their involvement in children's type 1 diabetes (T1D) management among African American and Latino parents. Methods African American and Latino parents (N = 28) of 5- to 9-year-old children with T1D completed audio-recorded, semi-structured interviews that were transcribed and analyzed using thematic analysis. Themes were identified that aligned with the theoretically-derived Capability-Opportunity-Motivation-Behavior (COM-B) framework. Results Parents described Capability-based facilitators of parent involvement, including positive stress management, religious/spiritual coping, organizational/planning skills, and diabetes knowledge. Capability-based barriers included child and parent distress. Interpersonal relationships, degree of flexibility in work environments, and access to diabetes technologies were both Opportunity-based facilitators and barriers; and Opportunity-based barriers consisted of food insecurity/low financial resources. Parents' desire for their child to have a "normal" life was described as both a Motivation-based facilitator and barrier. Conclusions African American and Latino families described helpful and unhelpful factors that spanned all aspects of the COM-B model. Reinforcing or targeting families' unique psychological, interpersonal, and environmental strengths and challenges in multilevel interventions has potential to maximize parental involvement in children's diabetes management.

Title: Applying behaviour change theory to speech and language therapy intervention for inducible laryngeal obstruction

Journal: International Journal of Language & Communication Disorders

Date: 2023 Apr

Short Title: Applying behaviour change theory to speech and language therapy intervention for inducible laryngeal obstruction

ISSN: 1368-2822

DOI: 10.1111/1460-6984.12880

Accession Number: WOS:000973629100001

Abstract: Background: Speech and language therapists (SLTs) provide interventions for inducible laryngeal obstruction (ILO) despite a current lack of evidence to inform intervention delivery. This study is the first step to develop an evidence-based intervention for ILO, using behaviour change theory and the Behaviour Change Technique Taxonomy version 1 (BCTTv1). Outcomes will inform the early development stage of a complex speech and language therapy intervention for ILO, enabling more precise reporting of ILO intervention studies, as per CONSORT guidelines. Aims: (1) To identify whether the BCTTv1 is a useful tool for characterising speech and language therapy interventions for ILO, based on existing literature, current practice and patient interviews. (2) To identify key behaviour change techniques (BCT) used within existing complex speech and language therapy interventions for ILO Methods and Procedures: A five-phase study was conducted: (1) a systematic literature search of six electronic databases (Medline, EMBASE, CINAHL (EBSCO), Scopus, Trip, Web of Science) and grey literature between 2008 and 2020; (2) observations of six speech and language therapy intervention sessions; (3) a semi-structured interview with an SLT to validate the observed BCTs; (4) consensus from four national expert SLTs regarding application of synthesised BCT data to their own experiences of ILO interventions; and (5) patient engagement to review and comment on findings. Outcomes and Results: Forty-seven BCTs in total were coded across all three sources. Thirty-two BCTs were identified in clinical observations; 31 in interviews with SLTs and 18 in the literature. Only six BCT were identified in all three sources. Expert SLTs confirmed clinical application and relevance. Patients reported finding the concept of BCT challenging but highlighted the value of psychoeducation to support their understanding of symptoms and in turn to understand the rationale behind speech and language therapy intervention recommendations. Conclusion: This study indicates that the BCTTv1 is a suitable framework to identify and describe intervention components used within speech and language therapy interventions for ILO. A practice-research gap exists, reinforcing that existing literature does not capture the complexity of speech and language therapy intervention for ILO. Further research is needed to develop our understanding of the BCTs that support optimal behaviour change for this patient group.

Accession Number: WOS:000934965000016

Abstract: Nitrous oxide (N2O) is an inhaled anaesthetic gas and a popular intoxicant. Excessive recreational use can cause spinal cord myelopathy. Previous studies have discussed the medical management. However, none have specified the sensorimotor rehabilitation management. This case report documents the investigations, physical rehabilitation and functional outcomes in two cases of N2O-associated myelopathy. Both presented with lower limb strength and sensorimotor integration impairments resulting in ataxic ambulation. Dorsal column signal abnormality was observed on T2-weighted MRI in one case. Myelopathy was diagnosed based on clinical presentation and both were treated with vitamin B-12. Rehabilitation was conceived and specified using the Rehabilitation Treatment Specification System (RTSS). Both cases achieved independent indoor gait on hospital discharge, and full function at 9 months in one case. Appropriate and timely medical management and reasoned rehabilitation provided excellent functional outcomes for N2O-related myelopathy. By using the RTSS, reasoned rehabilitation efficacy can be tested in the future.

Short Title: Food reformulation: the challenges to the food industry

ISSN: 0029-6651

DOI: 10.1017/s0029665112002868

Accession Number: WOS:000313826700008

Abstract: The role of the food industry (retailers, manufacturers and food service) in helping consumers eat healthily and sustainably has been receiving considerable attention in recent years. This paper focuses on the challenges facing the food industry and the role of food reformulation in meeting these challenges, through the

lens of a public health nutritionist. Attention has been heightened by the Government's Responsibility Deal, launched in early 2011 by the Department of Health (England), by the UK's engagement with the global food security and food supply sustainability agendas and by the Government Office of Science's Foresight report. The Responsibility Deal's food network has to date focused on reduction of trans fatty acids, salt and calories and out-of-home calorie labelling (in food service settings). New pledges are expected soon on increasing fruit and vegetable intakes. Reformulation is a major feature of the Responsibility Deal's approach, and along with other approaches such as portion control, choice editing and information provision, there is potential to increase the breadth of healthier choices available to the public. With the exception of fruit and vegetables, the emphasis has been almost exclusively on aspects of the diet that are in excess for many of the population (e. g. energy and salt). Evidence of low consumption of some key micronutrients by some groups of the population, particularly adolescents and young adults, often alongside excess energy intake compared with expenditure, is all too often overlooked. This paper summarises the progress made to date, the challenges faced and the opportunities that exist, with particular focus on reformulation. One of the biggest challenges is the relatively poor understanding of how to effect positive and long-term dietary behaviour change. The paper concludes that, in isolation, reformulation is unlikely to provide a complete solution to the challenge of improving eating patterns and nutrient provision, although it is a contributor.

DOI: 10.1186/s12889-016-3855-6

Article Number: 1194

Accession Number: WOS:000389387600001

Abstract: Background: Public knowledge of the association between alcohol and cancer is reported to be low. We aimed to provide up-to-date evidence for England regarding awareness of the link between alcohol and different cancers and to determine whether awareness differs by demographic characteristics, alcohol use, and geographic region. Methods: A representative sample of 2100 adults completed an online survey in July 2015. Respondents were asked to identify which health outcomes, including specific cancers, may be caused by

alcohol consumption. Logistic regressions explored whether demographic, alcohol use, and geographic characteristics predicted correctly identifying alcohol-related cancer risk. Results: Unprompted, 12.9% of respondents identified cancer as a potential health outcome of alcohol consumption. This rose to 47% when prompted (compared to 95% for liver disease and 73% for heart disease). Knowledge of the link between alcohol and specific cancers varied between 18% (breast) and 80% (liver). Respondents identified the following cancers as alcohol-related where no such evidence exists: bladder (54%), brain (32%), ovarian (17%). Significant predictors of awareness of the link between alcohol and cancer were being female, more highly educated, and living in North-East England. Conclusion: There is generally low awareness of the relationship between alcohol consumption and cancer, particularly breast cancer. Greater awareness of the relationship between alcohol and breast cancer in North-East England, where a mass media campaign highlighted this relationship, suggests that population awareness can be influenced by social marketing.

Short Title: Individual, healthcare professional and system-level barriers and facilitators to initiation and adherence to injectable therapies for type 2 diabetes: A systematic review and meta-ethnography

ISSN: 0742-3071

DOI: 10.1111/dme.14678

Article Number: e14678

Accession Number: WOS:000692459300001

Abstract: Aims To review and synthesise the contemporary qualitative evidence, relating to the individual, healthcare professional and system-level barriers and facilitators to injectable therapies in

people with type 2 diabetes, and evaluate (using an intersectional approach to explore the diverse perspectives of different identities) whether views have changed with treatment and guideline advancements. Methods A meta-ethnography approach used. Eight databases searched from the years 2006 (GLP-1 analogues introduced) to February 2021. Study selection (using a pre-defined inclusion criteria), quality appraisal and data extraction, conducted independently by two reviewers. Results Screened 7143 abstracts, assessed 93 full-text papers for eligibility and included 42 studies—using data from 818 individuals with type 2 diabetes and 160 healthcare professionals. Studies covered a diverse range of views from healthcare professionals and individuals, including those relating to older adults and people from ethnic migrant backgrounds, and 10 studies rated moderate to strong research value. Key themes abstracted: barriers (physical/psychological/social) and facilitators (motivation/capability/opportunity). Conclusions The first synthesis of contemporary qualitative data to adopt an intersectionality approach and explore diverse views relating to barriers and facilitators that influence engagement with injectable treatments for type 2 diabetes. A model is presented to help patients, health practitioners and policy makers identify barriers and facilitators and understand the complex interplay of physical, psychological and social factors involved when prescribing injectable therapies. Despite advances in injectable treatments and guidelines, findings highlight the many barriers that still exist and show how strongly held culturally-specific health beliefs of people from diverse socio-economic and ethnic backgrounds can become substantial obstacles to treatment.

intervention for the primary prevention of cardiovascular disease: a pragmatic randomised controlled trial

ISSN: 1741-7015

DOI: 10.1186/s12916-020-01664-0

Article Number: 198

Accession Number: WOS:000556290000001

Abstract: Background Cardiovascular disease is responsible for 31% of all global deaths. Primary prevention strategies are needed to improve longer-term adherence to statins and healthy lifestyle behaviours to reduce risk in people at risk of cardiovascular disease. Methods Pragmatic randomised controlled trial recruited between May 2016 and March 2017 from primary care practices, England. Participants (n = 212) prescribed statins for primary prevention of cardiovascular disease with total cholesterol level \geq 5 mmol/l were randomised: 105 to the intervention group and 107 to the control group, stratified by age and sex. The 3R intervention involved two facilitated, structured group education sessions focusing on medication adherence to statins, lifestyle behaviours and cardiovascular risk, with 44 weeks of medication reminders and motivational text messages and two supportive, coaching phone calls (at approximately 2 weeks and 6 months). The control group continued with usual clinical care. Both groups received a basic information leaflet. The primary outcome was medication adherence to statins objectively measured by a biochemical urine test. Self-reported adherence and practice prescription data provided additional measures. Secondary outcomes included cholesterol profile, blood pressure, anthropometric data, cardiovascular risk score, and self-reported lifestyle behaviours and psychological measures (health/medication beliefs, quality of life, health status). All outcomes were assessed at 12 months. Results Baseline adherence to statins was 47% (control) and 62% (intervention). No significant difference between the groups found for medication adherence to statins using either the urine test (OR 1.02, 95% CI 0.34 to 3.06, $P = 0.968$) or other measures. This may have been due to the higher than expected adherence levels at baseline. The adjusted mean difference between the groups (in favour of the intervention group) for diastolic blood pressure (-4.28 mmHg (95% CI -0.98 to -1.58 , $P = 0.002$)) and waist circumference (-2.55 cm (95% CI -4.55 to -0.55 , $P = 0.012$)). The intervention group also showed greater perceived control of treatment and more coherent understanding of the condition.

Conclusions The 3R programme successfully led to longer-term improvements in important clinical lifestyle indicators but no improvement in medication adherence, raising questions about the suitability of such a broad, multiple risk factor approach for improving medication adherence for primary prevention of CVD.

Abstract: The purpose of education and training in dermatology ranges from increasing knowledge and skills to improving confidence or enhancing patient outcomes. Specification of the purpose of the education and training is vital so that evaluation can be aligned to purpose, and thus provide evidence on effectiveness. Further, the quality and quality improvement of education and training can be enhanced by a careful specification of how they are expected to achieve their purpose. Multiple theories and methods can be used to evaluate both the process and the outcome of education and training. In this paper, we summarize some of these and focus particularly on the use of behavioural science to evaluate education and training. We illustrate these theories and methods with an example in dermatology.

Short Title: How behavioural science can contribute to health partnerships: the case of The Change Exchange
DOI: 10.1186/s12992-017-0254-4
Article Number: 30
Accession Number: WOS:000403202000001
Abstract: Background: Health partnerships often use health professional training to change practice with the aim of improving quality of care. Interventions to change practice can learn from behavioural science and focus not only on improving the competence

and capability of health professionals but also their opportunity and motivation to make changes in practice. We describe a project that used behavioural scientist volunteers to enable health partnerships to understand and use the theories, techniques and assessments of behavioural science. Case studies: This paper outlines how The Change Exchange, a collective of volunteer behavioural scientists, worked with health partnerships to strengthen their projects by translating behavioural science in situ. We describe three case studies in which behavioural scientists, embedded in health partnerships in Uganda, Sierra Leone and Mozambique, explored the behaviour change techniques used by educators, supported knowledge and skill development in behaviour change, monitored the impact of projects on psychological determinants of behaviour and made recommendations for future project developments. Discussion: Challenges in the work included having time and space for behavioural science in already very busy health partnership schedules and the difficulties in using certain methods in other cultures. Future work could explore other modes of translation and further develop methods to make them more culturally applicable. Conclusion: Behavioural scientists could translate behavioural science which was understood and used by the health partnerships to strengthen their project work.

Abstract: Introduction: The emergence of COVID-19 and the importance of behaviour change to limit its spread created an urgent need to apply behavioural science to public health. Knowledge mobilisation, the processes whereby research leads to useful findings that are implemented to affect positive outcomes, is a goal for researchers, policy makers and practitioners alike. This study aimed to explore the experience of using behavioural science in public health during COVID-19, to discover barriers and facilitators and whether the rapidly changing context of COVID-19 influenced knowledge mobilisation. **Methods:** We conducted a semi-structured interview study, with ten behavioural scientists and seven public health professionals in England, Scotland, Wales, The Netherlands and Canada. We conducted an inductive thematic analysis. **Results:** We report three key themes and 10 sub-themes: 1. Challenges and facilitators of translation of behavioural science into public health (Methods and frameworks supported translation, Lack of supportive infrastructure, Conviction and sourcing of evidence and Embracing behavioural science) 2. The unique context of translation (Rapid change in context, the multi-disciplinary team and the emotional toll). 3. Recommendations to support future behavioural science translation (Embedding experts into teams, Importance of a collaborative network and showcasing the role of behavioural science). **Discussion:** Barriers and facilitators included factors related to relationships between people, such as networks and teams; the expertise of individual people; and those related to materials, such as the use of frameworks and an overwhelming amount of evidence and literature. **Conclusion:** People and frameworks were seen as important in facilitating behavioural science in practice. Future research could explore how different frameworks are used. We recommend a stepped competency framework for behavioural science in public health and more focus on nurturing networks to facilitate knowledge mobilisation in future emergencies.

Abstract: The objective of this How to research series article is to provide guidance on getting started in Health Services Research. The purpose of health services research is to contribute knowledge that can be used to help improve health systems and clinical services through influencing policy and practice. The methods used are broad, have varying levels of rigor, and may require different specialist skills. This paper sets out practical steps for undertaking health services research. Importantly, use of the highlighted techniques can identify solutions to address inadequate knowledge translation or promote greater access to evidence-based stroke care to optimize patient outcomes.

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2015.04.002

Accession Number: WOS:000366299500013

Abstract: There is a growing emphasis on behavior change in intervention development programmes aimed at improving public health and healthcare professionals' practice. A number of frameworks and methodological tools have been established to assist researchers in developing interventions seeking to change healthcare professionals' behaviors. The key features of behavior change intervention design involve specifying the target group (i.e. healthcare professional or patient cohort), the target behavior and identifying mediators (i.e. barriers and facilitators) of behavior change. Once the target behavior is clearly specified and understood, specific behavior change techniques can then be used as the basis of the intervention

to target identified mediators of behavior change. This commentary outlines the challenges for pharmacy practice-based researchers in targeting dispensing as a behavior when developing behavior change interventions aimed at pharmacists and proposes a definition of dispensing to consider in future research. Title: The effectiveness of interventions to improve laboratory requesting patterns among primary care physicians: a systematic review

Journal: Implementation Science

Volume: 10

Date: Dec

Short Title: The effectiveness of interventions to improve laboratory requesting patterns among primary care physicians: a systematic review

ISSN: 1748-5908

DOI: 10.1186/s13012-015-0356-4

Article Number: 167

Accession Number: WOS:000365787300001

Abstract: Background: Laboratory testing is an integral part of day-to-day primary care practice, with approximately 30 % of patient encounters resulting in a request. However, research suggests that a large proportion of requests does not benefit patient care and is avoidable. The aim of this systematic review was to comprehensively search the literature for studies evaluating the effectiveness of interventions to improve primary care physician use of laboratory tests. Methods: A search of PubMed, Cochrane Library, Embase and Scopus (from inception to 09/02/14) was conducted. The following study designs were considered: systematic reviews, randomised controlled trials (RCTs), controlled clinical trials (CCTs), controlled before and after studies (CBAs) and interrupted time series analysis (ITSs). Studies were quality appraised using a modified version of the Effective Practice and Organisation of Care (EPOC) checklist. The population of interest was primary care physicians. Interventions were considered if they aimed to improve laboratory testing in primary care. The outcome of interest was a volume of laboratory tests. Results: In total, 6,166 titles and abstracts were reviewed, followed by 87 full texts. Of these, 11 papers were eligible for inclusion in the systematic review. This included four RCTs, six CBAs and one ITS study. The types of interventions examined included education, feedback, guidelines, education with feedback, feedback with guidelines and changing order

forms. The quality of included studies varied with seven studies deemed to have a low risk of bias, three with unclear risk of bias and one with high risk of bias. All but one study found significant reductions in the volume of tests following the intervention, with effect sizes ranging from 1.2 to 60 %. Due to heterogeneity, meta-analysis was not performed. Conclusions: Interventions such as educational strategies, feedback and changing test order forms may improve the efficient use of laboratory tests in primary care; however, the level of evidence is quite low and the quality is poor. The reproducibility of findings from different laboratories is also difficult to ascertain from the literature. Some standardisation of both interventions and outcome measures is required to enable formal meta-analysis.

Short Title: General practitioner views on the determinants of test ordering: a theory-based qualitative approach to the development of an intervention to improve immunoglobulin requests in primary care

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0465-8

Article Number: 102

Accession Number: WOS:000381663600002

Abstract: Background: Research suggests that variation in laboratory requesting patterns may indicate unnecessary test use. Requesting patterns for serum immunoglobulins vary significantly between general practitioners (GPs). This study aims to explore GP's views on testing to identify the determinants of behaviour and recommend feasible intervention strategies for improving immunoglobulin test use in primary care. Methods: Qualitative semi-structured interviews were conducted with GPs requesting laboratory tests at Cork University Hospital or University Hospital Kerry in the South of Ireland. GPs were identified using a Health Service Executive laboratory list of GPs in the Cork-Kerry region. A random sample of GPs (stratified by GP requesting patterns) was generated from this list. GPs were purposively sampled based on the criteria of location (urban/rural); length of time qualified; and practice size (single-handed/group). Interviews were carried out between December 2014 and February 2015. Interviews were transcribed verbatim using NVivo 10

software and analysed using the framework analysis method. Emerging themes were mapped to the theoretical domains framework (TDF), which outlines 12 domains that can enable or inhibit behaviour change. The behaviour change wheel and behaviour change technique (BCT) taxonomy were then used to identify potential intervention strategies. Results: Sixteen GPs were interviewed (ten males and six females). Findings suggest that intervention strategies should specifically target the key barriers to effective test ordering, while considering the context of primary care practice. Seven domains from the TDF were perceived to influence immunoglobulin test ordering behaviours and were identified as 'mechanisms for change' (knowledge, environmental context and resources, social/professional role and identity, beliefs about capabilities, beliefs about consequences, memory, attention and decision-making processes and behavioural regulation). Using these TDF domains, seven BCTs emerged as feasible 'intervention content' for targeting GPs' ordering behaviour. These included instructions on how to effectively request the test (how to perform behaviour), information on GPs' use of the test (feedback on behaviour), information about patient consequences resulting from not doing the test (information about health consequences), laboratory/consultant-based advice/education (credible source), altering the test ordering form (restructuring the physical environment), providing guidelines (prompts/cues) and adding interpretive comments to the results (adding objects to the environment). These BCTs aligned to four intervention functions: education, persuasion, environmental restructuring and enablement. Conclusions: This study has effectively applied behaviour change theory to identify feasible strategies for improving immunoglobulin test use in primary care using the TDF, 'behaviour change wheel' and BCT taxonomy. The identified BCTs will form the basis of a theory-based intervention to improve the use of immunoglobulin tests among GPs. Future research will involve the development and evaluation of this intervention.

Title: Changing Perceptions and Uses of "Companion Animal" Public and Pseudo-Public Spaces in Cities during COVID-19 Pandemic: The Case of Beijing

Journal: Land

Volume: 11

Issue: 9

Date: Sep

Short Title: Changing Perceptions and Uses of "Companion Animal"

Public and Pseudo-Public Spaces in Cities during COVID-19 Pandemic:
The Case of Beijing

DOI: 10.3390/land11091475

Article Number: 1475

Accession Number: WOS:000856776600001

Abstract: This paper examines the debate over the place of "companion animal" public space in China's cities. With the COVID-19 outbreak, this debate has entered a new phase, where the social response to the outbreak may have fundamentally changed the public's use and perception of "companion animal" public and pseudo-public space. This paper combines quantitative and qualitative analysis of posts and comments on two of China's largest social media platforms with a big data approach, based on a case study in Beijing, China. There were statistically significant differences in the perception and use of "companion animal" public spaces and pseudo-public spaces before and after the pandemic. We attribute the impact of the pandemic on "companion animal" spaces to three pathways: changes in opportunity, changes in ability, and changes in motivation. We found that the pandemic led to an increase in the amount of time available to some people but a decrease in the amount of "companion animal" public space available due to the pandemic closure. In addition, the use of "companion animal" public spaces in pseudo-public spaces declined, while those located within the open urban green space on the city's outskirts stood out after the outbreak. With the normalisation of the pandemic, there will be new challenges for the development and operation of companion-animal-related public spaces in cities, which will be the next focus of research. In addition, governments and social media should work together to promote and support sustainable animal ethical practices to better respond to the crisis. These findings will help complement the urban services system and guide future planning, design, and evaluation of related spaces.

Abstract: Antimicrobial resistance (AMR) is currently one of the most concerning threats in public health. The efforts to tackle the problem require a global One Health approach, using multidisciplinary approaches and a thorough understanding of the topic both by the general public and the experts. Currently, the lack of a shared mental model of the problem, the absence of a sense of responsibility amongst the different actors and a deficient education on the topic burden the efforts to slow down the emergency and spread of antimicrobial resistant infections. We here propose a multidisciplinary approach to tackle the AMR problem, taking into consideration not only the input from the biological and medical sciences but also the input from the social sciences. Specifically, we suggest strategies from education and psychology to increase awareness about antimicrobial resistance and to implement more effective interventions. Finally, we advocate for a comprehensive and a solidaristic model as the only solution for a problem which knows no borders. As such, political will and international cooperation will be key to achieve the desired change in antibiotic resistance trend.

DOI: 10.1186/s13012-017-0612-x

Article Number: 83

Accession Number: WOS:000405740400001

Abstract: Background: Evidence-based decision-making and practice are pivotal in public health. However, barriers do persist and they relate to evidence properties, organisations and contexts. To address these major knowledge transfer (KT) issues, we need to rethink how knowledge is produced and used, to enhance our understanding of decision-making processes, logics and mechanisms and to examine the ability of public health services to integrate research findings into their decisions and operations. This article presents a realist evaluation protocol to assess a KT scheme in prevention policy and practice at local level in France. Methods/

design: This study is a comparative multiple case study, using a realist approach, to assess a KT scheme in regional health agencies (ARS) and regional non-profit organisations for health education and promotion (IREPS), by analysing the configurations contexts/mechanisms/outcomes of it. The KT scheme assessed is designed for the use of six reviews of systematic reviews concerning the following themes: nutrition, alcohol, tobacco smoking, physical activity, emotional and sexual life and psychosocial skills. It combines the following activities: supporting the access to and the adaptation of scientific and usable evidences; strengthening professionals' skills to analyse, adopt and use the evidences in the course of their practices and their decision-making process; facilitating the use of evidence in the organisations and processes. RAMESE II reporting standards for realist evaluations was used.

Discussion: The aims of this study are to experiment and characterise the factors related to the scheme's ability to enable public health stakeholders to address the challenges of KT and to integrate scientific knowledge into policy and practice. We will use the realist approach in order to document the parameters of successful KT strategies in the specific contexts of preventive health services in France, while seeking to determine the transferability of such strategies.

Short Title: Evaluating participants' perceptions of a functional physical fitness assessment for those aged 60 years and over conducted in the community by student physiotherapists

ISSN: 1741-1645

DOI: 10.12968/ijtr.2019.0050

Accession Number: WOS:000636664200002

Abstract: Background/Aims Physical fitness is crucial in preserving independence and quality of life for older adults. A functional physical fitness assessment has been designed specifically for those aged 60 years and over. This study explored older people's perceptions of this assessment, conducted by student physiotherapists, and the feasibility of a larger study to evaluate the long-term effects of its use. Methods A total of five scheduled drop-in sessions were arranged. Participants aged 60 years and over were recruited. Physiotherapy students conducted the assessment and

participants completed follow-up physical activity status and quality of life questionnaires as well as an evaluation of the session. Focus groups were conducted to explore participant's perceptions and experiences. Data was analysed using descriptive statistics and thematic analysis. Results Overall, 91 adults (aged 60-93 years) participated, 75 (46 (61%) women and 10 (13%) men) completed questionnaires, and seven attended focus groups. In total, 100% of the 91 participants suggested that those aged 60 years and over would benefit from functional fitness assessment, and 79% perceived this would lead to increased physical activity. Focus group participants reported they enjoyed working with students and suggested that regular assessment would provide a yardstick for their level of fitness, that they would like to repeat their tests next year and that 'they were mentally a positive thing'. Conclusions Functional fitness assessments were perceived as useful and encouraged older adults to increase their activity levels. Students successfully completed the tests in non-healthcare settings. This study suggests that a large trial designed to assess the benefit of regular functional fitness assessment for the over 60s in community settings is feasible.

Short Title: Validation of the theoretical domains framework for use in behaviour change and implementation research

ISSN: 1748-5908

DOI: 10.1186/1748-5908-7-37

Article Number: 37

Accession Number: WOS:000307385900001

Abstract: Background: An integrative theoretical framework, developed for cross-disciplinary implementation and other behaviour change research, has been applied across a wide range of clinical situations. This study tests the validity of this framework.

Methods: Validity was investigated by behavioural experts sorting 112 unique theoretical constructs using closed and open sort tasks. The extent of replication was tested by Discriminant Content Validation and Fuzzy Cluster Analysis. Results: There was good support for a refinement of the framework comprising 14 domains of theoretical constructs (average silhouette value 0.29): 'Knowledge', 'Skills', 'Social/Professional Role and Identity', 'Beliefs about Capabilities', 'Optimism', 'Beliefs about Consequences', 'Reinforcement', 'Intentions', 'Goals', 'Memory, Attention and

Decision Processes', 'Environmental Context and Resources', 'Social Influences', 'Emotions', and 'Behavioural Regulation'. Conclusions: The refined Theoretical Domains Framework has a strengthened empirical base and provides a method for theoretically assessing implementation problems, as well as professional and other health-related behaviours as a basis for intervention development.

Accession Number: WOS:000556775900001

Abstract: Regular physical activity (PA) can address many of the negative side effects experienced by individuals following cancer treatment and support the optimization of physical and psychosocial well-being. However, many survivors of cancer are not sufficiently active to achieve these health benefits. The purpose of this study was to describe the development of a physical activity behavior change (PABC) intervention, MedEx IMPACT (IMprove Physical Activity after Cancer Treatment), which aims to increase cancer survivors' PA levels. A review of the literature and focus groups with survivors of cancer were conducted in order to generate recommendations to inform the intervention development process. This process was guided and informed by: (1) the Medical Research Council's (MRC) framework for the development, evaluation, and implementation of complex interventions, (2) the Behaviour Change Wheel (BCW), and (3) the Theoretical Domains Framework (TDF). Recommendations for strategies to support habitual PA and adherence to community-based exercise programs, generated by survivors of cancer who participated in 7 focus groups (n = 41), were synthesized with 13 statements of findings that were generated from 10 studies included within the

review of the literature. Detailed mapping exercises are presented which outline the link between these sources, the MRC framework, the BCW and TDF, and the intervention content. MedEx IMPACT is the first PABC intervention for survivors of cancer to be developed through the application of the MRC framework, BCW, and TDF. The next phase in this research is to test the acceptability and effectiveness of MedEx IMPACT.

Title: Environmentally sustainable hospital foodservices: Drawing on staff perspectives to guide change

Journal: Sustainable Production and Consumption

Volume: 25

Pages: 152-161

Date: Jan

Short Title: Environmentally sustainable hospital foodservices: Drawing on staff perspectives to guide change

ISSN: 2352-5509

DOI: 10.1016/j.spc.2020.08.003

Accession Number: WOS:000608159500011

Abstract: Foodservice is a key contributor to environmental impacts of the healthcare sector, in particular hospitals. Driving towards sustainable solutions in foodservices can bring financial and social benefits, whilst allowing hospitals to position themselves as leaders towards a sustainable food system and healthcare sector. Such a change depends on those working directly or indirectly with foodservices. Staff possess valuable knowledge, ideas, motivation and responsibility for improving the environmental sustainability of the foodservice system. The aim of this study was to explore the perspectives of staff working across the hospital food supply chain towards: (1) sustainable practices in hospital food provision; (2) existing barriers and enablers; and (3) recommendations for implementing sustainable foodservice practices in the future. Through qualitative inquiry, semi-structured interviews were conducted with individuals at operational and management levels responsible for policy, purchasing, production, onsite plating and delivery and waste disposal at three hospitals in Australia. Framework analysis was used to synthesise transcribed data into practices, barriers and enablers, and recommendations. Interviews (n=46 participants) identified current sustainable practices including those related to recyclable packaging, effective equipment and technology and efficient processes. Unsustainable practices included restrictions on sourcing food, packaging that cannot be

separated or recycled, rigid foodservice models and menu, waste production and processes. Enablers to improve sustainability included the power of individuals to influence change, education on recycling, knowledge generation, audits and grants for innovative research, rebates and quality improvement processes. Barriers included competing priorities, poor communication, lack of training opportunities and knowledge, infection control restrictions, lack of policy, funding, and time between meal ordering and delivery. Participants proposed practice changes across the food supply chain and recommended generation and sharing of knowledge, leadership and policy support. Perspectives of individuals within foodservice reveal shared motivation and desire for sustainable foodservices, with support needed from leaders and policy. Future research should use a co-design approach involving staff to create and implement sustainable strategies within hospitals. To see widespread and timely change, action is needed towards effective and meaningful policy. (C) 2020 Institution of Chemical Engineers. Published by Elsevier B.V. All rights reserved.

Title: When Less is More: A Short-form Tool to Increase Segmentation Implementation

Journal: Social Marketing Quarterly

Volume: 28

Issue: 3

Pages: 191-207

Date: Sep

Short Title: When Less is More: A Short-form Tool to Increase Segmentation Implementation

ISSN: 1524-5004

DOI: 10.1177/15245004221116082

Accession Number: WOS:000827202700001

Abstract: Background: Segmentation remains underutilised in social marketing research and practice. Simple segmentation tools that are easy to administer and simple for audience members to complete may increase the use of segmentation across the social marketing process. Focus of the Article: Segmentation is a foundational marketing principle which allows marketers to tailor marketing activity to the needs of specific groups (segments). Evidence shows that behaviour change is more likely when more principles are used, yet segmentation remains underutilised. Data-driven methods are used to identify segments based on several variables collected via surveys, but they take time, require large sample sizes and technical analyses; and can be costly and time consuming. Importance

to the Field: Simple diagnostic tools are needed to simplify data collection and increase the use of key social marketing principles such as segmentation. Methods: Three studies were conducted to create and verify a short diagnostic segmentation tool and later refine a tool that reflects contemporary social marketing practice. The first employed multiple linear regression to predict segment membership based on previously performed two-step cluster analysis. The second applied the tool to another data set to verify whether the tool could predict segment membership accurately. The final study delivers a short diagnostic tool following the same development approach to a data set drawn from a larger sample that included objective measures ensuring focus moved beyond how individuals think and feel. Results: Segments in the first study had been defined by five variables (derived from 16 survey questions). The tool was able to predict segment membership to a high level of accuracy from five questions. In the second study the tool was used to predict segments, which had high correspondence to the segments identified in that analysis, which was also based on five variables (16 questions). The third study extended development to an analysis using 16 defining variables, based on 40 survey questions. The final tool predicted segment membership to a high degree of accuracy based on five survey questions. Recommendations for Research or Practice: Segmentation is important for developing understanding that enables social marketers to design social change programs to meet the needs of more people. This simple tool developed and verified within and across samples has potential to simplify data collection enabling greater uptake of segmentation in social marketing practice. The final tool incorporated objective measures to ensure segmentation moves beyond the myopic consumer focus that has dominated social marketing. Future research could use the approach in this paper to derive short diagnostic tools with a broader range of behavioural contexts and with more diverse populations. Limitations: The behavioural measures used in these studies were self-report measures, and the use of a more objective measure would further strengthen both the segmentation analysis and short diagnostic tool. Accession Number: WOS:000608343900010

Abstract: Neck disorders are common in primary health care (PHC) physiotherapy. A neck-specific exercise program based on research findings was implemented among physiotherapists in Swedish PHC. The aim of the study was to evaluate the adoption of the program. We invited PHC physiotherapists to an educational session including theoretical information and practical training. Before the educational session the participants (n = 261) completed a baseline questionnaire. After 3 and 12 months, we distributed surveys to identify changes in practice and in confidence regarding diagnosis and treatment. We compared data from 3-months and 12-months follow-up, respectively, with baseline data. Self-reported frequency of most of the included assessment methods was unchanged after 12 months. Frequency of assessment of neck proprioception had increased significantly. Specific neck muscle exercise for treatment of whiplash associated disorders was applied more frequently after 3 and after 12 months than at baseline. Frequency of other treatment methods remained unchanged. Confidence in diagnosis and treatment increased significantly, particularly among women. The program was not adopted as expected, but resulted in increased confidence regarding diagnosis and treatment. The provision of a short educational session seemed not to be sufficient to obtain a sustained change in practice.

Short Title: 'Corona is coming': COVID-19 vaccination perspectives and experiences amongst Culturally and Linguistically Diverse West Australians

ISSN: 1369-6513

DOI: 10.1111/hex.13613

Accession Number: WOS:000870040500001

Abstract: Background Culturally and Linguistically Diverse (CALD) groups within high-income countries are at risk of being left behind by the COVID-19 vaccination rollout. They face both access and attitudinal barriers, including low trust in government and health authorities. Objective To explore perceptions and attitudes towards COVID-19 vaccination, as well as facilitators, barriers and strategies to promote uptake among CALD residents of Western Australia (WA), where there were almost no COVID-19 cases for 2 years. Design and Participants Perth, WA's capital, was chosen as the state's study site because most of the state's CALD population lives there. Eleven semistructured in-depth interviews and three focus groups (with 37 participants) were conducted with CALD residents between August and October 2021. Thematic analysis was conducted, informed by the 'Capability', 'Opportunity', 'Motivation', 'Behaviour' model. Results CALD participants faced barriers including a lack of knowledge about COVID-19 and the vaccines, low self-rated English proficiency and education levels, misinformation, passive government communication strategies and limited access to vaccine clinics/providers. They were, however, motivated to vaccinate by the imminent opening of state and international borders, trust in government and healthcare authorities, travel intentions and the desire to protect themselves and others. Conclusions Despite high levels of trust and significant desire for vaccines among CALD communities in Perth, current strategies were not meeting their needs and the community remains at risk from COVID-19. Tailored intervention strategies are required to provide knowledge, address misinformation and facilitate access to ensure uptake of COVID-19 vaccines—including for additional doses—amongst CALD communities. Governments should work with trusted CALD community members to disseminate tailored COVID-19 vaccine information and adequately translated resources. Patient or Public Contribution The Wesfarmers Centre of Vaccines and Infectious Diseases Community Reference Group at Telethon Kids Institute consulted on this project in September 2020; Ishar Multicultural Women's Health Services consulted on and facilitated the focus groups.

Article Number: e0279557

Accession Number: WOS:000925813500111

Abstract: Introduction Health care workers (HCWs) faced an increased risk of Coronavirus Disease 2019 (COVID19). Australia's COVID-19 vaccine rollout commenced in February 2021 to priority groups, including HCWs. Given their increased risk, as well as influence on patients' vaccine uptake, it was important that HCWs had a positive COVID-19 vaccination experience, as well as trusting the vaccine safety and efficacy data. Methods Semi-structured interviews were undertaken with 19 public- and privately-practicing HCWs in Western Australia between February-July 2021. Data were deductively analysed using NVivo 12 and guided by the Capability-Opportunity-Motivation-Behaviour model. Results 15/19 participants had received at least one COVID-19 vaccine. Participants were highly motivated, mostly to protect themselves and to get back to "normal", but also to protect patients. Many had a heightened awareness of COVID-19 severity due hearing from colleagues working in settings more impacted than Western Australia. Participants trusted the COVID-19 vaccine development and approval process; their histories of having to accept vaccines for work helped them to see COVID-19 vaccination as no different. Many recalled initially being unsure of how and when they'd be able to access the vaccine. Once they had this knowledge, half had difficulties with the booking process, and some were unable to access a clinic at a convenient location or time. Participants learnt about COVID-19 vaccination through government resources, health organisations, and their workplace, but few had seen any government campaigns for the wider public. Finally, most had discussed COVID19 vaccination with their social network. Conclusion HCWs in Western Australia demonstrated good knowledge about COVID-19 vaccination, with many reasons to vaccinate themselves and support the vaccination of others. Addressing the barriers identified in this study will be important for planning to vaccinate health workforces during future pandemics.

Abstract: Social Engineers can use influential techniques to exploit human behaviour. For a security officer, simulating and analysing such attacks would provide useful insights towards possible countermeasures. We propose the notion of influence tokens, which a social engineer can exploit to change human behaviour. We model the relationship between agents and a social engineer using Coloured Petri Nets, which govern the behaviour of influence tokens. We then illustrate our results showing how influence tokens propagate, impact and alters a Social Engineers success rate in a tailgating scenario. In particular, we show that a specific combination of tokens will increase the adversaries success rate, whereas, investing in a different set of tokens yields no further rewards for the adversary.

Accession Number: WOS:000773054100006

Abstract: An organisational requirement of no unauthorised personnel permitted in a restricted area may have a security policy such as

all employees must wear identification badges and employees must challenge people who are not wearing a badge. An employee's choice to wear/not wear their badge can be strongly related to how they perceive the security policy, which we call the compliance attitude. Peoples behaviour towards a security policy can influence other peoples compliance attitudes, such as challenging those not wearing a badge influences the compliance attitudes of the people who are challenged and those observing the challenge. The exchange of a challenge by social interaction between two or more people can create a social influence, whereby a persons choice to wear their badge is nudged. For the organisation, the problem is assessing how these social influences propagate throughout the compliance attitudes for particular security policies of all employees. We present SHRUBS which is a work in progress. It is a tool evaluating global security compliance attitudes of human agents. SHRUBS simulates behaviour for security policies where social interaction is present. It is built from conclusions in psychology, behavioural economics and human factors in security. SHRUBS takes as input, a list of behaviour parameters describing agent behaviour and returns the global compliance attitude from a set of traces formed through simulation. We demonstrate the application of SHRUBS with a running example to illustrate how one might mitigate against poor compliance attitudes amongst agents. We then go onto discuss the validation possibilities and explain this with a real world data set that we have collected. We envision that future versions of the tool would enable organisations to make more informed security policy decisions about employee behaviour, such as the best behavioural intervention to use.

Accession Number: WOS:000724824800013

Abstract: Background: Community-based physical activity programs typically evolve to respond to local conditions and feedback from stakeholders. Process evaluations are essential for capturing how programs are implemented, yet often fail to capture delivery evolution over time, meaning missed opportunities for capturing

lessons learned. Methods: This research paper reports on a staged approach to a process evaluation undertaken within a community-based UK 12-month physical activity program that aimed to capture change and adaptation to program implementation. Twenty-five one-to-one interviews and 12 focus groups took place over the 3 years of program delivery. Participants included program participants, management, and service deliverers. Results: Program adaptations that were captured through the ongoing process evaluation included changes to the design of promotional material, program delivery content, ongoing training in behavior change, and the addition of regular participant community events. The authors address how these strands evolved over program delivery, and how the process evaluation was able to capture them. Conclusion: The pragmatic evaluation approach enabled changes in response to the local context, as well as improvements in the program to be captured in a timely manner, allowing the delivery to be responsive and the evaluation flexible.

Date: Apr

Short Title: Heated Behaviour in the Classroom for Children with FASD: The Relationship between Characteristics Associated with ADHD, ODD and ASD, Hot Executive Function and Classroom Based Reward Systems

DOI: 10.3390/children10040685

Article Number: 685

Accession Number: WOS:000979068500001

Abstract: Possession of characteristics related to Attention Deficit Hyperactive Disorder, Oppositional Defiance Disorder, and Autism Spectrum Disorder in children prenatally exposed to alcohol contributes to challenges within the diagnostic pathway for Foetal Alcohol Spectrum Disorder (FASD). The presentation of these characteristics, though problematic for the children affected, may not result in referral for diagnosis; focusing on diagnostic thresholds masks the dimensional nature of these characteristics. Children with traits which are undiagnosed may not receive effective support and are often identified as exhibiting challenging behaviour. In the UK, children with undiagnosed Special Educational Needs (SEN) are more likely to experience school exclusion. Common

across each condition are challenges to executive function associated with emotional regulation (hot-executive function). This study explored the relationship between characteristics of Attention Deficit Hyperactive Disorder, Oppositional Defiance Disorder, Autistic-Like Traits, and hot executive functions on the helpfulness of reward-based interventions for children with suspected or diagnosed FASD. Data were collected online using caregiver referral questionnaire screeners for each measure (Child Autism Quotient Questionnaire, Vanderbilt ADHD Parental Rating Scale and The Childhood Executive Functioning Inventory) for children aged 6-12 years with suspected or diagnosed FASD (n = 121). Between-group comparisons showed no significant difference in the reporting of Attention Deficit Hyperactive Disorder characteristics, Oppositional Defiance Disorder characteristics, Autistic-Like Traits, and executive function, regardless of diagnostic state. Multiple regression analyses indicated that these personality characteristics and executive functions were associated with the perception of the reward system helpfulness. However, this pattern was qualified by both the type of hot executive function challenged (significant for Regulation not Inhibition) and whether the child had an FASD diagnosis. Thus, a dimensional approach may strengthen our understanding of the child's classroom experience and help overcome barriers to effective intervention and support.

Title: Using implementation science frameworks to explore barriers and facilitators for parents' use of therapeutic strategies following a parent-mediated autism intervention

Journal: Autism

Volume: 27

Issue: 4

Pages: 1011-1025

Date: May

Short Title: Using implementation science frameworks to explore barriers and facilitators for parents' use of therapeutic strategies following a parent-mediated autism intervention

ISSN: 1362-3613

DOI: 10.1177/13623613221125630

Accession Number: WOS:000877283900001

Abstract: One core component of the Paediatric Autism Communication Therapy-Generalised involves supporting parents to change their interaction and communication style with their child. This behaviour change has been found to affect child outcomes. Implementation science methodologies offer a range of opportunities to investigate how interventions are delivered in practice; however, few autism intervention studies have used such designs to explore the behaviour

change of parents. We interviewed 27 parents and explored their use of intervention strategies after the Paediatric Autism Communication Therapy-Generalised trial. We employed the Theoretical Domains Framework and Consolidated Framework for Implementation Research to systematically explore a range of barriers and facilitators experienced by the parents associated with parents' characteristics, their context and features of the intervention. Our analysis revealed barriers and facilitators across three themes: Motivating Factors, which was further subdivided into Compatibility and Buy-In and Alignment of Goals and Outcomes; Opportunity and Support; Parent Characteristics. Almost all parents reported continued use of the Paediatric Autism Communication Therapy-Generalised strategies. Facilitators (e.g. parental confidence in using the strategies) and barriers (e.g. child's behaviour) were identified. Consideration of these factors can inform identification of implementation strategies to test in future studies of Paediatric Autism Communication Therapy-Generalised and other parent-mediated early autism interventions.

Date: Dec

Short Title: Protocol for the PLAYshop randomised controlled trial: examining efficacy of a virtually delivered parent-focused physical literacy intervention for early childhood on child-specific and family-specific outcomes

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-066962

Article Number: e066962

Accession Number: WOS:000924549200034

Abstract: IntroductionThe PLAYshop programme is a novel, brief, theory-based, parent-focused physical literacy intervention in early childhood designed to address the major public health issue of childhood physical inactivity. The primary objective of this study

is to examine the efficacy of the virtually delivered PLAYshop programme in increasing preschool-aged children's physical literacy, including fundamental movement skills and motivation and enjoyment. Methods and analysis This study aims to recruit 130 families with preschool-aged children (3-5 years) from Alberta and British Columbia, Canada who will be randomised to an intervention or control group. The PLAYshop programme is informed by the Capability, Opportunity, Motivation, Behavior (COM-B) model and includes four intervention strategies: (1) educational training via a 60min virtual synchronous workshop, (2) educational resources via handouts, (3) material resources via a goody bag of basic active play equipment and (4) follow-up support via access to a digital app with an online toolkit and four biweekly booster lessons (1-week, 3-week, 5-week and 7-week follow-up). To assess the primary outcome of physical literacy, five fundamental movement skills (overhand throw, underhand throw, horizontal jump, hop, one leg balance) will be measured virtually at baseline and 2-month follow-up using the Test of Gross Motor Development (TGMD) and the Movement Assessment Battery for Children-Second Edition (MABC-2) tools. Additionally, children's motivation and enjoyment will also be assessed at baseline and 2-month follow-up by: (1) parental-report using items from the Preschool Physical Literacy Assessment (PrePLAY) and (2) self-report using an adapted Five Degrees of Happiness Likert scale for children. The control group will receive the PLAYshop programme after the 2-month follow-up. Ethics and dissemination The protocol was approved by the University of Alberta (00093764) and University of Victoria (16-444) Research Ethics Boards. Findings will be disseminated through peer-reviewed publications, conference presentations, social and traditional media and a circulated infographic. Trial registration number NCT05255250.

ISSN: 1471-9827

DOI: 10.1111/nbu.12516

Accession Number: WOS:000684985600014

Abstract: There is a drive in the UK to harness findings from novel fundamental and efficacy nutritional research and, through inter-disciplinary and multi-agency collaborations, to improve eating behaviour for the benefit of population health. This report summarises the progress made during the Medical Research Council-funded Hot Topic workshop on the planning for a potential UK-wide nutrition primary prevention randomised controlled trial with incident disease as the study endpoint: the UK Nutrition and Healthy Life Expectancy (NuLife) Trial. Through two workshops, along with online discussions and a systematic evidence synthesis, over 40 experts from a range of disciplines came together over 6 months. The workshop reached a consensus and delivered a three-stage plan with the ultimate ambitious aim of providing effective eating behaviour change strategies to address the growing inequalities in the UK and contribute to both a reduced risk of prevalent diet-related chronic disease and an increase in healthy life expectancy.

Title: Head in the clouds, feet on the ground: how transdisciplinary learning can foster transformative change-insights from a summer school

Journal: Biodiversity and Conservation

Date: 2023 May

Short Title: Head in the clouds, feet on the ground: how transdisciplinary learning can foster transformative change-insights from a summer school

ISSN: 0960-3115

DOI: 10.1007/s10531-023-02603-0

Accession Number: WOS:000990471600001

Abstract: There is a pressing need for transformative change, with a vision of long-term human well-being within planetary boundaries. The lack of progress-despite increasing awareness and action-illustrates how challenging it is to foster change in our complex global society. Education and learning are needed to enable change. Transdisciplinary learning, which meaningfully integrates diverse knowledge and perspectives, contributes to developing an integrative understanding-a necessity for tackling complex challenges. We explore how transdisciplinary learning for early-career researchers can foster transformative change and lead to increased biodiversity conservation. This paper focuses on a case study of the authors'

shared experiences during the 2021 Alternet Summer School, which focused on transformative change for biodiversity conservation and human well-being. In this introspective research, we gained insights through an online survey for participants and organizers of the summer school (n = 27). Using qualitative content analysis, we identify seven crucial elements of transdisciplinary learning which can lead to transformative change on (a) a personal level, as the learning process shifts values and helps researchers identify their roles; (b) a research level, by rethinking science and providing tools for transdisciplinary approaches, and (c) a societal level, by moving from the individual to the collective and constructing a shared vision for a sustainable future. Participants highlighted how changes on all these levels could benefit biodiversity conservation. These insights point to the benefit of transdisciplinary learning opportunities that empower young researchers to take up their part in fostering transformative change.

Short Title: Modifiable Psychosocial Constructs Associated With Physical Activity Participation in People With Multiple Sclerosis: A Systematic Review and Meta-Analysis

ISSN: 0003-9993

DOI: 10.1016/j.apmr.2017.01.027

Accession Number: WOS:000404322500018

Abstract: Objective: To synthesize current knowledge of the modifiable psychosocial constructs associated with physical activity (PA) participation in people with multiple sclerosis. Data Sources: A search was conducted through October 2015 in 8 electronic databases: CINAHL, PubMed, SPORTDiscus, Web of Knowledge, MEDLINE, EMBASE, Cochrane Database of Systematic Reviews, and PsycINFO. Study Selection: Cohort and intervention studies were included if they (1) included an objective or subjective measure of PA; (2) measured at

least 1 modifiable psychosocial construct; and (3) reported bivariate correlations (or these could be extracted) between the PA and psychosocial construct measures. A total of 13,867 articles were screened for inclusion, and 26 were included in the final analysis. Data Extraction: Meta-analyses of correlations were conducted using the Hedges-Olkin method. Where a meta-analysis was not possible, results were reported descriptively. Data Synthesis: Meta-analyses indicated a pooled correlation coefficient between (1) objective PA and self-efficacy (n=7) of $r=.30$ ($P<.0001$), indicating a moderate, positive association; (2) subjective PA and self-efficacy (n=7) of $r=.34$ ($P<.0001$), indicating a moderate, positive association; (3) subjective PA and goal-setting (n=5) of $r=.44$ ($P<.0001$), indicating a moderate-to-large positive association; and 4) subjective PA and outcome expectancies (n=4) (physical: $r=.13$, $P=.11$; social: $r=.19$, $P<.0001$; self-evaluative: $r=.27$, $P<.0001$), indicating small-moderate positive associations. Other constructs such as measures of health beliefs, enjoyment, social support, and perceived benefits and barriers were reported to be significantly correlated with PA in individual studies, but the number of studies was not sufficient for a meta-analysis. Conclusions: Future PA interventions should continue to focus on the psychosocial constructs of self-efficacy and goal-setting. However, there is a need to explore the associations between other constructs outside those reported in this review. ISSN: 2164-5515

DOI: 10.1080/21645515.2021.1954444

Accession Number: WOS:000685996000001

Abstract: The purpose of this review was to identify, characterize, and map the existing knowledge on a) nurses' and pharmacists' perceived barriers and enablers to addressing vaccine hesitancy among patients; and b) strategies or interventions for nurses and

pharmacists to address vaccine hesitancy in their practice. Our comprehensive search strategy targeted peer-reviewed and grey literature. Two independent reviewers screened papers and extracted data. We coded narrative descriptions of barriers and enablers and interventions using the Behavior Change Wheel. Sixty-six records were included in our review. Reported barriers (n = 9) and facilitators (n = 6) were identified in the capability, opportunity and motivation components. The majority of the reported interventions were categorized as education (n = 47) and training (n = 26). This current scoping review offers a detailed behavioral analysis of known barriers and enablers for nurses and pharmacists to address vaccine hesitancy and interventions mapped onto these behavioral determinants.

Abstract: Background There are increasing expectations for researchers and knowledge users in the health system to use a research partnership approach, such as integrated knowledge translation, to increase the relevance and use of research findings in health practice, programmes and policies. However, little is known about how health research trainees engage in research partnership approaches such as IKT. In response, the purpose of this scoping review was to map and characterize the evidence related to using an IKT or other research partnership approach from the perspective of health research trainees in thesis and/or postdoctoral work. Methods We conducted this scoping review following the Joanna Briggs Institute methodology and Arksey and O'Malley's framework. We searched the following databases in June

2020: MEDLINE, Embase, CINAHL and PsycINFO. We also searched sources of unpublished studies and grey literature. We reported our findings in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Extension for Scoping Reviews. Results We included 74 records that described trainees' experiences using an IKT or other research partnership approach to health research. The majority of studies involved collaboration with knowledge users in the research question development, recruitment and data collection stages of the research process. Intersecting barriers to IKT or other research partnerships at the individual, interpersonal and organizational levels were reported, including lack of skills in partnership research, competing priorities and trainees' "outsider" status. We also identified studies that evaluated their IKT approach and reported impacts on partnership formation, such as valuing different perspectives, and enhanced relevance of research. Conclusion Our review provides insights for trainees interested in IKT or other research partnership approaches and offers guidance on how to apply an IKT approach to their research. The review findings can serve as a basis for future reviews and primary research focused on IKT principles, strategies and evaluation. The findings can also inform IKT training efforts such as guideline development and academic programme development.

DOI: 10.3390/en15124354

Article Number: 4354

Accession Number: WOS:000816529400001

Abstract: Reducing office buildings' energy consumption can contribute significantly towards carbon reduction commitments since it represents similar to 40% of total energy consumption. Major components of this are lighting, electrical equipment, heating, and

central cooling systems. Solid evidence demonstrates that individual occupants' behaviors impact these energy consumption components. In this work, we propose the methodology of using virtual choreographies to identify and prioritize behavior-change interventions for office users based on the potential impact of specific behaviors on energy consumption. We studied the energy-related office behaviors of individuals by combining three sources of data: direct observations, electricity meters, and computer logs. Data show that there are behaviors with significant consumption impact but with little potential for behavioral change, while other behaviors have substantial potential for lowering energy consumption via behavioral change.

Short Title: Using the Behavior Change Wheel to Understand University Students' Prolonged Sitting Time and Identify Potential Intervention Strategies

ISSN: 1070-5503

DOI: 10.1007/s12529-020-09926-0

Accession Number: WOS:000561243600002

Abstract: Background Several national public health guidelines recommend individuals to minimize time spent in prolonged, continuous periods of sitting. Developing effective interventions to break up sitting, however, requires in-depth understanding of the behavior as well as identification of the key elements that need to be targeted to achieve change. This qualitative study focused on university students—a highly sedentary group—with the aim of the following: (i) exploring the factors influencing prolonged sitting time in this population; and (ii) identifying potential avenues for future intervention, based on the Behavior Change Wheel framework. Method Eighteen ambulatory undergraduate students participated in semi-structured one-on-one interviews, using the Capability, Opportunity, Motivation, Behavior (COM-B) model and the complementary Theoretical Domains Framework (TDF) as the theoretical framework. Data were analyzed using a directed content analysis approach, followed by inductive thematic analysis. Results All COM-B components and eight TDF domains were identified as relevant for influencing the target behavior. Conclusion Findings suggest that interventions and policies aimed at reducing prolonged sitting time in university students should (i) raise awareness about negative health implications; (ii) address productivity concerns; (iii) provide training in behavioral self-regulation; (iv) use external reminders; (v) implement habit formation techniques; and (vi) promote social acceptability for breaking up sitting.

Short Title: Serious electronic games as behavioural change interventions in healthcare-associated infections and infection prevention and control: a scoping review of the literature and future directions

ISSN: 2047-2994

DOI: 10.1186/s13756-016-0137-0

Article Number: 34

Accession Number: WOS:000385972100001

Abstract: Background: The uptake of improvement initiatives in infection prevention and control (IPC) has often proven challenging. Innovative interventions such as 'serious games' have been proposed in other areas to educate and help clinicians adopt optimal behaviours. There is limited evidence about the application and evaluation of serious games in IPC. The purposes of the study were: a) to synthesise research evidence on the use of serious games in IPC to support healthcare workers' behaviour change and best practice learning; and b) to identify gaps across the formulation and evaluation of serious games in IPC. Methods: A scoping study was conducted using the methodological framework developed by Arksey and O'Malley. We interrogated electronic databases (Ovid MEDLINE, Embase Classic + Embase, PsycINFO, Scopus, Cochrane, Google Scholar) in December 2015. Evidence from these studies was assessed against an analytic framework of intervention formulation and evaluation. Results: Nine hundred sixty five unique papers were initially identified, 23 included for full-text review, and four finally selected. Studies focused on intervention inception and development rather than implementation. Expert involvement in game design was reported in 2/4 studies. Potential game users were not included in needs assessment and game development. Outcome variables such as fidelity or sustainability were scarcely reported. Conclusions: The growing interest in serious games for health has not been coupled with adequate evaluation of processes, outcomes and contexts involved. Explanations about the mechanisms by which game components may facilitate behaviour change are lacking, further hindering adoption.

Title: Improving adherence to glaucoma medication: a randomised
controlled trial of a patient-centred intervention (The Norwich
Adherence Glaucoma Study)
Journal: Bmc Ophthalmology
Volume: 14
Date: Mar
Short Title: Improving adherence to glaucoma medication: a
randomised controlled trial of a patient-centred intervention (The
Norwich Adherence Glaucoma Study)
DOI: 10.1186/1471-2415-14-32
Article Number: 32
Accession Number: WOS:000334462500001
Abstract: Background: Improving adherence to ocular hypertension
(OH)/glaucoma therapy is highly likely to prevent or reduce
progression of optic nerve damage. The present study used a
behaviour change counselling intervention to determine whether
education and support was beneficial and cost-effective in improving
adherence with glaucoma therapy. Methods: A randomised controlled
trial with a 13-month recruitment and 8-month follow-up period was
conducted. Patients with OH/glaucoma attending a glaucoma clinic and
starting treatment with travoprost were approached. Participants
were randomised into two groups and adherence was measured over 8
months, using an electronic monitoring device (Travalert (R) dosing
aid, TDA). The control group received standard clinical care, and
the intervention group received a novel glaucoma education and
motivational support package using behaviour change counselling.
Cost-effectiveness framework analysis was used to estimate any

potential cost benefit of improving adherence. Results: Two hundred and eight patients were recruited (102 intervention, 106 control). No significant difference in mean adherence over the monitoring period was identified with 77.2% (CI, 73.0, 81.4) for the control group and 74.8% (CI, 69.7, 79.9) for the intervention group ($p = 0.47$). Similarly, there was no significant difference in percentage intraocular pressure reduction; 27.6% (CI, 23.5, 31.7) for the control group and 25.3% (CI, 21.06, 29.54) for the intervention group ($p = 0.45$). Participants in the intervention group were more satisfied with information about glaucoma medication with a mean score of 14.47/17 (CI, 13.85, 15.0) compared with control group which was 8.51 (CI, 7.72, 9.30). The mean intervention cost per patient was GB 10.35 pound (<US\$16) and not cost-effective. Conclusions: Adherence with travoprost was high and not further increased by the intervention. Nevertheless, the study demonstrated that provision of information, tailored to the individual, was inexpensive and able to achieve high patient satisfaction with respect to information about glaucoma medication. Measurement of adherence remains problematic since awareness of study participation may cause a change in participant behaviour. ISSN: 1323-7799

DOI: 10.1111/resp.12680

Accession Number: WOS:000373126900005

Abstract: People with chronic obstructive pulmonary disease (COPD) engage in low levels of physical activity (PA). Given the evidence for the health benefits associated with participating in 150min of moderate-to-vigorous intensity PA each week, there is considerable interest in methods to increase PA in people with COPD. Studies to date have focused largely on exercise training and behavioural approaches, and many have demonstrated minimal, if any effect. An intermediate goal that focuses on reducing time spent in sedentary behaviour (SB) and increasing participation in light intensity PA is a more realistic goal in this population and offers a gateway to higher intensity PA. Although strategies that are capable of reducing time spent in SB in COPD are unknown, studies that have shown some increase in PA in this population often provide individualized goal setting, motivational interviewing and frequent contact with health-care professionals to provide advice regarding strategies to overcome barriers. Therefore, these approaches should be considered in interventions to reduce time in SB. There are a range of devices available to monitor time in SB for use in both clinical and research settings. To move this area forward, a theoretically informed and systematic approach to behaviour change is needed. The theoretical model, the behaviour change wheel', is described and an example is provided of how it can be applied to a person with COPD.

DOI: 10.1186/s12931-022-02255-8

Article Number: 374

Accession Number: WOS:000922378300001

Abstract: Background Targeted lung cancer screening is effective in reducing mortality by upwards of twenty percent. However, screening is not universally available and uptake is variable and socially patterned. Understanding screening behaviour is integral to designing a service that serves its population and promotes equitable uptake. We sought to review the literature to identify barriers and facilitators to screening to inform the development of a pilot lung screening study in Scotland. Methods We used Arksey and O'Malley's scoping review methodology and PRISMA-ScR framework to identify relevant literature to meet the study aims. Qualitative, quantitative and mixed methods primary studies published between January 2000 and May 2021 were identified and reviewed by two reviewers for inclusion, using a list of search terms developed by the study team and adapted for chosen databases. Results Twenty-one articles met the final inclusion criteria. Articles were published between 2003 and 2021 and came from high income countries. Following data extraction and synthesis, findings were organised into four categories: Awareness of lung screening, Enthusiasm for lung screening, Barriers to lung screening, and Facilitators or ways of promoting uptake of lung screening. Awareness of lung screening was low while enthusiasm was high. Barriers to screening included fear of a cancer diagnosis, low perceived risk of lung cancer as well as practical barriers of cost, travel and time off work. Being health conscious, provider endorsement and seeking reassurance were all identified as facilitators of screening participation. Conclusions Understanding patient reported barriers and facilitators to lung screening can help inform the implementation of future lung screening pilots and national lung screening programmes.

Short Title: Scoping review of 30 years of suicide prevention in university students around the world: efficacy, effectiveness, and cost-effectiveness

ISSN: 0102-7972

DOI: 10.1186/s41155-022-00227-x

Article Number: 22

Accession Number: WOS:000826923400001

Abstract: A scoping review of systematic reviews was carried out to identify evidence of efficacy, effectiveness, and cost-effectiveness of universal and selective suicide prevention programs among university students worldwide. Five databases were reviewed using terms in English, Spanish, and Portuguese. The following were the inclusion criteria: systematic review or meta-analysis or meta-synthesis, suicide prevention in college students, evaluation of the efficacy, effectiveness and/or cost-effectiveness of interventions, and peer-reviewed studies. The quality of reviews was assessed. The field of study features three decades of publication in high-income countries. The strategy used, the components of the program, and the target audience to which they are delivered interfere with efficacy. In the psychoeducation strategy, the experiential and didactic components are more efficacious in the knowledge about suicide. And the motivational enhancement component promotes greater self-efficacy in suicide prevention. Programs that take a multimodal approach are effective in increasing short-term attitudes related to suicide and reducing rates of completed suicide. The gatekeeper strategy delivered to peer counselors is the most effective one in the outcomes, including short-term and long-term knowledge about suicide and its prevention and self-efficacy in suicide prevention. A greater number of evaluated studies of gatekeeper interventions were identified, indicating a trend in this research field. No review addressed the effects on subgroups that were classified based on sex, racial or sexual minorities, and special (indigenous) populations. Only one study addressed cost-effectiveness, pointing out that the psychoeducation and gatekeeper strategies have relevant net benefit rates, but the gatekeeper strategy has a higher cost-benefit ratio compared to the psychoeducation strategy. The findings indicate that psychoeducation and gatekeeper interventions tend to be more efficacious when they combine education and skills training to intervene in suicidal behavior. The components of the

intervention and the target audience to which it is delivered influence efficacy. Multimodal interventions evaluate completed suicide outcomes, but require greater implementation efforts, in terms of human and financial resources and more time for the evaluation.

Short Title: Co-Creating an Occupational Health Intervention within the Construction Industry in Sweden: Stakeholder Perceptions of the Process and Output

DOI: 10.3390/ijerph182412872

Article Number: 12872

Accession Number: WOS:000737871700001

Abstract: One way to prevent work-related stress, is to implement primary occupational health interventions aimed at improving the psychosocial work environment. However, such interventions have shown a limited effect, often due to implementation failure and poor contextual fit. Co-creation, where researchers, together with end-users and other relevant stakeholders, develop the intervention is increasingly encouraged. However, few studies have evaluated the effects of co-created interventions, and participants' experience of the co-creation process. This is one of the first studies evaluating stakeholder perceptions of co-creating an occupational health intervention. We applied a thematic analysis, with data from 12 semi-structured interviews with stakeholders involved in the co-creation. Our results show that the respondents, in general, were satisfied with engaging in the co-creation, and they reported an increased awareness regarding risk factors of stress and how these should be handled. Additionally, the respondents described trust in the intervention activities and a good fit into the context. The study indicates that co-creating occupational health interventions can enhance the implementation and the contextual fit.

Short Title: Effects of a co-created occupational health intervention on stress and psychosocial working conditions within the construction industry: A controlled trial

DOI: 10.3389/fpubh.2022.973890

Article Number: 973890

Accession Number: WOS:000865023800001

Abstract: Background Work-related stress problems, i.e., burnout, depression, and anxiety, is a rising global health challenge. Poor mental health also appears to be a challenge for the construction industry, even though the occupational health focus has traditionally been on the physical work environment and musculoskeletal disorders. Yet, studies targeting the organisational level (i.e., work environment, policy) to enhance mental health within the construction industry are scant. Therefore, our first objective was to evaluate the effectiveness of a co-created occupational health intervention on stress and psychosocial working conditions within the construction industry in Sweden. The second objective was to evaluate whether the intervention was implemented as intended, i.e., implementation fidelity. The trial is registered in the ISRCTN clinical trial registry (ISRCTN16548039,). Methods This is a controlled trial with one intervention and one matched control group. We co-created the program logic with stakeholders from the intervention group. The essence of the chosen intervention components, duties clarification, and structured roundmaking was enhanced planning and role clarification. We assessed adherence to the intervention and dose delivered (i.e., fidelity). We collected data on the outcomes (role clarity, team effectiveness, planning, staffing, quantitative demands, and the psychosocial safety climate) with online questionnaires at baseline, 12, and 24 months. Marginal means models adjusting for missing data patterns were applied to estimate potential differences in outcomes between groups over time. Results Fidelity was considered reasonably high. Yet, we found no intervention effects on the primary outcome stress. All outcomes, except role clarity deteriorated during the trial in the intervention and control group. However, the results indicate a

positive effect of the intervention components on professionals' role clarity. The pandemic appears to have negatively affected stress and psychosocial working conditions. Conclusion The study's results suggest that co-creating occupational health interventions could be one solution for improved implementation fidelity. More studies are needed to evaluate these intervention components. Also, we recommend researchers of future intervention studies consider using missing not at random, sensitivity analysis.

Title: Full title: the effects of health literacy on disease control in adolescents with asthma

Journal: Journal of Asthma

Date: 2022 Dec

Short Title: Full title: the effects of health literacy on disease control in adolescents with asthma

ISSN: 0277-0903

DOI: 10.1080/02770903.2022.2160344

Accession Number: WOS:000904985600001

Abstract: Objective: Increased health literacy (HL) improves the management of chronic diseases. Data on the HL levels of adolescents with asthma are limited. In this study, we aimed to investigate the HL levels of adolescents with asthma and the effect of HL levels on asthma control. Methods: Our research included 81 adolescents with asthma and 47 age and sex-matched controls. The validated version of the European Health Literacy Survey Questionnaire (HLS-EU-Q16) was utilized to estimate the participants' health literacy levels. In addition, the Asthma Control Test (ACT) was used to determine the degree of asthma control. Results: No significant difference between the asthmatic adolescents (n = 45, 55.6%) and the control group (n = 28, 59.6%) has been established in terms of the number of participants who were considered to have adequate HL (p = 0.658). The difference between the patient and control groups in health care, disease prevention, health promotion, and overall HL scores was determined non-significant. According to the ACT scores, the overall median HL score was significantly higher in patients with controlled asthma {34.4 (14.6:50)} than in those with uncontrolled asthma {32.3 (16.7:48.9)} (p = 0.037). It was determined that there was a difference in the distribution of controlled asthma, uncontrolled asthma, and controls in HL subgroups (poor, problematic-limited, sufficient, and perfect HL) (p =

0.002). Conclusion: The level of HL is associated with asthma control. A significant proportion of asthmatic adolescents who participated in our research displayed low HL scores. Further studies should be conducted to increase the HL levels of adolescents to achieve better asthma control.

Abstract: Aims and Objectives. To explore nurses' views of the barriers and facilitators to the use of a newly devised patient-centred pressure ulcer prevention care bundle. Background. Given pressure ulcer prevention strategies are not implemented consistently, the use of a pressure ulcer care bundle may improve implementation given bundles generally assist in standardising care. Design. A quality improvement project was undertaken after a pressure ulcer prevention care bundle was developed and pilot-tested. Methods. Short, conversational interviews with nurse explored their views of a patient-centred pressure ulcer care bundle. Interviews were audio-taped and transcribed. Inductive content analysis was used to analyse the transcripts. Results. A total of 20 nurses were interviewed. Five categories with corresponding subcategories emerged from the analysis. They were increasing awareness of pressure ulcer prevention, prompting pressure ulcer prevention activities, promoting active patient participation, barriers to using a pressure ulcer prevention care bundle and enabling integration of the pressure ulcer prevention care bundle into routine practice. Conclusions. Benefits of using a patient-centred pressure ulcer prevention care bundle may include prompting patients and staff to implement prevention strategies and promote active patient participation in care. The success of the care bundle relied on both patients' willingness to participate and nurses' willingness to incorporate it into their routine work.

Relevance to Clinical Practice. A patient-centred pressure ulcer prevention care bundle may facilitate more consistent implementation of pressure ulcer prevention strategies and active patient participation in care.

ISSN: 1441-3582

DOI: 10.1177/14413582231165268

Accession Number: WOS:000960781500001

Abstract: The world's current 'linear economy' business model diminishes finite resources and disregards ongoing detrimental effects being created on our planet. Society needs to do something different, and move to a circular economy for sustainability. Changing existing consumer behaviour to extend the life of currently unwanted household goods can play a beneficial role to increase circularity. Underpinned by the COM-B model of behaviour and associated Behaviour Change Wheel (BCW), this study explores householders' existing behaviour and views regarding unwanted goods, and perspectives of local government employees/contractors involved in collection of unwanted household goods, to develop recommended interventions to increase circularity. The study offers theoretical contributions as one of the first studies to apply the COM-B model and BCW within the circular economy context and identifies prioritisation/co-ordination as key issues needed in the model. Additionally, practical contributions are provided including recommendations for increased education, incentivisation and enablement (including improved infrastructure); with cost, safety, technology and politics key barriers to increasing circularity of unwanted goods by households. A crucial finding is a need for responsabilisation whereby all stakeholders must accept the specific role each needs to play in a co-ordinated effort to address the challenge of sustainability. The study provides social contribution addressing SDG Goal 12 (responsible consumption) and identifies how various stakeholders can do something different to assist increasing household participation in a circular economy - for the future of humankind and the planet.

Short Title: Beyond Individual Cognitions: Time for Intervention Science to Focus on Health Context and Audience

ISSN: 1543-3080

DOI: 10.1123/jpah.2023-0072

Accession Number: WOS:000974597600001

Abstract: Intervention science faces a hazardous paradox: on the one hand, vulnerable populations (eg, patients, people from low socioeconomic background, older adults) are those for whom adoption of healthy behaviors is most urgent; on the other hand, behavior change models are less predictive, and interventions less successful, in these populations. This commentary presents 4 reasons that may explain this issue: (1) research mostly focuses on what causes behavior and how to change it, at the expense of investigating among whom and under what conditions models are valid; (2) models put an undue emphasis on individual cognitions; (3) most studies are not conducted on vulnerable populations; and (4) most researchers are from high-income countries. Several avenues are proposed to address this issue: (1) providing a central place to the context and audience in health behavior change modelization, through collaborations with researchers from other disciplines and countries, and with members of the targeted audience; (2) better reporting samples' sociodemographic characteristics and increasing samples' diversity; and (3) using more rigorous and innovative designs (eg, powered randomized controlled trials, N-of-1 trials, intensive longitudinal studies). In conclusion, it becomes urgent to change the way we do research: the social utility and credibility of intervention science depend on it.

Title: Psychosocial interventions for supporting women to stop smoking in pregnancy

Journal: Cochrane Database of Systematic Reviews

Issue: 2

Short Title: Psychosocial interventions for supporting women to stop smoking in pregnancy

ISSN: 1469-493X

DOI: 10.1002/14651858.CD001055.pub5

Article Number: Cd001055

Accession Number: WOS:000396096600002

Abstract: Background Tobacco smoking remains one of the few preventable factors associated with complications in pregnancy, and has serious long-term implications for women and babies. Smoking in pregnancy is decreasing in high-income countries, but is strongly associated with poverty and is increasing in low-to middle-income countries. Objectives To assess the effects of smoking cessation interventions during pregnancy on smoking behaviour and perinatal health outcomes. Search methods In this sixth update, we searched the Cochrane Pregnancy and Childbirth Group's Trials Register (13 November 2015), checked reference lists of retrieved studies and contacted trial authors. Selection criteria Randomised controlled trials, cluster-randomised trials, and quasi-randomised controlled trials of psychosocial smoking cessation interventions during pregnancy. Data collection and analysis Two review authors independently assessed trials for inclusion and trial quality, and extracted data. Direct comparisons were conducted in RevMan, with meta-regression conducted in STATA 14. Main results The overall quality of evidence was moderate to high, with reductions in confidence due to imprecision and heterogeneity for some outcomes. One hundred and two trials with 120 intervention arms (studies) were included, with 88 trials (involving over 28,000 women) providing data on smoking abstinence in late pregnancy. Interventions were categorised as counselling, health education, feedback, incentives, social support, exercise and dissemination. In separate comparisons, there is high-quality evidence that counselling increased smoking cessation in late pregnancy compared with usual care (30 studies; average risk ratio (RR) 1.44, 95% confidence interval (CI) 1.19 to 1.73) and less intensive interventions (18 studies; average RR 1.25, 95% CI 1.07 to 1.47). There was uncertainty whether counselling increased the chance of smoking cessation when provided as one component of a broader maternal health intervention or comparing one type of counselling with another. In studies comparing counselling and usual care (largest comparison), it was unclear whether interventions prevented smoking relapse among women who had stopped smoking spontaneously in early pregnancy. However, a clear effect was seen in smoking abstinence at zero to five months postpartum (11 studies; average RR 1.59, 95% CI 1.26 to 2.01) and 12 to 17 months (two studies, average RR 2.20, 95% CI 1.23 to 3.96), with a borderline effect at six to 11 months (six studies; average RR 1.33, 95% CI 1.00 to 1.77). In other comparisons, the effect was unclear for most secondary outcomes, but sample sizes were small. Evidence suggests a borderline effect of health education compared with usual

care (five studies; average RR 1.59, 95% CI 0.99 to 2.55), but the quality was downgraded to moderate as the effect was unclear when compared with less intensive interventions (four studies; average RR 1.20, 95% CI 0.85 to 1.70), alternative interventions (one study; RR 1.88, 95% CI 0.19 to 18.60), or when smoking cessation health education was provided as one component of a broader maternal health intervention. There was evidence feedback increased smoking cessation when compared with usual care and provided in conjunction with other strategies, such as counselling (average RR 4.39, 95% CI 1.89 to 10.21), but the confidence in the quality of evidence was downgraded to moderate as this was based on only two studies and the effect was uncertain when feedback was compared to less intensive interventions (three studies; average RR 1.29, 95% CI 0.75 to 2.20). High-quality evidence suggests incentive-based interventions are effective when compared with an alternative (non-contingent incentive) intervention (four studies; RR 2.36, 95% CI 1.36 to 4.09). However pooled effects were not calculable for comparisons with usual care or less intensive interventions (substantial heterogeneity, $I^2 = 93\%$). High-quality evidence suggests the effect is unclear in social support interventions provided by peers (six studies; average RR 1.42, 95% CI 0.98 to 2.07), in a single trial of support provided by partners, or when social support for smoking cessation was provided as part of a broader intervention to improve maternal health. The effect was unclear in single interventions of exercise compared to usual care (RR 1.20, 95% CI 0.72 to 2.01) and dissemination of counselling (RR 1.63, 95% CI 0.62 to 4.32). Importantly, high-quality evidence from pooled results demonstrated that women who received psychosocial interventions had a 17% reduction in infants born with low birthweight, a significantly higher mean birthweight (mean difference (MD) 55.60 g, 95% CI 29.82 to 81.38 g higher) and a 22% reduction in neonatal intensive care admissions. However the difference in preterm births and stillbirths was unclear. There did not appear to be adverse psychological effects from the interventions. The intensity of support women received in both the intervention and comparison groups has increased over time, with higher intensity interventions more likely to have higher-intensity comparisons, potentially explaining why no clear differences were seen with increasing intervention intensity in meta-regression analyses. Among meta-regression analyses: studies classified as having 'unclear' implementation and unequal baseline characteristics were less effective than other studies. There was no clear difference between trials implemented by researchers (efficacy studies), and those implemented by routine pregnancy staff (effectiveness studies), however there was uncertainty in the effectiveness of counselling in four dissemination trials where the focus on the intervention was at an organisational level. The pooled effects were similar in interventions provided for women classified as having predominantly low socioeconomic status, compared to other women. The effect was significant in interventions among women from ethnic minority groups; however not among indigenous women. There were similar effect sizes in trials with biochemically validated smoking abstinence and those with self-reported abstinence. It was unclear whether incorporating use of self-help manuals or telephone support increased the effectiveness of interventions. Authors'

conclusions Psychosocial interventions to support women to stop smoking in pregnancy can increase the proportion of women who stop smoking in late pregnancy and the proportion of infants born low birthweight. Counselling, feedback and incentives appear to be effective, however the characteristics and context of the interventions should be carefully considered. The effect of health education and social support is less clear. New trials have been published during the preparation of this review and will be included in the next update.

Accession Number: WOS:000620757200001

Abstract: Background: Fifty percent of antibiotic courses in long-term care facilities (LTCFs) are unnecessary, leading to increased risk of harm. Most studies to improve antibiotic prescribing in LTCFs showed modest and unsustainable results. We aimed to identify facilitators, barriers and strategies in implementing a urinary tract infection (UTI)-focused antimicrobial stewardship (AS) intervention at a LTCF, with the secondary objective of exploring the pharmacist's potential roles. Methods: The study used a qualitative descriptive design. Participants attended either a focus group or one-on-one interview. Data were analyzed inductively using a codebook modified in an iterative analytic process. Barrier and facilitator themes were mapped using the capability, opportunity, motivation and behaviour (COM-B) model. Similarly, themes were identified from the transcripts regarding the pharmacist's roles.

Results: Sixteen participants were interviewed. Most barriers and facilitators mapped to the opportunities domain of the COM-B model. The main barrier themes were lack of access, lack of knowledge, ineffective communication, lack of resources and external factors, while the main facilitator themes were education, effective collaboration, good communication, sufficient resources and access. For the pharmacist's role, the barrier themes were ineffective collaboration and communication. Conclusion: This study supports the importance of tailoring interventions to target factors underlying barriers to behaviour change. At this LTCF, an effective antimicrobial stewardship intervention should incorporate strategies to improve access, knowledge, communication and collaboration in its design, having sufficient resources and addressing external factors to optimize its success and long-term sustainability.

Accession Number: WOS:000355340700001

Abstract: The enormous time lag between the discovery of new knowledge and its implementation poses a significant challenge to improving public health because of the very slow uptake into policy and practice. The field of dissemination and implementation research in behavioral medicine is receiving increased attention because of the keen interest in accelerating knowledge transfer from relevant research to improve the health and wellbeing of populations in many different settings, contexts, and countries around the world. This is particularly important in high-risk populations, resource-poor and developing regions of the world where the difference in health systems, languages, and cultures very significantly influences the translation of evidence into policy and practice. Moreover, demonstrating the broader societal and economic value of behavioral interventions in settings where they are implemented can further

support the sustainability, uptake, and implementation of these findings in other settings and contexts. This special issue presents a series of empirical studies, reviews, and case studies that address dissemination, implementation, and translation issues in both developed and developing countries. Specifically, the learnings from the application of many and varied theories and research methodologies are very relevant for bridging the current division between research findings and their translation and uptake into policy and practice.

Abstract: Background: Individuals recovering from acute exacerbation of chronic obstructive pulmonary disease (AECOPD) are most likely to exhibit sedentary behaviour (SB) and low levels of physical activity (PA). This study seeks to explore their choices for adopting current patterns of SB and PA post AECOPD and add to current literature on stable COPD. Method: A semi-structured interview, based on the broad framework of the Behaviour Change Wheel, was conducted on patients post AECOPD. A phenomenological approach was utilised inductively. Results: Six participants were interviewed at their homes. Four major themes were identified: (1) low perceived capabilities for engaging in PA; (2) limited understanding on COPD and PA; (3) lack of translation of health knowledge and intentions into actions; and (4) poor adherence to movement-advice from physiotherapist. Conclusion: Our findings revealed largely psychological and behavioural deficits influencing SB and PA in people post AECOPD, similar to those in stable COPD.

ISSN: 2168-6106

DOI: 10.1001/jamainternmed.2021.1000

Accession Number: WOS:000640666100003

Abstract: IMPORTANCE For critically ill patients with advanced medical illnesses and poor prognoses, overuse of invasive intensive care unit (ICU) treatments may prolong suffering without benefit. OBJECTIVE To examine whether use of time-limited trials (TLTs) as the default care-planning approach for critically ill patients with advanced medical illnesses was associated with decreased duration and intensity of nonbeneficial ICU care. DESIGN, SETTING, AND PARTICIPANTS This prospective quality improvement study was conducted from June 1, 2017, to December 31, 2019, at the medical ICUs of 3 academic public hospitals in California. Patients at risk for nonbeneficial ICU treatments due to advanced medical illnesses were identified using categories from the Society of Critical Care Medicine guidelines for admission and triage. INTERVENTIONS Clinicians were trained to use TLTs as the default communication and care-planning approach in meetings with family and surrogate decision makers. MAIN OUTCOMES AND MEASURES Quality of family meetings (process measure) and ICU length of stay (clinical outcome measure). RESULTS A total of 209 patients were included (mean [SD] age, 63.6 [16.3] years; 127 men [60.8%]; 101 Hispanic patients [48.3%]), with 113 patients (54.1%) in the preintervention period and 96 patients (45.9%) in the postintervention period. Formal family meetings increased from 68 of 113 (60.2%) to 92 of 96 (95.8%) patients between the preintervention and postintervention periods ($P < .01$). Key components of family meetings, such as discussions of risks and benefits of ICU treatments (preintervention, 15 [34.9%] vs postintervention, 56 [94.9%]; $P < .01$), eliciting values and preferences of patients (20 [46.5%] vs 58 [98.3%]; $P < .01$), and identifying clinical markers of improvement (9 [20.9%] vs 52 [88.1%]; $P < .01$), were discussed more frequently after intervention. Median ICU length of stay was significantly reduced

between preintervention and postintervention periods (8.7 [interquartile range (IQR), 5.7–18.3] days vs 7.4 [IQR, 5.2–11.5] days; $P = .02$). Hospital mortality was similar between the preintervention and postintervention periods (66 of 113 [58.4%] vs 56 of 96 [58.3%], respectively; $P = .99$). Invasive ICU procedures were used less frequently in the postintervention period (eg, mechanical ventilation preintervention, 97 [85.8%] vs postintervention, 70 [72.9%]; $P = .02$). CONCLUSIONS AND RELEVANCE In this study, a quality improvement intervention that trained physicians to communicate and plan ICU care with family members of critically ill patients in the ICU using TLTs was associated with improved quality of family meetings and a reduced intensity and duration of ICU treatments. This study highlights a patient-centered approach for treating critically ill patients that may reduce nonbeneficial ICU care.

DOI: 10.1016/j.acap.2022.05.014

Accession Number: WOS:000889963700020

Abstract: OBJECTIVE: This study identified developmental patterns of handwashing habit formation during childhood and examined their associations with later COVID-19 preventive practices. METHODS: We used data from the Taiwan Birth Cohort Study, which included 11,254 adolescents with complete data on childhood handwashing behavior and age-15 COVID-19 survey items. Bias-adjusted 3-step latent class analysis was used to test study hypotheses. RESULTS: The rates of handwashing and mask-wearing during the pandemic were 63.8% and 93.8%, respectively. Five distinct patterns of handwashing habit formation were identified: early formation (14.89%), delayed formation (17.73%), gradual formation (42.98%), inconsistent formation (9.78%), and nonformation (14.62%). Compared with adolescents with an early formation pattern of handwashing habits, those with other patterns exhibited lower odds ratios (ORs) of handwashing during COVID-19; these ORs were 0.67 (95% confidence interval [CI], 0.49-0.85), 0.60 (95% CI, 0.44-0.77), 0.29 (95% CI, 0.08-0.49), and 0.21 (95% CI, 0.01-0.40) for those with delayed formation, gradual formation, inconsistent formation, and nonformation patterns, respectively. Moreover, relative to that of adolescents with the early formation pattern, mask-wearing was less common among adolescents with gradual formation, inconsistent formation, and nonformation patterns, with ORs of 0.54 (95% CI, 0.16-0.92), 0.50 (95% CI, 0.03-0.96), and 0.26 (95% CI, 0.00-0.65), respectively. CONCLUSIONS: The early formation of hygienic habits is associated with higher adherence to pandemic preventive practices among adolescents. Our findings suggest that interventions to promote hygienic behaviors can start as early as age 3 through the introduction of healthy habits such as handwashing.

Short Title: Effectiveness of an App-Based Mobile Intervention for Precision Oral Self-Care in Patients with Periodontitis from Initial Therapy to Re-Evaluation

DOI: 10.3390/app11094229

Article Number: 4229

Accession Number: WOS:000649871900001

Abstract: Good oral hygiene is essential to oral health and oral disease prevention. Strengthening the adherence of patients with periodontitis to oral hygiene behaviors (OHBs) is crucial for the success of periodontal treatment. This study aims to investigate the intervention effectiveness of a novel mobile app for precision oral self-care, which was developed to help patients with periodontitis improving their oral hygiene through daily oral self-care. One-hundred and fifty eligible patients were recruited into this study and randomly allocated to the control (n = 75) or intervention group (n = 75), and their oral hygiene status (OHS) and OHBs were recorded at baseline and re-evaluation. The participants in the intervention group were required to perform daily oral self-care using our oral self-care app (OSCA) and the functional preferences and overall likeability of the OSCA were evaluated through a questionnaire survey. In total, 39 patients from the control group and 49 from the intervention group completed clinical examinations at baseline and re-evaluation. The results demonstrated that there was no significant difference in OHS improvement between the two groups. However, OHS improvement significantly differed between low-, moderate-, and high-frequency users, with frequency of use being positively correlated to the likeability of the app. Further investigation of the effectiveness of the OSCA intervention revealed that behavioral change in oral hygiene, frequency of OSCA use, and smoking affected OHS improvement. These outcomes indicate that our app-based mobile intervention may be of value for precision oral self-care in patients with periodontitis.

Article Number: 925905

Accession Number: WOS:000813974700001

Abstract: COVID-19 began to spread worldwide in early 2020. Various governments have taken measures such as isolation, travel bans, and evacuation, mandating people to wear masks and go out less, in an attempt to prevent the spread of the virus. Governments also

restrict human contact service industries, including beauty and hair salons. When the pandemic was very serious, consumers had great doubts about going for hairdressing so the beauty industry was greatly affected. This study designed and developed an app platform that considers the COVID-19 and is used for the psychological role of consumer safety. The methodology of this research is a qualitative study. Based on the Capability, Opportunity, Motivation, Behavior (COM-B) model, and presenting the context of capabilities, opportunities, and motives of the theoretical framework, this study investigates the factors that identify the demand for the development of the platform for the beauty industry app matching mechanism. Four groups of people including consumers, beauty technicians, store managers, and application development engineers all conduct interviews based on their ability, opportunity, and motivation after experiencing the using application of OpenBeautiful. The results found that all groups of people already had the knowledge and ability to avoid infection in a pandemic, so it was possible to establish the need and feasibility of using the app platform. The use of the beauty industry app platform can bring new consumption patterns and career opportunities, and can trigger more business behavior activities. Therefore, this study starts from the COM-B model, and then explores the user needs of the platform according to the COM-B model framework, and proposes the mechanism and platform of app matching. Finally, based on the conclusion of the study, we propose practices and suggestions for the future operation of the app matching platform.

Abstract: Background Melioidosis causes more than 1,000 deaths in Thailand each year. Infection occurs via inoculation, ingestion or inhalation of the causative organism (*Burkholderia pseudomallei*) present in soil and water. Here, we evaluated public awareness of melioidosis using a combination of population-based questionnaire, a public engagement campaign to obtain video clips made by the public,

and viewpoints on these video clips as potential educational tools about the disease and its prevention. Methods A questionnaire was developed to evaluate public awareness of melioidosis, and knowledge about its prevention. From 1 March to 31 April 2012, the questionnaire was delivered to five randomly selected adults in each of 928 districts in Thailand. A video clip contest entitled "Melioidosis, an infectious disease that Thais must know" was run between May and October 2012. The best 12 video clips judged by a contest committee were shown to 71 people at risk from melioidosis (diabetics). Focus group interviews were used to evaluate their perceptions of the video clips. Results Of 4,203 Thais who completed our study questionnaire, 74% had never heard of melioidosis, and 19% had heard of the disease but had no further knowledge. Most participants in all focus group sessions felt that video clips were beneficial and could positively influence them to increase adherence to recommended preventive behaviours, including drinking boiled water and wearing protective gear if in contact with soil or environmental water. Participants suggested that video clips should be presented in the local dialect with simple words rather than medical terms, in a serious manner, with a doctor as the one presenting the facts, and having detailed pictures of each recommended prevention method. Conclusions In summary, public awareness of melioidosis in Thailand is very low, and video clips could serve as a useful medium to educate people and promote disease prevention.

Title: The challenge of exercise (non-)adherence: a scoping review of methods and techniques applied to improve adherence to physical activity and exercise in people with inflammatory arthritis

Journal: Rheumatology Advances in Practice

Volume: 7

Issue: 1

Date: Dec

Short Title: The challenge of exercise (non-)adherence: a scoping review of methods and techniques applied to improve adherence to physical activity and exercise in people with inflammatory arthritis

DOI: 10.1093/rap/rkac096

Article Number: rkac096

Accession Number: WOS:000922124700005

Abstract: Lay Summary What does this mean for patients? People with inflammatory arthritis can benefit from physical activity and

exercise, but many do not stick to (adhere to) recommendations and carry out enough to see any benefit. We aimed to review previous research to look for ways to improve this. Four English language scientific databases were searched, and articles were included if they assessed whether people with inflammatory arthritis adhered to physical activity and/or exercise intervention(s). Eighteen studies were included, but adherence was normally assessed only as a less important, secondary outcome. Most studies did not measure adherence properly or use any theory to help promote it. We found that adherence to physical activity and exercise interventions was rarely the focus of research, despite its importance to maintaining health in people with inflammatory arthritis. These results suggest that there is considerable room for improvement, and more high-quality research is needed to understand how to improve adherence and develop successful interventions for people with inflammatory arthritis.

Objectives The aims were to explore the nature of methods/techniques applied to improve adherence to physical activity (PA) and exercise in people with inflammatory arthritis and to identify whether studies were theory based and/or used behaviour change techniques (BCTs).

Methods Searches were undertaken of English language articles within four databases: Embase, Medline, PsycINFO and Cochrane. Articles were included if they assessed adherence to a PA and/or exercise intervention. A narrative synthesis of the findings is reported.

Results Of 1909 studies screened, 18 studies met inclusion criteria. Adherence was most frequently included as a secondary outcome. Reporting of adherence measures was poor, in that 13 studies did not use a validated measure of adherence, with only three validated measures being identified. The majority of studies were not theory driven (n = 13), although the health belief model was the most used theoretical framework (n = 5). Only two studies mentioned both theory and BCTs. Four studies reported components that were mapped onto BCTs, with goal setting being the most prevalent.

Conclusion This scoping review found that adherence to PA and/or exercise interventions was rarely the focus of research, despite its importance in maintaining health in people with inflammatory arthritis. Where research has been conducted in this area, serious shortcomings were revealed, in that psychological theory, evidence-based BCTs derived from theory and valid adherence measures were not used to inform intervention design and target adherence, meaning that interventions were suboptimal. These results suggest that there is considerable room for improvement and that more high-quality research is required to investigate determinants of adherence and develop impactful interventions.

Short Title: When individual action requires collective approval: a roadmap for solar power adoption by strata property owners

ISSN: 2042-6763

DOI: 10.1108/jsocm-04-2022-0076

Accession Number: WOS:000879402600001

Abstract: Purpose This paper aims to examine a situation in which individual action requires collective approval – solar power adoption in strata properties – and offers a motivation-opportunity-ability theory-based model with which such a situation may be approached. Design/methodology/approach A Delphi methodology was undertaken for this study, with three iterative questionnaires administered online to a panel of strata property, renewable energy and sustainable housing experts. Findings The Delphi panel's insights have informed a new conceptual model, the Strata Solar Champion Roadmap (SSCR), outlining the variables affecting strata-based solar power adoption. Research limitations/implications Researchers and practitioners are encouraged to test and enhance the model's generalisability. Further case studies or quantitative analysis measuring the strength of the relationships identified in the SSCR model is particularly necessary. The SSCR could also be applied when examining other common strata governance disputes. Practical implications Policymakers and social marketers are encouraged to apply the SSCR when planning interventions to facilitate strata scheme solar power adoption. Furthermore, the SSCR offers guidance to strata property owners and strata schemes seeking to adopt solar power, thus increasing renewable energy use in a major sector of the Australian energy market. Originality/value Within this context, the SSCR's conceptualisation of strata-based solar PV adoption provides new insights into individual behaviour change requiring collective approval.

DOI: 10.1136/bmjopen-2020-044114

Article Number: e044114

Accession Number: WOS:000632921900036

Abstract: Objectives A compulsory hip check is performed on an infant at 6–8 weeks in primary care for the detection of developmental dysplasia of the hip (DDH). Missed diagnoses and infants incorrectly labelled with DDH remain an important problem. The nature of physician behaviour as a likely source of this problem has not been explored. The aims of this study were to make a behavioural diagnosis of general practitioners (GPs) who perform these hip checks, and identify potential behavioural change techniques that could make the hip checks more effective. Design Qualitative study with in-depth semistructured interviews of 6–8 weeks checks. We used the Capability, Opportunity, Motivation and Behaviour model in making a behavioural diagnosis and elicited factors that can be linked to improving the assessment. Setting Primary care. Participants 17 GPs (15 female) who had between 5 and 34 years of work experience were interviewed. Results Capability related to knowledge of evidence-based criteria and skill to identify DDH were important behavioural factors. Both physical (clinic time and space) and social (practice norms), opportunity were essential for optimal behaviour. Furthermore, motivation related to the importance of the 6–8 weeks check and confidence to perform the check and refer appropriately were identified in the behavioural diagnosis. Conclusion Aspects of capability, opportunity and motivation affect GPs' diagnosis and referral behaviours in relation to DDH. The findings from this work extend current knowledge and will inform the development of an intervention aimed at improving the diagnosis of DDH.

Short Title: Outcome evaluation of Active Herts: A community-based physical activity programme for inactive adults at risk of cardiovascular disease and/or low mental wellbeing

DOI: 10.3389/fpubh.2022.903109

Article Number: 903109

Accession Number: WOS:000861750200001

Abstract: Background: A high proportion of UK adults are inactive, which can lead to a range of physical and mental health concerns. Active Herts is a community-based physical activity programme for inactive adults at risk of cardiovascular disease and/or low mental wellbeing. This paper provides a pragmatic evaluation of this programme. Method: This longitudinal study observed 717 adults (68% female, mean age = 56.9 years) from the "Active Herts " programme. Programme users were provided with a 45-min consultation with a "Get Active Specialist, " who talked them through an Active Herts self-help booklet and then signposted them to free or subsidized local exercise sessions. Programme users were followed up with a booster call 2 weeks later. The Get Active Specialist was a registered exercise professional (REPS Level 3), with additional training from the study team in motivational interviewing, health coaching, COM-B behavioral diagnosis and delivery of behavior change techniques (BCTs) in practice. The Active Herts booklet contained theoretically-driven and evidence-based BCTs to translate behavioral science into public health practice. Physical activity (Metabolic Equivalent Time [METs], measured using the International Physical Activity Questionnaire (IPAQ), perceived health (EQ-5D-5L) and mental wellbeing (Warwick-Edinburgh Mental Wellbeing Scale: WEMWBS) were measured at baseline, 3, 6 and 12 months. Results: At the end of the 12-month programme, users showed sustained improvements in physical activity (by +1331 METS), exceeding weekly recommendations. Sitting (reducing by over an hour per day), sporting participation, and perceptions of health were also improved, with improvements in mental wellbeing in the first 3 months. Conclusion: Designing and delivering a community-based physical activity programme that is theoretically-driven and evidence-based with frequent behavior change training and supervision can yield a significant increase in self-reported physical activity, reduction in sitting behavior and improvements to perceived health and mental wellbeing. Future research should extend this approach, utilizing a real-world, pragmatic evaluation.

autoimmune inflammatory rheumatic diseases in coventry: Signs of progress but challenges remain

ISSN: 1478-2189

DOI: 10.1002/msc.1712

Accession Number: WOS:000881704200001

Abstract: Objective: The study investigated adherence with MMF treatment among patients attending rheumatology clinics at University Hospitals Coventry and Warwickshire NHS Trust (UHCW) with Autoimmune inflammatory rheumatic diseases (AIIRDs). Methods: This retrospective study collated hospital pharmacy data in patients who requested the prescription for MMF between January 2015 and December 2018. Clinical data were obtained from paper and electronic notes. Data were analysed using Microsoft Excel. Ethical approval was obtained through Coventry University. Results: We recruited 144 patients into this study with age range from 18 to 91 years, including 100 females and 44 males. There were 112 White patients, 22 of South Asian origin, 3 East Asian and 4 black patients. SLE (56), scleroderma (18), mixed connective tissue disease (15), myositis (13), vasculitis (13) were the commonest diagnoses. Overall adherence with Mycophenolate mofetil was 62%. The adherence rates were below 80% for all age groups with similar to 60% of patients having adherence levels of >60%. Poor adherence with MMF correlated with 3-fold increase in risk of flares compared to good adherence ($p = 0.002$). We also found a significant difference between Asian patients (mean adherence 47%) and White patients (mean adherence 65%, $p < 0.001$). Conclusion: Adherence with MMF has improved considerably compared to historical studies, although these remain suboptimal. Certain population groups such as young adults, elderly and Asian patients continue to have lower adherence and higher risk of flares. Strategies are needed to improve adherence levels overall and specifically in the high-risk groups to reduce risk of flares and organ damage.

Short Title: Behavior change interventions and policies influencing primary healthcare professionals' practice—an overview of reviews

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0538-8

Article Number: 3

Accession Number: WOS:000395704600003

Abstract: Background: There is a plethora of interventions and policies aimed at changing practice habits of primary healthcare professionals, but it is unclear which are the most appropriate, sustainable, and effective. We aimed to evaluate the evidence on behavior change interventions and policies directed at healthcare professionals working in primary healthcare centers. Methods: Study design: overview of reviews. Data source: MEDLINE (Ovid), Embase (Ovid), The Cochrane Library (Wiley), CINAHL (EbscoHost), and grey literature (January 2005 to July 2015). Study selection: two reviewers independently, and in duplicate, identified systematic reviews, overviews of reviews, scoping reviews, rapid reviews, and relevant health technology reports published in full-text in the English language. Data extraction and synthesis: two reviewers extracted data pertaining to the types of reviews, study designs, number of studies, demographics of the professionals enrolled, interventions, outcomes, and authors' conclusions for the included studies. We evaluated the methodological quality of the included studies using the AMSTAR scale. For the comparative evaluation, we classified interventions according to the behavior change wheel (Michie et al.). Results: Of 2771 citations retrieved, we included 138 reviews representing 3502 individual studies. The majority of systematic reviews (91%) investigated behavior and practice changes among family physicians. Interactive and multifaceted continuous medical education programs, training with audit and feedback, and clinical decision support systems were found to be beneficial in improving knowledge, optimizing screening rate and prescriptions, enhancing patient outcomes, and reducing adverse events. Collaborative team-based policies involving primarily family physicians, nurses, and pharmacists were found to be most effective. Available evidence on environmental restructuring and modeling was found to be effective in improving collaboration and adherence to treatment guidelines. Limited evidence on nurse-led care approaches were found to be as effective as general practitioners in patient satisfaction in settings like asthma, cardiovascular, and diabetes clinics, although this needs further evaluation. Evidence does not support the use of financial incentives to family physicians, especially for long-term behavior change. Conclusions: Behavior change interventions including education, training, and enablement in the context of collaborative team-based approaches are effective to change practice of primary healthcare professionals. Environmental restructuring approaches including nurse-led care and modeling need further evaluation. Financial incentives to family physicians do not influence long-term practice change.

Short Title: Increasing Children's physical Activity by Policy (CAP) in preschools within the Stockholm region: study protocol for a pragmatic cluster-randomized controlled trial

DOI: 10.1186/s13063-022-06513-4

Article Number: 577

Accession Number: WOS:000827750400003

Abstract: Background: Systematic reviews suggest that preschool environmental/organizational changes may be effective in increasing physical activity (PA) levels of preschool children, but evidence is scarce regarding feasible, effective, and equitable interventions that can be scaled up. Specifically, it is essential to understand whether introducing a multicomponent organizational change in terms of policy in the preschool context may be beneficial for children's PA levels and concomitant health outcomes. To bridge this knowledge gap, our main aim is to examine the feasibility and effectiveness of a policy package in increasing PA levels in preschool children, using a large-scale pragmatic cluster-randomized controlled trial.

Methods: This proposed study is a pragmatic cluster-randomized controlled trial with two conditions (intervention and control with a 1:1 ratio) with preschools as clusters and the unit of randomization. We aim to recruit approximately 4000 3–5-year-old children from 90 preschools and retain more than 2800 children from 85 preschools to provide adequate statistical power for the analyses. The intervention to implement is a co-created, multicomponent policy package running for 6 months in preschools randomized to intervention. Change in accelerometer measured PA levels in children between intervention and control from pre- and post-intervention will be the primary outcome of the study, while secondary outcomes include health outcomes such as musculoskeletal fitness, psychosocial functioning, and absence due to illness in children among others. Implementation will be studied carefully using both quantitative (dose, fidelity) and qualitative (interview) methodologies. The change in primary and secondary outcomes, from pre- to post-intervention, will be analyzed with linear mixed-effect models (to allow both fixed and random effects) nested on a preschool level. Discussion: This is a large-scale co-creation project involving the City of Stockholm, childcare stakeholders, preschool staff, and the research group with the potential to influence more than 30,000 preschool children within the Stockholm area. The study will add reliable evidence for the implementation of PA policies at the organizational level of preschools and clarify its potential effect on objectively measured PA and health markers in children.

Short Title: Development of a behavior change intervention to
improve physical activity adherence in individuals with metabolic
syndrome using the behavior change wheel

DOI: 10.1186/s12889-022-14129-1

Article Number: 1740

Accession Number: WOS:000853908000004

Abstract: Background Adherence to physical activity is inadequate in
adults with metabolic syndrome. Adherence to physical activity
recommendations is crucial and can result in improved health
outcomes and reduced medical burdens. A comprehensive behavior
change intervention, including identifying determinants of adherence
to physical activity recommendations, intervention options,
intervention content and implementation options, was imperative for
enhancing physical activity adherence. The aim of the study is to
develop an intervention to increase physical activity adherence
among individuals with metabolic syndrome. Methods The study
followed the eight steps of the Behavior Change Wheel guide,
including defining the problem in behavioral terms (Step 1),
selecting target behavior (Step 2), specifying target behavior (Step
3), identifying what needs to change (Step 4), identifying
intervention functions (Step 5), identifying policy categories (Step
6), identifying behavior change techniques (Step 7), and determining
model of delivery (Step 8). The semi-structured, in-depth interviews
were employed to identify the determinants of adherence to physical
activity among twenty-eight individuals with metabolic syndrome
based on capability, opportunity, motivation and behavior model.
Next, the intervention functions and policy categories were chosen
to address these determinants. Finally, behavior change techniques
were selected to assist in the delivery of the intervention
functions and be translated into intervention content. Results Our
study identified eighteen facilitators and fifteen barriers to
physical activity adherence. It resulted in the selection of seven
intervention functions and nineteen behavior change techniques for
the intervention program. Then, the current study identified an app
as the delivery mode. Finally, a behavioral change intervention was
generated for individuals with metabolic syndrome to increase

physical activity recommendation adherence. Conclusions The Behavior Change Wheel provided a systematic approach to designing a behavior change intervention, which helped improve the health outcomes and reduce medical burdens and economic burdens among individuals with metabolic syndrome. The findings suggested that potential intervention should pay special attention to increasing knowledge in metabolic syndrome, imparting skills of physical activity, offering a supportive environment, and providing suggestions on regular physical activity using the appropriate behavior change techniques. A feasibility study will be undertaken to assess the acceptability and effectiveness of the intervention program in the future.

Short Title: Determinants of adherence to diet and exercise behaviours among individuals with metabolic syndrome based on the Capability, Opportunity, Motivation, and Behaviour model: a cross-sectional study

ISSN: 1474-5151

DOI: 10.1093/eurjcn/zvac034

Accession Number: WOS:000807118400001

Abstract: Aims Adherence to diet and exercise recommendations is crucial among metabolic syndrome (MetS) individuals. However, no studies have focused on comprehensive behavioural changes of diet and exercise among individuals with MetS. The present study aimed to explore determinants of adherence to diet and exercise behaviours among people with MetS based on the Capability, Opportunity, Motivation, and Behaviour (COM-B) model. Methods and results A cross-sectional study was conducted in a health promotion centre of a large and general university hospital in Zhejiang Province, China, in 2021. A total of 241 individuals with MetS completed all scales. The mediation model was tested using structural equation modelling with bootstrapped samples. In the regression-based path analysis, MetS knowledge ($\beta = 0.140$), socioeconomic status ($\beta = 0.162$), and social support ($\beta = 0.143$) directly positively influenced

diet behaviour. In addition, social support indirectly positively influenced exercise behaviour through coping and adaptation ($\beta = 0.090$). The final theoretical model showed a good fit (root mean square error of approximation = 0.057, comparative fit index = 0.946). Conclusion Factors associated with diet behaviour were knowledge of MetS, socioeconomic status, and social support. Adaptation may be a mediator between social support and exercise behaviour. Intervention programmes targeting increased adherence to diet and exercise could include these factors for individuals with MetS. [GRAPHICS] .

Short Title: The use of smartphone health apps and other mobile health (mHealth) technologies in dietetic practice: a three country study

ISSN: 0952-3871

DOI: 10.1111/jhn.12446

Accession Number: WOS:000405385800004

Abstract: Background: Smartphone health applications (apps) and other mobile health (mHealth) technologies may assist dietitians in improving the efficiency of patient care. The present study investigated the use of health apps and text messaging in dietetic practice and formulated intervention recommendations for supporting app uptake by dietitians based on the behavioural COM-B' system, where interactions between capability, opportunity and motivation influence behaviour. Methods: A 52-item online survey tool, taking 20min to complete, was developed and piloted, with questions exploring the use of health apps and text messaging in dietetic practice, types of apps dietitians recommended and that patients used, and barriers and enablers to app use in dietetic practice. The Australian, New Zealand and British dietetic associations distributed the survey to their members. Results: A 5% response rate was achieved internationally, with 570 completed responses included for further analysis. Health apps, namely nutrition apps, were used by 62% of dietitians in their practice, primarily as an information

resource (74%) and for patient self-monitoring (60%). The top two nutrition apps recommended were MyFitnessPal((R)) (62%) and the Monash University Low FODMAP Diet((R)) (44%). Text messaging was used by 51% of respondents, mainly for appointment-related purposes (84%). Conclusions: Although the reported use of smartphone health apps in dietetic practice is high, health apps and other mHealth technologies are not currently being used for behaviour change, nor are they an integral part of the nutrition care process. Dietetic associations should provide training, education and advocacy to enable the profession to more effectively engage with and implement apps into their practice.

Title: Clinician Attitudes and Beliefs About Deintensifying Head and Neck Cancer Surveillance

Journal: Jama Otolaryngology-Head & Neck Surgery

Volume: 148

Issue: 1

Pages: 43-51

Date: Jan

Short Title: Clinician Attitudes and Beliefs About Deintensifying Head and Neck Cancer Surveillance

ISSN: 2168-6181

DOI: 10.1001/jamaoto.2021.2824

Accession Number: WOS:000714699800006

Abstract: IMPORTANCE Surveillance imaging and visits are costly and have not been shown to improve oncologic outcomes for patients with head and neck cancer (HNC). However, the benefit of surveillance visits may extend beyond recurrence detection. To better understand surveillance and potentially develop protocols to tailor current surveillance paradigms, it is important to elicit the perspectives of the clinicians who care for patients with HNC. OBJECTIVE To characterize current surveillance practices and explore clinician attitudes and beliefs on deintensifying surveillance for patients with HNC. DESIGN, SETTING, AND PARTICIPANTS This qualitative study was performed from January to March 2021. Guided by an interpretive description approach, interviews were analyzed to produce a thematic description. Data analysis was performed from March to April 2021. Otolaryngologists and radiation oncologists were recruited using purposive and snowball sampling strategies. MAIN OUTCOMES AND MEASURES The main outcomes were current practice, attitudes, and beliefs about deintensifying surveillance and survivorship as well as patients' values and perspectives collected from interviews of

participating physicians. RESULTS Twenty-one physicians (17 [81%] men) were interviewed, including 13 otolaryngologists and 8 radiation oncologists with a median of 8 years (IQR, 5–20 years) in practice. Twelve participants (57%) stated their practice comprised more than 75% of patients with HNC. Participants expressed that there was substantial variation in the interpretation of the surveillance guidelines. Participants were open to the potential for deintensification of surveillance or incorporating symptom-based surveillance protocols but had concerns that deintensification may increase patient anxiety and shift some of the burden of recurrence monitoring to patients. Patient and physician peace of mind, the importance of maintaining the patient–physician relationship, and the need for adequate survivorship and management of treatment-associated toxic effects were reported to be important barriers to deintensifying surveillance. CONCLUSIONS AND RELEVANCE In this qualitative study, clinicians revealed a willingness to consider altering cancer surveillance but expressed a need to maintain patient and clinician peace of mind, maintain the patient–clinician relationship, and ensure adequate monitoring of treatment-associated toxic effects and other survivorship concerns. These findings may be useful in future research on the management of posttreatment surveillance.

Title: Identification of factors influencing core competence promotion among professional nurses and midwives: A qualitative study using the COM-B model

Journal: Nurse Education in Practice

Volume: 69

Date: May

Short Title: Identification of factors influencing core competence promotion among professional nurses and midwives: A qualitative study using the COM-B model

ISSN: 1471-5953

DOI: 10.1016/j.nepr.2023.103619

Article Number: 103619

Accession Number: WOS:000966302700001

Abstract: Aim: To identify factors influencing a behaviour of improving core competencies among nurses and midwives in the Maternity and Child Health Care Hospital using the capability, opportunity, motivation and behaviour (COMB) model. Background: With the increasing number of women with pregnancy complications and the

COVID-19 pandemic, nurses and midwives are being challenged and enhancing their core competencies is imperative to ensure highquality care. To develop effective intervention strategies, it is essential to systematically explore what influences nurses and midwives to improve their core competencies. To this end, this study applied the COM-B model of behavioural change. Design: Qualitative study using the COM-B model. Methods: This qualitative descriptive study was conducted in 2022 using face-to-face interviews, including 49 nurses and midwives. Topic guides for the interviews were developed based on the COM-B model. Transcribed verbatim interviews were analysed using deductive thematic analysis. Results: The COM-B model captures several factors. Capability factors included clinical knowledge and selfdirected learning abilities. Opportunity factors included professional education covering necessary clinical skills, adequate clinical practice, personalised training, available time, insufficient clinical learning resources, absence of scientific research resources and support from leadership. Motivational factors were access to longterm work, incentive policies based on individuals' work values and responses to upward social comparison. Conclusions: The findings of this study suggested that prior to developing intervention strategies to enhance the core competencies of nurses and midwives, processing barriers to nurses' and midwives' capabilities, opportunities and motivation can facilitate the implementation of interventions.

Article Number: e2210596

Accession Number: WOS:000791489500002

Abstract: IMPORTANCE Promotion of clinician adherence to stroke

guidelines can improve stroke outcomes. **OBJECTIVE** To investigate the outcomes of a multilevel system program on clinician adherence to guidelines for treatment of patients with acute ischemic stroke (AIS). **DESIGN, SETTING, AND PARTICIPANTS** This quality improvement study used a prospective interrupted time series (ITS) and difference-in-difference (DID) design, from August 1, 2018, to January 31, 2020, divided into preprogram term and short and long postprogram terms; each term had 6 months. Data were collected during hospitalization and at discharge with an automated medical record data capture system in 58 public hospitals in Zhejiang province, China. Data were analyzed from August 2018 to January 2020. **EXPOSURES** The multilevel system program included a modularized standard template for medical records, centrally supported continuing education, continuous monitoring and feedback, and collaborative workshops. **MAIN OUTCOMES AND MEASURES** The primary outcome was adherence to 12 key performance indicators (KPIs), expressed as (1) percentage of patient-applicable KPIs achieved in each participant and (2) percentage of participants among whom all applicable KPIs were achieved (dichotomous all-or-none measure). The secondary outcome was severe disability or death (modified Rankin Scale 5–6) at discharge. **RESULTS** Among 45 091 patients (mean [SD] age, 69 [12] years; 18 347 female [40.7%]), 28 721 from 30 hospitals received the program and 16 370 from 28 hospitals continued routine care. In adjusted DID analysis, the program was associated with an increase in the absolute percentage of KPIs achieved per patient (6.46%; 95% CI, 5.49% to 7.43%), absolute rate of all-or-none success (8.29%; 95% CI, 6.99% to 9.60%), and decreased rate of severe disability or death at discharge (–1.68%; 95% CI, –2.99% to –0.38%). The ITS result showed the program was associated with an increase in KPIs achieved per patient per week (slope change in short-term period, 0.36%; 95% CI, 0.20% to 0.52%; level change in long-term period, 9.64%; 95% CI, 4.58% to 14.69%) and in all-or-none success (slope change in short-term period 0.34%; 95% CI, 0.23% to 0.46%; level change in long-term period 5.89%; 95% CI, 0.19% to 11.59%). **CONCLUSIONS AND RELEVANCE** The centrally supported program was associated with increases in clinician adherence to guidelines and reduced the proportion of severely disabled or deceased patients with AIS at discharge, providing support for its wider implementation.

Title: Prognostication in post-stroke aphasia: speech pathologists' clinical insights on formulating and delivering information about recovery

Journal: Disability and Rehabilitation

Volume: 44

Issue: 18

Pages: 5046-5059

Date: Aug

Short Title: Prognostication in post-stroke aphasia: speech pathologists' clinical insights on formulating and delivering information about recovery

ISSN: 0963-8288

DOI: 10.1080/09638288.2021.1922514

Accession Number: WOS:000648451100001

Abstract: Purpose For people with post-stroke aphasia, "Will I get better?" is a question often asked, but one that is intellectually and emotionally demanding for speech pathologists to answer. Speech pathologists' formulation and delivery of aphasia prognoses is varied and there is limited evidence for optimising practice. We aimed to understand speech pathologists' clinical experiences, reasoning, and support needs in aphasia prognostication. Materials and methods Twenty-five Australian speech pathologists working with people with aphasia participated in individual, semi-structured interviews. Their age, level of experience, work setting, and location were maximally varied. Interview responses were analysed qualitatively using thematic analysis. Results Five themes were drawn from the interviews: (1) prognostic challenges are shared but not voiced; (2) truth is there's no quick fix; (3) recovery is more than words; (4) the power of words; and, (5) prognostic competence is implicit. Conclusions Speech pathologists use implicit competencies to formulate and deliver aphasia prognoses. A patient-centred, holistic contextualisation of aphasia recovery may enable realistic, optimistic, and constructive conversations about prognosis. These conversations may have therapeutic potential if prognostic uncertainty, emotional adjustment, and conditional outcomes are carefully addressed. Future research should seek to understand the perceptions and preferences of people with aphasia and their significant others.

Short Title: Organizational antecedents and multiple paths of knowledge-sharing behavior of construction project members: evidence from Chinese construction enterprises

ISSN: 0969-9988

DOI: 10.1108/ecam-07-2022-0614

Accession Number: WOS:000865805000001

Abstract: Purpose Lack of knowledge-sharing behavior (KSB) among construction project members hinders propagation of expertise, working methods, and lessons learned within an organization, and deprives the organization of a sustainable competitive edge. The present study investigates the combined effect of organizational antecedents of construction projects on members' KSB and provides a reference for developing management initiatives to motivate KSB.

Design/methodology/approach Based on organizational theory and organizational behavior literature, five organizational antecedents associated with KSB from organizational culture and structure were identified. Subsequently, the authors used survey data from 152 organization members in Chinese construction enterprises to conduct the fuzzy-set qualitative comparative analysis (fsQCA) and reveal configurations of organizational antecedents influencing KSB.

Findings This study identifies five configuration paths that are sufficient for shaping the KSB of construction project members, integrated into two types of driving modes, namely "trust-driven" and "incentive-driven". Relevant discussions can guide managers of construction project organizations to position the driving strategies of KSB that match different organizational scenarios or constraints. Originality/value By analyzing the configuration effects of organizational antecedents on KSB, novel clues are provided for governing the deficiency of KSB among construction project members. This contributes to the literature on knowledge transfer and organizational behavior. The findings provide actionable insights for improving knowledge flow in construction project organizations and designing KSB guidance regimes.

Accession Number: WOS:000728299200001

Abstract: Introduction This study aimed to determine whether a 6-week behaviour change intervention was more effective than a sham intervention for reducing sedentary behaviour (SB) in people with chronic obstructive pulmonary disease (COPD). Methods People with stable COPD on the waitlist for entry into pulmonary rehabilitation were recruited to this multicentre trial with randomisation (independent, concealed allocation) to either an intervention group or sham group, assessor blinding and intention-to-treat (ITT) analysis. The behaviour change intervention consisted of once weekly sessions for 6 weeks with a physiotherapist to reduce SB through education, guided goals setting and real-time feedback on SB. The sham intervention consisted of once weekly phone calls for 6 weeks to monitor health status. SB was measured continuously over 7 days using thigh-worn accelerometry (activPAL3 micro). The primary outcome was time spent in SB. Participants with at least 4 days of ≥ 10 hours waking wear time were included in the ITT analysis and those who reported achieving $\geq 70\%$ of goals to reduce SB or who completed all sham calls were included in a per-protocol analysis. Results 70 participants were recruited and 65 completed the study (mean \pm SD age 74 \pm 9 years, mean FEV1 55% \pm 19% predicted, 49% male). At 6 weeks, no between-group differences in time spent in SB were observed in the ITT analysis (mean difference 5 min/day, 95% CI -38 to 48) or per-protocol analysis (-16 min/day, 95% CI -80 to 48). Discussion A 6-week behaviour change intervention did not reduce time in SB compared with a sham intervention in people with stable moderate-to-severe COPD prior to pulmonary rehabilitation. Pages: 99-109

Date: Feb

Short Title: Factors influencing the conduction of confidential

conversations with adolescents in the emergency department: A
multicenter, qualitative analysis

ISSN: 1069-6563

DOI: 10.1111/acem.14638

Accession Number: WOS:000918149500001

Abstract: Background: Health care providers (HCPs) in the emergency department (ED) frequently must decide whether to conduct or forego confidential conversations with adolescent patients about sensitive topics, such as those related to mental health, substance use, and sexual and reproductive health. The objective of this multicenter qualitative analysis was to identify factors that influence the conduct of confidential conversations with adolescent patients in the ED. **Methods:** In this qualitative study, we conducted semistructured interviews of ED HCPs from five academic, pediatric EDs in distinct geographic regions. We purposively sampled HCPs across gender, professional title, and professional experience. We used the Theoretical Domains Framework (TDF) to develop an interview guide to assess individual and system-level factors affecting HCP behavior regarding the conduct of confidential conversations with adolescents. Enrollment continued until we reached saturation. Interviews were recorded, transcribed, and coded by three investigators based on thematic analysis. We used the coded transcripts to collaboratively generate belief statements, which are first-person statements that reflect shared perspectives. **Results:** We conducted 38 interviews (18 physicians, 11 registered nurses, five nurse practitioners, and four physician assistants). We generated 17 belief statements across nine TDF domains. Predominant influences on having confidential conversations included self-efficacy in speaking with adolescents alone, wanting to address sexual health complaints, maintaining patient flow, experiencing parental resistance and limited space, and having inadequate resources to address patient concerns and personal preconceptions about patients. Perspectives divided between wanting to provide focused medical care related only to their chief complaint versus self-identifying as a holistic medical HCP. **Conclusions:** The factors influencing the conduct of confidential conversations included multiple TDF domains, elucidating how numerous intersecting factors influence whether ED HCPs address sensitive adolescent health needs. These data suggest methods to enhance and facilitate confidential conversations when deemed appropriate in the care of adolescents in the ED.

Short Title: "Is the focus in professional rugby ever really on health?": A qualitative study on the uptake of illness prevention guidelines in rugby

ISSN: 1469-0292

DOI: 10.1016/j.psychsport.2022.102327

Article Number: 102327

Accession Number: WOS:000890466000006

Abstract: Illness prevention is essential for athlete health management, but little is known about its uptake in sport. Prior to the pandemic, the International Olympic Committee (IOC) published a consensus statement recommending illness prevention guidelines are implemented in sports. Yet, little is known about guideline uptake. Therefore, this study aimed to explore the (1) illness experiences of rugby players and athlete support personnel and (2) barriers and enablers to illness prevention guideline uptake in rugby, using the lens of behaviour change theory. In a bid to inform and enhance athlete welfare, we sought to amplify the voices of participants through qualitative inquiry. Between August 2020 and May 2021, 16 semi-structured interviews were undertaken with players and athlete support personnel working across rugby. Analysis was conducted using Braun and Clarke's reflexive thematic analysis. Prior to COVID-19, participants deemed illness to be of little concern, with experience of illnesses and the global pandemic critical enablers to guideline uptake. The rugby environment was a barrier to illness prevention, particularly in women's and academy teams where resource deficiency was highlighted. 'Rugby identity' acted as both a barrier and enabler with participants' passion for rugby driving both guideline adherence and non-adherence. Tackling resource inequalities between men's and women's cohorts is critical to effectively implement guidelines. Coach and player education is essential, and emphasis must be placed on continuing preventative behaviours adopted due to COVID-19. Our findings offer new insight into illness prevention, moving away from prevailing quantitative research, and instead voicing players' experiences.

Short Title: Improving patient-centred care through a tailored intervention addressing nursing clinical handover communication in its organizational and cultural context

ISSN: 0309-2402

DOI: 10.1111/jan.15110

Accession Number: WOS:000786813000020

Abstract: Aims To increase the quality and safety of patient care, many hospitals have mandated that nursing clinical handover occur at the patient's bedside. This study aims to improve the patient-centredness of nursing handover by addressing the communication challenges of bedside handover and the organizational and cultural practices that shape handover. Design Qualitative linguistic ethnographic design combining discourse analysis of actual handover interactions and interviews and focus groups before and after a tailored intervention. Methods Pre-intervention we conducted interviews with nursing, medical and allied health staff (n = 14) and focus groups with nurses and students (n = 13) in one hospital's Rehabilitation ward. We recorded handovers (n = 16) and multidisciplinary team huddles (n = 3). An intervention of communication training and recommendations for organizational and cultural change was delivered to staff and championed by ward management. After the intervention we interviewed nurses and recorded and analyzed handovers. Data were collected from February to August 2020. Ward management collected hospital-acquired complication data. Results Notable changes post-intervention included a shift to involve patients in bedside handovers, improved ward-level communication and culture, and an associated decrease in reported hospital-acquired complications. Conclusions Effective change in handover practices is achieved through communication training combined with redesign of local practices inhibiting patient-centred handovers. Strong leadership to champion change, ongoing mentoring and reinforcement of new practices, and collaboration with nurses throughout the change process were critical to success. Impact Ineffective communication during handover jeopardizes patient safety and limits patient involvement. Our targeted, locally designed communication intervention significantly improved handover practices and patient involvement through the use of informational and interactional protocols, and redesigned handover tools and meetings. Our approach promoted a ward culture that prioritizes patient-centred care and patient safety. This innovative intervention resulted in an associated decrease in hospital-acquired complications. The intervention has been rolled out to a further five wards across two hospitals.

Short Title: Nutrition knowledge assessment tools for older adults and their carers: a scoping review

ISSN: 0954-4224

DOI: 10.1017/s0954422421000330

Accession Number: WOS:000973202200001

Abstract: Poor nutritional intake is common among older adults. Given that nutrition knowledge is an important determinant of eating behaviour and nutritional status, understanding areas of inadequate knowledge can guide educational interventions to reduce risk of nutritional deficiencies and promote healthy ageing. This review investigated tools assessing general nutritional knowledge of older adults and their carers. Following the Joanna Briggs for Scoping Reviews guidelines, 4 databases (MEDLINE, CINAHL, Global Health and Embase) and grey literature were searched. Studies of any type containing general nutrition knowledge assessment tools for older adults or their carers were included. In total, 6934 articles were identified, of which 24 met the eligibility criteria, and 23 unique nutrition knowledge assessment tools were included. Of these tools, 14 were original, 6 were modified from other tools and 3 used dietary-related responses from national dietary survey questions. 6 tools were developed for carers (mostly nurses) and 17 tools for older adults. Tools had between 4 and 110 items. The most common topics for general nutrition knowledge questions were related to nutrients and roles, food sources of nutrients, and diet-disease relationships. 8 tools were developed prior to 2000. Most studies did not specify or assess psychometric properties of the tool, with only 9 (38 %) and 6 (26 %) studies testing for reliability and validity, respectively, and only 1 tool was considered reliable. Additional research for the development of reliable and validated tools or the validation of existing tools to assess nutrition knowledge of older adults and their carers is needed across different healthcare settings.

DOI: 10.1093/pubmed/fdy094

Accession Number: WOS:000467912400020

Abstract: Background National Health Service England encourages staff to use everyday interactions with patients to discuss healthy lifestyle changes as part of the 'Making Every Contact Count' (MECC) approach. Although healthcare, government and public health organisations are now expected to adopt this approach, evidence is lacking about how MECC is currently implemented in practice. This study explored the views and experiences of those involved in designing, delivering and evaluating MECC. Methods We conducted a qualitative study using semi-structured interviews with 13 public health practitioners with a range of roles in implementing MECC across England. Interviews were conducted via telephone, transcribed verbatim and analysed using an inductive thematic approach. Results Four key themes emerged identifying factors accounting for variations in MECC implementation: (i) 'design, quality and breadth of training', (ii) 'outcomes attended to and measured', (iii) 'engagement levels of trainees and trainers' and (iv) 'system-level influences'. Conclusions MECC is considered a valuable public health approach but because organisations interpret MECC differently, staff training varies in nature. Practitioners believe that implementation can be improved, and an evidence-base underpinning MECC developed, by sharing experiences more widely, introducing standardization to staff training and finding better methods for assessing meaningful outcomes.

Title: Recognition of Obesity and Perceptions of Weight Loss Management in Patients With Chronic Kidney Disease: A Retrospective Cross-Sectional Study

Journal: Canadian Journal of Kidney Health and Disease

Volume: 9

Date: Oct

Short Title: Recognition of Obesity and Perceptions of Weight Loss Management in Patients With Chronic Kidney Disease: A Retrospective Cross-Sectional Study

DOI: 10.1177/20543581221129465

Article Number: 20543581221129465

Accession Number: WOS:000869096400001

Abstract: Background: Obesity is, directly and indirectly, linked to the progression of chronic kidney disease (CKD). However, nephrologists' recognition of obesity and willingness to address and manage obesity are unknown. Objectives: The aim of this article is to investigate if obesity is recognized and documented in the clinical encounter and to examine nephrologists' perceptions of obesity and comfort with weight loss management. Design: We conducted a 2-part study. Part I used a retrospective chart review and part II used an anonymous online survey of practicing nephrologists (n = 14) in our center. Setting: The study took place in the Multi-care Kidney Clinic (MCKC) at London Health Sciences Centre in London, Ontario, Canada. Patients: In part I, we conducted a retrospective chart review of 10 random patients with advanced CKD and obesity (body mass index [BMI] > 30 kg/m²) from each of the nephrologists between January and December 2019. Methods: In part I, charts were assessed for documentation of obesity and/or a treatment plan (lifestyle counseling, pharmacologic intervention, and specialist referral). In part II, a survey completed by the nephrologists explored their current experience and perceptions of obesity and comfort with weight loss management. Responses were ranked on a 5-point Likert scale. Results: In all, 140 patient charts were reviewed. The median age was 69 (interquartile range [IQR] = 60–77) years, estimated glomerular filtration rate (eGFR) was 17 (IQR = 12–20) ml/min/1.73 m², weight was 99 (IQR = 90–116) kg, and BMI was 36 (IQR 33–40) kg/m². Obesity with a BMI was documented in 36 (26%) charts, and only 2 (1%) documented a weight loss plan, which only included non-pharmacologic strategies. There were 13 survey responses (93% response rate). All nephrologists agreed that obesity negatively affects the health of patients with CKD. Twelve (92%) reported discussing obesity with patients, but none felt that they had time to treat it. All reported discussions of obesity would evoke a negative patient response, while 5 (38%) thought patients actually want to discuss obesity. Regarding treatment, 8 (62%) nephrologists felt comfortable with non-pharmacologic treatment, but only 1 respondent was comfortable with pharmacologic treatments. Twelve (92%) nephrologists thought patients should be referred to a specialist. Limitations: There was limited generalizability as this was a single center study. The BMI may reflect hypervolemia rather than body mass. Conclusion: In our study, nephrologists rarely document and manage obesity in patients with advanced CKD, despite their perception of treatment benefits. Improved outcomes of obesity management for patients with CKD will require increased knowledge and clinical tools to efficiently address obesity with patients.

Title: Understanding Preferences for Lifestyle-Focused Visual Text Messages in Patients With Cardiovascular and Chronic Respiratory Disease: Discrete Choice Experiment

Journal: Journal of Medical Internet Research

Volume: 23

Issue: 9

Date: Sep

Short Title: Understanding Preferences for Lifestyle-Focused Visual Text Messages in Patients With Cardiovascular and Chronic Respiratory Disease: Discrete Choice Experiment

ISSN: 1438-8871

DOI: 10.2196/26224

Article Number: e26224

Accession Number: WOS:000697697700001

Abstract: Background: Supporting healthy lifestyle changes is a key aim of cardiovascular and pulmonary rehabilitation programs. SMS text messaging programs have demonstrated effectiveness in cardiovascular disease risk reduction, weight loss, increasing physical activity, and smoking cessation. The optimization of SMS text messaging programs may deliver greater population benefits as mobile phone use becomes ubiquitous. Visual messaging (ie, image-based messages) has the potential to communicate health messages via digital technology and result in enhanced engagement. Objective: This study aims to determine and understand patient preferences for lifestyle-focused visual text messages that support cardiovascular and pulmonary rehabilitation. Methods: A discrete choice experiment was conducted in a 4-stage iterative process to elicit patient preferences for visual message features. Attribute and level development yielded 3 attributes (purpose, image type, and web address), and 16 choice sets were subsequently constructed according to a full factorial design. Patients participating in cardiovascular and pulmonary rehabilitation were surveyed (on the web) for their preferences regarding the visual message choice sets. Respondents were asked to choose among 16 pairs of visual messages regarding key lifestyle behaviors, namely, physical activity and nutrition. The data were analyzed using a conditional logit model. Results: There was a total of 1728 observations from 54 unique respondents. Two factors that were associated with patient preference were gain-framed purpose compared with no purpose (odds ratio [OR] 1.93, 95% CI 1.40–2.65) and real images compared with cartoon images (OR 1.26, 95% CI 1.04–1.54). A loss-framed purpose was less preferred than no purpose (OR 0.55, 95% CI 0.42–0.74). Overall, patients preferred positive images that were colorful and engaged with text that supported the image and had a preference for images of real people rather than cartoons. Conclusions: A discrete choice experiment is a scientific method for eliciting patient preferences for a visual messaging intervention that is designed to support changes in lifestyle behaviors. SMS text messaging programs that use visual aids may result in greater patient satisfaction by using a gain frame, using real images, and avoiding a loss frame. Further

research is needed to explore the feasibility of implementation and the health and behavioral outcomes associated with such visual messaging programs.

Date: Aug

Short Title: Experiences Influencing Walking Football Initiation in 55-to 75-Year-Old Adults: A Qualitative Study

ISSN: 1063-8652

DOI: 10.1123/japa.2019-0123

Accession Number: WOS:000552014100003

Abstract: Adults aged 55 and older are least likely to play sport. Despite research suggesting this population experiences physical and psychological benefits when doing so, limited research focuses on older adult sport initiation, especially in "adapted sports" such as walking football. The aim of this study was to explore initiation experiences of walking football players between 55 and 75 years old. Semistructured interviews took place with 17 older adults playing walking football for 6 months minimum (M-age = 64). Inductive analysis revealed six higher order themes representing preinitiation influences. Eight further higher order themes were found, relating to positive and negative experiences during initiation. Fundamental influences preinitiation included previous sporting experiences and values and perceptions. Emergent positive experiences during initiation included mental development and social connections. Findings highlight important individual and social influences when initiating walking football, which should be considered when encouraging 55- to 75-year-old adults to play adapted sport. Policy and practice recommendations are discussed.

Abstract: Background: Pregnancy and the postpartum period are difficult times with increased risks of weight gain and weight retention. This study aims to provide new insights into developing and designing information and communication technology interventions to support a healthy postpartum lifestyle through behavioral changes. Methods: A participatory design approach, combined with the behavior change wheel, was applied. The intervention was based on outcomes from co-creation with postpartum parents, healthcare professionals, IT consultants, and researchers. Results: An intervention was developed that reflects users' requests and needs to support a healthy postpartum lifestyle through behavioral change. The intervention includes podcasts, video exercises, weight

tracking, and weekly push notifications. Conclusion: Developing an intervention to support a healthy postpartum lifestyle is feasible using both a participatory design and the behavior change wheel.

Title: Barriers to a healthy postpartum lifestyle and the possibilities of an information technology-based intervention: A qualitative study

Journal: Midwifery

Volume: 98

Date: Jul

Short Title: Barriers to a healthy postpartum lifestyle and the possibilities of an information technology-based intervention: A qualitative study

ISSN: 0266-6138

DOI: 10.1016/j.midw.2021.102994

Article Number: 102994

Accession Number: WOS:000654352300006

Abstract: Background: Being overweight or obese is associated with higher risk of adverse maternal and fetal outcomes, including gestational diabetes and childhood obesity. Many women exceed the gestational weight gain recommendations. Thus, it is important to focus on the women's lifestyle between their pregnancies to lower the risk of weight retention before the next pregnancy as well as in a life course perspective. Objective: The objective of this study was to explore barriers postpartum women experience with respect to a healthy lifestyle during the postpartum period, and to assess whether an IT-based intervention might be a supportive tool to assist and motivate postpartum women to healthy lifestyle. Method: A systematic text condensation was applied to semi-structured focus groups. Five focus group interviews were carried out with a total of 17 postpartum women and two interviews with a total of six health professionals. Participants were recruited through the municipality in Svendborg, Denmark, and at Odense University Hospital in Odense, Denmark, during a four-month period in early 2018. The results were analysed within the frame of the capability, opportunity, motivation and behaviour model (COM-B). Results: From the women's perspective, better assistance is needed from the health professionals to obtain or maintain a healthy lifestyle. The women need tools that inform and help them understand and prioritize own health related risks, and to motivate them to plan and take care of their own health.

There is room for engaging the partner more in the communication related to the baby and family's lifestyle. Lastly, the women already use audiobooks and podcasts to obtain information. Conclusion: Postpartum women need tools that inform and motivate for a healthy lifestyle postpartum. The tools should allow access to high quality information from health care professionals when the information is needed and also allow engagement from the partner. An IT-based intervention could be a way to support and motivate postpartum women for a healthy lifestyle.

Title: Adult experiences of constraint-induced movement therapy programmes: a qualitative study using the Theoretical Domains Framework and Capability, Opportunity, Motivation - Behaviour system
Journal: Brain Impairment

Date: 2022 Aug

Short Title: Adult experiences of constraint-induced movement therapy programmes: a qualitative study using the Theoretical Domains Framework and Capability, Opportunity, Motivation - Behaviour system

ISSN: 1443-9646

DOI: 10.1017/BrImp.2022.18

Article Number: Pii s1443964622000183

Accession Number: WOS:000843906000001

Abstract: Aim: To explore the experiences of adults who completed a constraint-induced movement therapy (CIMT) programme, and the barriers and enablers to their participation. Methods: Qualitative design using semi-structured interviews. Stroke and brain injury survivors (n = 45) who had completed CIMT as part of their usual rehabilitation were interviewed 1 month post-CIMT. Interviews were audio-recorded, transcribed and imported into Nvivo for analysis. Inductive coding was used to identify initial themes. Themes were then deductively mapped to the Capability, Opportunity, Motivation - Behaviour system, a behaviour change model, to identify barriers and enablers to CIMT programme adherence and engagement. Results: Enablers influencing participation included being provided with education about the programme (Capability - psychological), seeing improvements in arm function (Motivation - reflective), being committed to the programme (Motivation - reflective) and having strong social support from staff, family and allied health students (Opportunity - social). The structured programme was a motivator and

offered a way to fill the time, particularly during inpatient rehabilitation (Opportunity – physical). Barriers to participation included experiencing physical and mental fatigue (Capability – physical) and frustration early in the CIMT programme (Motivation – automatic), and finding exercises boring and repetitive (Motivation – automatic). Conclusion: Therapist provision of educational supports for CIMT participants and their families is important to maximise CIMT programme uptake. During CIMT delivery, we recommend the provision of positive feedback and coaching in alignment with CIMT principles, and the inclusion of social supports such as group-based programmes to enhance participant adherence.

Short Title: Qualitative evaluation of a codesigned faith-based intervention for Muslim women in Scotland to encourage uptake of breast, colorectal and cervical cancer screening

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2021-058739

Article Number: e058739

Accession Number: WOS:000800792400024

Abstract: Objectives This pilot study aimed to evaluate the acceptability of a codesigned, culturally tailored, faith-based online intervention to increase uptake of breast, colorectal and cervical screening in Scottish Muslim women. The intervention was codesigned with Scottish Muslim women (n=10) and underpinned by the reframe, reprioritise and reform model and the behaviour change wheel. Setting The study was conducted online, using Zoom, due to the COVID-19 pandemic. Participants Participants (n=18) taking part in the intervention and subsequently in its evaluation, were Muslim women residing in Scotland, recruited through purposive and snowball sampling from a mosque and community organisations. Participants were aged between 25 years and 54 years and of Asian and Arab ethnicity. Design The study's codesigned intervention included (1) a peer-led discussion of barriers to screening, (2) a health education session led by a healthcare provider, (3) videos of Muslim women's

experiences of cancer or screening, and (4) a religious perspective on cancer screening delivered by a female religious scholar (alimah). The intervention was delivered twice online in March 2021, followed 1 week later by two focus groups, consisting of the same participants, respectively, to discuss participants' experiences of the intervention. Focus group transcripts were analysed thematically. Results Participants accepted the content and delivery of the intervention and were positive about their experience of the intervention. Participants reported their knowledge of screening had increased and shared positive views towards cancer screening. They valued the multidimensional delivery of the intervention, appreciated the faith-based perspective, and in particular liked the personal stories and input from a healthcare provider. Conclusion Participatory and community-centred approaches can play an important role in tackling health inequalities in cancer and its screening. Despite limitations, the intervention showed potential and was positively received by participants. Feasibility testing is needed to investigate effectiveness on a larger scale in a full trial. ISSN: 0894-587X

DOI: 10.1007/s10488-022-01235-w

Accession Number: WOS:000898605900001

Abstract: Evidence supporting the efficacy of therapeutic virtual reality (VR) for mental health conditions is rapidly growing. However, little is known about how best to implement VR, or the challenges perceived by treatment providers. This study aimed to (1) synthesis perspectives of staff working in private mental healthcare and (2) use the Theoretical Domains Framework (TDF) and Behaviour Change Wheel (BCW) to identify mechanisms of change targets and intervention functions to facilitate its clinical implementation. Semi-structured interviews were conducted with clinicians (n = 14)

and service managers (n = 5) working in a major private mental health hospital in Victoria, Australia. Transcripts were coded using framework analysis to identify relevant TDF domains. Specific belief statements were generated and coded as a barrier and/or facilitator and thematically organised within domains. Domains were ranked for importance based on frequency, elaboration, and evidence of conflicting beliefs. Using the BCW, domains were mapped to their respective COM-B components and indicated intervention functions. A total of 11 TDF domains were identified as relevant to early-stage implementation of therapeutic VR. Three domains were judged as highly important (beliefs about consequences; environmental context and resources; knowledge), while seven domains were judged as moderately important (social/professional role and identity; emotions; skills; memory, attention, and decision processes; intentions; beliefs about capabilities; social influences). Based on current data, we propose a theory-informed roadmap to promote VR uptake in mental healthcare services. A priority for intervention development should be addressing knowledge gaps and attitudinal barriers (e.g., safety concerns) with education and training.

Abstract: Child obesity and being overweight is a health problem of increasing occurrence. Sedentary lifestyles and lack of exercise affect young children's motor skills development, hence their quality of life. This study presents the design and evaluation of Hunting Relics, a collaborative exergame to promote collective exertion in young children. The system runs on an interactive floor and was designed using an iterative user-centered methodology in combination with the Capability, Opportunity, and Motivation to generate Behavior (COM-B) model. To evaluate the impact of our design choices, two deployment studies were conducted. Results show that Hunting Relics augments existing exercise routines, keeps young

children engaged for the long term, and persuades them to discover new collaborative practices to support exercising. A discussion follows about how the COM-B model is a useful framework to design exergames for young children and the impact of Hunting Relics from an educational, technical, and clinical perspective.

Short Title: Improving Personal Characterization of Meaningful Activity in Adults with Chronic Conditions Living in a Low-Income Housing Community

DOI: 10.3390/ijerph120911379

Accession Number: WOS:000361889100057

Abstract: Purpose: To understand how adults living in a low-income, public housing community characterize meaningful activity (activity that gives life purpose) and if through short-term intervention, could overcome identified individual and environmental barriers to activity engagement. Methods: We used a mixed methods design where Phase 1 (qualitative) informed the development of Phase 2 (quantitative). Focus groups were conducted with residents of two low-income, public housing communities to understand their characterization of meaningful activity and health. From these results, we developed a theory-based group intervention for overcoming barriers to engagement in meaningful activity. Finally, we examined change in self-report scores from the Meaningful Activity Participation Assessment (MAPA) and the Engagement in Meaningful Activity Survey (EMAS). Results: Health literacy appeared to impact understanding of the questions in Phase 1. Activity availability, transportation, income and functional limitations were reported as barriers to meaningful activity. Phase 2 within group analysis revealed a significant difference in MAPA pre-post scores ($p = 0.007$), but not EMAS ($p = 0.33$). Discussion: Health literacy should be assessed and addressed in this population prior to intervention. After a group intervention, participants had a change in characterization of what is considered healthy, meaningful

activity but reported fewer changes to how their activities aligned with their values.

DOI: 10.1136/bmjopen-2017-016781

Article Number: e016781

Accession Number: WOS:000406391200242

Abstract: Introduction Exercise-based cardiac rehabilitation (CR) independently alters the clinical course of cardiovascular diseases resulting in a significant reduction in all-cause and cardiac mortality. However, only 15%-30% of all eligible patients participate in a phase 2 ambulatory programme. The uptake rate of community-based programmes following phase 2 CR and adherence to long-term exercise is extremely poor. Newer care models, involving telerehabilitation programmes that are delivered remotely, show considerable promise for increasing adherence. In this view, the PATHway (Physical Activity Towards Health) platform was developed and now needs to be evaluated in terms of its feasibility and clinical efficacy. Methods and analysis In a multicentre randomised controlled pilot trial, 120 participants (m/f, age 40-80 years) completing a phase 2 ambulatory CR programme will be randomised on a 1:1 basis to PATHway or usual care. PATHway involves a comprehensive, internet-enabled, sensor-based home CR platform and provides individualised heart rate monitored exercise programmes (exerclasses and exergames) as the basis on which to provide a personalised lifestyle intervention programme. The control group will receive usual care. Study outcomes will be assessed at baseline, 3 months and 6 months after completion of phase 2 of the CR programme. The primary outcome is the change in active energy expenditure. Secondary outcomes include cardiopulmonary endurance capacity, muscle strength, body composition, cardiovascular risk factors, peripheral endothelial vascular function, patient satisfaction, health-related quality of life (HRQoL), well-being,

mediators of behaviour change and safety. HRQoL and healthcare costs will be taken into account in cost-effectiveness evaluation. Ethics and dissemination The study will be conducted in accordance with the Declaration of Helsinki. This protocol has been approved by the director and clinical director of the PATHway study and by the ethical committee of each participating site. Results will be disseminated via peer-reviewed scientific journals and presentations at congresses and events.

Title: Self-reported behaviour change among multiple sclerosis community members and interested laypeople following participation in a free online course about multiple sclerosis

Journal: Health Promotion Journal of Australia

Volume: 33

Issue: 3

Pages: 768-778

Date: Jul

Short Title: Self-reported behaviour change among multiple sclerosis community members and interested laypeople following participation in a free online course about multiple sclerosis

ISSN: 1036-1073

DOI: 10.1002/hpja.559

Accession Number: WOS:000729421200001

Abstract: Issue addressed Evaluated the impact of Understanding Multiple Sclerosis (MS) massive open online course, which was intended to increase understanding and awareness about MS, on self-reported health behaviour change. Methods Observational cohort study evaluating pre- (baseline) and post-course (8-10-week follow-up) survey data. The main study outcomes were self-reported health behaviour change, change type and measurable improvement. We also collected participant characteristic data (eg, age, physical activity). We compared participants who reported health behaviour change at follow-up to those who did not and compared those who

improved with those who did not using chi square and t tests. Participant characteristics, change types and change improvement were described descriptively. Results A total of N = 560 course completers were included in this study. The study cohort included MS community members (eg, people with MS, health care providers) and nonmembers. Two hundred and forty-seven (44.1%) reported behaviour change in ≥ 1 area at follow-up, 160 (64.8%) reported a measurable change and, of these, 109 (68.1%) showed improvement. Participants who reported a change and those who improved had significantly lower precourse health behaviours and characteristics (eg, quality of life, diet quality). The most reported change types were knowledge, exercise/physical activity, diet and care practice. Conclusion Understanding MS encourages health behaviour change among course completers, primarily through the provision of information and goal-setting activities and discussions. So what? An online education intervention can effectively encourage health behaviour change over an 8-10-week follow-up period. Information provision, including both scientific evidence and lived experience, and goal-setting activities and discussions are the primary mechanisms underpinning that change.

Title: Acute post-stroke aphasia management: An implementation science study protocol using a behavioural approach to support practice change

Journal: International Journal of Language & Communication Disorders

Volume: 58

Issue: 3

Pages: 968-976

Date: May

Short Title: Acute post-stroke aphasia management: An implementation science study protocol using a behavioural approach to support practice change

ISSN: 1368-2822

DOI: 10.1111/1460-6984.12816

Accession Number: WOS:000898938500001

Abstract: BackgroundEvidence should guide decisions in aphasia practice across the continuum of stroke care; however, evidence-practice gaps persist. This is particularly pertinent in the acute setting where 30% of people with stroke will have aphasia, and speech pathologists experience many challenges implementing evidence-based practice. This has important consequences for people

with aphasia and their close others, as well as speech pathologists working in acute settings. Aims This study protocol details how we will target practice change using a behavioural approach, with the aim of promoting the uptake of synthesized evidence in aphasia management post-stroke in the acute hospital setting. Methods & Procedures We will conduct a mixed-methods before-and-after study following the Knowledge-to-Action (KTA) framework. Researchers, speech pathologists and people with lived experience of aphasia will collaborate to identify and prioritize practice gaps, and develop and implement changes to clinical practice based on the Theoretical Domains Framework and Behaviour Change Wheel. Discussion This study may provide a template for acute stroke services in how to use an implementation science approach to promote the application of synthesized evidence into routine clinical practice to ensure people with aphasia receive high-quality services. Collaboration among researchers, healthcare providers, people with aphasia and their close others ensures that the identification and targeting of practice gaps are driven by theory, lived experience and the local context. WHAT THIS PAPER ADDS What is already known on this subject Synthesized evidence, such as clinical guidelines and consensus statements, provides the highest level of evidence to inform clinical practice, yet discrepancies between delivered care and evidence remain. This discrepancy is of note in the acute setting where clinicians report many challenges implementing the best available evidence, combined with a high proportion of people with stroke who will have aphasia (30%). There are many reasons why evidence is not put into practice, and efforts to change clinical practice need to consider these barriers when developing interventions. What this paper adds to existing knowledge This study protocol details an implementation science approach to affect clinical practice change, informed by a collaboration of key stakeholders (researchers, speech pathologists, and people with aphasia and their close others). Protocol papers that focus on bridging the gap between evidence and practice are uncommon in communication disorders; moreover, explicit prioritization of practice gaps is a critical but often overlooked aspect of promoting evidence-based practice. What are the potential or actual clinical implications of this work? This protocol provides insights into how one study site identified and prioritized evidence-practice gaps using a participatory approach. We provide insights into how clinical practice change may occur by describing how we plan to identify priority evidence-practice gaps and develop an intervention to improve the use of aphasia evidence in routine practice. This protocol aims to share an implementation science approach to service improvement that may be replicated across other services.

Short Title: The Agewell trial: a pilot randomised controlled trial of a behaviour change intervention to promote healthy ageing and reduce risk of dementia in later life

DOI: 10.1186/s12888-015-0402-4

Article Number: 25

Accession Number: WOS:000349923200001

Abstract: Background: Lifestyle factors represent prime targets for behaviour change interventions to promote healthy ageing and reduce dementia risk. We evaluated a goal-setting intervention aimed at promoting increased cognitive and physical activity and improving mental and physical fitness, diet and health. Methods: This was a pilot randomised controlled trial designed to guide planning for a larger-scale investigation, provide preliminary evidence regarding efficacy, and explore feasibility and acceptability. Primary outcomes were engagement in physical and cognitive activity. Participants aged over 50 living independently in the community were recruited through a community Agewell Centre. Following baseline assessment participants were randomly allocated to one of three conditions: control (IC) had an interview in which information about activities and health was discussed; goal-setting (GS n = 24) had an interview in which they set behaviour change goals relating to physical, cognitive and social activity, health and nutrition; and goal-setting with mentoring (GM, n = 24) had the goal-setting interview followed by bi-monthly telephone mentoring. Participants and researchers were blinded to group assignment. Participants were reassessed after 12 months. Results: Seventy-five participants were randomised (IC n = 27, GS n = 24, GM n = 24). At 12-month follow-up, the two goal-setting groups, taken together (GS n = 21, GM n = 22), increased their level of physical (effect size 0.37) and cognitive (effect size 0.15) activity relative to controls (IC n = 27). In secondary outcomes, the two goal-setting groups taken together achieved additional benefits compared to control (effect sizes ≥ 0.2) in memory, executive function, cholesterol level, aerobic capacity, flexibility, balance, grip strength, and agility. Adding follow-up mentoring produced further benefits compared to goal-setting alone (effect sizes ≥ 0.2) in physical activity, body composition, global cognition and memory, but not in other domains. Implementation of the recruitment procedure, assessment and intervention was found to be feasible and the approach taken was acceptable to participants, with no adverse effects. Conclusions: A brief, low-cost goal-setting intervention is feasible and acceptable, and has the potential to achieve increased activity engagement.

Short Title: Barriers and facilitators to the use of personal information documents in health and social care settings for people living with dementia: A thematic synthesis and mapping to the COM-B framework

ISSN: 1369-6513

DOI: 10.1111/hex.13497

Accession Number: WOS:000781615100001

Abstract: Introduction: People living with dementia experience communication difficulties. Personal information documents, or healthcare passports, enable communication of information essential for the care of a person with dementia. Despite the potential for providing person-centred care, personal information documents are not ubiquitously used. The Capability Opportunity Motivation-Behaviour (COM-B) model can be used to understand factors determining individuals' behaviours. Objectives: This study aimed to identify the barriers to and facilitators of the use of healthcare passports for people living with dementia through a systematic review methodology. Methods: A systematic search of six electronic databases was undertaken. Grey literature was searched using three databases. All study types reporting barriers to or facilitators of the use of personal information documents in the care of adults living with dementia in high-income countries were included. Study quality was assessed using the NICE Quality Appraisal Checklist. Thematic synthesis was used to develop descriptive themes, which were subsequently mapped to the COM-B framework. Results: Nineteen papers were included. Themes included training, awareness, embedding the process in norms and appreciating the value of the personal information documents. A broad range of barriers and facilitators was identified within each COM-B domain. Conclusion: This framework provides a starting point for evidence-informed initiatives to improve the use of personal information documents in the care of people with dementia.

DOI: 10.12968/ijpn.2015.21.8.392
Accession Number: WOS:000389314500007
Abstract: Background: Most Australians die in acute hospital settings. Despite this, hospitals remain ill-equipped to care for dying patients with hospital deaths not uncommonly perceived as distressing by both patients and their families. As a quality improvement project, a care bundle for the dying was developed and piloted on two medical wards. The aim of this study was to examine whether or not the quality initiative had any effect on the ward nurse's attitudes and self-assessed competency to care for dying patients. Methods: A pre-and post-survey using self-administered questionnaires were given to nursing staff who voluntarily completed these before and after implementation of the caring for the dying bundle. Results: Over the 6 months the bundle was piloted, 74.5% of people who died did so with the bundle in place. While this was seen as clinically useful by nearly half the nurses who responded, there was not a significant change in the staff's attitudes or self-assessed competency to care for dying patients. There was a minor change in the Thanatophobia Scale (pre 18.2: SD +/- 9.0 versus post 16.8: SD 7.8; P=0.53), the Self-efficacy in Palliative Care Scale for communication (pre 47.4: SD +/- 17.4 versus post 54.7: SD +/- 17.9; P=0.11) and patient management respectively (pre 54.3: SD +/- 12.9 versus 59.1: SD +/- 12.6; P=0.15). Discussion: This work highlighted that at least in the short term, that a quality initiative had only a modest impact on nursing attitudes to caring for dying patients. However, as a collection of clinical tools grouped as a care bundle, a proportion of nursing staff acknowledged this initiative as useful. Conclusion: Further research is required to understand if such an initiative approach may, in the long term, positively impacts attitude. This is highly relevant given the increasing numbers of people likely to die in acute care.

Short Title: Incorporating Consumer Insights into the UK Food Packaging Supply Chain in the Transition to a Circular Economy

DOI: 10.3390/su12156106

Article Number: 6106

Accession Number: WOS:000559156600001

Abstract: The growth of eating lunch purchased out of the home has led to an increased need for pre-packaged food-to-go products. Single-use plastic packaging is frequently chosen for its food safety and convenience attributes; however, the material format is under scrutiny due to concerns over economic waste and environmental impact. A circular economy could transform linear make-use-dispose supply chains into circular systems, ensuring the cycling of valuable plastic resources. However, there has been limited research into how consumers will behave within circular economic systems. Understanding consumer behaviour with packaging disposed out of the home could aid designers in developing solutions society will adopt in the transition to a circular economy. This study evaluates the application of behaviour research methods, and the behavioural insight outputs, with stakeholders from the UK food-to-go packaging supply chain. A novel co-design workshop and business origami technique allowed multiple stakeholder groups to collaboratively discuss, evaluate, and plan how consumer behaviour techniques could be used within their supply chain packaging development process. Although all stakeholders identified strengths in incorporating behaviour studies into the development process, providing essential knowledge feedback loops, barriers to their application include the cost and time to implement, plus the existing inconsistent UK waste infrastructure.

Short Title: A remote ethnography methodology to gain packaging behaviour insights

ISSN: 0894-3214

DOI: 10.1002/pts.2635

Accession Number: WOS:000743074000001

Abstract: Remote ethnography requires the observation of human interaction in the natural world without the researcher being present. Well-established in industrial and user experience design remote ethnography provides insight into the user's behaviour whilst completing a specific task in a defined environment. Designers in established fields such as Design for Sustainable Behaviour have applied this behavioural understanding to develop interventions to positively adapt unsustainable behaviours. Existing research techniques have evidenced limitations in fully understanding consumer packaging disposal behaviour, with a clear gap in behavioural insights with packaging used out of the home. A novel mixed-methods approach was developed using remote ethnography to explore consumer food-to-go packaging disposal behaviour out of the home, providing insights which could be evaluated for their application within the packaging development process. In explaining the new methodological approach, this paper (a) proposes a mixed-methods approach by which packaging developers can better understand packaging disposal behaviour out of the home, (b) explains this research method in the context of a food-to-go packaging disposal case study and (c) evaluates the value of the mixed-methods approach within the food packaging development process.

Short Title: "I do not have time. Is there a handout I can use?":

combining physicians' needs and behavior change theory to put physical activity evidence into practice

ISSN: 0937-941X

DOI: 10.1007/s00198-017-3975-6

Accession Number: WOS:000402832500019

Abstract: Guidelines for physical activity exist and following them would improve health. Physicians can advise patients on physical activity. We found barriers related to physicians' knowledge, a lack of tools and of physician incentives, and competing demands for limited time with a patient. We discuss interventions that could reduce these barriers. Uptake of physical activity (PA) guidelines would improve health and reduce mortality in older adults. However, physicians face barriers in guideline implementation, particularly when faced with needing to tailor recommendations in the presence of chronic disease. We performed a behavioral analysis of physician barriers to PA guideline implementation and to identify interventions. The Too Fit To Fracture physical activity recommendations were used as an example of disease-specific PA guidelines. Focus groups and semi-structured interviews were conducted with physicians and nurse practitioners in Ontario, stratified by type of physician, geographic area, and urban/rural, and transcribed verbatim. Two researchers coded data and identified emerging themes. Using the behavior change wheel framework, themes were categorized into capability, opportunity and motivation, and interventions were identified. Fifty-nine family physicians, specialists, and nurse practitioners participated. Barriers were as follows: Capability-lack of exercise knowledge or where to refer; Opportunity-pragmatic tools, fit within existing workflow, available programs that meet patients' needs, physical activity literacy and cultural practices; Motivation-lack of incentives, not in their scope of practice or professional identity, competing priorities, outcome expectancies. Interventions selected: education, environmental restructuring, enablement, persuasion. Policy categories: communications/marketing, service provision, guidelines. Key barriers to PA guideline implementation among physicians include knowledge on where to refer or what to say, access to pragmatic programs or resources, and things that influence motivation, such as competing priorities or lack of incentives. Future work will report on the development and evaluation of knowledge translation interventions informed by the barriers.

Short Title: Parent and child perceptions of school-based obesity prevention in England: a qualitative study

DOI: 10.1186/s12889-015-2567-7

Article Number: 1224

Accession Number: WOS:000366010800001

Abstract: Background: Schools are key settings for childhood obesity prevention, and the location for many intervention studies. This qualitative study aims to explore parent and child experiences of the WAVES study obesity prevention intervention, in order to gain understanding of the mechanisms by which the intervention results in behaviour change, and provide context to support interpretation of the main trial results. Methods: Focus groups were held with 30 parents and 62 children (aged 6–7 years) from primary schools in the West Midlands, UK. Data analysis (conducted using NVivo 10) was guided by the Framework Approach. Results: Three over-arching themes were identified: 'Impact', 'Sustainability' and 'Responsibilities', under which sub-themes were determined. Participants were supportive of the school-based intervention. Parental involvement and the influential role of the teacher were seen as key ingredients for success in promoting consistent messages and empowering some parents to make positive behavioural changes at home. Parents recognised that whilst they held the primary responsibility for obesity prevention in their children, they faced a number of barriers to healthier lifestyles, and agreed that schools have an important role to play. Conclusions: This study enabled us to better understand aspects of the WAVES study intervention programme that have the potential to initiate positive behaviour changes in families, and indicated that a combination of pathways influenced such changes. Pathways included: increasing capability through improving knowledge and skills of children and parents; increasing motivation through parental empowerment and role modelling; and the direct provision of opportunities to lead healthier lifestyles. Strategies to sustain behaviour changes, and the school role in supporting these, are important considerations.

Date: 2023 May

Short Title: Promotion of Sexual Health Self-Efficacy through Gender-Transformative Intervention with Adolescent Boys

ISSN: 1554-6128

DOI: 10.1080/15546128.2023.2213453

Accession Number: WOS:000993492500001

Abstract: This mixed-methods study examined how WiseGuyz, a gender-transformative healthy relationships program, can support positive sexual health self-efficacy (SHSE) among adolescents. 570 adolescent boys provided data on SHSE from before to after the program, and 20 adolescent boys participated in interviews and focus groups to discuss their sexual health education needs. Results showed that boys who participated in WiseGuyz reported a significant increase in SHSE from pretest to post-test and that WiseGuyz was different from typical school-based sexual health education in terms of content and facilitation and increasing program engagement. These findings indicate the potential for gender-transformative interventions in supporting positive SHSE.

Title: Identifying solutions to increase participation in physical activity interventions within a socio-economically disadvantaged community: a qualitative study

Journal: International Journal of Behavioral Nutrition and Physical Activity

Volume: 11

Date: May

Short Title: Identifying solutions to increase participation in physical activity interventions within a socio-economically disadvantaged community: a qualitative study

DOI: 10.1186/1479-5868-11-68

Article Number: 68

Accession Number: WOS:000336765700001

Abstract: Background: There is an urgent need to increase population levels of physical activity, particularly amongst those who are socio-economically disadvantaged. Multiple factors influence physical activity behaviour but the generalisability of current evidence to such 'hard-to-reach' population subgroups is limited by difficulties in recruiting them into studies. Also, rigorous qualitative studies of lay perceptions and perceptions of community leaders about public health efforts to increase physical activity

are sparse. We sought to explore, within a socio-economically disadvantaged community, residents' and community leaders' perceptions of physical activity (PA) interventions and issues regarding their implementation, in order to improve understanding of needs, expectations, and social/environmental factors relevant to future interventions. Methods: Within an ongoing regeneration project (Connswater Community Greenway), in a socio-economically disadvantaged community in Belfast, we collaborated with a Community Development Agency to purposively sample leaders from public- and voluntary-sector community groups and residents. Individual semi-structured interviews were conducted with 12 leaders. Residents (n = 113), of both genders and a range of ages (14 to 86 years) participated in focus groups (n = 14) in local facilities. Interviews and focus groups were recorded, transcribed verbatim and analysed using a thematic framework. Results: Three main themes were identified: awareness of PA interventions; factors contributing to intervention effectiveness; and barriers to participation in PA interventions. Participants reported awareness only of interventions in which they were involved directly, highlighting a need for better communications, both inter- and intra-sectoral, and with residents. Meaningful engagement of residents in planning/organisation, tailoring to local context, supporting volunteers, providing relevant resources and an 'exit strategy' were perceived as important factors related to intervention effectiveness. Negative attitudes such as apathy, disappointing experiences, information with no perceived personal relevance and limited access to facilities were barriers to people participating in interventions. Conclusions: These findings illustrate the complexity of influences on a community's participation in PA interventions and support a social-ecological approach to promoting PA. They highlight the need for cross-sector working, effective information exchange, involving residents in bottom-up planning and providing adequate financial and social support. An in-depth understanding of a target population's perspectives is of key importance in translating PA behaviour change theories into practice.

ISSN: 2040-2244

DOI: 10.2166/wcc.2015.004

Accession Number: WOS:000378052600007

Abstract: Social learning concepts of developed countries are often recommended for implementing strategies for climate change adaptation in developing countries. The effectiveness of these replications is questionable, because it is necessary to align the set-up of learning processes with the social, economic and environmental conditions of the local context. In this paper, we compare the theory of social learning in Learning Alliances with a Working Group for climate change adaptation in Can Tho City in Vietnam to see how far it is possible to extrapolate current social learning concepts from developed countries to developing countries. The Working Group facilitates participation processes among stakeholders to use and produce knowledge, to work together on problems and to further develop solutions. This is mostly similar to the social learning form of a Learning Alliance. However, the interactions among stakeholders in the Working Group evolve in a much more formal way, which leads to several problems caused by the relative inflexibility of the top-down stipulation of stakeholders' participation, planning procedures and solution approaches. To overcome this challenge, we recommend introducing elements of Learning Alliances to the Working Group, in order to stimulate an open dialogue with incentives and an extension of an action practice approach.

With Dementia in Their Environments (COPE)": A Hybrid
Implementation-Effectiveness Study

ISSN: 0016-9013

DOI: 10.1093/geront/gnaa105

Accession Number: WOS:000692622100021

Abstract: Background and Objectives: The translation of reablement programs into practice is lagging despite strong evidence for interventions that maintain function for the person living with dementia as well as improve carer well-being. The aim was to evaluate the implementation of an evidence-based program, Care of People with Dementia in Their Environments (COPE), into health services. Research Design and Methods: An implementation-effectiveness hybrid design was used to evaluate implementation outcomes while simultaneously involving a pragmatic pre-post evaluation of outcomes for people with dementia. We report uptake, fidelity to intervention, outcomes for people living with dementia and carers, and beliefs and behaviors of interventionists contributing to successful implementation. Results: Seventeen organizations in Australia across 3 health contexts, 38 occupational therapists, and 17 nurses participated in training and implementation. While there were challenges and delays in implementation, most organizations were able to offer the program and utilized different models of funding. Overall, we found there was moderate fidelity to components of the program. Pre-post outcomes for carer well-being and coping (Perceived Change Index, $p < .001$) and activity engagement of the person living with dementia ($p = .002$) were significantly increased, replicating previous trial results. What contributed most to therapists implementing the program (Determinants of Implementation Behaviour Questionnaire) was a stronger intent to deliver ($p < .001$), higher confidence ($p < .001$), a sense of control in delivery ($p = .004$), and a belief the program was very useful to their clients ($p = .002$). Discussion and Implications: This study demonstrated that implementation is possible in multiple health systems and beneficial to individuals and their families.

Short Title: Integrated solutions for sustainable fall prevention in primary care, the iSOLVE project: a type 2 hybrid effectiveness implementation design

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0529-9

Article Number: 12

Accession Number: WOS:000395707600001

Abstract: Background: Despite strong evidence giving guidance for effective fall prevention interventions in community-residing older people, there is currently no clear model for engaging general medical practitioners in fall prevention and routine use of allied health professionals in fall prevention has been slow, limiting widespread dissemination. This protocol paper outlines an implementation-effectiveness study of the Integrated Solutions for Sustainable Fall Prevention (iSOLVE) intervention which has developed integrated processes and pathways to identify older people at risk of falls and engage a whole of primary care approach to fall prevention. Methods/design: This protocol paper presents the iSOLVE implementation processes and change strategies and outlines the study design of a blended type 2 hybrid design. The study consists of a two-arm cluster randomized controlled trial in 28 general practices and recruiting 560 patients in Sydney, Australia, to evaluate effectiveness of the iSOLVE intervention in changing general practitioner fall management practices and reducing patient falls and the cost effectiveness from a healthcare funder perspective. Secondary outcomes include change in medications known to increase fall risk. We will simultaneously conduct a multi-methodology evaluation to investigate the workability and utility of the implementation intervention. The implementation evaluation includes in-depth interviews and surveys with general practitioners and allied health professionals to explore acceptability and uptake of the intervention, the coherence of the proposed changes for those in the work setting, and how to facilitate the collective action needed to implement changes in practice; social network mapping will explore professional relationships and influences on referral patterns; and, a survey of GPs in the geographical intervention zone will test diffusion of evidence-based fall prevention practices. The project works in partnership with a primary care health network, state fall prevention leaders, and a community of practice of fall prevention advocates. Discussion: The design is aimed at providing clear direction for sustainability and informing decisions about generalization of the iSOLVE intervention processes and change strategies. While challenges exist in hybrid designs, there is a potential for significant outcomes as the iSOLVE pathways project brings together practice and research to collectively solve a major national problem with implications for policy service delivery.

Title: Assessing the Potential for Nurse-Led HIV Pre- and Postexposure Prophylaxis in Ontario

Journal: Canadian Journal of Nursing Research

Volume: 53

Issue: 2

Pages: 145-154

Date: Jun

Short Title: Assessing the Potential for Nurse-Led HIV Pre- and Postexposure Prophylaxis in Ontario

ISSN: 0844-5621

DOI: 10.1177/0844562120924269

Accession Number: WOS:000655051700007

Abstract: Background and purpose: HIV prevention efforts in Ontario require increased implementation of strategies including post- and pre-exposure prophylaxis. Access to these interventions could be improved by their provision through nurse-led models of care. We assessed nurses' readiness to deliver these interventions using a behavioral change framework. Methods: We distributed an online survey to nurses in every Ontario sexual health clinic, HIV clinic, and community health center between March-June 2018, to determine the level of support for nurse-led postexposure prophylaxis/preexposure prophylaxis; we also explored nurses' "capabilities," "opportunities," and "motivations" for providing postexposure prophylaxis/pre-exposure prophylaxis. Results: Overall, 72.7% of respondents supported implementation of both nurse-led postexposure prophylaxis and pre-exposure prophylaxis. More experienced nurses were less likely to support nurse-led postexposure prophylaxis and pre-exposure prophylaxis (adjusted odds ratio = 0.55 per decade nursing, 95% confidence interval (0.37, 0.82)). Nurses reported a high degree of knowledge of topics related to postexposure

prophylaxis/pre-exposure prophylaxis, with the exception of creatinine interpretation. Conclusions: Ontario nurses report high levels of support for nurse-led postexposure prophylaxis and pre-exposure prophylaxis and are well positioned to provide these interventions. Targeted education and implementation efforts are needed to engage these nurses in postexposure prophylaxis and pre-exposure prophylaxis delivery.

Issue: 1

Short Title: Protocol for a cluster randomised controlled trial of the DAFNEplus (Dose Adjustment For Normal Eating) intervention compared with 5x1 DAFNE: a lifelong approach to promote effective self-management in adults with type 1 diabetes

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2020-040438

Article Number: e040438

Accession Number: WOS:000611963800056

Abstract: Introduction The successful treatment of type 1 diabetes (T1D) requires those affected to employ insulin therapy to maintain their blood glucose levels as close to normal to avoid complications in the long-term. The Dose Adjustment For Normal Eating (DAFNE) intervention is a group education course designed to help adults with T1D develop and sustain the complex self-management skills needed to adjust insulin in everyday life. It leads to improved glucose levels in the short term (manifest by falls in glycated haemoglobin, HbA1c), reduced rates of hypoglycaemia and sustained improvements in quality of life but overall glucose levels remain well above national targets. The DAFNEplus intervention is a development of DAFNE designed to incorporate behavioural change techniques, technology and longer-term structured support from healthcare professionals (HCPs). Methods and analysis A pragmatic cluster randomised controlled trial in adults with T1D, delivered in

diabetes centres in National Health Service secondary care hospitals in the UK. Centres will be randomised on a 1:1 basis to standard DAFNE or DAFNEplus. Primary clinical outcome is the change in HbA1c and the primary endpoint is HbA1c at 12 months, in those entering the trial with HbA1c >7.5% (58 mmol/mol), and HbA1c at 6 months is the secondary endpoint. Sample size is 662 participants (approximately 47 per centre); 92% power to detect a 0.5% difference in the primary outcome of HbA1c between treatment groups. The trial also measures rates of hypoglycaemia, psychological outcomes, an economic evaluation and process evaluation. Ethics and dissemination Ethics approval was granted by South West-Exeter Research Ethics Committee (REC ref: 18/SW/0100) on 14 May 2018. The results of the trial will be published in a National Institute for Health Research monograph and relevant high-impact journals.

Article Number: 17423953211069090

Accession Number: WOS:000737888000001

Abstract: Objectives Research suggests that higher Body Mass Index is associated with improved survival in people with Amyotrophic Lateral Sclerosis (pwALS). Yet, understanding of the barriers and enablers to increasing calorie intake is limited. This study sought to explore these issues from the perspective of pwALS, informal carers, and healthcare professionals. Methods Interviews with 18 pwALS and 16 informal carers, and focus groups with 51 healthcare professionals. Data were analysed using template analysis and mapped to the COM-B model and Theoretical Domains Framework (TDF). Results All three COM-B components (Capability, Opportunity and Motivation) are important to achieving high calorie diets in pwALS. Eleven TDF domains were identified: Physical skills (ALS symptoms); Knowledge (about high calorie diets and healthy eating); Memory, attention, and decision processes (reflecting cognitive difficulties); Environmental context/resources (availability of informal and formal carers); Social influences (social aspects of eating); Beliefs about consequences (healthy eating vs. high calorie diets); Identity (interest in health lifestyles); Goals (sense of control); Reinforcement (eating habits); and Optimism and Emotion (low mood, poor appetite). Discussion To promote high calorie diets for pwALS, greater clarity around the rationale and content of recommended diets is needed. Interventions should be tailored to patient symptoms, preferences, motivations, and opportunities.

DOI: 10.1186/s12887-023-03940-3

Article Number: 131

Accession Number: WOS:000954718400003

Abstract: Background Many children and adolescents with Type 1 Diabetes Mellitus (T1DM) don't meet the recommended levels of physical activity. Healthcare professionals (HCPs) have a key role in supporting and encouraging children and adolescents with T1DM to be physically active. This study aims to understand the perspectives of HCPs in relation to supporting physical activity and implementing guidelines relating to physical activity. **Methods** An online mixed methods survey was circulated to HCPs in pediatric diabetes units in England and Wales. Participants were asked about how they support physical activity in their clinic and their perceptions of barriers/enablers of providing physical activity support to children and adolescents with T1DM. Quantitative data were analysed descriptively. An deductive thematic approach was applied to the free text responses using the Capability Opportunity Motivation model of Behaviour (COM-B) as a framework. **Results** Responses were received from 114 individuals at 77 different pediatric diabetes units (45% of pediatric diabetes units in England and Wales). HCPs surveyed felt that the promotion of physical activity is important (90%) and advised patients to increase levels of physical activity (88%). 19% of the respondents felt they did not have sufficient knowledge to provide support. HCPs reported limited knowledge and confidence, time and resources as barriers to providing support. They also felt the current guidance was too complicated with few practical solutions. **Conclusion** Pediatric HCPs need training and support to be able to encourage and support children and adolescents with T1D to be a physical activity. In addition, resources that provide simple and practical advice to manage glucose around exercise are needed.

Abstract: Introduction A physical activity counseling intervention based on a motivation-volition model was developed and delivered to in-patients with Major Depressive Disorders with the aim of increasing lifestyle physical activity. The aim of this study is to evaluate the short-term outcomes of this intervention. **Methods** A multi-center randomized controlled trial was conducted in four Swiss psychiatric clinics. Adults who were initially insufficiently physically active and were diagnosed with Major Depressive Disorder according to ICD-10 were recruited. The sample consisted of 113 participants in the intervention group (M-age = 42 years, 56% women) and 107 in the control group (M-age = 40 years, 49% women). Motivation and volition determinants of physical activity were assessed with questionnaires. Implicit attitudes were assessed with an Implicit Association Test. Physical activity was self-reported and measured with hip-worn accelerometers over 7 consecutive days starting on the day following the data collection. **Results** According to accelerometer measures, step count decreased on average 1,323 steps less per day (95% CI = -2,215 to -431, $p < 0.01$) over time in the intervention group compared to the control group. A trend was recognized indicating that moderate-to-vigorous physical activity decreased on average 8.37 min less per day (95% CI = -16.98 to 0.23, $p < 0.06$) over time in the intervention group compared to the control group. The initial phase of the intervention does not seem to have affected motivational and volitional determinants of and implicit attitudes toward physical activity. **Conclusion** Physical activity counseling may be considered an important factor in the transition from in-patient treatment. Methods to optimize the intervention during this period could be further explored to fulfill the potential of this opportunity.

Accession Number: WOS:000835725300002

Abstract: Introduction: Physical activity can be an effective complementary treatment for major depression, yet among afflicted people, physical inactivity is prevalent. The aim of the "Physical Activity Counseling in In-Patients with Major Depression" (PACINPAT) trial was to promote a more physically active lifestyle by implementing a theory-based in-person and remote counseling intervention. It is not only important to establish whether this approach works, but also how, when and why it works. Hence, the aim of this study was to explore how participants receiving a theory-based physical activity counseling intervention experienced the intervention. Methods: Semi-structured interviews were conducted with 12 participants who were recruited purposively after completing the intervention and data assessments within the PACINPAT randomized controlled trial being conducted in four Swiss psychiatric clinics. The interviews were analyzed according to the six steps of reflexive thematic analysis. Findings: Twelve initially physically inactive adults described managing life with depression as "balancing pressures" which strongly influenced their well-being and physical activity behaviors. This became visible in the varying experiences to the intervention: (1) Expansive: increasing well-being with maintained physical activity; (2) Adoptive: fragile well-being with relationship-dependent physical activity; (3) Stagnant: declining well-being with shift away from physical activity; and (4) Confirmatory: unchanged well-being with unaffected physical activity. Conclusion: Participants with major depression who took part in the same physical activity counseling intervention experienced it in four distinguishable ways, which were noticeably linked with their level of self-management. Identifying these experience patterns is promising, because it could lead to refining the intervention to improve effectiveness for individuals. Further investigation is required to validate these suggested experience patterns.

Article Number: 316

Accession Number: WOS:000982157600003

Abstract: Background The physical activity counseling for in-patients with major depression (PACINPAT) randomized controlled trial was launched to tackle physical inactivity for in-patients with major depressive disorder. Evidence shows that despite potential treatment effects, physical inactivity is prevalent in this population. To contribute to the assessment of how this in-person and remote, theory-based, individually tailored intervention was designed, received and effected behavior, the aim of this study was to evaluate its implementation. Methods This implementation evaluation was conducted within a multi-center randomized controlled trial according to the Process Evaluation Framework by the Medical Research Council including the analysis of reach, dose, fidelity and adaptation. Data were collected from the implementers and the participants randomized to the intervention group of the trial. Results The study sample comprised 95 physically inactive in-patients (mean age: 42 years, 53% women) with diagnosed major depressive disorder. The intervention reached the intended population (N = 95 in-patients enrolled in the study). The intervention dose varied between early dropouts (counseling sessions, M = 1.67) and study completers with some participants receiving a low dose (counseling sessions, M = 10.05) and high dose (counseling sessions, M = 25.37). Differences in the attendance groups were recognizable in the first two counseling sessions (duration of counseling session about 45 min in early dropouts versus 60 min for study completers). Fidelity of the in-person counseling content was partly achieved and adapted, whereas that of the remote counseling content was well achieved. Participants (86% at follow up) reported satisfaction with the implementers of the intervention. Adaptations were made to content, delivery mode and dose. Conclusion The PACINPAT trial was implemented in the intended population, in varying doses and with adaptations made to in-person counseling content and remote counseling dose. These findings are key to understanding outcome analyses within the PACINPAT trial, further developing interventions and contributing to implementation research among in-patients with depressive disorders.

Accession Number: WOS:000798307700001

Abstract: Health psychology as a discipline has existed for more than four decades and is primarily concerned with research, theory, and practice at the nexus of psychology and health. The discipline is well established across Europe, the United States, and Australia with health psychology societies, postgraduate programmes, conferences, and academic journals dedicated to the discipline in the majority of these countries. However, in South Africa, health psychology remains a broad umbrella term under which psychologists and other health care professionals conduct research. Health psychology is concerned with the biological, social, psychological, contextual, and structural drivers of health and illness, and relies on theory and empirically-driven research to identify and understand important links between health and behaviour. In South Africa, where a large proportion of the population faces multiple co-occurring disease epidemics, such as HIV/AIDS, TB, COVID-19, diabetes, and heart disease, there is a need for a uniting sub-discipline like health psychology to focus intervention efforts and to meet the sustainable development goals. The recent re-establishment of a special interest group in health psychology in the Psychological Society of South Africa (PsySSA) is an important first step. In this article, and as members of the newly re-established special interest group in health psychology, we call attention to the need to promote health psychology in South Africa. In this article, we describe the paradigmatic traditions and theoretical models that inform the discipline. We then argue why health psychology should be prioritised again and recommend future directions for health psychology in South Africa.

Pages: E388-E393

Date: Jun

Short Title: Opportunistic pulse checks in primary care to improve recognition of atrial fibrillation: a retrospective analysis of electronic patient records

ISSN: 0960-1643

DOI: 10.3399/bjgp18X696605

Accession Number: WOS:000442323400001

Abstract: Background Atrial fibrillation (AF) is an important and modifiable risk factor for stroke. Earlier identification may reduce stroke-related morbidity and mortality. Trial evidence shows that opportunistic pulse regularity checks in individuals aged ≥ 65 years increases detection of AF. However, this is not currently recommended by the National Screening Programme or implemented by most clinical commissioning groups (CCGs). Aim To evaluate the impact of a systematic programme to promote pulse regularity checks, the programme's uptake in general practice, and the prevalence of AF. Design and setting Retrospective analysis of electronic primary care patient records in three east London CCGs (City and Hackney, Newham, and Tower Hamlets) over 10 years. Method Rates of pulse regularity checks and prevalence of AF in individuals aged ≥ 65 years were compared from the pre-intervention period, 2007-2011, to the post-intervention period, 2012-2017. Results Across the three CCGs, rates of pulse regularity checks increased from a mean of 7.3% pre-intervention to 66.4% post-intervention, achieving 93.1% (n = 58 722) in the final year. Age-standardised prevalence of AF in individuals aged ≥ 65 years increased significantly from a pre-intervention mean of 61.4/1000 to a post-intervention mean of 64.5/1000. There was a significant increase in a post-intervention trend to a final-year mean of 67.3/1000: an improvement of 9.6% (5.9/1000) with 790 additional new cases identified. Conclusion Organisational alignment, standardised data entry, peer-performance dashboards, and financial incentives rapidly and generally increased opportunistic screening with pulse regularity checks. This was associated with a significant increase in detection and prevalence of AF and is of public health importance.

Short Title: Do practitioners and friends support patients with coronary heart disease in lifestyle change? a qualitative study

DOI: 10.1186/1471-2296-14-126

Article Number: 126

Accession Number: WOS:000323837100001

Abstract: Background: Healthy lifestyles help to prevent coronary heart disease (CHD) but outcomes from secondary prevention interventions which support lifestyle change have been disappointing. This study is a novel, in-depth exploration of patient factors affecting lifestyle behaviour change within an intervention designed to improve secondary prevention for patients with CHD in primary care using personalised tailored support. We aimed to explore patients' perceptions of factors affecting lifestyle change within a trial of this intervention (the SPHERE Study), using semi-structured, one-to-one interviews, with patients in general practice. Methods: Interviews (45) were conducted in purposively selected general practices (15) which had participated in the SPHERE Study. Individuals, with CHD, were selected to include those who succeeded in improving physical activity levels and dietary fibre intake and those who did not. We explored motivations, barriers to lifestyle change and information utilised by patients. Data collection and analysis, using a thematic framework and the constant comparative method, were iterative, continuing until data saturation was achieved. Results: We identified novel barriers to lifestyle change: such disincentives included strong negative influences of social networks, linked to cultural norms which encouraged consumption of 'delicious' but unhealthy food and discouraged engagement in physical activity. Findings illustrated how personalised support within an ongoing trusted patient-professional relationship was valued. Previously known barriers and facilitators relating to support, beliefs and information were confirmed. Conclusions: Intervention development in supporting lifestyle change in secondary prevention needs to more effectively address patients' difficulties in overcoming negative social influences and maintaining interest in living healthily.

Accession Number: WOS:000587791500008

Abstract: Preexposure prophylaxis (PrEP) is highly effective in preventing HIV among both men and women, with the reduction in risk directly linked to medication adherence. Navigation services and other adherence interventions have demonstrated efficacy in medication uptake; however, their use may not be fully integrated into clinic operations or their roles clearly defined. This quality improvement (QI) project developed an evidenced–based PrEP Navigation (PN) tool to identify patient–reported barriers to uptake and to support process improvement at a large community health center in Washington, DC. Outcomes related to patient–reported barriers, patient demographics, and time to medication pickup from the pharmacy were measured before and after implementation. A total of 198 patients were included in this analysis. Mean days from initial prescription to medication pickup was reduced by 1.42 days ($p = .030$) following PN tool implementation. The evidenced–based PN tool is modifiable to the needs of the individual clinic and the patients they care for to support wide–scale PrEP uptake and continuous system process improvements.

Short Title: Promoting social capital to alleviate loneliness and improve health among older people in Spain

ISSN: 0966-0410

DOI: 10.1111/hsc.12284

Accession Number: WOS:000392755700015

Abstract: Loneliness is especially frequent among older people in Southern Europe. Furthermore, promoting social capital to tackle loneliness and its health effects is an understudied intervention strategy. Therefore, a complex intervention was piloted in Spain in a pre-post study with a 2-year follow-up. Its aims were to explore the feasibility of the intervention and its short- and long-term effects. It was conducted in one mixed rural/urban and two urban areas of diverse socioeconomic levels from 2011 to 2012. The intervention framework was based on social capital theory applying a behaviour change model and care co-ordination. The intervention comprised: (i) a co-ordinated action aimed at building a network between primary healthcare centres and community assets in the neighbourhood and (ii) a group-based programme, which promoted social capital among lonely older people, especially social support and participation. Older people active in senior centres volunteered as gatekeepers. The main outcome domain was loneliness. Secondary outcome domains were participation, social support, self-perceived health, quality of life, depressive symptoms and use of health resources. Pre-post changes were assessed with t-test, Wilcoxon signed-rank test and McNemar's test. Differences between the three time points were assessed with a one-way ANOVA with repeated measures. Social workers and nurses were successfully involved as group leaders, 10 volunteers took part and 38 participants were included. After the intervention, loneliness decreased while social participation and support significantly increased. Furthermore, the number of visits to nurses increased. Exactly 65.8% of the participants built social contacts within the group and 47.4% became engaged in new activities. Two years later, social effects were maintained and depressive symptoms had decreased. Exactly 44.7% of the participants continued to be in contact with at least one person from the group and 39.5% continued participating. The intervention contributes a novel and feasible social capital-based approach for alleviating loneliness among older adults while prompting meaningful changes in their lives.

DOI: 10.1016/j.jpeds.2022.05.011

Accession Number: WOS:000854101300024

Abstract: Objective To test associations between parent-reported confidence to avoid hospitalization and caregiving strain, activation, and health-related quality of life (HRQOL). Study design In this prospective cohort study, enrolled parents of children with medical complexity (n = 75) from 3 complex care programs received text messages (at random times every 2 weeks for 3 months) asking them to rate their confidence to avoid hospitalization in the next month. Low confidence, as measured on a 10-point Likert scale (1 = not confident; 10 = fully confident), was defined as a mean rating <5. Caregiving measures included the Caregiver Strain Questionnaire, Family Caregiver Activation in Transition (FCAT), and caregiver HRQOL (Medical Outcomes Study Short Form 12 [SF12]). Relationships between caregiving and confidence were assessed with a hierarchical logistic regression and classification and regression trees (CART) model. Results The parents were mostly mothers (77%) and were linguistically diverse (20% spoke Spanish as their primary language), and 18% had low confidence on average. Demographic and clinical variables had weaker associations with confidence. In regression models, low confidence was associated with higher caregiver strain (aOR, 3.52; 95% CI, 1.45-8.54). Better mental HRQOL was associated with lower likelihood of low confidence (aOR, 0.89; 95% CI, 0.80-0.97). In the CART model, higher strain similarly identified parents with lower confidence. In all models, low confidence was not associated with caregiver activation (FCAT) or physical HRQOL (SF12) scores. Conclusions Parents of children with medical complexity with high strain and low mental HRQOL had low confidence in the range in which intervention to avoid hospitalization would be warranted. Future work could determine how adaptive interventions to improve confidence and prevent hospitalizations should account for strain and low mental HRQOL.

Short Title: Influence government: Exploring practices, ethics, and power in the use of targeted advertising by the UK state

ISSN: 2053-9517

DOI: 10.1177/20539517221078756

Article Number: 20539517221078756

Accession Number: WOS:000772268000001

Abstract: We have identified an emerging tool being used by the UK government across a range of public bodies in the service of public policy – the online targeted advertising infrastructure and the practices, consultancy firms, and forms of expertise which have grown up around it. This reflects an intensification and adaptation of a broader 'behavioural turn' in the governmentality of the UK state and the increasing sophistication of everyday government communications. Contemporary UK public policy is fusing with the powerful tools for behaviour change created by the platform economy. Operational data and associated systems of classification and profiling from public bodies are being hybridised with traditional consumer marketing profiles and then 'projected' onto the classification systems of the targeted advertising infrastructures. This is not simply a case of algorithms being used for sorting, surveilling, and scoring; rather this suggests that targeted interventions in the cultural and behavioural life of communities are now a core part of governmental power which is being algorithmically-driven, in combination with influencer networks, traditional forms of messaging, and frontline operational practices. We map these uses and practices of what we describe as the 'Surveillance Influence Infrastructure', identifying key ethical issues and implications which we believe have yet to be fully investigated or considered. What we find particularly striking is the coming-together of two separate structures of power – the governmental turn to behaviourism and prevention on one hand, and the infrastructures of targeting and influence (and their complex tertiary markets) on the other. We theorise this as a move beyond 'nudge' or 'behavioural science' approaches, towards a programme which we term 'influence government'.

DOI: 10.1111/1747-0080.12344

Accession Number: WOS:000399944700003

Abstract: AimImplementation of an intervention can result in a discrepancy between what was planned and what is delivered, affecting outcomes for recipients. The aim was to explore, from the perspective of hospital foodservice staff, their experiences delivering a nutrition intervention and the barriers and enablers to its implementation. MethodsA process evaluation of a pilot study was undertaken using qualitative description. A purposive sample (n = 15) of hospital foodservice supervisors and foodservice assistants responsible for delivering a higher energy menu to hospital patients participated in focus groups and semistructured interviews. Theoretical frameworks of behaviour underpinned the method. Content analysis elicited factors (sub-themes) influencing foodservice staff's capability, opportunity and motivation to provide the nutrition intervention. Thematic analysis (by two independent researchers) further explored factors (themes) related to the process of the intervention's implementation. ResultsFive key themes (and 15 sub-themes) explained factors effecting implementation of the nutrition intervention. Aspects of the foodservice environment and patients' resistance were barriers to implementation and perceived sustainability. Teamwork, problem solving, leadership and job satisfaction were enablers. There was an opportunity to optimise training and feedback. Characteristics of foodservice staff, including their: knowledge, beliefs and perceptions of diet, health and their job role, had the potential to influence their behaviours and decision making. ConclusionsA number of interacting factors influenced foodservice staff's delivery of a higher energy menu as planned. Addressing the challenges of time, foodservice structure, patients' resistance, gaps in knowledge and misconceptions among foodservice staff may enhance similar nutrition interventions in the future.

DOI: 10.1007/s00520-022-07273-2

Accession Number: WOS:000821994100001

Abstract: Purpose To explore the experiences of women with breast cancer and pelvic floor (PF) dysfunction and the perceived enablers and barriers to uptake of treatment for PF dysfunction during their recovery. Method Purposive sampling was used to recruit 30 women with a past diagnosis of breast cancer and PF dysfunction. Semi-structured interviews were conducted, and data were analysed inductively to identify new concepts in the experiences of PF dysfunction in women with breast cancer and deductively according to the capability, opportunity, motivation and behaviour (COM-B) framework to identify the enablers and barriers to the uptake of treatment for PF dysfunction in women with breast cancer. Results Participants were aged between 31 and 88 years, diagnosed with stages I–IV breast cancer and experienced either urinary incontinence (n = 24/30, 80%), faecal incontinence (n = 6/30, 20%) or sexual dysfunction (n = 20/30, 67%). They were either resigned to or bothered by their PF dysfunction; bother was exacerbated by embarrassment from experiencing PF symptoms in public. Barriers to accessing treatment for PF dysfunction included a lack of awareness about PF dysfunction following breast cancer treatments and health care professionals not focussing on the management of PF symptoms during cancer treatment. An enabler was their motivation to resume their normal pre-cancer lives. Conclusion Participants in this study reported that there needs to be more awareness about PF dysfunction in women undergoing treatment for breast cancer. They would like to receive information about PF dysfunction prior to starting cancer treatment, be screened for PF dysfunction during cancer treatment and be offered therapies for their PF dysfunction after primary cancer treatment. Therefore, a greater focus on managing PF symptoms by clinicians may be warranted in women with breast cancer.

Abstract: Background: A wide range of diverse and inconsistent terminology exists in the field of knowledge translation. This limits the conduct of evidence syntheses, impedes communication and collaboration, and undermines knowledge translation of research findings in diverse settings. Improving uniformity of terminology could help address these challenges. In 2012, we convened an international working group to explore the idea of developing a common terminology and an overarching framework for knowledge translation interventions. Findings: Methods included identifying and summarizing existing frameworks, mapping together a subset of those frameworks, and convening a multi-disciplinary group to begin working toward consensus. The group considered four potential approaches to creating a simplified framework: melding existing taxonomies, creating a framework of intervention mechanisms rather than intervention strategies, using a consensus process to expand one of the existing models/frameworks used by the group, or developing a new consensus framework. Conclusions: The work group elected to draft a new, simplified consensus framework of interventions to promote and integrate evidence into health practices, systems and policies. The framework will include four key components: strategies and techniques (active ingredients), how they function (causal mechanisms), how they are delivered (mode of delivery), and what they aim to change (intended targets). The draft framework needs to be further developed by feedback and consultation with the research community and tested for usefulness through application and evaluation.

Article Number: 57

Accession Number: WOS:000381784300001

Abstract: Background: Health systems globally promote appropriate prescribing by healthcare providers and safe and effective medicine use by consumers. Rx for Change, a publicly available database, provides access to systematic reviews regarding best practices for prescribing and using medicines. Despite the value of the database for improving prescribing and medicine use, its use remains suboptimal. This study aimed to develop a training program for five medicine-focused organisations in Canada and Australia to facilitate the use and understanding of the Rx for Change database. Methods: Four steps were undertaken: 1) key informant interviews were completed across all organisations to understand the knowledge user perspective; 2) a directed content analysis was completed of the interview transcripts and proposed training was developed; 3) a second round of feedback on the proposed training by knowledge users was gathered; and 4) feedback was integrated to develop the final training. Results: Sixteen key informant interviews with knowledge users were conducted. Themes for training content included the scope of, navigation and strategies for using Rx for Change (generic content) and practical examples on incorporating evidence within their workplace context (tailored content). The final training consisted of an informational video, a 60-minute face-to-face workshop and two post-training reminders. Conclusions: A method of engaging knowledge users in the development of a training program to improve the use of an on-line database of systematic reviews was established and used to design training. Next steps include the delivery and evaluation of the training.

DOI: 10.1371/journal.pone.0247455

Article Number: e0247455

Accession Number: WOS:000623082400056

Abstract: Objectives This paper reports a mixed methods evaluation of a new pathway to improve clinical outcomes for older people with fractures treated at a hospital Trust in the West Midlands, UK. The paper focuses specifically on the context surrounding the translation of the new pathway into practice and the way that external and internal factors influenced its adaptation and implementation. Methods Quantitative analysis used a controlled Interrupted Time Series (ITS) to estimate the effect of the new pathway on patient complication rate, median length of hospital stay and 30-day mortality by comparing the pre- and post-intervention periods. ITS data were extracted from the UK Trauma Audit and Research Network (TARN) database and a patient-level control group identified using propensity score matching. Parallel qualitative analysis aimed to examine the context surrounding the new pathway and how external and internal factors might influence its adaptation and implementation into clinical practice. Data were collected via semi-structured interviews (n = 16) undertaken with staff and clinical stakeholders within the Trust and were analysed using the COM-B (Capability, Opportunity, Motivation) model of behaviour. Results No statistically significant effects were found for any of the patient outcomes studied in the controlled ITS analysis. Qualitative data suggest that the lack of effectiveness of the new initiative can be explained with reference to the capability, opportunity and motivation of internal Trust stakeholders to engage with the pathway, which created a non-receptive environment within the Trust. Conclusions Successfully implementing new care pathways in environments that may be non-receptive to change requires efforts to be put into winning 'hearts and minds' within the organisation to ensure engagement from key stakeholders during intervention development. Evidence must be provided internally of the way that a given intervention will alleviate the problematic issues being experienced within the organisation, and external dissemination of results should be avoided until there is evidence of a positive effect within the organisation where the new care pathway is first implemented.

Short Title: Development of a theory-based intervention to increase cognitively able frail elders' engagement with advance care planning using the behaviour change wheel

DOI: 10.1186/s12913-021-06548-4

Article Number: 712

Accession Number: WOS:000677514000002

Abstract: Background Advance care planning (ACP) conversations support people to think about, discuss and document their beliefs, values and preferences regarding future care. This process means that should the person lose capacity in the future, care can be provided, consistent with their personal values and beliefs. The ACP process is particularly relevant for older people living with frailty (frail elders) as they are vulnerable to sudden deterioration. However, ACP is rarely undertaken by frail elders. The aim of this study was to develop an intervention to increase multidisciplinary health and social care professionals' (H&SCPs) engagement of cognitively able, domestic-dwelling frail elders with ACP. **Methods** Intervention development was guided by the Medical Research Council framework for complex interventions and the Behaviour Change Wheel. Multiple methods were used to understand ACP barriers and enablers: a systematic integrative review, a survey (n=73 H&SCPs), and semi-structured interviews (n=10 frail elders, n=8 family members). A conceptual model, developed from the integrative review, underpinned data collection for the survey and interviews. Synthesis of this data, including patient and public involvement, was then used to identify H&SCPs behaviours that needed to change for ACP to be implemented and decide content and implementation for the intervention. **Results** Following the Behaviour Change Wheel system, and based on the findings of the review, survey and interviews, the prototype intervention, Conversations on Living and Dying (CLaD), was developed. The CLaD prototype consisted of one 3.5-hour educational skills session for H&SCPs supported by a toolkit. Content focussed on the relevance of ACP for frail elders, experience of ACP by frail elders, and strategies H&SCPs could adopt to encourage frail elders' engagement with ACP. Strategies include recognising the importance of relationships and living well now, preparing frail elders for ACP conversations and starting ACP early. Participants who took part in initial prototype refinement reported that the intervention helped them think differently about ACP and encouraged them to engage with frail elders. **Conclusions** The use of behavioural theory enabled the development of CLaD, an evidence-based, theory-driven, person-centred intervention to support ACP engagement with frail elders. While feasibility testing is required, initial prototype refinement demonstrated that H&SCPs found the intervention to be acceptable, engaging, and clinically valuable in their practice with frail elders and their families.

Short Title: Development and optimisation of a multi-component workplace intervention to increase cycling for the Cycle Nation Project

DOI: 10.3389/fspor.2022.857554

Article Number: 857554

Accession Number: WOS:000882188400001

Abstract: The Cycle Nation Project (CNP) aimed to develop, test the feasibility of and optimize a multi-component individual-/social-level workplace-based intervention to increase cycling among office staff at a multinational bank (HSBC UK). To do this, we first explored barriers to cycling in a nationally-representative survey of UK adults, then undertook focus groups with bank employees to understand any context-specific barriers and ways in which these might be overcome. These activities led to identification of 10 individual-level, two social-level, and five organizational-level modifiable factors, which were mapped to candidate intervention components previously identified in a scoping review of cycling initiatives. Interviews with HSBC UK managers then explored the practicality of implementing the candidate intervention components in bank offices. The resultant pilot CNP intervention included 32 core components across six intervention functions (education, persuasion, incentivisation, training, environmental restructuring, enablement). Participants received a loan bike for 12-weeks (or their own bike serviced), and a 9-week cycle training course (condensed to 6 weeks for those already confident in basic cycling skills), including interactive information sharing activities, behavior change techniques (e.g., weekly goal setting), bike maintenance training, practical off-road cycling skill games and on-road group rides. Sessions were delivered by trained bank staff members who were experienced cyclists. The CNP pilot intervention was delivered across three sites with 68 participants. It was completed in two sites (the third site was stopped due to COVID-19) and was feasible and acceptable to both women and men and across different ethnicities. In addition, the CNP intervention was successful (at least in the short term) in increasing cycling by 3

rides/week on average, and improving perceptions of safety, vitality, confidence, and motivation to cycle. Following minor modifications, the long-term effectiveness and cost-effectiveness of the CNP intervention should be tested in a full-scale randomized controlled trial.

Title: Development of a behaviour change intervention to increase upper limb exercise in stroke rehabilitation

Journal: Implementation Science

Volume: 10

Date: Mar

Short Title: Development of a behaviour change intervention to increase upper limb exercise in stroke rehabilitation

ISSN: 1748-5908

DOI: 10.1186/s13012-015-0223-3

Article Number: 34

Accession Number: WOS:000350849000001

Abstract: Background: Two thirds of survivors will achieve independent ambulation after a stroke, but less than half will recover upper limb function. There is strong evidence to support intensive repetitive task-oriented training for recovery after stroke. The number of repetitions needed is suggested to be in the order of hundreds, but this is not currently being achieved in clinical practice. In an effort to bridge this evidence-practice gap, we have developed a behaviour change intervention that aims to increase provision of upper limb repetitive task-oriented training in stroke rehabilitation. This paper aims to describe the systematic processes that took place in collaboratively developing the behaviour change intervention. Methods: The methods used in this study were not defined a priori but were guided by the Behaviour Change Wheel. The process was collaborative and iterative with four stages of development emerging (i) establishing an intervention development group; (ii) structured discussions to understand the problem, prioritise target behaviours and analyse target behaviours; (iii) collaborative design of theoretically underpinned intervention components and (iv) piloting and refining of intervention components. Results: The intervention development group consisted of the research team and stroke therapy team at a local stroke rehabilitation unit. The group prioritised four target behaviours at

the therapist level: (i) identifying suitable patients for exercises, (ii) provision of exercises, (iii) communicating exercises to family/visitors and (iv) monitoring and reviewing exercises. It also provides a method for self-monitoring performance in order to measure fidelity. The developed intervention, PRACTISE (Promoting Recovery of the Arm: Clinical Tools for Intensive Stroke Exercise), consists of team meetings and the PRACTISE Toolkit (screening tool and upper limb exercise plan, PRACTISE exercise pack and an audit tool). Conclusions: This paper provides an example of how the Behaviour Change Wheel may be applied in the collaborative development of a behaviour change intervention for health professionals. The process involved was resource-intensive, and the iterative process was difficult to capture. The use of a published behaviour change framework and taxonomy will assist replication in future research and clinical use. The feasibility and acceptability of PRACTISE is currently being explored in two other stroke rehabilitation units.

Short Title: Case Series of a Knowledge Translation Intervention to Increase Upper Limb Exercise in Stroke Rehabilitation

ISSN: 0031-9023

DOI: 10.2522/ptj.20150694

Accession Number: WOS:000389399100009

Abstract: Background and Purpose. Current approaches to upper limb rehabilitation are not sufficient to drive neural reorganization and maximize recovery after stroke. To address this evidence-practice gap, a knowledge translation intervention using the Behaviour Change Wheel was developed. The intervention involves collaboratively working with stroke therapy teams to change their practice and increase therapy intensity by therapists prescribing supplementary self-directed arm exercise. The purposes of this case series are:

(1) to provide an illustrative example of how a research-informed process changed clinical practice and (2) to report on staff members' and patients' perceptions of the utility of the developed

intervention. Case Descriptions. A participatory action research approach was used in 3 stroke rehabilitation units in the United Kingdom. The intervention aimed to change 4 therapist-level behaviors: (1) screening patients for suitability for supplementary self-directed arm exercise, (2) provision of exercises, (3) involving family and caregivers in assisting with exercises, and (4) monitoring and progressing exercises. Data on changes in practice were collected by therapy teams using a bespoke audit tool. Utility of the intervention was explored in qualitative interviews with patients and staff. Outcomes. Components of the intervention were successfully embedded in 2 of the 3 stroke units. At these sites, almost all admitted patients were screened for suitability for supplementary self-directed exercise. Exercises were provided to 77%, 70%, and 88% of suitable patients across the 3 sites. Involving family and caregivers and monitoring and progressing exercises were not performed consistently. Conclusions. This case series is an example of how a rigorous research-informed knowledge translation process resulted in practice change. Research is needed to demonstrate that these changes can translate into increased intensity of upper limb exercise and affect patient outcomes. Notes: Connell, Louise A. McMahon, Naoimh E. Short Title: Mechanisms of action of an implementation intervention in stroke rehabilitation: a qualitative interview study

DOI: 10.1186/s12913-016-1793-8

Article Number: 534

Accession Number: WOS:000384370500004

Abstract: Background: Despite best evidence demonstrating the effectiveness of increased intensity of exercise after stroke, current levels of therapy continue to be below those required to optimise motor recovery. We developed and tested an implementation intervention that aims to increase arm exercise in stroke rehabilitation. The aim of this study was to illustrate the use of a behaviour change framework, the Behaviour Change Wheel, to identify the mechanisms of action that explain how the intervention produced change. Methods: We implemented the intervention at three stroke rehabilitation units in the United Kingdom. A purposive sample of

therapy team members were recruited to participate in semi-structured interviews to explore their perceptions of how the intervention produced change at their work place. Audio recordings were transcribed and imported into NVivo 10 for content analysis. Two coders separately analysed the transcripts and coded emergent mechanisms. Mechanisms were categorised using the Theoretical Domains Framework (TDF) (an extension of the Capability, Opportunity, Motivation and Behaviour model (COM-B) at the hub of the Behaviour Change Wheel). Results: We identified five main mechanisms of action: 'social/professional role and identity', 'intentions', 'reinforcement', 'behavioural regulation' and 'beliefs about consequences'. At the outset, participants viewed the research team as an external influence for whom they endeavoured to complete the study activities. The study design, with a focus on implementation in real world settings, influenced participants' intentions to implement the intervention components. Monthly meetings between the research and therapy teams were central to the intervention and acted as prompt or reminder to sustain implementation. The phased approach to introducing and implementing intervention components influenced participants' beliefs about the feasibility of implementation. Conclusions: The Behaviour Change Wheel, and in particular the Theoretical Domains Framework, were used to investigate mechanisms of action of an implementation intervention. This approach allowed for consideration of a range of possible mechanisms, and allowed us to categorise these mechanisms using an established behaviour change framework. Identification of the mechanisms of action, following testing of the intervention in a number of settings, has resulted in a refined and more robust intervention programme theory for future testing.

Abstract: Introduction Mothers with gestational diabetes mellitus (GDM) are at increased risk of pregnancy-related complications and developing type 2 diabetes after delivery. Diet and physical activity-based interventions may prevent GDM, but variations in populations, interventions and outcomes in primary trials have limited the translation of available evidence into practice. We plan to undertake an individual participant data (IPD) meta-analysis of randomised trials to assess the differential effects and cost-effectiveness of diet and physical activity-based interventions in preventing GDM and its complications. **Methods** The International Weight Management in Pregnancy Collaborative Network database is a living repository of IPD from randomised trials on diet and physical activity in pregnancy identified through a systematic literature search. We shall update our existing search on MEDLINE, Embase, BIOSIS, LILACS, Pascal, Science Citation Index, Cochrane Database of Systematic Reviews, Cochrane Central Register of Controlled Trials, Database of Abstracts of Reviews of Effects and Health Technology Assessment Database without language restriction to identify relevant trials until March 2021. Primary researchers will be invited to join the Network and share their IPD. Trials including women with GDM at baseline will be excluded. We shall perform a one and two stage random-effect meta-analysis for each intervention type (all interventions, diet-based, physical activity-based and mixed approach) to obtain summary intervention effects on GDM with 95% CIs and summary treatment-covariate interactions. Heterogeneity will be summarised using I^2 and $\tau(2)$ statistics with 95% prediction intervals. Publication and availability bias will be assessed by examining small study effects. Study quality of included trials will be assessed by the Cochrane Risk of Bias tool, and the Grading of Recommendations, Assessment, Development and Evaluations approach will be used to grade the evidence in the results. A model-based economic analysis will be carried out to assess the cost-effectiveness of interventions to prevent GDM and its complications compared with usual care. Ethics and dissemination Ethics approval is not required. The study is registered on the International Prospective Register of Systematic Reviews (CRD42020212884). Results will be submitted for publication in peer-reviewed journals.

Abstract: Introduction 72 Effectiveness of HPs PA counselling 73 Changing HP PA counselling behaviour 73 Changing patient PA behaviour 73 Brief PA counselling 73 Case studies 74 Case study 1 – HP students working together with patients with persistent pain 74 Case study 2 ? accredited exercise physiology case study sessions 74 Case study 3 ? experiential learning: medical students exercise trained by exercise science students 75 Case study 4 ? targeting hospital-based HPs 75 There is strong evidence that physical activity (PA) counselling from a health professional (HPs) leads to in-creased PA of their patients. Despite this, there remains a large evidence-practice gap between HP knowledge of the contribution of physical inactivity to chronic disease prevention and management, and routine effective assessment and prescription of PA. This article will present evidence on the effectiveness of HP-PA counselling and suggested behaviour change frameworks that can be used by HP. Four case studies are provided as examples of programs integrated into current HP student and post-graduate training programs. ? 2020 Elsevier Inc. All rights reserved.

DOI: 10.1136/bmjopen-2021-056348

Article Number: e056348

Accession Number: WOS:000775120600016

Abstract: Introduction The inappropriate use of antibiotics is a key driver of antimicrobial resistance. In China, antibiotic prescribing and consumption exceed recommended levels and are relatively high internationally. Understanding the influences on antibiotic use is essential to informing effective evidence-based interventions. We conducted a scoping review to obtain an overview of empirical research about key behavioural, cultural, economic and social influences on antibiotic use in China. Methods Searches were conducted in Econlit, Medline, PsycINFO, Social Science citation index and the Cochrane Database of Systematic Reviews for the period 2003 to early 2018. All study types were eligible including observational and intervention, qualitative and quantitative designs based in community and clinical settings. Two authors independently screened studies for inclusion. A data extraction form was developed incorporating details on study design, behaviour related to antibiotic use, influences on behaviour and information on effect (intervention studies only). Results Intervention studies increased markedly from 2014, and largely focused on the impact of national policy and practice directives on antibiotic use in secondary and tertiary healthcare contexts in China. Most studies used pragmatic designs, such as before and after comparisons. Influences on antibiotic use clustered under four themes: antibiotic prescribing; adherence to antibiotics; self-medicating behaviour and over-the-counter sale of antibiotics. Many studies highlighted the use of antibiotics without a prescription for common infections, which was facilitated by availability of left-over medicines and procurement from local pharmacies. Conclusions Interventions aimed at modifying antibiotic prescribing behaviour show evidence of positive impact, but further research using more robust research designs, such as randomised trials, and incorporating process evaluations is required to better assess outcomes. The effect of national policy at the primary healthcare level needs to be evaluated and further exploration of the influences on antibiotic self-medicating is required to develop interventions that tackle this behaviour.

Abstract: Background and Objectives The Covid-19 pandemic reduced access to social activities and routine health care that are central to dementia prevention. We developed a group-based, video-call, cognitive well-being intervention; and investigated its acceptability and feasibility; exploring through participants' accounts how the intervention was experienced and used in the pandemic context. Research Design and Method We recruited adults aged 60+ years with memory concerns (without dementia). Participants completed baseline assessments and qualitative interviews/focus groups before and after the 10-week intervention. Qualitative interview data and facilitator notes were integrated in a thematic analysis. Results 12/17 participants approached completed baseline assessments, attended 100/120 (83.3%) intervention sessions and met 140/170 (82.4%) of goals set. Most had not used video calling before. In the thematic analysis, our overarching theme was social connectedness. Three sub-themes were as follows: Retaining independence and social connectedness: social connectedness could not be at the expense of independence; Adapting social connectedness in the pandemic: participants strived to compensate for previous social connectedness as the pandemic reduced support networks; Managing social connections within and through the intervention: although there were tensions, for example, between sharing of achievements feeling supportive and competitive, participants engaged with various lifestyle changes; social connections supported group attendance and implementation of lifestyle changes. Discussion and Implications Our intervention was acceptable and feasible to deliver by group video-call. We argue that dementia prevention is both an individual and societal concern. For more vulnerable populations, messages that lifestyle change can help memory should be communicated alongside supportive, relational approaches to enabling lifestyle changes.

Abstract: The paper is the story of building a design research group from scratch. As there has been some recent interest in design research as a team based activity, this article illustrates how we built the Imagination research team and how it continues to develop. This article gives us the chance to reflect on how far we have come in the last decade. Once we were a few dedicated members of staff wanting to bring design research to a small university in the north of the UK. Now we are one of the leading centers of excellence worldwide for design research. This article uses case studies from research projects and Ph.D. research to demonstrate Imagination's research philosophy-open-ended and anti-disciplinary. We celebrate the plurality of ways design research is carried out. The article highlights how we use design research to address global challenges, and how these have also shaped our teaching and further research. We end by considering the value of design research and how we, as a team, can take Imagination forward into the next decade.

Title: Toward a Behavior Theory-Informed and User-Centered Mobile App for Parents to Prevent Infant Falls: Development and Usability Study

Journal: Jmir Pediatrics and Parenting

Volume: 4

Issue: 4

Date: Oct-Dec

Short Title: Toward a Behavior Theory-Informed and User-Centered Mobile App for Parents to Prevent Infant Falls: Development and Usability Study

ISSN: 2561-6722

DOI: 10.2196/29731

Article Number: e29731

Accession Number: WOS:000780484800012

Abstract: Background: Falls account for approximately 50% of infant injury hospitalizations, and caretaker behavior is central to preventing infant falls. Behavior theory-informed interventions for injury prevention have been suggested, but to date, few have been reported. The potential of using smartphones for injury prevention intervention delivery is also underexploited. Objective: This study aims to develop a behavior theory- and evidence-based as well as user-centered digital intervention as a mobile app for parents to prevent infant falls following agile development practices. Methods: Infant falls while feeding was selected as the fall mechanism to demonstrate the approach being taken to develop this intervention. In phase 1, the Behaviour Change Wheel was used as a theoretical framework supported by a literature review to define intervention components that were then implemented as a mobile app. In phase 2, after the person-based approach, user testing through think-aloud interviews and comprehension assessments were used to refine the content and implementation of the intervention. Results: The target behaviors identified in phase 1 were adequate rest for the newborn's mother and safe feeding practices defined as prepare, position, and place. From behavioral determinants and the Behaviour Change Wheel, the behavior change functions selected to achieve these target behaviors were psychological capability, social opportunity, and reflective motivation. The selected behavior change techniques aligned with these functions were providing information on health consequences, using a credible source, instruction on performing each behavior, and social support. The defined intervention was implemented in a draft Android app. In phase 2, 4 rounds of user testing were required to achieve the predefined target comprehension level. The results from the think-aloud interviews were used to refine the intervention content and app features. Overall, the results from phase 2 revealed that users found the information provided to be helpful. Features such as self-tracking and inclusion of the social and environmental aspects of falls prevention were

liked by the participants. Important feedback for the successful implementation of the digital intervention was also obtained from the user testing. Conclusions: To our knowledge, this is the first study to apply the Behaviour Change Wheel to develop a digital intervention for child injury prevention. This study provides a detailed example of evidence-based development of a behavior theory-informed mobile intervention for injury prevention refined using the person-based approach.

Short Title: Antibiotic prescribing in UK general dental practice: a cross-sectional study

ISSN: 0301-5661

DOI: 10.1111/cdoe.12199

Accession Number: WOS:000372036600006

Abstract: Objectives To assess the extent to which antibiotic prescribing in general dental practice conforms to clinical guidelines and to describe factors associated with antibiotic prescription in the absence of spreading infection or systemic involvement. Methods A cross-sectional study of the management of adult patients with acute dental conditions by General Dental Practitioners (GDPs) in Wales, UK. Clinical information on the management of patients was compared to clinical and prescribing guidelines published by the Scottish Dental Clinical Effectiveness Programme and the Faculty of General Dental Practice (UK).

Multilevel logistic regression was used to identify patient, practitioner and consultation characteristics predictive of antibiotic prescribing in the absence of infection.

Results Antibiotics were prescribed to 57.4% of 568 patients. Over half of antibiotics (65.6%) were prescribed in situations where there was no evidence of spreading infection, and 70.6% were used without the provision of an operative intervention. Only 19.0% of antibiotics were prescribed in situations where their use was indicated by clinical guidelines. Factors associated ($P < 0.05$) with antibiotic prescription in the absence of infection were failure of previous operative treatment (Odds Ratio (OR) 13.57), shortage of

clinical time to undertake treatment (OR 10.21), patients who were unable or unwilling to accept operative treatment (OR 4.89), patient requests for antibiotics (OR 3.69) and acute periodontal conditions (OR 3.37). Conclusions A high level of inappropriate antibiotic prescribing was observed amongst the GDPs studied. Features of the healthcare environment, such as clinical time pressures, and patient-related characteristics, such as expectations for antibiotics and refusal of operative treatment, are associated with antibiotic prescribing in the absence of infection. Individuals responsible for the commissioning and delivery of dental services should seek to develop targeted interventions addressing these issues in order to ensure optimal antimicrobial stewardship within dentistry.

Short Title: Implementation of physical activity interventions for people with inflammatory arthritis: an overview and future recommendations

DOI: 10.1093/rap/rkac094

Article Number: rkac094

Accession Number: WOS:000922124700008

Abstract: Regular physical activity is important for both physical and mental health. This is particularly important for people with inflammatory arthritis, because of the benefits on both disease-specific and systemic outcomes and the increased risk of comorbidities such as cardiovascular disease. Despite a wealth of evidence supporting physical activity interventions, there remains a significant gap in implementation into routine care. This overview describes what implementation is, examines why it is important to consider implementation approaches to improve uptake of physical activity, highlights factors that influence successful implementation using exemplars from both osteoarthritis and inflammatory arthritis and recommends where future research is needed. Lay Summary Regular physical activity is important for physical and mental health in people with arthritis. Physical activity may help arthritis symptoms and reduce the chances of developing other conditions such as heart disease. However, physical

activity is not routinely recommended to all. Physical activity programs are not offered to everyone with arthritis who may benefit. This is called an implementation gap. This overview describes what implementation is and how it can be used to improve physical activity uptake. We report examples of successful physical activity implementation for arthritis and recommend where more research is needed.

Short Title: Applying the Intervention Mapping Protocol to promote Active Transport to School in primary school students: the ProATS intervention

ISSN: 1579-1726

Accession Number: WOS:000832990200001

Abstract: The school setting is presented as an ideal context for behavioral interventions. Accordingly, evidence shows that school-based interventions positively impact on Active Transportation to School (ATS). However, behavioral interventions are rarely developed in a systematic way. The aim of this manuscript is to describe the content and development process of the ProATS (Promoting Active Transportation to School) intervention. For this purpose, an Intervention Mapping Protocol (IMP) is used for the design, implementation, and evaluation of ProATS. This intervention aims to increase ATS in children aged 10 to 12 years is used. ProATS is based on a literature review and is developed by a multidisciplinary team. There is input from experts (Local Working Group), school representatives (Planning Committee), and a facilitator in each school (a member of the research team). The ProATS intervention results in the following two components (i) curricular path, (ii) non-curricular path. In parallel, a guide is elaborated, which includes the strategies and activities to design and implement the ProATS project. The results of the pilot study seem promising, showing a significant increase in ATS (i.e., the frequency of ATS). IMP, targeting behavioral changes such as ATS, is a complex and time-consuming process. Yet, it helped us to carry out the planning and development of the ProATS intervention to make it feasible,

effective, and sustainable. The process explanation followed with the IMP allows replication of the intervention in other school contexts.

Abstract: Asthma brings considerable challenges for family doctors because of its variety of shapes, different levels of severity, a wide age range, and the fact that in the last decades clinicians are able to offer much better treatment options with a better level of disease control and a higher quality of life. The objectives of the current review article are to provide an up-to-date review by primary care respiratory leaders from different countries of the most significant challenges regarding asthma diagnosis and management, the importance of team work and the problems in recognizing and dealing with difficult-to-manage and severe asthma in primary care. The article provides a short review of the main challenges faced by family physicians and other primary health care professionals in supporting their patients in the management of asthma, such as asthma diagnosis, promoting access to spirometry, the importance of a multiprofessional team for the management of asthma, how to organize an asthma review, the promotion of patient autonomy and shared decision-making, improving the use of inhalers, the importance of the personalized asthma action plan, dealing with difficult-to-manage and severe asthma in primary care and choosing when, where and how to refer patients with severe asthma. The article also discusses the development of an integrated approach to asthma care in the community and the promotion of Asthma Right Care.

Short Title: I-DECIDE: A Social Prescribing and Digital Intervention Protocol to Promote Sexual and Reproductive Health and Quality of Life among Young Cape Verdeans

DOI: 10.3390/ijerph18030850

Article Number: 850

Accession Number: WOS:000615141000001

Abstract: Cape Verdean governments have intensified the investment on the National Reproductive Health Program, aiming to provide universal and qualified services, especially to the youngest people. Nevertheless, data suggest that some health challenges remain in this group (e.g., high rates of early/unplanned pregnancies, illegal abortions, sexual risk behaviors). In this paper, we present a protocol of a community-based social prescribing and digital intervention to promote wellbeing and quality of life across the life course of young Cape Verdeans, with a specific focus on Sexual and Reproductive Health (SRH) related behaviors. The intervention program, to be developed in three years, will follow an Intervention Mapping approach, namely regarding needs assessment and study's protocol. The program's implementation and evaluation will occur simultaneously. The main expected result is the development of a sustainable training program implemented in coproduction with Cape Verdeans from Mindelo (in Sao Vicente island), with replicable potential in other Cape Verdean regions. The intervention will contribute to SRH-related literacy through the digital health literacy materials and to quality of life across the young's life course.

Abstract: This study aims to explore a set of design components that
a game-based learning programme should have in order to encourage
active ageing and healthy lifestyles. Semi-structured interviews
were conducted with 10 Subject Matter Experts from the Industry and
the Educational Sector in the fields of Games, Human-Computer
Interaction, Psychology and Ageing Studies. A thematic analysis of
the interviewee's answers identified a set of recommendations for
the following topics: Designing age-friendly environments;
Perspectives on the (Co-) Design Process; Designing for learning and
behaviour change; and the monetization of a game.

Accession Number: WOS:000839990400001

Abstract: The COVID-19 pandemic and its mobility restrictions have been an external shock, influencing mental wellbeing. However, does risk exposure to COVID-19 affect the mental wellbeing effect of lockdowns? This paper examines the 'welcomed lockdown' hypothesis, namely the extent to which there is a level of risk where mobility restrictions are not a hindrance to mental wellbeing. We exploit the differential timing of exposure to the pandemic, and the different stringency of lockdown policies across European countries and we focus on the effects on two mental health conditions, namely anxiety and depression. We study whether differences in the individual symptoms of anxiety and depression are explained by the combination of pandemic mortality and stringency of lockdown. We draw on an event study approach, complemented with a Difference-in-Difference (DiD), and Regression Discontinuity Design (RDD). Our estimates suggest an average increase in depression (3.95%) and anxiety (10%) symptoms relative to the mean level on the day that lockdown took effect. However, such effects are wiped out when a country's exhibits high mortality ('pandemic category 5'). Hence, we conclude that in an environment of high mortality, lockdowns no longer give rise to a reduction in mental wellbeing consistent with the 'welcome lockdown' hypothesis.

Short Title: Periodontal diseases: is it possible to prevent them? A populational and individual approach

ISSN: 1807-3107

DOI: 10.1590/1807-3107bor-2021.vol35.0098

Article Number: e098

Accession Number: WOS:000745242300004

Abstract: Periodontal diseases are infectious inflammatory chronic diseases of a multifactorial nature. They are primarily caused by dysbiotic ecological changes in dental biofilm, which may be influenced by risk factors. The prevention of periodontal diseases may involve different strategies focused on reducing distal, intermediate, and proximal risk factors at both the population and individual levels. Effective prevention depends on interdisciplinary and common risk factor approaches. Also, patient-centered preventive models are more effective than professional-centered models in the management of periodontal diseases. Regular and periodic control of dental biofilm is an essential measure for the different levels of prevention of periodontal diseases. The effectiveness of periodontal disease prevention largely depends on positive modifications of behavior, knowledge, health literacy, patient empowerment, motivation, and compliance.

Abstract: Background. In the domain of health behavior change, the deployment and utilization of information and communications technologies as a way to deliver interventions appear to be promising. This article describes the development of a web-based tailored intervention, TAVIE en sante, to support people living with HIV in the adoption of healthy behaviors. Methods. This intervention

was developed through an Intervention Mapping (IM) framework and is based on the theory of planned behavior. Results. Crucial steps of IM are the selection of key determinants of behavior and the selection of useful theory-based intervention methods to change the targeted determinants (active ingredients). The content and the sequence of the intervention are then created based on these parameters. TAVIE en sante is composed of 7 interactive web sessions hosted by a virtual nurse. It aims to develop and strengthen skills required for behavior change. Based on an algorithm using individual cognitive data (attitude, perceived behavioral control, and intention), the number of sessions, theory-based intervention methods, and messages contents are tailored to each user. Conclusion. TAVIE en sante is currently being evaluated. The use of IM allows developing intervention with a systematic approach based on theory, empirical evidence, and clinical and experiential knowledge.

Title: Barriers and facilitators to HIV Pre-Exposure Prophylaxis (PrEP) in Specialist Sexual Health Services in the United Kingdom: A systematic review using the PrEP Care Continuum

Journal: Hiv Medicine

Date: 2023 Apr

Short Title: Barriers and facilitators to HIV Pre-Exposure Prophylaxis (PrEP) in Specialist Sexual Health Services in the United Kingdom: A systematic review using the PrEP Care Continuum

ISSN: 1464-2662

DOI: 10.1111/hiv.13492

Accession Number: WOS:000972296500001

Abstract: ObjectivesHIV pre-exposure prophylaxis (PrEP) delivery in the UK is inequitable; over 95% of PrEP users were men who have sex with men (MSM) despite making up less than 50% of new HIV diagnoses. We conducted a systematic review to identify modifiable barriers and facilitators to PrEP delivery in the UK among underserved populations. MethodsWe searched bibliographic/conference databases using the terms HIV, PrEP, barriers, facilitators, underserved populations, and UK. Modifiable factors were mapped along the PrEP Care Continuum (PCC) to identify targets for interventions. ResultsIn total, 44 studies were eligible: 29 quantitative, 12 qualitative and three mixed-methods studies. Over half (n = 24

[54.5%]) exclusively recruited MSM, whereas 11 were in mixed populations (all included MSM as a sub-population) and the other nine were in other underserved populations (gender and ethnicity minorities, women, and people who inject drugs). Of the 15 modifiable factors identified, two-thirds were at the PrEP contemplation and PrEP preparation steps of the PCC. The most reported barriers were lack of PrEP awareness (n = 16), knowledge (n = 19), willingness (n = 16), and access to a PrEP provider (n = 16), whereas the more reported facilitators were prior HIV testing (n = 8), agency and self-care (n = 8). All but three identified factors were at the patient rather than provider or structural level. Conclusions This review highlights that the bulk of the scientific literature focuses on MSM and on patient-level factors. Future research needs to ensure underserved populations are included and prioritized (e.g. ethnicity and gender minorities, people who inject drugs) and provider and structural factors are investigated. DOI: 10.1038/s41415-022-5271-x

Accession Number: WOS:000927940500019

Abstract: Objectives Assess the feasibility of using the Identification and Referral to Improve Safety (IRIS) intervention in a general dental practice setting and evaluating it using a cluster randomised trial design. IRIS is currently used in general medical practices to aid recognition and support referral into specialist support of adults presenting with injuries and other presenting factors that might have resulted from domestic violence and abuse. Also, to explore the feasibility of a cluster randomised trial

design to evaluate the adapted IRIS. Design Feasibility study for a cluster randomised trial of a practice-based intervention. Setting Greater Manchester general dental practices. Results It was feasible to adapt the IRIS intervention used in general medical practices to general dental practices in terms of training the clinical team and establishing a direct referral pathway to a designated advocate educator. General dental practices were keen to adopt the intervention, discuss with patients when presented with the opportunity and utilise the referral pathway. However, we could not use practice IT software prompts and data collection as for general practitioners because there is no unified dental IT system and because coding in dentistry for diagnoses, procedures and outcomes is not developed in the UK. Conclusion While it was feasible to adapt elements of the IRIS intervention to general dental practice and there was general acceptability, we did not have enough empirical data to plan a definitive cluster randomised trial design to evaluate the IRIS-dentistry intervention within general dental practices.

ISSN: 1369-6513

DOI: 10.1111/hex.13325

Accession Number: WOS:000681081600001

Abstract: Background Obesity rates are higher among people of lower socioeconomic status. While numerous health behaviour interventions targeting obesity exist, they are more successful at engaging higher socioeconomic status populations, leaving those in less affluent circumstances with poorer outcomes. This highlights a need for more tailored interventions. The aim of this study was to enhance an existing weight loss course for adults living in low socioeconomic communities. Methods The Behaviour Change Wheel approach was followed to design an add-on intervention to an existing local authority-run weight loss group, informed by mixed-methods research

and stakeholder engagement. Results The COM-B analysis of qualitative data revealed that changes were required to psychological capability, physical and social opportunity and reflective motivation to enable dietary goal-setting behaviours. The resulting SMART-C booklet included 6 weeks of dietary goal setting, with weekly behavioural contract and review. Conclusion This paper details the development of the theory- and evidence-informed SMART-C intervention. This is the first report of the Behaviour Change Wheel being used to design an add-on tool to enhance existing weight loss services. The process benefitted from a further checking stage with stakeholders.

Issue: 2

Date: Apr

Short Title: Interventions to Increase Physical Activity in Community-Dwelling Older Adults in Regional and Rural Areas: A Realist Synthesis Review Protocol

DOI: 10.3390/mps6020029

Article Number: 29

Accession Number: WOS:000978243400001

Abstract: The importance of physical activity (PA) for the health and wellbeing of older adults is well documented, yet many older adults are insufficiently active. This issue is more salient in regional and rural areas, where evidence of the most critical components of interventions that explain PA participation and maintenance in older populations is sparse. This realist review will (1) systematically identify and synthesise literature on PA interventions in community-dwelling older adults in regional and rural areas, and (2) explore how and why those interventions increase PA in that population. Using a realist synthesis framework and the behaviour change wheel (BCW), context-mechanism-outcome (C-M-O) patterns of PA interventions for older adults in regional and rural areas will be synthesised. Thematic analysis will be employed to compare, contrast, and refine emerging C-M-O patterns to understand how contextual factors trigger mechanisms that influence regional and rural community-dwelling older adults' participation in PA interventions. This realist review will be the first to adopt a BCW analysis and a realist synthesis framework to explore PA

interventions in community-dwelling older adults in regional and rural areas. This review will provide recommendations for evidence-based interventions to improve PA participation and adherence by revealing the important mechanisms apparent in this context.

DOI: 10.1080/14992027.2021.1951852

Accession Number: WOS:000686001100001

Abstract: Objective The current study aimed to: i) determine the patterns of hearing protection device (HPD) use in early-career musicians, ii) identify barriers to and facilitators of HPD use, and iii) use the Behaviour Change Wheel (BCW) to develop an intervention to increase uptake and sustained use of HPDs. Design A mixed-methods approach using questionnaires and semi-structured interviews. Study sample Eighty early-career musicians (age range = 18-26 years; women n = 39), across all categories of musical instrument. Results 42.5% percent of participants reported using HPDs at least once a week, 35% less than once a week, and 22.5% reported never using HPDs for music-related activities. Six barriers and four facilitators of HPD use were identified. Barriers include the impact of HPDs on listening to music and performing, and a lack of concern about noise exposure. Barriers/facilitators were mapped onto the Theoretical Domains Framework. Following the systematic process of the BCW, our proposed intervention strategies are based on 'Environmental Restructuring', such as providing prompts to increase awareness of noisy settings, and 'Persuasion/Modelling', such as providing credible role models. Conclusions For the first time, the present study demonstrates the use of the BCW for designing interventions in the context of hearing conservation.

Article Number: 723962

Accession Number: WOS:000692555300001

Abstract: Behavioural interventions can support the adoption of healthier lifestyles and improve physical health outcomes, but it is unclear what factors might drive success of such interventions in people with serious mental illness (SMI). We systematically identified and reviewed evidence of the association between determinants of physical health self-management behaviours in adults with SMI. Data about American Association of Diabetes Educator's Self-Care Behaviours (AADE-7) were mapped against the novel Mechanisms of Action (MoA) framework. Twenty-eight studies were included in the review, reporting evidence on 104 determinant-behaviour links. Beliefs about capabilities and beliefs about consequences were the most important determinants of behaviour, especially for being physically active and healthy eating. There was some evidence that emotion and environmental context and resources played a role in determining reducing risks, being active, and taking medications. We found very limited evidence associated with problem solving, and no study assessed links between MoAs and healthy coping. Although the review predominantly identified evidence about associations from cross-sectional studies that lacked validated and objective measures of self-management behaviours, these findings can facilitate the identification of behaviour change techniques with hypothesised links to determinants to support self-

management in people with SMI.

Short Title: What influences birth place preferences, choices and decision-making amongst healthy women with straightforward pregnancies in the UK? A qualitative evidence synthesis using a 'best fit' framework approach

DOI: 10.1186/s12884-017-1279-7

Article Number: 103

Accession Number: WOS:000397716200001

Abstract: Background: English maternity care policy has supported offering women choice of birth setting for over twenty years, but only 13% of women in England currently give birth in settings other than obstetric units (OUs). It is unclear why uptake of non-OU settings for birth remains relatively low. This paper presents a synthesis of qualitative evidence which explores influences on women's experiences of birth place choice, preference and decision-making from the perspectives of women using maternity services. Methods: Qualitative evidence synthesis of UK research published January 1992-March 2015, using a 'best-fit' framework approach. Searches were run in seven electronic data bases applying a comprehensive search strategy. Thematic framework analysis was used to synthesise extracted data from included studies. Results: Twenty-four papers drawing on twenty studies met the inclusion criteria.

The synthesis identified support for the key framework themes. Women's experiences of choosing or deciding where to give birth were influenced by whether they received information about available options and about the right to choose, women's preferences for different services and their attributes, previous birth experiences, views of family, friends and health care professionals and women's beliefs about risk and safety. The synthesis additionally identified that women's access to choice of place of birth during the antenatal period varied. Planning to give birth in OU was straightforward, but although women considering birth in a setting other than hospital OU were sometimes well-supported, they also encountered obstacles and described needing to 'counter the negativity' surrounding home birth or birth in midwife-led settings. Conclusions: Over the period covered by the review, it was straightforward for low risk women to opt for hospital birth in the UK. Accessing home birth was more complex and contested. The evidence on freestanding midwifery units (FMUs) is more limited, but suggests that women wanting to opt for an FMU birth experienced similar barriers. The extent to which women experienced similar problems accessing alongside midwifery units (AMUs) is unclear. Women's preferences for different birth options, particularly for 'hospital' vs non-hospital settings, are shaped by their pre-existing values, beliefs and experience, and not all women are open to all birth settings.

DOI: 10.3390/s22072795

Article Number: 2795

Accession Number: WOS:000781122800001

Abstract: Diet behaviour is influenced by the interplay of the physical and social environment as well as macro-level and individual factors. In this study, we focus on diet behaviour at an individual level and describe the design of a behaviour change

artefact to support diet behaviour change in persons with type 2 diabetes. This artefact was designed using a human-centred design methodology and the Behaviour Change Wheel framework. The designed artefact sought to support diet behaviour change through the addition of healthy foods and the reduction or removal of unhealthy foods over a 12-week period. These targeted behaviours were supported by the enabling behaviours of water consumption and mindfulness practice. The artefact created was a behaviour change planner in calendar format, that incorporated behaviour change techniques and which focused on changing diet behaviour gradually over the 12-week period. The behaviour change planner forms part of a behaviour change intervention which also includes a preparatory workbook exercise and one-to-one action planning sessions and can be customised for each participant.

Title: IMProving care After inherited Cancer Testing (IMPACT) study: protocol of a randomized trial evaluating the efficacy of two interventions designed to improve cancer risk management and family communication of genetic test results

Journal: BMC Cancer

Volume: 21

Issue: 1

Date: Oct

Short Title: IMProving care After inherited Cancer Testing (IMPACT) study: protocol of a randomized trial evaluating the efficacy of two interventions designed to improve cancer risk management and family communication of genetic test results

DOI: 10.1186/s12885-021-08822-4

Article Number: 1099

Accession Number: WOS:000707007100001

Abstract: Background Implementing genetic testing for inherited cancer predisposition into routine clinical care offers a tremendous opportunity for cancer prevention and early detection. However, genetic testing itself does not improve outcomes; rather, outcomes depend on implemented follow-up care. The IMPACT study is a hybrid type I randomized effectiveness-implementation trial to simultaneously evaluate the effectiveness of two interventions for

individuals with inherited cancer predisposition focused on: 1) increasing family communication (FC) of genetic test results; and 2) improving engagement with guideline-based cancer risk management (CRM). Methods This prospective study will recruit a racially, geographically, and socioeconomically diverse population of individuals with a documented pathogenic/likely pathogenic (P/LP) variant in an inherited cancer gene. Eligible participants will be asked to complete an initial trial survey and randomly assigned to one of three arms: A) GeneSHARE, a website designed to increase FC of genetic test results; B) My Gene Counsel's Living Lab Report, a digital tool designed to improve understanding of genetic test results and next steps, including CRM guidelines; or C) a control arm in which participants continue receiving standard care. Follow-up surveys will be conducted at 1, 3, and 12 months following randomization. These surveys include single-item measures, scales, and indices related to: 1) FC and CRM behaviors and behavioral factors following the COM-B theoretical framework (i.e., capability, opportunity, and motivation); 2) implementation outcomes (i.e., acceptability, appropriateness, exposure, and reach); and 3) other contextual factors (i.e., sociodemographic and clinical factors, and uncertainty, distress, and positive aspects of genetic test results). The primary outcomes are an increase in FC of genetic test results (Arm A) and improved engagement with guideline-based CRM without overtreatment or undertreatment (Arm B) by the 12-month follow-up survey. Discussion Our interventions are designed to shift the paradigm by which individuals with P/LP variants in inherited cancer genes are provided with information to enhance FC of genetic test results and engagement with guideline-based CRM. The information gathered through evaluating the effectiveness and implementation of these real-world approaches is needed to modify and scale up adaptive, stepped interventions that have the potential to maximize FC and CRM. Protocol version September 17th, 2021 Amendment Number 04.

Short Title: Systematic review of context-aware digital behavior change interventions to improve health

ISSN: 1869-6716

DOI: 10.1093/tbm/ibaa099

Accession Number: WOS:000732777000001

Abstract: Health risk behaviors are leading contributors to morbidity, premature mortality associated with chronic diseases, and escalating health costs. However, traditional interventions to change health behaviors often have modest effects, and limited applicability and scale. To better support health improvement goals across the care continuum, new approaches incorporating various smart technologies are being utilized to create more individualized digital behavior change interventions (DBCIs). The purpose of this study is to identify context-aware DBCIs that provide individualized interventions to improve health. A systematic review of published literature (2013-2020) was conducted from multiple databases and manual searches. All included DBCIs were context-aware, automated digital health technologies, whereby user input, activity, or location influenced the intervention. Included studies addressed explicit health behaviors and reported data of behavior change outcomes. Data extracted from studies included study design, type of intervention, including its functions and technologies used, behavior change techniques, and target health behavior and outcomes data. Thirty-three articles were included, comprising mobile health (mHealth) applications, Internet of Things wearables/sensors, and internet-based web applications. The most frequently adopted behavior change techniques were in the groupings of feedback and monitoring, shaping knowledge, associations, and goals and planning. Technologies used to apply these in a context-aware, automated fashion included analytic and artificial intelligence (e.g., machine learning and symbolic reasoning) methods requiring various degrees of access to data. Studies demonstrated improvements in physical activity, dietary behaviors, medication adherence, and sun protection practices. Context-aware DBCIs effectively supported behavior change to improve users' health behaviors.

Short Title: Behavioural change box? Applying the COM-B model to understand behavioural triggers that support consumption of fruits and vegetable among subscribers of a fruit and vegetable box scheme

ISSN: 1368–9800

DOI: 10.1017/s1368980021003839

Article Number: Pii s1368980021003839

Accession Number: WOS:000721004700051

Abstract: Objective: To understand the key mechanisms that support healthy dietary habits promoted by fruit and vegetable (F&V) box schemes, testing relevant behaviour change triggers identified under the COM-B model in an evaluation research study of a Portuguese F&V box scheme (PROVE). Design: Correlation study with a post-test-only non-equivalent group design based on survey data. The mechanisms underpinning the differences between subscribers and non-subscribers are operationalised as mediation effects. Data availability, theoretical relevance and empirical validation supported the selection and testing of four potential mediators for the effects of subscribing to the box scheme on F&V consumption. These estimations derive from the coefficients of a structural equation model combined with the product coefficient approach and Sobel test. Setting: The study is part of a wider evaluation study on the impact of the PROVE box scheme on sustainability, health and equity. Participants: A sample of PROVE box subscribers (n 294) was compared with a matched subsample of non-subscribers (n 571) in a nationally representative survey. Results: Subscribing to the PROVE box correlates with an increased probability of eating at least five portions of F&V, irrespective of differences in age, education and perceived economic difficulties. Diet quality perceptions, and more robustly, the strength of meal habits and household availability were identified as relevant mediators. Conclusions: The subscription to an F&V box scheme is connected with proximal context that enables the consumption of F&V by ensuring more readily available F&V and better situational conditions associated with healthier meal habits.

Date: Jan

Short Title: Codesigning an intervention to strengthen COVID-19 vaccine uptake in Congolese migrants in the UK (LISOLO MALAMU): a participatory qualitative study protocol

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-063462

Accession Number: WOS:000922698000003

Abstract: Introduction Migrants positively contribute to host societies yet experience barriers to health and vaccination services and systems and are considered to be an underimmunised group in many European countries. The COVID-19 pandemic has highlighted stark inequities in vaccine uptake, with migrants facing access and informational barriers and lower vaccine confidence. A key challenge, therefore, is developing tailored vaccination interventions, services and systems which account for and respond to the unique drivers of vaccine uptake in different migrant populations. Participatory research approaches, which meaningfully involve communities in co-constructing knowledge and solutions, have generated considerable interest in recent years for those tasked with designing and delivering public health interventions. How such approaches can be used to strengthen initiatives for COVID-19 and routine vaccination merits greater consideration. Methods and analysis LISOLO MALAMU ('Good Talk') is a community-based participatory research study which uses qualitative and coproduction methodologies to involve adult Congolese migrants in developing a tailored intervention to increase COVID-19 vaccine uptake. Led by a community-academic coalition, the study will involve (1) semistructured in-depth interviews with adult Congolese migrants (born in Democratic Republic of Congo, >18 years), (2) interviews with professional stakeholders and (3) codesign workshops with adult Congolese migrants. Qualitative data will be analysed collaboratively using reflexive thematic analysis, and behaviour change theory will be used in parallel to support the coproduction of interventions and make recommendations across socioecological levels. The study will run from approximately November 2021 to November 2022. Ethics and dissemination Ethics approval was granted by the St George's University Research Ethics Committee (REC reference: 2021.0128). Study findings will be disseminated to a range of local, national and international audiences, and a community celebration event will be held to show impact and recognise contributions. Recommendations for implementation and evaluation of prototyped interventions will be made.

Title: Applying the COM-B model to understand wearable activity tracker use in children and adolescents
Journal: Journal of Public Health-Heidelberg
Date: 2022 Oct
Short Title: Applying the COM-B model to understand wearable activity tracker use in children and adolescents
ISSN: 2198-1833
DOI: 10.1007/s10389-022-01763-7
Accession Number: WOS:000876026400002
Abstract: Aim Wearable activity trackers (wearables) are increasingly popular intervention tools for increasing child and adolescent physical activity (PA) levels. However, the large-scale habitual use of wearables in children and adolescents is unknown. This study investigated the prevalence of wearable use in children and adolescents, and what factors impact their use. Subjects and methods This study utilised a cross-sectional survey and the 'Capability, Opportunity, Motivation and Behaviour' (COM-B) model was applied to explore what child/adolescent and parental characteristics impact wearable use. Parents/guardians of 5- to 17-year-olds were invited to complete the survey. The survey was open internationally, and consisted of between 19 and 23 questions, depending on child/adolescent wearable use. Multinomial logistic regression analyses were conducted to explore variables impacting wearable use, in children (5 to 9 years) and adolescents (10 to 17 years). Results The survey was completed by 652 parents, representing 831 children/adolescents. Most children/adolescents had never used a wearable (n = 429; 51.6%), and 252 (30.3%) and 150 (18.1%) currently or had previously used a wearable, respectively. Child age and sex, capability, opportunity and motivation for PA were associated with wearable use, and differences were present between child (5 to 9 years) and adolescent (10 to 17 years) wearable use. Conclusions This study offers a novel contribution to the understanding of child and adolescent habitual wearable use, and what impacts wearable use in these age groups.

DOI: 10.1371/journal.pone.0239402

Article Number: e0239402

Accession Number: WOS:000577103100015

Abstract: Background Evidence indicates that early life is critical for determining future obesity risk. A sharper policy focus on pregnancy and early childhood could help improve obesity prevention efforts. This study aimed to systematically identify and categorise policy levers used in England with potential to influence early life course (pregnancy, 0–5 years) and identify how these interface with energy balance behaviours. The objective is to identify gaps and where further policy actions could most effectively focus. Methods A behavioural science approach was taken using the Capability–Opportunity–Motivation–Behaviour (COM–B) model and Behaviour Change Wheel (BCW) framework. The key determinants of energy balance in the early years were identified from the Foresight Systems Map. Policy actions were scoped systematically from available literature, including any health or non-health policies which could impact on energy balance behaviours. Foresight variables and policy actions were considered in terms of COM–B and the BCW to determine approaches likely to be effective for obesity prevention and treatment. Existing policies were overlaid across the map of key risk factors to identify gaps in obesity prevention and treatment provision. Results A wide range of policy actions were identified (n = 115) to address obesity-relevant risk factors. These were most commonly educational or guidelines relating to environmental restructuring (i.e. changing the physical or social context). Scope for strengthening policies relating to the food system (e.g. the market price of food) and psychological factors contributing to obesity were identified. Policies acted via all aspects of the COM–B model, but there was scope for improving policies to increase capability through skills acquisition and both reflective and automatic motivation. Conclusions There is substantial policy activity to address early years obesity but much is focused on education. Scope exists to strengthen actions relating to upstream policies which act on food systems and those targeting psychological factors contributing to obesity risk.

Volume: 5

Issue: 1

Date: Nov

Short Title: Developing interventions to improve health: a systematic mapping review of international practice between 2015 and 2016

DOI: 10.1186/s40814-019-0512-8

Article Number: 127

Accession Number: WOS:000704687000001

Abstract: Background Researchers publish the processes they use to develop interventions to improve health. Reflecting on this endeavour may help future developers to improve their practice. **Methods** Our aim was to collate, describe, and analyse the actions developers take when developing complex interventions to improve health. We carried out a systematic mapping review of empirical research studies that report the development of complex interventions to improve health. A search was undertaken of five databases over 2015–2016 using the term 'intervention dev*'. Eighty-seven journal articles reporting the process of intervention development were identified. A purposive subset of 30 articles, using a range of published approaches to developing interventions, was selected for in-depth analysis using principles of realist synthesis to identify the actions of intervention development and rationales underpinning those actions. **Results** The 87 articles were from the USA (39/87), the UK (32/87), continental Europe (6/87), and the rest of the world (10/87). These mainly took a pragmatic self-selected approach (n = 43); a theory- and evidence-based approach, e.g. Intervention Mapping, Behaviour Change Wheel (n = 22); or a partnership approach, e.g. community-based participatory research, co-design (n = 10). Ten actions of intervention development were identified from the subset of 30 articles, including identifying a need for an intervention, selecting the intervention development approach to follow, considering the needs of the target population, reviewing published evidence, involving stakeholders, drawing or generating theory, and designing and refining the intervention. **Rationales** for these actions were that they would produce more engaging, acceptable, feasible, and effective interventions. **Conclusions** Developers take a variety of approaches to the international endeavour of complex intervention development. We have identified and described a set of actions taken within this endeavour regardless of whether developers follow a published approach or not. Future developers can use these actions and the rationales that underpin them to help them make decisions about the process of intervention development.

Short Title: Barriers and enablers to monitoring and deprescribing
opioid analgesics for chronic non-cancer pain: a systematic review
with qualitative evidence synthesis using the Theoretical Domains
Framework

ISSN: 2044-5415

DOI: 10.1136/bmjqs-2021-014186

Accession Number: WOS:000746630100001

Abstract: Background Understanding barriers and enablers to
monitoring and deprescribing opioids will enable the development of
tailored interventions to improve both practices. Objective To
perform a qualitative evidence synthesis of the barriers and
enablers to monitoring ongoing appropriateness and deprescribing of
opioids for chronic non-cancer pain (CNCP) and to map the findings
to the Theoretical Domains Framework (TDF). Methods We included
English-language qualitative studies that explored healthcare
professional (HCP), patient, carer and the general public's
perceptions regarding monitoring and deprescribing opioids for CNCP.
We searched MEDLINE, EMBASE, Cumulative Index to Nursing and Allied
Health Literature (CINAHL), Allied and Complementary Medicine
Database (AMED) and PsycINFO from inception to August 2020. Two
authors independently selected the studies, extracted the data,
assessed the methodological quality using the Critical Appraisal
Skills Programme, and assessed the confidence in the findings using
GRADE CERQual (Grading of Recommendations Assessment, Development,
and Evaluation Confidence in the Evidence from Reviews of
Qualitative Research). We used an inductive approach to synthesis of
qualitative data and mapped identified themes to TDF domains.
Results From 6948 records identified we included 21 studies,
involving 209 HCPs and 330 patients. No studies involved carers or
the general public. Five barrier themes were identified: limited
alternatives to opioids, management of pain is top priority, patient
understanding, expectations and experiences, prescriber pressures,
and reluctance to change. Four enabler themes were identified:
negative effects of opioids and benefits of deprescribing, clear
communication and expectations for deprescribing, support for

patients, and support for prescribers. 16 barrier and 12 enabler subthemes were identified; most were graded as high (n=15) or moderate (n=9) confidence. The TDF domains 'beliefs about consequences', 'environmental context and resources', 'social influences' and 'emotion' were salient for patients and HCPs. The domains 'skills' and 'beliefs about capabilities' were more salient for HCPs. Conclusion Future implementation interventions aimed at monitoring and deprescribing opioids should target the patient and HCP barriers and enablers identified in this synthesis. PROSPERO registration number CRD42019140784.

Short Title: Invasive species management will benefit from social impact assessment

ISSN: 0021-8901

DOI: 10.1111/1365-2664.12817

Accession Number: WOS:000397930300002

Abstract: 1. Invasive species management aims to prevent or mitigate the impacts of introduced species but management interventions can themselves generate social impacts that must be understood and addressed. 2. Established approaches for addressing the social implications of invasive species management can be limited in effectiveness and democratic legitimacy. More deliberative, participatory approaches are emerging that allow integration of a broader range of socio-political considerations. Nevertheless, there is a need to ensure that these are rigorous applications of social science. 3. Social impact assessment offers a structured process of identifying, evaluating and addressing social costs and benefits. We highlight its potential value for enabling meaningful public participation in planning and as a key component of integrated assessments of management options. 4. Policy implications. As invasive species management grows in scope and scale, social impact assessment provides a rigorous process for recognising and responding to social concerns. It could therefore produce more democratic, less conflict-prone and more effective interventions.

Short Title: Working to improve survival and health for babies born
very preterm: the WISH project protocol

DOI: 10.1186/1471-2393-13-239

Article Number: 239

Accession Number: WOS:000329252300002

Abstract: Background: Babies born very preterm (before 30 weeks
gestation) are at high risk of dying in their first weeks of life,
and those who survive are at risk of developing cerebral palsy in
childhood. Recent high-quality evidence has shown that giving women
magnesium sulphate immediately prior to very early birth can
significantly increase the chances of their babies surviving free of
cerebral palsy. In 2010 Australian and New Zealand clinical practice
guidelines recommended this therapy. The WISH (Working to Improve
Survival and Health for babies born very preterm) Project aims to
bi-nationally improve and monitor the use of this therapy to reduce
the risk of very preterm babies dying or having cerebral palsy.

Methods/Design: The WISH Project is a prospective cohort study. The
25 Australian and New Zealand tertiary level maternity hospitals
will be provided with a package of active implementation strategies
to guide the introduction and local adaptation of guideline
recommendations. Surveys will be conducted at individual hospitals
to evaluate outcomes related to local implementation progress and
the use and value of the WISH implementation strategies. For the
hospitals participating in the 'WISH audit of uptake and health
outcomes data collection', the primary health outcomes (assessed
through case note review, and 24 month corrected age questionnaires)
will be: the proportion of eligible women receiving antenatal
magnesium sulphate; and rates of death prior to primary hospital
discharge and cerebral palsy at two years corrected age in infants
born to eligible mothers. For hospitals wishing to assess factors
influencing translation locally, barriers and facilitators will be
measured through interviews with health care professionals, to
further guide implementation strategies. Study outcomes for the
early phase of the project (Year 1) will be compared with the later

intervention phase (Years 2 and 3). Discussion: The WISH Project will offer insight into the effectiveness of a multifaceted implementation strategy to improve the uptake of a novel neuroprotective therapy in obstetric clinical practice. The successful implementation of antenatal magnesium sulphate for fetal neuroprotection in Australia and New Zealand could lead to over 90 fewer very preterm babies dying or suffering the long-term consequences of cerebral palsy each year.

DOI: 10.14336/ad.2020.1114

Accession Number: WOS:000667454200020

Abstract: Frailty is a prevalent condition among Canadians; over one million are diagnosed as medically frail, and in the next ten years this number will double. Information and telecommunication technologies can provide a low-cost method for managing frailty more proactively. This study aims to examine the range and extent of information and telecommunication technologies for managing frailty in older adults, their technology readiness level, the evidence, and the associated outcomes. A systematic literature review was conducted. Four databases were searched for studies: Medline, EMBASE, CINAHL, and Web of Science. In total, we included 19 studies (out of 9,930) for the data abstraction. Overall, our findings indicate that (1) the proposed frailty phenotype is the most common ground truth to be used for assessing frailty; (2) the most common uses of information and telecommunication technologies for managing frailty are detection, and monitoring and detection, while interventional studies on frailty are very rare; (3) the five main types of information and telecommunication technologies for managing

frailty in older adults are information and telecommunication technology-based platforms, smartphones, telemonitoring (home monitoring), wearable sensors and devices (commercial off-the-shelf), and multimedia formats for online access; (4) the technology readiness level of information and telecommunication technologies for managing frailty in older adults is the "Technology Demonstration" level, i.e., not yet ready to be operated in an actual operating environment; and (5) the level of evidence is still low for information and telecommunication technology studies that manage frailty in older adults. In conclusion, information and telecommunication technologies for managing frailty in the older adult population are not yet ready to be full-fledged technologies for this purpose.

Title: Predicting the Users' Level of Engagement with a Smartphone Application for Smoking Cessation: Randomized Trial and Machine Learning Analysis

Journal: European Addiction Research

Date: 2023 Apr

Short Title: Predicting the Users' Level of Engagement with a Smartphone Application for Smoking Cessation: Randomized Trial and Machine Learning Analysis

ISSN: 1022-6877

DOI: 10.1159/000530111

Accession Number: WOS:000975484600001

Abstract: Introduction: Studies of the users' engagement with smoking cessation application (apps) can help understand how these apps are used by smokers, in order to improve their reach and efficacy. Objective: The present study aimed at identifying the best predictors of the users' level of engagement with a smartphone app for smoking cessation and at examining the relationships between predictors and outcomes related to the users' level of engagement with the app. Methods: A secondary analysis of data from a randomized trial testing the efficacy of the Stop-Tabac smartphone app was used. The experimental group used the "full" app and the control group used a "dressed down" app. The study included a baseline and 1-month and 6-month follow-up questionnaires. A total of 5,293 participants answered at least the baseline questionnaires; however, in the current study, only the 1,861 participants who answered at least the baseline and the 1-month follow-up questionnaire were included. Predictors were measured at baseline and after 1 month and outcomes after 6 months. Data were analyzed using machine learning algorithms. Results: The best predictors of the outcomes were, in decreasing order of importance, intention to

stop smoking, dependence level, perceived helpfulness of the app, having quit smoking after 1 month, self-reported usage of the app after 1 month, belonging to the experimental group (vs. control group), age, and years of smoking. Most of these predictors were also significantly associated with the participants' level of engagement with the app. Conclusions: This information can be used to further target the app to specific groups of users, to develop strategies to enroll more smokers, and to better adapt the app's content to the users' needs.

Short Title: Improving antibiotic use through behaviour change: a systematic review of interventions evaluated in low- and middle-income countries

ISSN: 0268-1080

DOI: 10.1093/heapol/czab021

Accession Number: WOS:000728176700016

Abstract: Antibiotic resistance (ABR) has been identified as a critical threat to global health at the highest policy fora. A leading cause of ABR is the inappropriate use of antibiotics by both patients and healthcare providers. Although countries around the world have committed to developing and implementing national action plans to tackle ABR, there is a considerable gap in evidence about effective behaviour change interventions addressing inappropriate use of antibiotics in low- and middle-income countries (LMICs), where ABR is growing at an alarming rate. We conducted a systematic review to synthesize evidence about the effectiveness and cost-effectiveness of behaviour change interventions to reduce inappropriate use of antibiotics in LMICs. Three databases were searched using a set of predefined search terms and exclusion criteria. The search identified 43 relevant articles. A narrative synthesis of results was conducted using the Behaviour Change Wheel framework to categorize intervention components. The majority of the reviewed studies were set in lower-middle-income or low-income countries located in Sub-Saharan Africa or East Asia and the Pacific. Twenty-four articles evaluated multi-faceted interventions

over a period of 12 months or less. Despite the widespread use of antibiotics in the community, interventions were primarily implemented in public health facilities, targeting health professionals such as doctors, nurses, and other allied medical staff. Although education for providers was the most widely used strategy for influencing antibiotic use, it was shown to be most effective when used in conjunction with training or other enabling and supportive measures to nudge behaviour. Six articles included an evaluation of costs of interventions and found a reduction in costs in inpatient and outpatient settings, and one article found a training and guidelines implementation-based intervention to be highly cost-effective. However, the small number of articles conducting an economic evaluation highlights the need for such analyses to be conducted more frequently to support priority setting in resource-constrained environments.

ISSN: 0090-0036

DOI: 10.2105/ajph.2013.301554

Accession Number: WOS:000331038500020

Abstract: Objectives. We sought to determine if reported racial discrimination was associated with medication nonadherence among African Americans with hypertension and if distrust of physicians was a contributing factor. Methods. Data were obtained from the TRUST project conducted in Birmingham, Alabama, 2006 to 2008. All participants were African Americans diagnosed with hypertension and receiving care at an inner city, safety net setting. Three categories of increasing adherence were defined based on the Morisky Medication Adherence Scale. Trust in physicians was measured with the Hall General Trust Scale, and discrimination was measured with the Experiences of Discrimination Scale. Associations were quantified by ordinal logistic regression, adjusting for gender, age, education, and income. Results. The analytic sample consisted

of 227 African American men and 553 African American women, with a mean age of 53.7 +/- 9.9 years. Mean discrimination scores decreased monotonically across increasing category of medication adherence (4.1, 3.6, 2.9; P = .025), though the opposite was found for trust scores (36.5, 38.5, 40.8; P < .001). Trust mediated 39% (95% confidence interval = 17%, 100%) of the association between discrimination and medication adherence. Conclusions. Within our sample of inner city African Americans with hypertension, racial discrimination was associated with lower medication adherence, and this association was partially mediated by trust in physicians. Patient, physician and system approaches to increase "earned" trust may enhance existing interventions for promoting medication adherence.

Title: Iowa Implementation for Sustainability Framework

Journal: Implementation Science

Volume: 17

Issue: 1

Date: Jan

Short Title: Iowa Implementation for Sustainability Framework

ISSN: 1748-5908

DOI: 10.1186/s13012-021-01157-5

Article Number: 1

Accession Number: WOS:000738622600001

Abstract: Background An application-oriented implementation framework designed for clinicians and based on the Diffusion of Innovations theory included 81 implementation strategies with suggested timing for use within four implementation phases. The purpose of this research was to evaluate and strengthen the framework for clinician use and propose its usefulness in implementation research. Methods A multi-step, iterative approach guided framework revisions. Individuals requesting the use of the framework over the previous 7 years were sent an electronic questionnaire. Evaluation captured framework usability, generalizability, accuracy, and implementation phases for each strategy. Next, nurse leaders who use the framework pile sorted strategies for cultural domain analysis. Last, a panel of five EBP/implementation experts used these data and built consensus to strengthen the framework. Results Participants (n = 127/1578; 8% response) were predominately nurses (94%), highly educated (94% Master's or higher), and from across healthcare (52% hospital/

system, 31% academia, and 7% community) in the USA (84%). Most (96%) reported at least some experience using the framework and 88% would use the framework again. A 4-point scale (1 = not/disagree to 4 = very/agree) was used. The framework was deemed useful (92%, rating 3-4), easy to use (72%), intuitive (67%), generalizable (100%), flexible and adaptive (100%), with accurate phases (96%), and accurate targets (100%). Participants (n = 51) identified implementation strategy timing within four phases (Cochran's Q); 54 of 81 strategies (66.7%, $p < 0.05$) were significantly linked to a specific phase; of these, 30 (55.6%) matched the original framework. Next, nurse leaders (n = 23) completed a pile sorting activity. Anthropac software was used to analyze the data and visualize it as a domain map and hierarchical clusters with 10 domains. Lastly, experts used these data and implementation science to refine and specify each of the 75 strategies, identifying phase, domain, actors, and function. Strategy usability, timing, and groupings were used to refine the framework. Conclusion The Iowa Implementation for Sustainability Framework offers a typology to guide implementation for evidence-based healthcare. This study specifies 75 implementation strategies within four phases and 10 domains and begins to validate the framework. Standard use of strategy names is foundational to compare and understand when implementation strategies are effective, in what dose, for which topics, by whom, and in what context.

prescribing in older hospitalized patients: a qualitative study

ISSN: 0306-5251

DOI: 10.1111/bcp.12555

Accession Number: WOS:000353346700016

Abstract: Aims Older patients commonly suffer from multimorbidities and take multiple medications. As a result, these patients are more vulnerable to potentially inappropriate prescribing (PIP). PIP in older patients may result in adverse drug events (ADEs) and hospitalizations. However, little has been done to identify why PIP occurs. The objectives of this study were (i) to identify hospital doctors' perceptions as to why PIP occurs, (ii) to identify the barriers to addressing the issues identified and (iii) to determine which intervention types would be best suited to improving prescribing. Methods Semi-structured interviews based on the Theoretical Domains Framework (TDF), a tool used to apply behaviour change theories, were conducted with 22 hospital doctors. Content analysis was conducted to identify domains of the TDF that could be targeted to improve prescribing for older people. These domains were then mapped to the behaviour change wheel to identify possible intervention types. Results Content analysis identified five of the 12 domains in the TDF as relevant: (i) environmental context and resources, (ii) knowledge, (iii) skills, (iv) social influences and (v) memory/attention and decision processes. Using the behaviour change wheel, the types of interventions deemed suitable were those based on training and environmental restructuring. Conclusion This study shows that doctors feel there is insufficient emphasis on geriatric pharmacotherapy in their undergraduate/postgraduate training. An intervention providing supplementary training, with particular emphasis on decision processes and dealing with social influences would be justified. This study has, however, uncovered many areas for potential intervention in the future.

Abstract: Background: This study examined how occupational therapists, nurses, and their managers within different organizational contexts in the Australian health and aged care system prepare for implementation. The program being implemented was the Care of People with dementia in their Environment (COPE) program, a community reablement program for people with dementia and their carers. Methods: Qualitative data from 29 in-depth interviews were collected from occupational therapists, nurses, and their managers. Recruitment ensured a variety of organizational contexts were included. Thematic analysis was used to capture key themes. Results: Themes include innovation in a time of instability and uncertainty, values that align with the innovation, shifting the day-to-day practice, and confidence in new specialized skills. Conclusion: Organizations need to carefully consider internal and external contexts when planning implementation efforts. Study findings have informed plans for embedding delivery of the program within the health and aged care sector.

DOI: 10.2196/resprot.4485

Article Number: e58

Accession Number: WOS:000360877600012

Abstract: Background: Twice daily toothbrushing with fluoridated toothpaste is the most widely advocated preventive strategy for dental caries (tooth decay) and is recommended by professional dental associations. Not all parents, children, or adolescents follow this recommendation. This protocol describes the methods for the implementation and evaluation of a quality improvement health promotion program. Objective: The objective of the study is to show a theory-informed, evidence-based program to improve twice daily toothbrushing and oral health-related quality of life that may reduce dental caries, dental treatment need, and costs. Methods: The design is a parallel-group, pragmatic randomized controlled trial. Families of Medicaid-insured children and adolescents within a large dental care organization in central Oregon will participate in the trial (n=21,743). Families will be assigned to one of three groups: a test intervention, an active control, or a passive control condition. The intervention aims to address barriers and support for twice-daily toothbrushing. Families in the test condition will receive toothpaste and toothbrushes by mail for all family members every three months. In addition, they will receive education and social support to encourage toothbrushing via postcards, recorded telephone messages, and an optional participant-initiated telephone helpline. Families in the active control condition will receive the kit of supplies by mail, but no additional instructional information or telephone support. Families assigned to the passive control will be on a waiting list. The primary outcomes are restorative dental care received and, only for children younger than 36 months old at baseline, the frequency of twice-daily toothbrushing. Data will be collected through dental claims records and, for children younger than 36 months old at baseline, parent interviews and clinical exams. Results: Enrollment of participants and baseline interviews have been completed. Final results are expected in early summer, 2017. Conclusions: If proven effective, this simple intervention can be sustained by the dental care organization and replicated by other organizations and government.

community-based physical activity opportunities: A realist scoping
review
ISSN: 0966-0410
DOI: 10.1111/hsc.13186
Accession Number: WOS:000579213100001
Abstract: Deemed a global public health problem by the World Health
Organization, physical inactivity is estimated to be responsible for
one in six deaths in the United Kingdom (UK) and to cost the
nation's economy 7.4 pound billion per year. A response to the
problem receiving increasing attention is connecting primary care
patients with community-based physical activity opportunities. We
aimed to explore what is known about the effectiveness of different
methods of connecting primary care patients with community-based
physical activity opportunities in the United Kingdom by answering
three research questions: 1) What methods of connection from primary
care to community-based physical activity opportunities have been
evaluated?; 2) What processes of physical activity promotion
incorporating such methods of connection are (or are not) effective
or acceptable, for whom, to what extent and under what
circumstances; 3) How and why are (or are not) those processes
effective or acceptable? We conducted a realist scoping review in

which we searched Cochrane, Medline, PsycNET, Google Advanced Search, National Health Service (NHS) Evidence and NHS Health Scotland from inception until August 2020. We identified that five methods of connection from primary care to community-based physical activity opportunities had been evaluated. These were embedded in 15 processes of physical activity promotion, involving patient identification and behaviour change strategy delivery, as well as connection. In the contexts in which they were implemented, four of those processes had strong positive findings, three had moderately positive findings and eight had negative findings. The underlying theories of change were highly supported for three processes, supported to an extent for four and refuted for eight processes. Comparisons of the processes and their theories of change revealed several indications helpful for future development of effective processes. Our review also highlighted the limited evidence base in the area and the resulting need for well-designed theory-based evaluations.

Short Title: A Realist Evaluation of Team Interventions in Acute Hospital Contexts-Use of Two Case Studies to Test Initial Programme Theories

DOI: 10.3390/ijerph18168604

Article Number: 8604

Accession Number: WOS:000689204700001

Abstract: Background: Designing and implementing team interventions to improve quality and safety of care in acute hospital contexts is challenging. There is little emphasis in the literature on how contextual conditions impact interventions or how specific active ingredients of interventions impact on team members' reasoning and enact change. This realist evaluation helps to deepen the

understanding of the enablers and barriers for effective team interventions in these contexts. Methods: Five previously developed initial programme theories were tested using case studies from two diverse hospital contexts. Data were collected from theory driven interviews (n = 19) in an Irish context and from previously conducted evaluative interviews (n = 16) in a US context. Data were explored to unpack the underlying social and psychological drivers that drove both intended and unintended outcomes. Patterns of regularity were identified and synthesised to develop middle-range theories (MRTs). Results: Eleven MRTs demonstrate how and why intervention resources introduced in specific contextual conditions enact reasoning mechanisms and generate intended and unintended outcomes for patients, team members, the team and organisational leaders. The triggered mechanisms relate to shared mental models; openness, inclusivity and connectedness; leadership and engagement; social identity and intrinsic motivational factors. Conclusions: The findings provide valuable information for architects and facilitators of team interventions in acute hospital contexts, as well as help identify avenues for future research. Dataset: The data presented in this study are available on request from the corresponding author. The data are not publicly available due to their sensitive nature and potential identification of participants. DOI: 10.1016/j.idh.2022.03.003

Accession Number: WOS:000831242200005

Abstract: Background: SARS-CoV-2 can be transmitted within offices. Traditional respiratory transmission modes have undergone reassessment and a new paradigm has emerged. This paradigm needs examining prior to identifying control measures to prevent office acquired infections (OAI). Methods: An ongoing assessment of the SARS-CoV-2 transmission literature, including international public health guidance, began 30/1/2020 and continued to submission

7/2/2022. The evidence for the established respiratory transmission paradigm (either droplet or aerosols) and that of a newly emerging paradigm (aerosol and/or droplets) were explored. Based on the new paradigm control measures needed to minimise OAI were produced. Results: The old paradigm of respiratory transmission of being either droplet or airborne cannot be evidenced. SARS-CoV-2 is emitted in virus laden particles that can be inhaled and/or sprayed on facial mucous membranes (Airborne being the dominant route). Office hygiene measures include: minimising the opportunities for the virus to enter the building. Reducing the susceptibility of people to the virus. Minimising exposure risks within offices, and optimising success in deployment. Conclusion: Standard office hygiene precautions are needed to reduce OAI risks from SARS-CoV-2. Efforts should focus on enabling the smooth functioning of the office whilst minimising risks that the virus will transmit therein. This includes: local risk assessments as transmission risks vary based on building design, ventilation, capacity, and ways of working. Additionally, using experts to optimise ventilation systems. Abstract: Introduction Discharge communication is an important aspect of patient care but frequently has shortcomings in emergency departments (EDs). In a paediatric context, youth or parents with young children often leave the ED with minimal opportunity to ask questions or to ensure comprehension of important information. Strategies for improving discharge communication have primarily targeted patients and/or parents, although neither group has been engaged in intervention design or implementation. Furthermore, ED

healthcare providers (HCPs), important actors in discharge communication practice, are rarely consulted regarding intervention design decisions. We will generate evidence to enhance discharge communication by engaging youth, parents and HCPs in the codesign of ED discharge communication strategies (EDUCATE) for asthma and minor head injury. Methods and analysis This mixed methods study will take place at two academic paediatric EDs in Canada. The study will occur in two phases: (A) codesign and refinement of the intervention prototypes; and (B) usability testing of the prototypes. During the first phase, two codesign teams (one for each condition) will follow a series of structured design meetings based on the Behavior Change Wheel to develop the EDUCATE interventions. Each codesign team (composed of youth, parents, HCPs and study researchers) will collaborate to identify priority target behaviours and acceptable components to include in the interventions. During the second phase, we will conduct usability testing in two EDs with a group of youth, parents and HCPs to refine the interventions. Two cycles of usability testing will be conducted with intervention refinement occurring at the end of each cycle. Ethics and dissemination Informed consent will be obtained from all participants. Ethics approval for this study has been obtained from the Research Ethics Board, IWK Health Centre. Results from this study will form the basis of a future effectiveness implementation trial. Key findings will be presented at national and international conferences and published within peer-reviewed journals.

Accession Number: WOS:000397356000008

Abstract: Realising energy efficiency opportunities in new commercial office buildings is an easier task than retrofitting older, mid-tier building stock. As a result, a number of government programs aim to support retrofits by offering grants, upgrades, and energy audits to facilitate energy efficiency opportunities. This study reports on a state government program in Victoria, Australia, where the uptake of such offerings was lower than expected, prompting the program team to consider whether targeting facilities managers (FMs), rather than building owners, might be a better way of delivering the program. The influences and practices of FMs that impact on their ability to be advocates for energy efficiency were explored. The results revealed that complex building ownership arrangements, poor communication skills, isolation from key decision making processes, a lack of credible business cases and information, split incentives, and the prospect of business disruptions can all impact on FMs' ability to drive organizational change. Future program efforts should continue to interrogate the social context of retrofits in mid-tier buildings, including other influences and influencers beyond FMs, and adapt accordingly.

DOI: 10.1111/jocn.13586

Accession Number: WOS:000398914400028

Abstract: Aims and objectives To describe the importance of, and methods for, successfully conducting and translating research into clinical practice. Background There is universal acknowledgement that the clinical care provided to individuals should be informed on the best available evidence. Knowledge and evidence derived from robust scholarly methods should drive our clinical practice, decisions and change to improve the way we deliver care. Translating research evidence to clinical practice is essential to safe, transparent, effective and efficient healthcare provision and meeting the expectations of patients, families and society. Despite its importance, translating research into clinical practice is challenging. There are more nurses in the frontline of health care than any other healthcare profession. As such, nurse-led research is

increasingly recognised as a critical pathway to practical and effective ways of improving patient outcomes. However, there are well-established barriers to the conduct and translation of research evidence into practice. Design This clinical practice discussion paper interprets the knowledge translation literature for clinicians interested in translating research into practice. Methods This paper is informed by the scientific literature around knowledge translation, implementation science and clinician behaviour change, and presented from the nurse clinician perspective. We provide practical, evidence-informed suggestions to overcome the barriers and facilitate enablers of knowledge translation. Examples of nurse-led research incorporating the principles of knowledge translation in their study design that have resulted in improvements in patient outcomes are presented in conjunction with supporting evidence. Conclusions Translation should be considered in research design, including the end users and an evaluation of the research implementation. The success of research implementation in health care is dependent on clinician/consumer behaviour change and it is critical that implementation strategy includes this. Relevance to practice Translating best research evidence can make for a more transparent and sustainable healthcare service, to which nurses are central.

Short Title: Effect of an intervention for patients 65 years and older with blunt chest injury: Patient and health service outcomes

ISSN: 0020-1383

DOI: 10.1016/j.injury.2022.04.024

Accession Number: WOS:000884904500006

Abstract: Introduction: Blunt chest injury in older adults, aged 65 years and older, leads to significant morbidity and mortality. The aim of this study was to evaluate the effect of a multidisciplinary chest injury care bundle (ChIP) on patient and health service outcomes in older adults with blunt chest injury. Methods: ChIP comprised multidimensional implementation guidance in three key

pillars of care for blunt chest injury: respiratory support, analgesia, and complication prevention. Implementation was guided using the Behaviour Change Wheel. This proof-of-concept controlled pre-and post-test study with two intervention and two control sites in Australia was conducted from July 2015 to June 2019. The primary outcomes were non-invasive ventilation (NIV) use, unplanned Intensive Care Unit (ICU) admissions, and in-hospital mortality. Secondary outcomes were health service and costing outcomes. Results: There were 1122 patients included in the analysis, with 673 at intervention sites (331 pre-test and 342 post-test) and 449 at control sites (256 pre-test and 193 post-test). ChIP was associated with unplanned ICU admissions and in NIV use with a reduction of the odds in the post vs the pre periods in the intervention sites when compared to the controls (ratio of OR = 0.13, 95%CI = 0.03-0.55) and (ratio of OR = 0.14, 95%CI = 0.02-0.98) respectively. There was no significant change in mortality. Implementing ChIP was also associated with health service team reviews with an increased odds in the post vs pre periods in the intervention sites in comparison to the controls for surgical review (ratio of OR = 6.93, 95%CI = 4.70-10.28), ICU doctor (ratio of OR = 5.06, 95%CI = 2.26-9.25), ICU liaison (ratio of OR = 14.14, 95%CI = 3.15-63.31), and pain (ratio of OR = 5.59, 95%CI = 3.25-9.29). ChIP was also related to incentive spirometry (ratio of OR = 6.35, 95%CI = 3.15-12.82) and overall costs (ratio of mean ratio = 1.34, 95%CI = 1.09-1.66) with a higher ratio for intervention sites. Conclusion: Implementation of ChIP using the Behaviour Change Wheel was associated with reduced unplanned ICU admissions and NIV use and improved health care delivery. Abstract: Background Blunt chest injury leads to significant morbidity and mortality. The aim of this study was to evaluate the effect of a multidisciplinary chest injury care bundle (ChIP) on patient and health service outcomes. ChIP provides guidance in three key pillars of care for blunt chest injury—respiratory support, analgesia and complication prevention. ChIP was implemented using a multi-faceted implementation plan developed using the Behaviour Change Wheel. **Methods** This controlled pre-and post-test study (two intervention and two non-intervention sites) was conducted from July 2015 to June 2019. The primary outcome measures were unplanned Intensive Care Unit (ICU) admissions, non-invasive ventilation use and mortality. **Results** There were 1790 patients included. The intervention sites had a 58% decrease in non-invasive ventilation use in the post- period compared to the pre-period (95% CI 0.18–0.96). ChIP was associated with 90% decreased odds of unplanned ICU admissions (95% CI 0.04–0.29) at the intervention sites compared to the control groups in the post- period. There was no significant change in mortality. There were higher odds of health service team reviews (surgical OR 6.6 (95% CI 4.61–9.45), physiotherapy OR 2.17 (95% CI 1.52–3.11), ICU doctor OR 6.13 (95% CI 3.94–9.55), ICU liaison OR 55.75 (95% CI 17.48–177.75), pain team OR 8.15 (95% CI 5.52 --12.03), analgesia (e.g. patient controlled analgesia OR 2.6 (95% CI 1.64–3.94) and regional analgesia OR 8.8 (95% CI 3.39–22.79), incentive spirometry OR 8.3 (95% CI 4.49–15.37) and, high flow nasal oxygen OR 22.1 (95% CI 12.43–39.2) in the intervention group compared to the control group in the post-period. **Conclusion** The implementation of a chest injury care bundle using behaviour change theory was associated with a sustained improvement in evidence-based practice resulting in reduced unplanned ICU admissions and non-invasive ventilation requirement. **Notes:** Curtis, Kate Kourouche, Sarah Asha, Stephen Considine, Julie Fry, Margaret Middleton, Sandy Mitchell, Rebecca Munroe, Belinda Shaban, Ramon Z. Short Title: Does electronic medical record redesign increase screening of risk for pressure injury, falls and substance use in the Emergency Department? An implementation evaluation

DOI: 10.1016/j.auec.2020.04.002

Accession Number: WOS:000647173400001

Abstract: Background: Following the provision of urgent care, screening for risks known to impact patient outcomes is an extension of safe emergency nursing care, in particular for falls, pressure injury and substance use. Screening is a process that primarily aims to identify people at increased risk for specific complications. This study aimed to describe and evaluate the implementation of a consolidated electronic checklist on the screening completion rates for falls, pressure injury and substance use in a regional health district. Methods: This pre-post study used emergency data from four Emergency Departments (EDs) in southern NSW, Australia between November 2016 and February 2019. Patient characteristics, triage category, discharge diagnosis, arrival date and time, screening completion date and time and treatment location were extracted. Descriptive statistics were used to describe the characteristics of the presentations. Z test with adjusted p-values using Bonferroni Correction method was used to compare the characteristics of the presentations and the rates of screening completion. The Theoretical Domains Framework was used to identify any deficits in the implementation. Results: There were 33,561 patients in the pre and 35,807 in the post group. There were no differences in patient characteristics between the two groups. The mean emergency department (ED) length of stay was unchanged (490.5 min pre vs 489.9 min post). The proportion of patients who had all three screens completed increased from 1.3% to 5.5% ($p < 0.001$). Pressure injury risk screening increased from 46.6% (pre) to 53.1% (post) ($p < 0.001$) as did substance use screening (1.7% vs 12.4%, $p < 0.001$). Screening was strongly associated to which hospital the patient was admitted, their age and ED length of stay. Of the 51 mapped intervention functions, 20 (39%) were used in the implementation. Conclusions: The introduction of a consolidated electronic checklist for use by emergency nurses to complete fall, pressure injury and substance use screening resulted in an overall increase in risk screening. However screening rates remained poor. Implementation that considers the capability, opportunity and motivation of those that need to alter their behaviour would likely improve the overall compliance. Title: Targeting Parents for Childhood Weight Management:
Development of a Theory-Driven and User-Centered Healthy Eating App

Journal: Jmir Mhealth and Uhealth

Volume: 3

Issue: 2

Date: Apr-Jun

Short Title: Targeting Parents for Childhood Weight Management:
Development of a Theory-Driven and User-Centered Healthy Eating App

ISSN: 2291-5222

DOI: 10.2196/mhealth.3857

Article Number: e69

Accession Number: WOS:000359791800019

Abstract: Background: The proliferation of health promotion apps along with mobile phones' array of features supporting health behavior change offers a new and innovative approach to childhood weight management. However, despite the critical role parents play in children's weight related behaviors, few industry-led apps aimed at childhood weight management target parents. Furthermore, industry-led apps have been shown to lack a basis in behavior change theory and evidence. Equally important remains the issue of how to maximize users' engagement with mobile health (mHealth) interventions where there is growing consensus that inputs from the commercial app industry and the target population should be an integral part of the development process. Objective: The aim of this study is to systematically design and develop a theory and evidence-driven, user-centered healthy eating app targeting parents for childhood weight management, and clearly document this for the research and app development community. Methods: The Behavior Change Wheel (BCW) framework, a theoretically-based approach for intervention development, along with a user-centered design (UCD) philosophy and collaboration with the commercial app industry, guided the development process. Current evidence, along with a series of 9 focus groups (total of 46 participants) comprised of family weight management case workers, parents with overweight and healthy weight children aged 5-11 years, and consultation with experts, provided data to inform the app development. Thematic analysis of focus groups helped to extract information related to relevant theoretical, user-centered, and technological components to underpin the design and development of the app. Results: Inputs from parents and experts working in the area of childhood weight management helped to identify the main target behavior: to help parents provide appropriate food portion sizes for their children. To achieve this target behavior, the behavioral diagnosis revealed the need for eliciting change in parents' capability, motivation, and opportunity in 10-associated Theoretical Domains Framework (TDF) domains. Of the 9 possible intervention functions, 6 were selected to bring about this change which guided the selection of 21 behavior change techniques. Parents' preferences for healthy eating app features revolved around four main themes (app features, time saving

and convenience, aesthetics, and gamification) whereupon a criterion was applied to guide the selection on which preferences should be integrated into the design of the app. Collaboration with the app company helped to build on users' preferences for elements of gamification such as points, quizzes, and levels to optimize user engagement. Feedback from parents on interactive mock-ups helped to inform the final development of the prototype app. Conclusions: Here, we fully explicate a systematic approach applied in the development of a family-oriented, healthy eating health promotion app grounded in theory and evidence, and balanced with users' preferences to help maximize its engagement with the target population.

Short Title: From Ideas to Interventions: A Review and Comparison of Frameworks Used in Early Phase Behavioral Translation Research

ISSN: 0278-6133

DOI: 10.1037/hea0001095

Accession Number: WOS:000750056800010

Abstract: Developing and testing more effective health-related behavioral interventions is critical to making progress in improving disease prevention and treatment. One way to achieve this goal is to use a systematic and progressive framework that outlines the steps needed to translate theories, findings, and basic understandings about human behavior into risk factor and disease management or mitigation strategies. Although several frameworks and process models have been designed to inform the development and optimization of health-related behavioral interventions, little guidance is available to compare key aspects of these models, clarify their common and unique features, and aid in selecting the best approach for a specific research question. This article describes the major frameworks that focus on early phase translation—that is, approaches that address the design and optimization of behavioral interventions before testing in Phase III efficacy trials. Differences between and common features of these models are described, opportunities for combining frameworks to maximize their impact are noted, and guidance is provided to enable investigators to choose the most useful model(s) when designing and optimizing health-related

behavioral interventions. The goal of this article is to promote the consistent use of frameworks that encourage a systematic, progressive approach to behavioral intervention development and testing as one way to encourage the creation of well-characterized, optimized, and potentially more effective health-related behavioral interventions.

Accession Number: WOS:000361636600001

Abstract: Objective: Given the critical role of behavior in preventing and treating chronic diseases, it is important to accelerate the development of behavioral treatments that can improve chronic disease prevention and outcomes. Findings from basic behavioral and social sciences research hold great promise for addressing behaviorally based clinical health problems, yet there is currently no established pathway for translating fundamental behavioral science discoveries into health-related treatments ready for Phase III efficacy testing. This article provides a systematic framework for developing behavioral treatments for preventing and treating chronic diseases. Method: The Obesity-Related Behavioral Intervention Trials (ORBIT) model for behavioral treatment development features a flexible and progressive process, prespecified clinically significant milestones for forward movement, and return to earlier stages for refinement and optimization. Results: This article presents the background and rationale for the ORBIT model, a summary of key questions for each phase, a selection of study designs and methodologies well-suited to answering these questions, and prespecified milestones for forward or backward movement across phases. Conclusions: The ORBIT model provides a progressive, clinically relevant approach to increasing the number of evidence-based behavioral treatments available to prevent and treat chronic diseases.

Abstract: Non-adherence to medicines is a significant clinical and financial burden, but successful strategies to improve it, and thus bring about significant improvements in clinical outcome, remain elusive. Many barriers exist, including a lack of awareness amongst some healthcare professionals as to the extent and impact of non-adherence and a dearth of skills to address it successfully. Patients may not appreciate that they are non-adherent, feel they cannot disclose it or underestimate its impact on their health in the short and longer term. In describing the evidence-based frameworks that identify the causal factors behind medicines taking (or not taking) behaviours, we can start to personalise interventions to enable individuals to make informed decisions about their treatments and thus overcome real and perceived barriers to adherence.

Abstract: E-health applications can support continuing care for persons with chronic diseases such as multiple sclerosis (MS). We have developed a web-based mobile app called VIOLA to be used at home by persons with MS (pwMS) who previously participated in an innovative multidisciplinary rehab program. The purpose of VIOLA is to reinforce what participants have learned about a healthy lifestyle and to keep them motivated to adhere to rehabilitation programs. As the outbreak of the Covid-19 pandemic has severely curtailed pwMS contact with their usual health providers, we quickly updated VIOLA to grant continuity of care to our home-bound patients. By monitoring pwMS subscriptions to individual modules, we found a definite increase after the national lockdown was declared. Subscribers rated the app very positively. Encouraged by the positive feedbacks, we are planning to extend the access to our app also to pwMS with no prior specific learning experience. This would limit the psychophysical consequences of the lockdown. Furthermore, VIOLA could be effective in maintaining a proper lifestyle, contributing to improve the quality of life of pwMS. VIOLA has the potential of increasing the adherence of pwMS to the rehabilitation confirming that digital communication tools are a valuable solution for those home-bound.]

Abstract: Purpose A lack of social interaction during early stroke recovery can negatively affect neurological recovery and health-related quality of life of patients with aphasia following stroke. A Communication Enhanced Environment (CEE) model was developed to increase patient engagement in language activities early after stroke. This study aimed to examine staff (n = 20) and volunteer (n = 2) perceptions of a CEE model and factors influencing the implementation and use of the model. This study formed part of a broader study that developed and embedded a CEE model on two hospital wards. **Materials and methods** Six focus groups and one interview with hospital staff were conducted and analysed using a qualitative description approach. Feedback emailed by volunteers was included in the data set. **Results** Staff and volunteers perceived the CEE model benefitted themselves, the hospital system and patients. Staff identified a range of factors that influenced the implementation and use of the CEE model including individual staff, volunteer and patient factors, hospital features, the ease with which the CEE model could be used, and the implementation approach. **Conclusions** This study provides valuable insights into staff perceptions which may inform the implementation of interventions and future iterations of a CEE model.

Abstract: Objectives: Develop and implement a Communication Enhanced Environment model and explore its effect on language activities for patients early after stroke. Method and design: Before-and-after pilot study. Setting: An acute/slow stream rehabilitation and a rehabilitation ward in a private hospital in Perth, Western Australia. Participants: Fourteen patients recruited within 21 days of stroke. Seven recruited during the before-phase (control group: patients with aphasia = 3, patients without aphasia = 4) and seven recruited in the after-phase (intervention group: patients with aphasia = 4, patients without aphasia = 3). Intervention: The intervention group exposed to a Communication Enhanced Environment model had access to equipment, resources, planned social activities and trained communication partners. Both groups received usual stroke care. Data collection: Hospital site champions monitored the availability of the intervention. Behavioural mapping completed during the first minute of each 5-minute interval over 12 hours (between 7 am and 7 pm) determined patient engagement in language activities. Results: Seventy-one percent of the Communication Enhanced Environment model was available to the intervention group who engaged in higher, but not significant (95% CI), levels of language activities (600 of 816 observation time points, 73%) than the control group (551 of 835 observation time points, 66%). Unforeseen reorganisation of the acute ward occurred during the study. Conclusions: Implementation of a Communication Enhanced Environment model was feasible in this specific setting and may potentially influence patients' engagement in language activities. The unforeseen contextual challenges that occurred during the study period demonstrate the challenging nature of the hospital environment and will be useful in future research planning. Title: Conceptual model for dietary behaviour change at household level: a 'best-fit' qualitative study using primary data

Journal: BMC Public Health

Volume: 14

Date: Jun

Short Title: Conceptual model for dietary behaviour change at household level: a 'best-fit' qualitative study using primary data

DOI: 10.1186/1471-2458-14-574

Article Number: 574

Accession Number: WOS:000338965500003

Abstract: Background: Interventions having a strong theoretical basis are more efficacious, providing a strong argument for incorporating theory into intervention planning. The objective of this study was to develop a conceptual model to facilitate the planning of dietary intervention strategies at the household level in rural Kerala. Methods: Three focus group discussions and 17 individual interviews were conducted among men and women, aged between 23 and 75 years. An interview guide facilitated the process to understand: 1) feasibility and acceptability of a proposed dietary behaviour change intervention; 2) beliefs about foods, particularly fruits and vegetables; 3) decision-making in households with reference to food choices and access; and 4) to gain insights into the kind of intervention strategies that may be practical at community and household level. The data were analysed using a modified form of qualitative framework analysis, which combined both deductive and inductive reasoning. A priori themes were identified from relevant behaviour change theories using construct definitions, and used to index the meaning units identified from the primary qualitative data. In addition, new themes emerging from the data were included. The associations between the themes were mapped into four main factors and its components, which contributed to construction of the conceptual model. Results: Thirteen of the a priori themes from three behaviour change theories (Trans-theoretical model, Health Belief model and Theory of Planned Behaviour) were confirmed or slightly modified, while four new themes emerged from the data. The conceptual model had four main factors and its components: impact factors (decisional balance, risk perception, attitude); change processes (action-oriented, cognitive); background factors (personal modifiers, societal norms); and overarching factors (accessibility, perceived needs and preferences), built around a three-stage change spiral (pre-contemplation, intention, action). Decisional balance was the strongest in terms of impacting the process of behaviour change, while household efficacy and perceived household cooperation were identified as 'markers' for stages-of-change at the household level. Conclusions: This type of framework analysis made it possible to develop a conceptual model that could facilitate the design of intervention strategies to aid a household-level dietary behaviour change process.

Short Title: An integrated community and primary healthcare worker intervention to reduce stigma and improve management of common mental disorders in rural India: protocol for the SMART Mental Health programme

DOI: 10.1186/s13063-021-05136-5

Article Number: 179

Accession Number: WOS:000625418900001

Abstract: Background: Around 1 in 7 people in India are impacted by mental illness. The treatment gap for people with mental disorders is as high as 75–95%. Health care systems, especially in rural regions in India, face substantial challenges to address these gaps in care, and innovative strategies are needed. Methods: We hypothesise that an intervention involving an anti-stigma campaign and a mobile-technology-based electronic decision support system will result in reduced stigma and improved mental health for adults at high risk of common mental disorders. It will be implemented as a parallel-group cluster randomised, controlled trial in 44 primary health centre clusters servicing 133 villages in rural Andhra Pradesh and Haryana. Adults aged ≥ 18 years will be screened for depression, anxiety and suicide based on Patient Health Questionnaire (PHQ-9) and Generalised Anxiety Disorders (GAD-7) scores. Two evaluation cohorts will be derived—a high-risk cohort with elevated PHQ-9, GAD-7 or suicide risk and a non-high-risk cohort comprising an equal number of people not at elevated risk based on these scores. Outcome analyses will be conducted blinded to intervention allocation. Expected outcomes: The primary study outcome is the difference in mean behaviour scores at 12 months in the combined 'high-risk' and 'non-high-risk' cohort and the mean difference in PHQ-9 scores at 12 months in the 'high-risk' cohort. Secondary outcomes include depression and anxiety remission rates in the high-risk cohort at 6 and 12 months, the proportion of high-risk individuals who have visited a doctor at least once in the previous 12 months, and change from baseline in mean stigma, mental health knowledge and attitude scores in the combined non-high-risk and high-risk cohort. Trial outcomes will be accompanied by detailed economic and process evaluations. Significance: The findings are likely to inform policy on a low-cost scalable solution to destigmatise common mental disorders and reduce the treatment gap for under-served populations in low-and middle-income country settings.

Abstract: There is a long-standing interest among clinicians and researchers in the healthcare community in the role that patients' involvement in their healthcare management might play in improving health outcomes and healthcare quality, as well as in controlling the costs of healthcare provision. Recent advances in mobile computing technology make it feasible to scale successful patient engagement programs first delivered in limited face-to-face trials to larger patient populations. However, comparatively little is known about how technology-enabled patient engagement systems might fare in deployments in clinical contexts involved in the treatment of patients with chronic diseases. We initiated a six-month trial with 25 patients to explore patient and provider interactions with one commercially available patient engagement system. We deployed the system comprised of a kiosk, mobile phone and web user interfaces to patients with a primary diagnosis of Diabetes Mellitus, type 2 or Hypertension who were receiving care at a large urban medical practice that emphasizes patient engagement. We used a mixed-methods methodology to collect qualitative and quantitative feedback on the use of the technology. We found a large range among patients in their ability to engage through the technology.

Physicians were generally interested and positive about the use of

the technology. We are currently exploring ways to help both stakeholders improve in incorporating the newly available data into their work practices.

Short Title: A Self-help Tool to Facilitate Implementation of eHealth Initiatives in Health Care (E-Ready): Formative Evaluation

DOI: 10.2196/17568

Article Number: e17568

Accession Number: WOS:000854067700023

Abstract: Background: eHealth interventions have the potential to increase the efficiency and effectiveness of health care. However, research has shown that implementing eHealth in routine health care practice is difficult. Organizational readiness to change has been shown to be central to successful implementation. This paper describes the development and formative evaluation of a generic self-help tool, E-Ready, designed to be used by managers, project leaders, or others responsible for implementation in a broad range of health care settings. Objective: The aim of this study is to develop and evaluate a tool that could facilitate eHealth implementation in, for example, health care. Methods: A first version of the tool was generated based on implementation theory (E-Ready 1.0). A formative evaluation was undertaken through expert panels (n=15), cognitive interviews (n=17), and assessment of measurement properties on E-Ready items from 3 different workplaces (n=165) using Rasch analyses. E-Ready 1.0 was also field tested among the target population (n=29). Iterative revisions were conducted during the formative evaluation process, and E-Ready 2.0 was generated. Results: The E-Ready Tool consists of a readiness assessment survey and a hands-on manual. The survey measures perceived readiness for change (willingness and capability) at individual and collective levels: perceived conditions for change at the workplace, perceived individual conditions for change, perceived support and engagement among management, perceived readiness among colleagues, perceived consequences on status quo, and perceived workplace attitudes. The manual contains a brief introduction, instructions on how to use the tool, information on the themes of E-Ready, instructions on how to create an implementation plan, brief advice for success, and tips for further reading on implementation

theory. Rasch analyses showed overall acceptable measurement properties in terms of fit validity. The subscale Individual conditions for change (3 items) had the lowest person reliability (0.56), whereas Perceived consequences on status quo (5 items) had the highest person reliability (0.87). Conclusions: E-Ready 2.0 is a new self-help tool to guide implementation targeting health care provider readiness and engagement readiness ahead of eHealth initiatives in, for example, health care settings. E-Ready can be improved further to capture additional aspects of implementation; improvements can also be made by evaluating the tool in a larger sample.

Abstract: Projects and programs have long been the primary instrument for achieving development goals in low- and middle-income countries. One criticism of the project-focused approach is its failure to focus on broader systemlevel changes. This paper explores how Mayne's COM-B Theory of Change model can enhance the evaluation of how projects and system-level investments can lead to system-level changes, especially in a development context. Using a real-world example, we offer several evaluation questions to initiate thinking about what might be needed to extend the ideas in the COM-B theory of change to facilitate better interrogation of systems-level change efforts.

Abstract: The pressing need to measure and improve antibiotic use was recognized >40 years ago, so why have we failed to achieve sustained improvement at scale? In his 2014 Reith Lectures about the future of medicine, the US surgeon Atul Gawande said that failure in medicine is largely due to ineptitude (failure to use existing knowledge) rather than ignorance (lack of knowledge). Consequently, it is notable that most interventions to improve antimicrobial prescribing are either designed to educate individual practitioners or patients about policies or to restrict prescribing to make practitioners follow policies. Interventions that enable practitioners to apply existing knowledge through decision support, feedback and action planning are relatively uncommon. There is an urgent need to improve the design and reporting of interventions to change behaviour. However, achieving sustained improvement at scale will also require a more profound understanding of the role of context. What makes contexts receptive to change and which elements of context, under what circumstances, are important for human performance? Answering these questions will require interdisciplinary work with social scientists to integrate complementary approaches from human factors and ergonomics, improvement science and educational research. We need to rethink professional education to embrace complexity and enable teams to learn in practice. Workplace-based learning of improvement science will enable students and early-career professionals to become change agents and transform training from a burden on clinical teams into a driver for improvement. This will make better use of existing resources, which is the key to sustainability at scale.

Abstract: Background Antibiotic resistance is a major public health problem. Infections caused by multidrug-resistant bacteria are associated with prolonged hospital stay and death compared with infections caused by susceptible bacteria. Appropriate antibiotic use in hospitals should ensure effective treatment of patients with infection and reduce unnecessary prescriptions. We updated this systematic review to evaluate the impact of interventions to improve antibiotic prescribing to hospital inpatients. Objectives To estimate the effectiveness and safety of interventions to improve antibiotic prescribing to hospital inpatients and to investigate the effect of two intervention functions: restriction and enablement. Search methods We searched the Cochrane Central Register of Controlled Trials (CENTRAL) (the Cochrane Library), MEDLINE, and Embase. We searched for additional studies using the bibliographies of included articles and personal files. The last search from which records were evaluated and any studies identified incorporated into the review was January 2015. Selection criteria We included randomised controlled trials (RCTs) and non-randomised studies (NRS). We included three non-randomised study designs to measure behavioural and clinical outcomes and analyse variation in the effects: non-randomised trials (NRT), controlled beforeafter (CBA) studies and interrupted time series (ITS) studies. For this update we also included three additional NRS designs (case control, cohort, and qualitative studies) to identify unintended consequences. Interventions included any professional or structural interventions as defined by the Cochrane Effective Practice and Organisation of Care Group. We defined restriction as 'using rules to reduce the opportunity to engage in the target behaviour (or increase the target behaviour by reducing the opportunity to engage in competing behaviours)'. We defined enablement as 'increasing means/reducing barriers to increase capability or opportunity'. The main comparison was between intervention and no intervention. Data collection and analysis Two review authors extracted data and assessed study risk of bias. We performed meta-analysis and meta-regression of RCTs and metaregression of ITS studies. We classified behaviour change functions for all interventions in the review, including those studies in the previously published versions. We analysed dichotomous data with a risk difference (RD). We assessed certainty of evidence with GRADE criteria. Main results This review includes 221 studies (58 RCTs, and 163 NRS). Most studies were from North America (96) or Europe (87). The remaining studies were from Asia (19), South America (8), Australia (8), and the East Asia (3). Although 62% of RCTs were at a high risk of bias, the results for the main review outcomes were similar when we restricted the analysis to studies at low risk of bias. More hospital inpatients were treated according to antibiotic prescribing policy with the intervention compared with no intervention based on 29 RCTs of predominantly enablement interventions (RD 15%, 95% confidence interval (CI) 14% to 16%; 23,394 participants; high-certainty evidence). This represents an increase from 43% to 58%. There were

high levels of heterogeneity of effect size but the direction consistently favoured intervention. The duration of antibiotic treatment decreased by 1.95 days (95% CI 2.22 to 1.67; 14 RCTs; 3318 participants; high-certainty evidence) from 11.0 days. Information from non-randomised studies showed interventions to be associated with improvement in prescribing according to antibiotic policy in routine clinical practice, with 70% of interventions being hospital-wide compared with 31% for RCTs. The risk of death was similar between intervention and control groups (11% in both arms), indicating that antibiotic use can likely be reduced without adversely affecting mortality (RD 0%, 95% CI -1% to 0%; 28 RCTs; 15,827 participants; moderate-certainty evidence). Antibiotic stewardship interventions probably reduce length of stay by 1.12 days (95% CI 0.7 to 1.54 days; 15 RCTs; 3834 participants; moderate-certainty evidence). One RCT and six NRS raised concerns that restrictive interventions may lead to delay in treatment and negative professional culture because of breakdown in communication and trust between infection specialists and clinical teams (low-certainty evidence). Both enablement and restriction were independently associated with increased compliance with antibiotic policies, and enablement enhanced the effect of restrictive interventions (high-certainty evidence). Enabling interventions that included feedback were probably more effective than those that did not (moderate-certainty evidence). There was very low-certainty evidence about the effect of the interventions on reducing *Clostridium difficile* infections (median 48.6%, interquartile range -80.7% to -19.2%; 7 studies). This was also the case for resistant gram-negative bacteria (median -12.9%, interquartile range -35.3% to 25.2%; 11 studies) and resistant gram-positive bacteria (median -19.3%, interquartile range -50.1% to +23.1%; 9 studies). There was too much variance in microbial outcomes to reliably assess the effect of change in antibiotic use. Heterogeneity of intervention effect on prescribing outcomes We analysed effect modifiers in 29 RCTs and 91 ITS studies. Enablement and restriction were independently associated with a larger effect size (high-certainty evidence). Feedback was included in 4 (17%) of 23 RCTs and 20 (47%) of 43 ITS studies of enabling interventions and was associated with greater intervention effect. Enablement was included in 13 (45%) of 29 ITS studies with restrictive interventions and enhanced intervention effect. Authors' conclusions We found high-certainty evidence that interventions are effective in increasing compliance with antibiotic policy and reducing duration of antibiotic treatment. Lower use of antibiotics probably does not increase mortality and likely reduces length of stay. Additional trials comparing antibiotic stewardship with no intervention are unlikely to change our conclusions. Enablement consistently increased the effect of interventions, including those with a restrictive component. Although feedback further increased intervention effect, it was used in only a minority of enabling interventions. Interventions were successful in safely reducing unnecessary antibiotic use in hospitals, despite the fact that the majority did not use the most effective behaviour change techniques. Consequently, effective dissemination of our findings could have considerable health service and policy impact. Future research

should instead focus on targeting treatment and assessing other measures of patient safety, assess different stewardship interventions, and explore the barriers and facilitators to implementation. More research is required on unintended consequences of restrictive interventions.

Short Title: Exploring condom use decision-making among adolescents: the synergistic role of affective and rational processes

DOI: 10.1186/s12889-021-11926-y

Article Number: 1894

Accession Number: WOS:000708891500007

Abstract: Background: Condom use remains the most effective behavioural method for the prevention of HIV and unplanned pregnancies. However, condom use remains inconsistent among young people. Exploring the condom use decision-making processes that adolescents engage in might provide information that would assist in the prevention of many challenges related to poor sexual and reproductive health outcomes. This study therefore aimed to explore the factors that influenced decision-making about sexual debut and condom use of adolescents from two schools in the Western Cape, South Africa. Methods: A sample of 16 adolescents were selected using purposive sampling. Data were collected using semi-structured, individual interviews. Thematic analysis was used to analyse the data generated. Results: The link between sexual debut and affective processes was frequently discussed in condom use decision-making. Decisions about sexual debut were influenced by the belief that sex was a perceived symbol of 'true love' on the one hand, and respect for perceived parental expectations of age-appropriate sex, on the other. Condom use decision-making was shaped by adolescents' concerns about their future and lack of stability in their lives. Adolescents' fears of pregnancy, parenthood and disease shaped their condom use decision-making. It became evident that rational and affective decision-making in condom use choice were not mutually exclusive, but that these processes happened simultaneously. Conclusions: The study highlighted the role of affective states as

part of the process of examining alternatives when deciding to use a condom or not. Interventions to strengthen condom use decision-making should therefore incorporate not only rational but also affective processes to improve adolescent sexual and reproductive outcomes.

Short Title: Addressing the Digital Inverse Care Law in the Time of COVID-19: Potential for Digital Technology to Exacerbate or Mitigate Health Inequalities

ISSN: 1438-8871

DOI: 10.2196/21726

Article Number: e21726

Accession Number: WOS:000637594200003

Abstract: Digital technologies have been transforming methods of health care delivery and have been embraced within the health, social, and public response to the COVID-19 pandemic. However, this has directed attention to the "inverse information law" (also called "digital inverse care law") and digital inequalities, as people who are most in need of support (in particular, older people and those experiencing social deprivation) are often least likely to engage with digital platforms. The response to the COVID-19 pandemic represents a sustained shift to the adoption of digital approaches to working and engaging with populations, which will continue beyond the COVID-19 pandemic. Therefore, it is important to understand the underlying factors contributing to digital inequalities and act immediately to avoid digital inequality contributing to health inequalities in the future. The response to COVID-19 represents a sustained shift to adopting digital approaches to working and engaging with populations which will continue beyond this pandemic. Therefore it is important that we understand the underlying factors contributing to digital inequalities, and act now to protect against digital inequality contributing to health inequalities in the future.

Title: Taking Action in Student Harassment Situations: Application of the Behaviour Change Wheel to Bystander Intervention

Journal: Violence and Victims

Volume: 37

Issue: 1

Pages: 116-140

Short Title: Taking Action in Student Harassment Situations: Application of the Behaviour Change Wheel to Bystander Intervention

ISSN: 0886-6708

DOI: 10.1891/vv-d-19-00078

Accession Number: WOS:000758930500007

Abstract: This study applied the Behaviour Change Wheel (BCW) to understand barriers and facilitators to bystander behaviours in UK students. The BCW includes detailed examination of the capabilities, opportunities and motivations involved in behaviours. Two surveys (n = 515; n = 201) and a focus group study (n = 12) were undertaken. Capability to intervene may be influenced by confidence and beliefs about physical ability and safety. Students appeared to have the physical opportunity to intervene, but social opportunity might be influenced by cultural norms. Motivations might be influenced by beliefs as well as inherent stereotypes about perpetrators and victims. Behaviour change techniques (BCTs) such as instruction on how to perform the behaviour, reattribution and creating a valued self-identity should be applied to overcome these barriers. A logic model to theorise the change processes underlying bystander behaviours in this population offers a new perspective on what needs to be addressed in interventions.

Short Title: Factors That Influence Walking Intervention Adherence for Older Adults Living in Retirement Communities

ISSN: 1063-8652

DOI: 10.1123/japa.2020-0279

Accession Number: WOS:000771574200009

Abstract: Walking interventions improve health outcomes among older adults. However, few clinical trials evaluate long-term behavior change adherence. The authors explored factors that influence walking adherence in older adults following their participation in a clinical trial. They conducted n= 7 focus groups with n= 23 participants enrolled in the parent study (ClinicalTrials.gov number: NCT03654807). The authors used content analysis to code data according to the social-ecological model. They found that supportive services (exercise classes) in retirement communities have multilevel impacts on adherence to walking activity. Residents from communities offering services continued walking because of increased confidence gained in the parent trial, while residents in communities without services were motivated by their functional improvements. Residents voiced frustration with retirement community physical activity programs that did not address the full spectrum of physical functioning. Findings support the need for retirement communities to account for various motivational factors in tailoring programs to promote increased physical activity for older adults.

Short Title: Rationale and design of integrating a parents first obesity intervention with a pediatric weight management intervention for rural families-Evaluating the ripple effect

ISSN: 1551-7144

DOI: 10.1016/j.cct.2023.107140

Article Number: 107140

Accession Number: WOS:000951896900001

Abstract: Rural families are disproportionately affected by obesity. Obesity often runs in families and is impacted by hereditary components, the shared home environment, and parent modeling/child observational learning. Moreover, parent changes in weight predict child changes in weight. Thus, targeting the family unit has the potential to enhance outcomes for adults and children simultaneously. Additionally, engaging rural nurses in medical clinics and schools may be important in determining whether rural telehealth programs are successfully implemented and sustained. This paper describes the rationale and design of a randomized control

trial (RCT) evaluating the effectiveness of an integrated adult-and child-focused obesity treatment tailored for rural participants. Outcomes of this study include participant weight loss from baseline to 9-months, device-measured physical activity, and dietary intake. This project will additionally compare reach between clinic and school settings and evaluate the impact of nurse engagement. This study will include 240 participants from eight rural communities who will be randomized to either a Parent +Family-based group or a Newsletter +Family-based group. Parents in the Parent +Family-based group will receive a 3-month adult obesity treatment designed for adult behavior change as a first step. Then, parents and children together will enter the family-based program (iAmHealthy), allowing for potential enhancement of a theorized ripple effect. Parents in the Newsletter +Family-based group will receive 3 monthly newsletters and then participate in the 6-month family-based intervention designed for child behavior change. This study is the first RCT to examine the effectiveness of an integrated adult-and child-focused obesity treatment program.

Short Title: Theory-Informed Design of a Tailored Strategy for Implementing Household TB Contact Investigation in Uganda

DOI: 10.3389/fpubh.2022.837211

Article Number: 837211

Accession Number: WOS:000781991300001

Abstract: Since 2012, the World Health Organization has recommended household contact investigation as an evidence-based intervention to find and treat individuals with active tuberculosis (TB), the most common infectious cause of death worldwide after COVID-19.

Unfortunately, uptake of this recommendation has been suboptimal in low- and middle-income countries, where the majority of affected individuals reside, and little is known about how to effectively deliver this service. Therefore, we undertook a systematic process to design a novel, theory-informed implementation strategy to promote uptake of contact investigation in Uganda, using the COM-B (Capability-Opportunity-Motivation-Behavior) model and the Behavior

Change Wheel (BCW) framework. We systematically engaged national, clinic-, and community-based stakeholders and collectively re-examined the results of our own formative, parallel mixed-methods studies. We identified three core behaviors within contact investigation that we wished to change, and multiple antecedents (i.e., barriers and facilitators) of those behaviors. The BCW framework helped identify multiple intervention functions targeted to these antecedents, as well as several policies that could potentially enhance the effectiveness of those interventions. Finally, we identified multiple behavior change techniques and policies that we incorporated into a multi-component implementation strategy, which we compared to usual care in a household cluster-randomized trial. We introduced some components in both arms, including those designed to facilitate initial uptake of contact investigation, with improvement relative to historical controls. Other components that we introduced to facilitate completion of TB evaluation-home-based TB-HIV evaluation and follow-up text messaging-returned negative results due to implementation failures. In summary, the Behavior Change Wheel framework provided a feasible and transparent approach to designing a theory-informed implementation strategy. Future studies should explore the use of experimental methods such as micro-randomized trials to identify the most active components of implementation strategies, as well as more creative and entrepreneurial methods such as human-centered design to better adapt the forms and fit of implementation strategies to end users.

Accession Number: WOS:000804163100023

Abstract: Objective Develop a Conservative Kidney Management (CKM) Pathway for patients unlikely to benefit from dialysis. We sought to determine (1) core components of care and (2) implementation strategies across a multisector healthcare system. Design We used the Knowledge to Action Cycle and the Theoretical Domains Framework to identify barriers and facilitators to CKM. Activities included a current state assessment, World Cafes, interviews, focus groups and readiness for change assessments. Setting A provincial initiative in Alberta, Canada. Participants 282 participants were purposively selected to reflect those involved in the care of patients receiving CKM. This included policy-makers, multidisciplinary healthcare professionals, patients and their family. Main outcome measures Theoretical domains linked to pathway content and implementation strategies. Results Environmental context and resources, social/professional role and identity, knowledge and social influences were the most influential behaviour change domains identified. The most effective strategies for facilitating behaviour change were identified to be education, training, environmental restructuring and modelling. Core components of care were determined to be guidelines for treating symptoms and disease complications consistent with the philosophy of CKM, timely communication of the choice for CKM, coordination with community services, crisis planning, advance care planning and tools to enhance patients' capacity for self-management and shared decision-making. This resulted in development of Alberta's CKM Pathway, an interactive, digital, decision-support tool consisting of: (1) a patient decision aid; (2) a patient/family portal; and (3) a healthcare professional portal, where all resources can be freely accessed. Conclusions The pathway was codesigned by patients and healthcare professionals and involves tailor-made combinations of tools to address unique patient needs and system-community circumstances. Most of the strategies are adaptable to local context and are likely translatable to the implementation of sustainable CKM in other national and international jurisdictions.

Article Number: 194

Accession Number: WOS:000730546500001

Abstract: Background Parents have faced unique challenges during the coronavirus disease 2019 (COVID-19) pandemic, including mobility constraints, isolation measures, working from home, and the closure of schools and childcare facilities. There is presently a lack of in-depth qualitative research exploring how these changes have affected parents' mental health and wellbeing. Methods Semi-structured qualitative interviews with 29 parents of young children. Interviews were analysed using reflexive thematic analysis. Results We identified five superordinate themes affecting participant mental health and wellbeing: (1) navigation of multiple responsibilities and change inside the home; (2) disruption to home life; (3) changes to usual support networks; (4) changes in personal relationships; and (5) use of coping strategies. Participants described stress and exhaustion from navigating multiple pressures and conflicting responsibilities with home, schooling, and work, without their usual support networks and in the context of disrupted routines. Family roles and relationships were sometimes tested, however, many parents identified coping strategies that protected their wellbeing including access to outdoor space, spending time away from family, and avoiding conflict and pandemic-related media coverage. Conclusions Employers must be cognisant of the challenges that the pandemic has placed on parents, particularly women and lone parents. Flexible working arrangements and support might therefore relieve stress and increase productivity. Coping strategies identified by parents in this study could be harnessed and encouraged by employers and policymakers to promote positive wellbeing during times of stress throughout the pandemic and beyond.

ISSN: 1445-8330

DOI: 10.1111/inm.12971

Accession Number: WOS:000739893100001

Abstract: Implementing psychosocial approaches into mental health inpatient settings continues to be challenging. This is despite mental health policies prioritizing trauma-informed and recovery-orientated care approaches. This study reports on an interdisciplinary project that implemented and examined the uptake of weighted modalities in a psychiatric inpatient rehabilitation setting. While over-reliance on pro re nata (PRN) medication in these settings has been reported, weighted modalities are a sensory approach that can be self-initiated by consumers as an alternative to use of PRN to manage distress and agitation. A mixed-methods realist approach was used to determine what works, for whom, and in what circumstances weighted modalities were offered by clinicians and used by consumers. Additionally, we were interested in determining whether there was an associated change in PRN use during the trial. Data included in-depth interviews with consumers (n = 12) and clinicians (n = 11), and extraction of PRN medication use preceding, throughout, and following implementation. Statistical analysis revealed a significant increase in PRN rates in the first 3 months of implementation (mean difference from baseline = 29.5, P = 0.047) but a significant decrease in the second three-month period following implementation (mean difference from baseline = -30.7, P = 0.036). Qualitative findings highlighted the key components of successful implementation as being environmental restructuring (availability/accessibility and visibility of weighted modalities) and social influences. Strategies to enhance these components are discussed.

ISSN: 2047-4873

DOI: 10.1093/eurjpc/zwab115

Accession Number: WOS:000756327500001

Abstract: Aims Despite the high use of cardioprotective medications, the risk factor control in patients with coronary heart disease (CHD) is still inadequate. Guidelines identify healthy lifestyles as equally important in secondary prevention as pharmacotherapy. Here, we describe reasons for poor lifestyle adherence from the patient's perspective. Methods and results In the EUROASPIRE IV and V surveys, 16 259 CHD patients were examined and interviewed during a study visit \geq 6 months after hospital discharge. Data gathering was fully standardized. The Brief Illness Perception questionnaire was completed by a subsample of 2379 patients. Half of those who were smoking prior to hospital admission, were still smoking; 37% of current smokers had not attempted to quit and 51% was not considering to do so. The prevalence of obesity was 38%. Half of obese patients tried to lose weight in the past month and 61% considered weight loss in the following month. In relation to physical activity, 40% was on target with half of patients trying to do more everyday activities. Less than half had the intention to engage in planned exercise. Only 29% of all patients was at goal for all three lifestyle factors. The number of adverse lifestyles was strongly related to the way patients perceive their illness as threatening. Lifestyle modifications were more successful in those having participated in a cardiac rehabilitation and prevention programme. Patients indicated lack of self-confidence as the main barrier to change their unhealthy behaviour. Conclusion Modern secondary prevention programmes should target behavioural change in all patients with adverse lifestyles.

Article Number: e1886

Accession Number: WOS:000587332000001

Abstract: Introduction: The perception of health professionals about chronic obstructive pulmonary disease (COPD) has not been thoroughly investigated. Objective: To analyze the perception of health professionals about the impact of COPD on the lives of affected individuals. Materials and methods: Qualitative and cross-sectional study with five health professionals: two nurses, two physiotherapists, and one medical doctor. They participated in a focus group (FG) session, with semistructured questions covering: definition of COPD, activities of daily living (ADL), and physical activity of daily living (PADL), as well as the importance of these outcomes in the lives of individuals with COPD. Data analysis: The FG was recorded, transcribed, and analyzed according to the content analysis. Results: The FG highlighted four main themes: physical-functional and emotional impairment of individuals, the importance of patient-health professional contact, repercussions of COPD on the patients' physical activity, and strategies for promoting physical activity. Based on the four themes exposed, the health professionals reported that there is a progression in the lives of individuals' with COPD, which is divided into three phases: adaptation, reluctance, and dependence. Conclusion: There was a negative perception of the health professionals regarding the functionality and emotion of patients with COPD. Emotional aspects, family support, and architectural structure can positively or negatively influence patients' ADL and PADL. Finally, there was a perception of progression in the life of patients with COPD, since their initial adaptation, evolving to physical and emotional dependence.

fundamental care to reduce hospital-associated decline in older patients

ISSN: 0309-2402

DOI: 10.1111/jan.14954

Accession Number: WOS:000671166600001

Abstract: Aims To examine the effectiveness of targeted nursing interventions on mobilization, nutrition and cognitive engagement to reduce functional and hospital-associated decline (HAD) in older patients. Design Systematic review of experimental studies using randomized and quasi-experimental designs. Data sources We searched electronic databases CINAHL, MEDLINE, EMBASE, Cochrane library, google scholar and BMJ quality reports from January 2009 to February 2020. Review methods We reviewed intervention studies that targeted ward nursing teams to increase mobilization, nutrition or cognitive engagement of older adults. Inclusion criteria included older patients, acute care (medical, surgical and older adult wards) and reporting patient level outcomes. Quality appraisal included the Joanna Briggs Critical Appraisal Checklist for Quasi-Experimental Studies. Results From 1729 papers, 18 studies using quasi-experimental and pre-post designs were selected. Study heterogeneity necessitated a narrative synthesis. The quality of evidence was low to moderate. All studies used multicomponent strategies, and 10 studies used evidence translation frameworks to align interventions to local barriers. Overall, 74% (n = 14) of studies reported a significant improvement in the stated primary outcome. Eight studies reported a significant increase in mobilization (e.g., sitting in a chair or walking), and four reported improved functional outcomes. Five studies improved nutrition outcomes (e.g., protein or energy intake), and three studies reported a significant reduction in delirium. Conclusion Acknowledging methodological limitations, the evidence indicates that nursing teams using evidence-translation frameworks can improve mobilization, nutrition and cognitive engagement in acute care settings. Future research requires higher-quality pragmatic trial designs, standardized outcomes, staff co-designed interventions, evidence-translation frameworks and patient engagement to make more confident inference about effectiveness. Impact Nursing teams with the support of hospital management have to address ward and system barriers to prioritize fundamental care to improve patient outcomes. There is sufficient evidence on multicomponent interventions and implementation strategies to inform nurse-led quality improvement.

Short Title: The SMILE integrated care model in allogeneic Stem cell Transplantation facilitated by eHealth: a protocol for a hybrid effectiveness-implementation randomised controlled trial

DOI: 10.1186/s12913-022-08293-8

Article Number: 1067

Accession Number: WOS:000842154100005

Abstract: Background: While effectiveness outcomes of eHealth-facilitated integrated care models (eICMs) in transplant and oncological populations are promising, implementing and sustaining them in real-world settings remain challenging. Allogeneic stem cell transplant (alloSCT) patients could benefit from an eICM to enhance health outcomes. To combat health deterioration, integrating chronic illness management, including continuous symptom and health behaviour monitoring, can shorten reaction times. We will test the 1st-year post-alloSCT effectiveness and evaluate bundled implementation strategies to support the implementation of a newly developed and adapted eICM in allogeneic stem cell transplantation facilitated by eHealth (SMILE-ICM). SMILE-ICM has been designed by combining implementation, behavioural, and computer science methods. Adaptions were guided by FRAME and FRAME-IS. It consists of four modules: 1) monitoring & follow-up; 2) infection prevention; 3) physical activity; and 4) medication adherence, delivered via eHealth and a care coordinator (an Advanced Practice Nurse). The implementation was supported by contextually adapted implementation strategies (e.g., creating new clinical teams, informing local opinion leaders). Methods: Using a hybrid effectiveness-implementation randomised controlled trial, we will include a consecutive sample of 80 adult alloSCT patients who were transplanted and followed by University Hospital Basel (Switzerland). [Inclusion criteria are basic German proficiency; elementary computer literacy; internet access; and written informed consent. Patients will be excluded if their condition prevents the use of technology, or if they are followed up only at external centres. Patient-level (1:1) stratified randomisation into a usual care group and a SMILE-ICM group will take place 10 days pre-transplantation. To gauge the SMILE-ICM's effectiveness primary outcome (re-hospitalisation rate), secondary outcomes (healthcare utilization costs; length of inpatient re-hospitalizations, medication adherence; treatment and self-management burden; HRoL; Graft-versus-Host Disease rate; survival; overall survival rate) and implementation outcomes (acceptability, appropriateness, feasibility, fidelity), we will use multi-method, multi-informant assessment (via questionnaires, interviews, electronic health record data, cost capture methods). Discussion: The SMILE-ICM has major innovative potential for reengineering alloSCT follow-up care,

particularly regarding short- and medium-term outcomes. Our dual focus on implementation and effectiveness will both inform optimization of the SMILE-ICM and provide insights regarding implementation strategies and pathway, understudied in eHealth-facilitated ICMs in chronically ill populations.

Title: Exploring falls prevention capabilities, barriers and training needs among patient sitters in a hospital setting: A pilot survey

Journal: Geriatric Nursing

Volume: 39

Issue: 3

Pages: 263-270

Date: May-Jun

Short Title: Exploring falls prevention capabilities, barriers and training needs among patient sitters in a hospital setting: A pilot survey

ISSN: 0197-4572

DOI: 10.1016/j.gerinurse.2017.09.006

Accession Number: WOS:000437808100002

Abstract: Older patients in hospitals are at high risk of falls. Patient sitters are sometimes employed to directly observe patients to reduce their risk of falling although there is scant evidence that this reduces falls. The primary aim of this pilot survey (n = 31) was to explore the patient sitters' falls prevention capability, self-efficacy and the barriers and enablers they perceived influenced their ability to care for patients during their shifts. Feedback was also sought regarding training needs. Most (90%) participants felt confident in their role. The most frequent reasons for falls identified were patient-related (n = 91, 64%), but the most frequent responses identifying preventive strategies were environment-related (n = 54, 64%), suggesting that the sitters' capability was limited. The main barriers identified to keeping patients safe from falling were patient-related (n = 36, 62%) such as cognitive impairment. However, opportunities that would enable sitters to do their work properly were most frequently categorized as being staff related (n = 20, 83%), suggesting that the sitters

have limited ability to address these barriers encountered. While 74% of sitters reported they had received previous training, 84% of participants would like further training. Patient sitters need more training, and work practice needs to be standardized prior to future research into sitter use for falls prevention. (C) 2017 Elsevier Inc. All rights reserved.

Title: GetGreen Vietnam: towards more sustainable behaviour among the urban middle class

Journal: Journal of Cleaner Production

Volume: 134

Pages: 178-190

Date: Oct

Short Title: GetGreen Vietnam: towards more sustainable behaviour among the urban middle class

ISSN: 0959-6526

DOI: 10.1016/j.jclepro.2016.01.063

Accession Number: WOS:000382409700017

Abstract: In Vietnam, the middle class is expected to grow from 12 million to 33 million people between 2012 and 2020. The growth causes an increase as well as a shift in consumption. Products that were not accessible or affordable before will become increasingly so, such as cars, dishwashers, meat products and air-conditioning. In urban areas the changes are most prominent and so are the side effects: increased amounts of waste, smog, pollution and use of fossil energy or pesticides. The main objective of this study was to identify sustainable behaviour that followed or did not follow from the intervention project GetGreen Vietnam. 604 urban middle class consumers participated in a series of sustainable consumption trainings. Before, during and after the trainings, quantitative and qualitative data was collected on 90 sustainable actions. 64% of the participants self-reported to be engaged in a sustainable action before the intervention and this percentage increased to 80% after. The group environment and activity-based meetings of GetGreen Vietnam project (GGVN) were critical for the success of the intervention. Participants reported that before GGVN certain actions were already habitual as a money saving strategy (e.g. sparse electricity use or food leftovers re-use) or due to past scarcity (e.g. sparse water use). Many participants reported the intention to buy sustainable products but fewer participants took action to do so. A powerful strategy toward more sustainable consumption in Vietnam can be to create more group based activities around the

themes of energy and shopping for food. A twofold approach is needed that both installs new sustainable consumption patterns and keeps old habits rooted in daily rituals. Role models should set an example for the young population and consumers and (Vietnamese) producers should be better connected to increase mutual trust and transparency. (C) 2016 Elsevier Ltd. Short Title: Lifestyle Behavior Interventions for Preventing Cancer in Adults with Inherited Cancer Syndromes: Systematic Review

DOI: 10.3390/ijerph192114098

Article Number: 14098

Accession Number: WOS:000881197900001

Abstract: (1) Background: The link between lifestyle behaviors and cancer risk is well established, which is important for people with personal/family history or genetic susceptibility. Genetic testing is not sufficient motivation to prompt healthier lifestyle behaviors. This systematic review aims to describe and assess interventions for promoting healthy behaviors in people at high risk of cancer. (2) Methods: The review was performed according to PRISMA guidelines using search terms related to hereditary cancer and health education to identify studies indexed in: CINAHL, MEDLINE, PubMed, Cochrane Library, Scopus, and Joanna Briggs, and published from January 2010 to July 2022. (3) Results: The search yielded 1558 initial records; four randomized controlled trials were eligible. Three included patients with and without a personal history of cancer who were at increased risk of cancer due to inherited cancer syndromes, and one included people undergoing genetic testing due to family history. Interventions targeted diet, physical activity, and alcohol. (4) Conclusions: There is a paucity of research on interventions for promoting healthy lifestyle behaviors in people with a high risk of cancer. Interventions produced positive short-term results, but there was no evidence that behavioral

modifications were sustained over time. All healthcare professionals can actively promote healthy behaviors that may prevent cancer.

Abstract: Based on the policy science literature, we formulate nine core questions that can guide the formulation, negotiation, development and implementation of Health in All Policies (HiAP). Each question is grounded in the political and policy science literature and culminates in checklist items that HiAP developers must consider.

Short Title: From Positive Youth Development to Youth's Engagement: the Dream Teens

ISSN: 2073-7629

Accession Number: WOS:000407310600002

Abstract: In addition to the empirical validation of 'health and happiness' determinants, theoretical models suggesting where to ground actions are necessary. In the beginning of the twentieth century, intervention models focused on evaluation and empirical validation were only concerned about overt behaviours (verbal and non-verbal) and covert behaviours (cognitions and emotions). Later on in the middle of the century, there was a shift from treating the problems to a positive approach, focused on promoting assets and individual strengths. Thus, the role of social competences, self-regulation and resilience became salient. Researchers also highlighted the importance of social cohesion and social support, as active health and wellbeing facilitators. More recently, in the twentyfirst century, the population's engagement (positive engagement) has become crucial. This paper presents the evolution of this theoretical and scientific path, using Portugal as a case study, where early interventions focused on the positive aspects of both covert and overt behaviours, while more recent interventions included explicitly the perspective of youth engagement and participation, as is the case of the Dream Teens Project. It is expected that the political and professional understanding of this trajectory will allow professionals to provide better health and educational services, improving young people's engagement, quality of life, health and wellbeing.

ISSN: 0813-0531

DOI: 10.37464/2020.381.144

Accession Number: WOS:000626045900004

Abstract: Objective: To explore factors that can influence implementation of a nurse-led model of care for early medication

abortion provision in the primary healthcare setting of regional and rural Victoria, Australia. Background: Global research indicates that an increased involvement of primary healthcare nurses in the delivery of early medication abortion provision has the potential to improve abortion access. In Victoria, access in regional and rural areas is restricted despite abortion being legal. A nurse-led early medication abortion provision model is feasible and can potentially improve the current situation. Study design and methods: An online three-round classic Delphi method was used. This paper reports the qualitative findings. Non-probability sampling techniques were used to recruit a panel of professional experts. Data from the three questionnaires were collected and analysed using thematic analysis. Factors influencing model implementation were categorised into the Capabili Opportunity, Motivation-Behaviour framework. Results: A total of 24 medical and other health professionals participated. They identified a range of factors that can hinder model implementation, including a lack of affordable medication abortion education, no remuneration for nurse-led early medication abortion provision, and concerns related to stigma and support. Discussion and conclusion: Understanding and addressing barriers to model implementation may enable the development of primary healthcare nurses' role in the delivery of early medication abortion provision to improve abortion access. Impact: To improve abortion access in Victoria's under-served regions, the potential of nurse-led early medication abortion provision was explored. Barriers to model implementation relate to a lack of medication abortion education and funding, professional support and stigma concerns. The study identified a range of support elements that would enable primary healthcare nurses to develop new roles and responsibilities in the delivery of medication abortion services.

Abstract: Research institutions' research culture is increasingly recognized as a central driver of research integrity. Institutions are urged to develop research integrity promotion plans to foster a

culture of research integrity. A host of guidelines and associated initiatives have been issued but specific, actionable recommendations for institutions are scattered across the scientific literature and generally not acknowledged and implemented (yet). Based on a broad literature review, in the current paper some practical advice for institutions is suggested, grouped into (1) policies, procedures, and processes; (2) dealing with breaches of research integrity; (3) education and training; and (4) monitoring and evaluation. With each section, we formulate specific recommendations.

DOI: 10.1177/10468781221114160

Accession Number: WOS:000823500400001

Abstract: Background To overcome the high failure rate of gameful interventions, we need to better understand their design and evaluation strategies to build an evidence-base for best-practice approaches that bring about meaningful change. This systematic review asks: 'What behavioural and technological design and evaluation theories and approaches are applied in games developed to bring about positive environmental outcomes?'. Method We reviewed 52 papers published between 2015 and 2020 that used gameful interventions to improve behaviour related to environmental outcomes. These papers were analysed to review the behavioural and technical design, and the assessment and evaluation approaches, employed by the intervention designers. Results We found that these publications report on simple aspects of the behavioural and technical design behind the intervention but fail to justify their design choices in terms of theory and evidence. Furthermore, variability across their evaluation approaches and outcomes exists. Discussion This review highlights several systemic flaws in the literature that limit our understanding of gameful interventions in

the pro-environmental context. First, based on this review, we cannot be convinced that these interventions were designed according to best practice for intervention design or for technology development. Second, the justification for proposing a gameful intervention is not always clear. Finally, it is unclear whether these interventions are being evaluated based on best practice. Thus, it is not clear that we can draw confident conclusions about evidence-based outcomes of short-term engagement (in structural gamification interventions) or long-term behaviour change (in content gamification and serious game interventions).

DOI: 10.1098/rstb.2021.0271

Article Number: 20210271

Accession Number: WOS:000797648500006

Abstract: We are dependent on our oceans for economic, health and social benefits; however, demands on our oceans are escalating, and the state of the oceans is deteriorating. Only 2% of countries are on track to achieve the desired outcomes for the sustainable development goal (SDG 14) for the oceans by 2030, and the changes needed to prevent further degradation, or limit the impact of existing degradation, are not being undertaken fast enough. This paper uses a socio-ecological lens to explore the nature of actors and behaviours for change at the local, community, state, national and international levels, and introduces the need for technology, information- and knowledge-sharing, and policy as interconnected mediators, that work both in concert, and independently, to address the 'super wicked' problem of ocean health and to promote resilience. We recommend the need to develop transformational teams and leaders, as well as transformative policies within a holistic and integrated system to ensure ocean health initiatives are greater than the sum of their parts and are actual, realistic, achievable and evidence-informed pathways to change. This article is part of the

theme issue 'Nurturing resilient marine ecosystems'.

Accession Number: WOS:000815471100001

Abstract: Sexually transmitted infections (STIs) remain a major public health threat, disproportionately affecting young people, and men who have sex with men. In this narrative review of the current state of behavioural science research on STI prevention, we consider the definition, health impacts, correlates and determinants, and interventions to promote STI prevention behaviour. Research on STI prevention behaviour has extended from a focus on abstinence, partner reduction and condom use, to also include novel preventive behaviours, notably treatment-as-prevention, pre-exposure prophylaxis (i.e., the preventive use of medicines by uninfected people), and vaccination for some STIs. Social-cognitive factors specified by, for instance the theory of planned behaviour, are critical proximal determinants of STI prevention behaviours, and related interventions can effectively promote STI prevention behaviours. Social-ecological perspectives highlight that individual-level determinants are embedded in more distal environmental influences, with social stigma especially affecting STI prevention behaviours and requiring effective intervention. Further to providing a major domain of application, STI prevention also poses critical challenges and opportunities for health psychology theory and research. We identify a need for health behaviour theory that addresses the processes linking multiple levels of influence on behaviour and provides practical guidance for multi-level behaviour change interventions adapted to specific contexts.

ISSN: 1940-0640

DOI: 10.1186/s13722-022-00355-w

Article Number: 7

Accession Number: WOS:000928119000001

Abstract: Background Smoking and resulting health problems disproportionately impact low socioeconomic status (SES) individuals. Building resilience presents an approach to 'closing the gap'. Mindfulness-based interventions and setting realistic goals are preferred in low socioeconomic communities. We aim to test if these interventions, delivered online and consolidated with peer support offered via ex-smokers, are successful in promoting smoking cessation and resilience. Our conceptualisation of resilience encompasses the inner capacity/skills and external resources (e.g., social support) which smokers utilise to bounce back from adversity. We include a process evaluation of barriers/facilitators to interventions and cost-effectiveness analysis (from health system perspective). Methods We plan a four-arm parallel 12-month RCT with a 6-month follow-up to test the efficacy of three group-based interventions each followed by peer support. Arm 1: mindfulness-integrated cognitive behavioural therapy; Arm 2: mindfulness training; Arm 3: setting realistic goals; Arm 4: active control group directed to quit services. All interventions will be administered online. Participants are adult smokers in Australia (N = 812) who have an average weekly household income less than \$457AUD or receive welfare benefits. Group-based interventions will occur over 6 months, followed by 6 months of forum-based peer support. Primary outcome: self-reported 14-day period prevalence of smoking abstinence at 6 months, with remote biochemical verification of saliva cotinine (< 30 ng/mL). Secondary outcomes include: internal resilience (Connor-Davidson Resilience Scale-25); external resilience (ENRICH social support tool); quality adjusted life years (EQ-5D-5L); self-efficacy for smoking abstinence (Smoking-

Abstinence Self-Efficacy Questionnaire); motivation to quit smoking (Biener and Abrams Contemplation Ladder); nicotine dependence (Fagerstrom Test for Nicotine Dependency); equanimity (Equanimity Scale-16); stress (Perceived Stress Scale-10); goal assessment/attainment (Problems and Goals Assessment Scale). Discussion This study is the first to compare resilience interventions for low SES smokers which have been identified by them as acceptable. Our various repeated measures and process evaluation will facilitate exploration of mechanisms of impact. We intervene within the novel framework of the Psychosocial Model of Resilience, applying a promising paradigm to address a critical and inequitable public health problem. Trial registration Australian New Zealand Clinical Trials Registry ID: ACTRN12621000445875, registered 19 April 2021 (). The Universal Trial Number is U1111-1261-8951

Short Title: Accelerating the adoption of water sensitive innovations: community perceptions of practices and technologies to mitigate urban stormwater pollution

ISSN: 0964-0568

DOI: 10.1080/09640568.2021.2002279

Accession Number: WOS:000741248900001

Abstract: Water management increasingly focuses on tackling stormwater pollution to improve waterway health. Community members have a role in adopting pollution-reduction practices and supporting technologies such as water sensitive urban design. However, because communities are unfamiliar with these practices and technologies, little is known about how they make sense of these 'water sensitive innovations'. Drawing on Diffusion of Innovations theory, we conduct focus groups across different regions of Australia. Our findings indicate that key barriers to adoption included poor understanding

of the relative advantage of these practices and technologies, and perceived poor compatibility with community members' lifestyle and local geography. In turn, appraisals of relative advantage were constrained by limited observability of stormwater pollution and the benefits that innovations generate for people and the environment. Our findings suggest engagement strategies should emphasize the relevance and advantages of water sensitive innovations, and help individuals visualize the intangible elements of stormwater pollution management.

Abstract: The first wave of SARS-CoV-2 has deeply affected long term care facilities in the province of Quebec. In response, governmental officials took protective measures, such as suspending visits and activities and even requiring residents to self-isolate to their room. Consequently, residents with major cognitive impairments were cut from their routine as well as from significant social interactions, support, and stimulation essential to their well-being. This isolation negatively affected many residents. For some of them, the loss of bearings resulted in newly or deteriorated behavioral and psychological symptoms of dementia (BPSD). These residents were then more at risk of contracting the virus or contaminating others. To face this challenge, hotels in the Greater Montreal area were transformed into temporary care facilities. As members of a multidisciplinary team specialized in the management of BPSD, we were asked to support the redeployed staff who had little experience in this domain. In this paper, we present the innovative tools implemented in this uncommon work setting. We also discuss factors identified as facilitating the care and treatment of people with BPSD. This experience leads us to propose avenues toward better BPSD management.

Volume: 23

Issue: 4

Pages: 24-29

Date: Mar

Short Title: Protocol for a block randomised controlled trial of an intervention to improve heart failure care

ISSN: 1351-5578

DOI: 10.7748/nr.23.4.24.s6

Accession Number: WOS:000376183800006

Abstract: Aim To describe the design of a randomised controlled trial conducted to evaluate a culturally tailored, nurseled educational intervention. Background Self-care strategies are critical to improving health outcomes in heart failure. The family unit is crucial in collectivist cultures, but little is known about involving the family in the self-care of patients with heart failure. Discussion Involving the family in the self-care of heart failure is a novel approach. To the authors' knowledge, no one has evaluated it using a randomised controlled trial. Conclusion A valid comparison of outcomes between the control group and the intervention group involved in the study was provided in this trial. The chosen design, randomised controlled trial, enabled the assessment of the intervention. Implications for practice The application of a family self-care intervention in a collectivist culture was shown to improve clinical and quality outcomes of patients with heart failure. Considering the individual and the community needs is vital in improving these outcomes.

Short Title: A family-focused intervention for heart failure self-care: conceptual underpinnings of a culturally appropriate intervention

ISSN: 0309-2402

DOI: 10.1111/jan.12768

Accession Number: WOS:000367947700018

Abstract: Aim. A discussion of the conceptual elements of an intervention tailored to the needs of Lebanese families. Background. The role of informal caregiving is strongly recommended for individuals with chronic conditions including heart failure. Although this importance is recognized, conceptual and theoretical underpinnings are not well elucidated nor are methods of intervention implementation. Design. Discussion paper on the conceptual underpinning of the FAMILY model. Methods and data sources. This intervention was undertaken using linked methods: (1) Appraisal of theoretical model; (2) review of systematic reviews on educational interventions promoting self-management in chronic conditions in four databases with no year limit; (3) socio-cultural context identification from selected papers; (4) expert consultation using consensus methods; and (5) model development. Results. Theories on self-care and behavioural change, eighteen systematic reviews on educational interventions and selected papers identifying sociocultural elements along with expert opinion were used to guide the development of The FAMILY Intervention Heart Failure Model. Theory and practice driven concepts identified include: behavioural change, linkage, partnership and self-regulation. Implications for nursing. Heart failure is a common condition often requiring in-hospital and home-based care. Educational interventions targeting the sociocultural influences of the patients and their family caregivers through a structured and well-designed program can improve outcomes. Conclusion. As the burden of chronic diseases increases globally, particularly in emerging economies, developing models of intervention that are appropriate to both the individual and the socio-cultural context are necessary.

DOI: 10.1097/ncq.0000000000000646

Accession Number: WOS:000938255200006

Abstract: Background:Implementation of the Surviving Sepsis Campaign (SSC) guidelines into practice has demonstrated improved outcomes.

Local Problem:Compliance with a sepsis protocol, based on the SSC guidelines, in an urban teaching hospital was below the national average.

Methods:A pre- and posttest intervention design was used to improve clinician knowledge, confidence, and compliance with the protocol.

Interventions:Educational modules were developed on the SSC guidelines and reminder system alerts (RSA) for timely reevaluation of patients with sepsis and lactate monitoring were implemented.

Results:A total of 33 (48%) clinicians participated. There was an increase in knowledge, documentation of sepsis reassessment, and serum lactate monitoring.

Conclusions:The results demonstrate that education, combined with RSAs, can improve protocol knowledge and compliance.

Short Title: Lifestyle Interventions to Prevent Cardiovascular Events After Stroke and Transient Ischemic Attack Systematic Review and Meta-Analysis

ISSN: 0039-2499

DOI: 10.1161/strokeaha.116.013794

Accession Number: WOS:000391944900031

Abstract: Background and Purpose—Patients with a transient ischemic attack or ischemic stroke have an increased risk of subsequent cardiovascular events. The purpose of this systematic review and meta-analysis was to determine whether lifestyle interventions focusing on behaviorally modifiable risk factors with or without an exercise program are effective in terms of (1) preventing recurrent cardiovascular events, (2) reducing mortality, and (3) improving modifiable risk factors associated with cardiovascular disease in patients after a transient ischemic attack or ischemic stroke. Methods—For this systematic review and meta-analysis, we systematically searched PubMed, Embase, PsycInfo, and the Cochrane Library from the start of the database to May 7, 2015. Subgroup analyses were conducted to explore the influence of therapy-related factors. Results—Twenty-two randomized controlled trials were identified with a total of 2574 patients. Pooling showed a significant reduction in systolic blood pressure by the lifestyle interventions applied, compared with usual care (mean difference, -3.6 mm Hg; 95% confidence interval, -5.6 to -1.6, I² = 33%). No significant effect was found on cardiovascular events, mortality, diastolic blood pressure, or cholesterol. In the subgroup analyses, the trials with cardiovascular fitness interventions, trials with an intervention that lasted longer than 4 months, and interventions that used >3 behavior change techniques were more effective in reducing systolic blood pressure. Conclusions—We found that lifestyle interventions are effective in lowering systolic blood pressure. About other end points, this systematic review found no effect of lifestyle interventions on cardiovascular event rate mortality, diastolic blood pressure, or total cholesterol. Title: Electronically monitored medication adherence in idiopathic pulmonary fibrosis: prevalence, predictors and outcomes

Journal: Erj Open Research

Volume: 8

Issue: 3

Date: Jun

Short Title: Electronically monitored medication adherence in idiopathic pulmonary fibrosis: prevalence, predictors and outcomes

DOI: 10.1183/23120541.00030-2022

Article Number: 00030

Accession Number: WOS:000835961400001

Abstract: Medication adherence studies in idiopathic pulmonary fibrosis (IPF) are limited, use cross-sectional designs and report discontinuation rates. We prospectively investigated adherence to pirfenidone in IPF patients using electronic monitoring, which provides insights on whether and when the medication was taken on a day-by-day basis. We investigated the impact of nonadherence on lung function and selected predictors for nonadherence based on the COM-B behavioural model. The longitudinal statistical analyses included generalised estimation equations and linear mixed effects models. 55 patients initiating pirfenidone were followed-up for 2 years after diagnosis (76.4% men, mean age 71.1 years (range 50–87 years), mean forced vital capacity (FVC) 88% predicted (SD 18.3), mean diffusing capacity of the lung for carbon monoxide (D-LCO) 58.1% predicted (SD 14.7)). Our data showed an association ($p=0.03$) between the proportion of days with three pirfenidone intakes (i.e. dosing adherence) and FVC % predicted, whereby a high dosing adherence seemed necessary to maintain stable or improving FVC % predicted values. 58.2% of the participants were able to implement at least 90% correct dosing days, yet adherence significantly decreased over time. Too short dosing intervals had negative effects on lung function outcomes. Knowledge on IPF and self-reported adherence were significantly associated with electronically measured adherence. In conclusion, nonadherence is prevalent and might negatively affect lung function. Further research is needed on the impact of nonadherence on outcomes and its predictors, so that tailored interventions can be developed. Meanwhile, a self-report questionnaire could be used to identify adherence issues and teams should equip patients with knowledge about their treatment and how to take it.

Short Title: Improving Adherence to Essential Birth Practices Using the WHO Safe Childbirth Checklist With Peer Coaching: Experience

From 60 Public Health Facilities in Uttar Pradesh, India

ISSN: 2169-575X

DOI: 10.9745/ghsp-d-16-00410

Accession Number: WOS:000406250500007

Abstract: Background: Adherence to evidence-based essential birth practices is critical for improving health outcomes for mothers and newborns. The WHO Safe Childbirth Checklist (SCC) incorporates these practices, which occur during 4 critical pause points: on admission, before pushing (or cesarean delivery), soon after birth, and before discharge. A peer-coaching strategy to support consistent use of the SCC may be an effective approach to increase birth attendants' adherence to these practices. Methods: We assessed data from 60 public health facilities in Uttar Pradesh, India, that received an 8-month staggered coaching intervention from December 2014 to September 2016 as part of the BetterBirth Trial, which is studying effectiveness of an SCC-centered intervention on maternal and neonatal harm. Nurse coaches recorded birth attendants' adherence to 39 essential birth practices. Practice adherence was calculated for each intervention month. After 2 months of coaching, a subsample of 15 facilities was selected for independent observation when the coach was not present. We compared adherence to the 18 practices recorded by both coaches and independent observers. Results: Coaches observed birth attendants' behavior during 5,971 deliveries. By the final month of the intervention, 35 of 39 essential birth practices had achieved >90% adherence in the presence of a coach, compared with only 7 of 39 practices during the first month. Key behaviors with the greatest improvement included explanation of danger signs, temperature measurement, assessment of fetal heart sounds, initiation of skin-to-skin contact, and breastfeeding. Without a coach present, birth attendants' average adherence to practices and checklist use was 24 percentage points lower than when a coach was present (range: -1% to 62%). Conclusion: Implementation of the WHO Safe Childbirth Checklist with coaching improved uptake of and adherence to essential birth practices. Coordination and communication among facility staff, as well as behaviors with an immediate, tangible benefit, showed the greatest improvement. Difficult-to-perform behaviors and those with delayed or theoretical benefits were less likely to be sustained without a coach present. Coaching may be an important component in implementing the Safe Childbirth Checklist at scale. Note: At the time of publication of this article, the results of evaluation of the impact of the BetterBirth intervention were pending publication in another journal. After the impact findings have been published, we will update this article on the effect of the intervention on birth practices with a reference to the impact findings.

Date: Oct

Short Title: Role of Psychosocial Factors and Health Literacy in Pregnant Women's Intention to Use a Decision Aid for Down Syndrome Screening: A Theory-Based Web Survey

ISSN: 1438-8871

DOI: 10.2196/jmir.6362

Article Number: e283

Accession Number: WOS:000387985700012

Abstract: Background: Deciding about undergoing prenatal screening is difficult, as it entails risks, potential loss and regrets, and challenges to personal values. Shared decision making and decision aids (DAs) can help pregnant women give informed and values-based consent or refusal to prenatal screening, but little is known about factors influencing the use of DAs. Objective: The objective of this study was to identify the influence of psychosocial factors on pregnant women's intention to use a DA for prenatal screening for Down syndrome (DS). We also added health literacy variables to explore their influence on pregnant women's intention. Methods: We conducted a survey of pregnant women in the province of Quebec (Canada) using a Web panel. Eligibility criteria included age > 18 years, > 16 weeks pregnant, low-risk pregnancy, and having decided about prenatal screening for the current pregnancy. We collected data based on an extended version of the Theory of Planned Behavior assessing 7 psychosocial constructs (intention, attitude, anticipated regret, subjective norm, descriptive norm, moral norm, and perceived control), 3 related sets of beliefs (behavioral, normative, and control beliefs), 4 health literacy variables, and sociodemographics. Eligible women watched a video depicting the behavior of interest before completing a Web-based questionnaire. We performed descriptive, bivariate, and ordinal logistic regression analyses. Results: Of the 383 eligible pregnant women who agreed to participate, 350 pregnant women completed the Web-based questionnaire and 346 were retained for analysis (completion rate 350/383, 91.4%; mean age 30.1, SD 4.3, years). In order of importance, factors influencing intention to use a DA for prenatal screening for DS were attitude (odds ratio, OR, 9.16, 95% CI 4.02-20.85), moral norm (OR 7.97, 95% CI 4.49-14.14), descriptive norm (OR 2.83, 95% CI 1.63-4.92), and anticipated regret (OR 2.43, 95% CI 1.71-3.46). Specific attitudinal beliefs significantly related to intention were that using a DA would reassure them (OR 2.55, 95% CI 1.73-4.01), facilitate their reflections with their spouse (OR 1.55, 95% CI 1.05-2.29), and let them know about the

advantages of doing or not doing the test (OR 1.53, 95% CI 1.05–2.24). Health literacy did not add to the predictive power of our model (P values range .43–.92). Conclusions: Implementation interventions targeting the use of a DA for prenatal screening for DS by pregnant women should address a number of modifiable factors, especially by introducing the advantages of using the DA (attitude), informing pregnant women that they might regret not using it (anticipated regret), and presenting the use of DAs as a common practice (descriptive norm). However, interventions on moral norms related to the use of DA should be treated with caution. Further studies that include populations with low health literacy are needed before decisive claims can be made.

Title: The boundedly rational employee: Security economics for behaviour intervention support in organizations

Journal: Journal of Computer Security

Volume: 30

Issue: 3

Pages: 435-464

Short Title: The boundedly rational employee: Security economics for behaviour intervention support in organizations

ISSN: 0926-227X

DOI: 10.3233/jcs-210046

Accession Number: WOS:000824268300006

Abstract: Security policy-makers (influencers) in an organization set security policies that embody intended behaviours for employees (as decision-makers) to follow. Decision-makers then face choices, where this is not simply a binary decision of whether to comply or not, but also how to approach compliance and secure working alongside other workplace pressures, and limited resources for identifying optimal security-related choices. Conflict arises because of information asymmetries present in the relationship, where influencers and decision-makers both consider costs, gains, and losses in ways which are not necessarily aligned. With the need to promote 'good enough' decisions about security-related behaviours under such constraints, we hypothesize that actions to resolve this misalignment can benefit from constructs from both traditional economics and behavioural economics. Here we demonstrate how current

approaches to security behaviour provisioning in organizations mirror rational-agent economics, even where behavioural economics is embodied in the promotion of individual security behaviours. We develop and present a framework to accommodate bounded security decision-making, within an ongoing programme of behaviours which must be provisioned for and supported. Our four stage plan to Capture, Adapt, Realign, and Enable behaviour choices provides guidance for security managers, focusing on a more effective response to the uncertainty associated with security behaviour in organizations.

Date: Nov

Short Title: A home-based pulmonary rehabilitation mHealth system to enhance the exercise capacity of patients with COPD: development and evaluation

DOI: 10.1186/s12911-021-01694-5

Article Number: 325

Accession Number: WOS:000721961400002

Abstract: Background Patients with chronic obstructive pulmonary disease (COPD) experience deficits in exercise capacity and physical activity as their disease progresses. Pulmonary rehabilitation (PR) can enhance exercise capacity of patients and it is crucial for patients to maintain a lifestyle which is long-term physically active. This study aimed to develop a home-based rehabilitation mHealth system incorporating behavior change techniques (BCTs) for COPD patients, and evaluate its technology acceptance and feasibility. Methods Guided by the medical research council (MRC) framework the process of this study was divided into four steps. In the first step, the prescription was constructed. The second step was to formulate specific intervention functions based on the behavior change wheel theory. Subsequently, in the third step we conducted iterative system development. And in the last step two pilot studies were performed, the first was for the improvement of system functions and the second was to explore potential clinical benefits and validate the acceptance and usability of the system. Results A total of 17 participants were enrolled, among them 12 COPD participants completed the 12-week study. For the clinical outcomes, Six-Minute Walk Test (6MWT) showed significant difference ($P = .023$) over time with an improvement exceeded the minimal clinically

important difference (MCID). Change in respiratory symptom (CAT score) was statistically different ($P = .031$) with a greater decrease of -3 . The mMRC levels reduced overall and showed significant difference. The overall compliance of this study reached 82.20% ($\pm 1.68\%$). The results of questionnaire and interviews indicated good technology acceptance and functional usability. The participants were satisfied with the mHealth-based intervention. Conclusions This study developed a home-based PR mHealth system for COPD patients. We showed that the home-based PR mHealth system incorporating BCTs is a feasible and acceptable intervention for COPD patients, and COPD patients can benefit from the intervention delivered by the system. The proposed system played an important auxiliary role in offering exercise prescription according to the characteristics of patients. It provided means and tools for further individuation of exercise prescription in the future.

Issue: 11

Short Title: Preventing obesity in infants: the Growing healthy feasibility trial protocol

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2015-009258

Article Number: e009258

Accession Number: WOS:000368840100038

Abstract: Introduction: Early childhood is an important period for establishing behaviours that will affect weight gain and health across the life course. Early feeding choices, including breast and/or formula, timing of introduction of solids, physical activity and electronic media use among infants and young children are considered likely determinants of childhood obesity. Parents play a primary role in shaping these behaviours through parental modelling, feeding styles, and the food and physical activity environments provided. Children from low socioeconomic backgrounds have higher rates of obesity, making early intervention particularly important. However, such families are often more difficult to reach and may be less likely to participate in traditional programs that support healthy behaviours. Parents across all socio-demographic groups frequently access primary health care (PHC) services, including nurses in community health services and general medical practices, providing

unparalleled opportunity for engagement to influence family behaviours. One emerging and promising area that might maximise engagement at a low cost is the provision of support for healthy parenting through electronic media such as the Internet or smart phones. The Growing healthy study explores the feasibility of delivering such support via primary health care services. Methods: This paper describes the Growing healthy study, a non-randomised quasi experimental study examining the feasibility of an intervention delivered via a smartphone app (or website) for parents living in socioeconomically disadvantaged areas, for promoting infant feeding and parenting behaviours that promote healthy rather than excessive weight gain. Participants will be recruited via their primary health care practitioner and followed until their infant is 9 months old. Data will be collected via web-based questionnaires and the data collected inherently by the app itself. Ethics and dissemination: This study received approval from the University of Technology Sydney Ethics committee and will be disseminated via peer-reviewed publications and conference presentations.

Short Title: High-risk health behaviours of pregnancy-planning women and men: Is there a need for preconception care?

ISSN: 0266-6138

DOI: 10.1016/j.midw.2021.103244

Article Number: 103244

Accession Number: WOS:000791684500013

Abstract: Aim: To examine the prevalence and predictors of high-risk health behaviours in pregnancy-planning women and men. Design: Cross-sectional online survey. Setting: Canada. Participants: Canadian women (n = 529) and men (n = 92) self-identifying as planning a

pregnancy within 5 years, recruited through email and social media. Measurements: Health behaviours examined included smoking, alcohol and cannabis use, internet addiction, low physical activity, overweight and obesity, eating habits, and sleeping less than 6 h/night. Findings: Prevalent preconception high-risk health behaviours in both women and men were low physical activity (women 44.9%, men 38.8%), overweight and obesity (women 52.5%, men 64.9%), and unhealthy eating habits (women 42.8%, men 55.8%), while men had a significantly higher prevalence of cigarette smoking (women 4.9%, men 12.0%, $p = .008$) and alcohol use (women 19.6%, men 40.7%, $p < .001$). The mean number of high-risk health behaviours in women was 2.1 (SD = 1.37) compared to 2.5 (SD = 1.37) in men ($p = .001$). Significant predictors of a higher number of high-risk health behaviours included multiparity, low education and depression in women, and higher perceived stress in men. Key Conclusions: There is a high prevalence of high-risk health behaviours in women and men actively trying to conceive or planning to achieve pregnancy soon. Health promotion should be a key component of preconception health interventions for both women and men as part of a life course approach to optimizing population health. Implementation for Practice: Findings demonstrate modifiable targets for preconception programs and factors that can be used to identify at-risk groups requiring intervention. Individual-level interventions require societal changes that promote healthy behaviours through better health policies and strong public health messaging. (c) 2021 Published by Elsevier Ltd.

Abstract: Background Long-term adherence to exercise is often poor for people with coronary heart disease (CHD) who have completed supervised, centre-based cardiac rehabilitation. The aim of this study is to assess the feasibility of a remotely prescribed,

delivered and monitored cardiac rehabilitation intervention using a wearable device to support long-term adherence to exercise and physical activity during maintenance of cardiac rehabilitation. Methods After completing cardiac rehabilitation, 30 participants with CHD, will be randomised (1:1) to an intervention (n = 15) or a usual care group (n = 15) in a 12-month feasibility randomised controlled trial (RCT). The intervention will comprise of an exercise consultation, personalised exercise prescription delivered via a wearable activity monitor using biometric feedback, regular monitoring via check-ins, and feedback text-messages for 6-months. Participants will be assessed at baseline (following completion of cardiac rehabilitation) and at three-, six-, and 12-months post-randomisation. The primary outcome will be feasibility, including assessment of eligibility, recruitment, adherence, and acceptability. Secondary outcomes will include exercise capacity, physical activity behaviours, cardiovascular disease risk and quality of life. Semi-structured interviews will be conducted at three-, six-, and 12-months post-randomisation (and with those who drop-out) to explore the acceptability of the study intervention and procedures. A questionnaire will be offered to those who decline participation. Discussion The MAINTAIN study will evaluate the feasibility of conducting a future definitive multi-centre RCT testing a remotely prescribed and monitored long-term mHealth maintenance exercise programme, versus usual care, for people with CHD who have completed cardiac rehabilitation.

Title: Women's Risk Perceptions and Willingness to Engage in Risk-Reducing Interventions for the Prevention of Obesity-Related Endometrial Cancer

Journal: International Journal of Womens Health

Volume: 14

Pages: 57-66

Short Title: Women's Risk Perceptions and Willingness to Engage in Risk-Reducing Interventions for the Prevention of Obesity-Related Endometrial Cancer

ISSN: 1179-1411

DOI: 10.2147/ijwh.S326417

Accession Number: WOS:000750552400001

Abstract: Introduction: Endometrial cancer rates are rising in parallel with the global obesity epidemic. Our aim was to assess the willingness of women at greatest risk of obesity-related endometrial cancer to engage with risk-reducing strategies and establish perceived barriers that may preclude their participation in a randomized controlled trial of primary endometrial cancer prevention. Materials and Methods: Women attending gynecology, obesity and sleep apnea clinics in Manchester Academic Health Sciences Centre-affiliated hospitals with obesity classes II (BMI 35-39.9kg/m(2)) and III (BMI >= 40kg/m(2)) were invited to participate in a cross-sectional survey. We asked women about their perceived risk, knowledge of risk factors and willingness to engage with endometrial cancer risk-reducing interventions. Results: Seventy-four women with a median age of 51 years (range 22-73) and BMI of 47kg/m(2) (range 34-81) took part in the study. Two-thirds (65.6%) knew that obesity was a risk factor for endometrial cancer but few were able to recall other major risk factors. Just over half (53.5%) perceived their risk of developing endometrial cancer to be higher than average. Women were prepared to lose weight (94%), eat healthily (91%), exercise more (87%), take a pill every day (74%) or receive an intra-uterine device (49%) for primary endometrial cancer prevention. Perceived barriers included cost, forgetting, willpower, finding time, physical fitness, social anxiety, possible side effects and previous bad experiences. Conclusion: Women at highest risk of obesity-related endometrial cancer may not always appreciate their susceptibility. However, willingness to engage in risk-reducing strategies suggests recruitment to a randomized controlled trial for primary endometrial cancer prevention could be feasible. Short Title: A meta-analysis of serious digital games for healthy lifestyle promotion

ISSN: 0091-7435

DOI: 10.1016/j.ypmed.2014.08.026

Accession Number: WOS:000346221600018

Abstract: Several systematic reviews have described health-promoting effects of serious games but so far no meta-analysis has been reported. This paper presents a meta-analysis of 54 serious digital game studies for healthy lifestyle promotion, in which we investigated the overall effectiveness of serious digital games on healthy lifestyle promotion outcomes and the role of theoretically and clinically important moderators. Findings showed that serious games have small positive effects on healthy lifestyles ($g = 0.260$, 95% CI $0.148; 0.373$) and their determinants ($g = 0.334$, 95% CI $0.260; 0.407$), especially for knowledge. Effects on clinical outcomes were significant, but much smaller ($g = 0.079$, 95% CI $0.038; 0.120$). Long-term effects were maintained for all outcomes except for behavior. Serious games are best individually tailored to both socio-demographic and change need information, and benefit from a strong focus on game theories or a dual theoretical foundation in both behavioral prediction and game theories. They can be effective either as a stand-alone or multi-component programs, and appeal to populations regardless of age and gender. Given that effects of games remain heterogeneous, further explorations of which game features create larger effects are needed. (C) 2014 Elsevier Inc. All rights reserved.

Title: Interventions to enhance adherence to dietary advice for preventing and managing chronic diseases in adults

Journal: Cochrane Database of Systematic Reviews

Issue: 2

Short Title: Interventions to enhance adherence to dietary advice for preventing and managing chronic diseases in adults

ISSN: 1469-493X

DOI: 10.1002/14651858.CD008722.pub2

Article Number: Cd008722

Accession Number: WOS:000315460300010

Abstract: Background It has been recognized that poor adherence can be a serious risk to the health and wellbeing of patients, and greater adherence to dietary advice is a critical component in preventing and managing chronic diseases. Objectives To assess the effects of interventions for enhancing adherence to dietary advice for preventing and managing chronic diseases in adults. Search methods We searched the following electronic databases up to 29 September 2010: The Cochrane Library (issue 9 2010), PubMed, EMBASE (Embase.com), CINAHL (Ebsco) and PsycINFO (PsycNET) with no language restrictions. We also reviewed: a) recent years of relevant conferences, symposium and colloquium proceedings and abstracts; b) web-based registries of clinical trials; and c) the bibliographies of included studies. Selection criteria We included randomized controlled trials that evaluated interventions enhancing adherence to dietary advice for preventing and managing chronic diseases in adults. Studies were eligible if the primary outcome was the client's adherence to dietary advice. We defined 'client' as an adult participating in a chronic disease prevention or chronic disease management study involving dietary advice. Data collection and analysis Two review authors independently assessed the eligibility of the studies. They also assessed the risk of bias and extracted data using a modified version of the Cochrane Consumers and Communication Review Group data extraction template. Any discrepancies in judgement were resolved by discussion and consensus, or with a third review author. Because the studies differed widely with respect to interventions, measures of diet adherence, dietary advice, nature of the chronic diseases and duration of interventions and follow-up, we conducted a qualitative analysis. We classified included studies according to the function of the intervention and present results in a narrative table using vote counting for each category of intervention. Main results We included 38 studies involving 9445 participants. Among studies that measured diet adherence outcomes between an intervention group and a control/usual care group, 32 out of 123 diet adherence outcomes favoured the intervention group, 4 favoured the control group whereas 62 had no significant difference between groups (assessment was impossible for 25 diet adherence outcomes since data and/or statistical analyses needed for comparison between groups were not provided). Interventions shown to improve at least one diet adherence outcome are: telephone follow-up, video, contract, feedback, nutritional tools and more complex interventions including multiple interventions. However, these interventions also shown no difference in some diet adherence outcomes compared to a control/usual care group making inconclusive results about the most effective intervention to enhance dietary advice. The majority of studies reporting a diet adherence outcome favouring the intervention group compared to the control/usual care group in the short-term also reported no significant effect at later time points. Studies investigating interventions such as a group session, individual session, reminders, restriction and behaviour change techniques reported no diet adherence outcome showing a

statistically significant difference favouring the intervention group. Finally, studies were generally of short duration and low quality, and adherence measures varied widely. Authors' conclusions There is a need for further, long-term, good-quality studies using more standardized and validated measures of adherence to identify the interventions that should be used in practice to enhance adherence to dietary advice in the context of a variety of chronic diseases.

Date: Mar

Short Title: Appropriate prescribing in nursing homes demonstration project (APDP) study protocol: pragmatic, cluster-randomized trial and mixed methods process evaluation of an Ontario policy-maker initiative to improve appropriate prescribing of antipsychotics

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0410-x

Article Number: 45

Accession Number: WOS:000373182100001

Abstract: Background: Antipsychotic medications are routinely prescribed in nursing homes to address the behavioral and psychological symptoms of dementia. Unfortunately, inappropriate prescribing of antipsychotic medications is common and associated with increased morbidity, adverse drug events, and hospitalizations. Multifaceted interventions can achieve a 12-20 % reduction in antipsychotic prescribing levels in nursing homes. Effective interventions have featured educational outreach and ongoing performance feedback. Methods/Design: This pragmatic, cluster-randomized control trial and embedded process evaluation seeks to determine the effect of adding academic detailing to audit and feedback on prescribing of antipsychotic medications in nursing homes, compared with audit and feedback alone. Nursing homes within pre-determined regions of Ontario, Canada, are eligible if they express an interest in the intervention. The academic detailing intervention will be delivered by registered health professionals following an intensive training program including relevant clinical issues and techniques to support health professional behavior change. Physicians in both groups will have the opportunity to access confidential reports summarizing their prescribing patterns

for antipsychotics in comparison to the local and provincial average. Participating homes will be allocated to one of the two arms of the study (active/full intervention versus standard audit and feedback) in two waves, with a 2:1 allocation ratio. Homes will be randomized after stratifying for geography, baseline antipsychotic prescription rates, and size, to ensure a balance of characteristics. The primary outcome is antipsychotic dispensing in nursing homes, measured 6 months after allocation; secondary outcomes include clinical outcomes and healthcare utilization. Discussion: Policy-makers and the public have taken note that antipsychotics are used in nursing homes in Ontario far more than other jurisdictions. Academic detailing can be an effective technique to address challenges in appropriate prescribing in nursing homes, but effect sizes vary widely. This opportunistic, policy-driven evaluation, embedded within a government-initiated demonstration project, was designed to ensure policy-makers receive the best evidence possible regarding whether and how to scale up the intervention.

ISSN: 0008-400X

DOI: 10.1037/cbs0000373

Accession Number: WOS:000947173700001

Abstract: Understanding diversity of views, values, and experiences through audience segmentation are essential elements in effective public health messaging. The present study aims to describe the patterns of preventive behaviours and concerns among Canadians throughout different times of the pandemic, as well as identify demographic characteristics that are associated with these patterns. A probability-based sample of 4,627 Canadians was collected by Statistics Canada to complete COVID-19-related surveys in April 2020 and July 2020. Latent class analysis was used to determine the clusters of concerns and preventive behaviours from 21 variables; a set of chi-square tests were run to determine the demographic

association. Six classes emerge with varying levels of concerns and preventive behaviours across both time points, albeit some of the group interpretations have changed. Most notably, one latent group showed very little concern about the pandemic. All groups, including the ones with the least concern, still performed the most basic preventive measures such as washing their hands more often across both times. There were also some notable groups who were concerned about social cohesion on top of concerns for overall population health. Demographic associations appear mixed across time, although men, rural residents, and those with lower education were more likely to be in the group showing the least concerns and fewest preventive behaviours. Novel strategies might be required to reach segments whose concerns might be unaddressed and continually skeptical towards public health messaging for the ongoing vaccine rollouts and future health crisis.

Title: Designing, Developing, Evaluating, and Implementing a Smartphone-Delivered, Rule-Based Conversational Agent (DISCOVER): Development of a Conceptual Framework

Journal: Jmir Mhealth and Uhealth

Volume: 10

Issue: 10

Date: Oct

Short Title: Designing, Developing, Evaluating, and Implementing a Smartphone-Delivered, Rule-Based Conversational Agent (DISCOVER): Development of a Conceptual Framework

ISSN: 2291-5222

DOI: 10.2196/38740

Article Number: e38740

Accession Number: WOS:000882790100004

Abstract: Background: Conversational agents (CAs), also known as chatbots, are computer programs that simulate human conversations by using predetermined rule-based responses or artificial intelligence algorithms. They are increasingly used in health care, particularly via smartphones. There is, at present, no conceptual framework guiding the development of smartphone-based, rule-based CAs in health care. To fill this gap, we propose structured and tailored guidance for their design, development, evaluation, and implementation. Objective: The aim of this study was to develop a conceptual framework for the design, evaluation, and implementation of smartphone-delivered, rule-based, goal-oriented, and text-based CAs for health care. Methods: We followed the approach by Jabareen, which was based on the grounded theory method, to develop this conceptual framework. We performed 2 literature reviews focusing on

health care CAs and conceptual frameworks for the development of mobile health interventions. We identified, named, categorized, integrated, and synthesized the information retrieved from the literature reviews to develop the conceptual framework. We then applied this framework by developing a CA and testing it in a feasibility study. Results: The Designing, Developing, Evaluating, and Implementing a Smartphone-Delivered, Rule-Based Conversational Agent (DISCOVER) conceptual framework includes 8 iterative steps grouped into 3 stages, as follows: design, comprising defining the goal, creating an identity, assembling the team, and selecting the delivery interface; development, including developing the content and building the conversation flow; and the evaluation and implementation of the CA. They were complemented by 2 cross-cutting considerations—user-centered design and privacy and security—that were relevant at all stages. This conceptual framework was successfully applied in the development of a CA to support lifestyle changes and prevent type 2 diabetes. Conclusions: Drawing on published evidence, the DISCOVER conceptual framework provides a step-by-step guide for developing rule-based, smartphone-delivered CAs. Further evaluation of this framework in diverse health care areas and settings and for a variety of users is needed to demonstrate its validity. Future research should aim to explore the use of CAs to deliver health care interventions, including behavior change and potential privacy and safety concerns.

Short Title: Conversational Agent for Healthy Lifestyle Behavior Change: Web-Based Feasibility Study

DOI: 10.2196/27956

Article Number: e27956

Accession Number: WOS:000853675400018

Abstract: Background: The rising incidence of chronic diseases is a growing concern, especially in Singapore, which is one of the high-income countries with the highest prevalence of diabetes.

Interventions that promote healthy lifestyle behavior changes have been proven to be effective in reducing the progression of

prediabetes to diabetes, but their in-person delivery may not be feasible on a large scale. Novel technologies such as conversational agents are a potential alternative for delivering behavioral interventions that promote healthy lifestyle behavior changes to the public. Objective: The aim of this study is to assess the feasibility and acceptability of using a conversational agent promoting healthy lifestyle behavior changes in the general population in Singapore. Methods: We performed a web-based, single-arm feasibility study. The participants were recruited through Facebook over 4 weeks. The Facebook Messenger conversational agent was used to deliver the intervention. The conversations focused on diet, exercise, sleep, and stress and aimed to promote healthy lifestyle behavior changes and improve the participants' knowledge of diabetes. Messages were sent to the participants four times a week (once for each of the 4 topics of focus) for 4 weeks. We assessed the feasibility of recruitment, defined as at least 75% (150/200) of our target sample of 200 participants in 4 weeks, as well as retention, defined as 33% (66/200) of the recruited sample completing the study. We also assessed the participants' satisfaction with, and usability of, the conversational agent. In addition, we performed baseline and follow-up assessments of quality of life, diabetes knowledge and risk perception, diet, exercise, sleep, and stress. Results: We recruited 37.5% (75/200) of the target sample size in 1 month. Of the 75 eligible participants, 60 (80%) provided digital informed consent and completed baseline assessments. Of these 60 participants, 56 (93%) followed the study through till completion. Retention was high at 93% (56/60), along with engagement, denoted by 50% (30/60) of the participants communicating with the conversational agent at each interaction. Acceptability, usability, and satisfaction were generally high. Preliminary efficacy of the intervention showed no definitive improvements in health-related behavior. Conclusions: The delivery of a conversational agent for healthy lifestyle behavior change through Facebook Messenger was feasible and acceptable. We were unable to recruit our planned sample solely using the free options in Facebook. However, participant retention and conversational agent engagement rates were high. Our findings provide important insights to inform the design of a future randomized controlled trial. Short Title: An Evaluation of a Commercialized mHealth Intervention to Promote Physical Activity in the Workplace

DOI: 10.3389/fpubh.2022.740350

Article Number: 740350

Accession Number: WOS:000777345500001

Abstract: BackgroundUPnGO with ParticipACTION (UPnGO) was a commercialized 12-month workplace physical activity intervention, aimed at encouraging employees to sit less and move more at work. Its design took advantage of the ubiquitous nature of mobile fitness trackers and aimed to be implemented in any office-based workplace in Canada. The program was available at cost from June 2017 to April 2020. The objectives of this study are to evaluate the program and identify key lessons from the commercialization of UPnGO.

MethodsUsing a quasi-experimental design over 3 time points: baseline, 6 months, 12 months, five evaluation indicators were measured as guided by the RE-AIM framework. Reach was defined as the number and percentage of employees who registered for UPnGO and the number and percentage of sedentary participants registered. Effectiveness was assessed through average daily step count.

Adoption was determined by workplace champion and senior leadership responses to the off-platform survey. Implementation was assessed as the percentage of participants who engaged with specific program elements at the 3-evaluation time points. Maintenance was assessed by the number of companies who renewed their contracts for UPnGO.

ResultsReach across 17 organizations, 1980 employees participated in UPnGO, with 27% of participants identified as sedentary at baseline. Effectiveness Daily step count declined from 7,116 +/- 3,558 steps at baseline to 6,969 +/- 6,702 ($p = <0.001$) at 12 months. Adoption Workplace champion and senior leadership engagement declined from 189 to 21 and 106 to 5 from baseline to 12 months, respectively.

Maintenance Two companies renewed their contracts beyond the first year. ConclusionsThe commercialization of UPnGO was an ambitious initiative that met with limited success; however, some key lessons can be generated from the attempt. The workplace remains an important environment for PA interventions but effective mHealth PA programs may be difficult to implement and sustain long-term.

Abstract: The problem of solid waste management presents an issue of increasing importance in many low-income settings, including the progressively urbanised context of Kenya. Kisumu County is one such setting with an estimated 500 t of waste generated per day and with less than half of it regularly collected. The open burning and natural decay of solid waste is an important source of greenhouse gas (GHG) emissions and atmospheric pollutants with adverse health consequences. In this paper, we use system dynamics modelling to investigate the expected impact on GHG and PM_{2.5} emissions of (i) a waste-to-biogas initiative and (ii) a regulatory ban on the open burning of waste in landfill. We use life tables to estimate the impact on mortality of the reduction in PM_{2.5} exposure. Our results indicate that combining these two interventions can generate over 1.1 million tonnes of cumulative savings in GHG emissions by 2035, of which the largest contribution (42%) results from the biogas produced replacing unclean fuels in household cooking. Combining the two interventions is expected to reduce PM_{2.5} emissions from the waste and residential sectors by over 30% compared to our baseline scenario by 2035, resulting in at least around 1150 cumulative life years saved over 2021-2035. The contribution and novelty of this study lies in the quantification of a potential waste-to-biogas scenario and its environmental and health impact in Kisumu for the first time. Short Title: Patient motivation to lose weight: Importance of healthcare professional support, goals and self-efficacy

ISSN: 0953-6205

DOI: 10.1016/j.ejim.2021.01.019

Accession Number: WOS:000690383400003

Abstract: Background: People with obesity (PwO) often struggle to achieve and maintain weight loss. This can perpetuate and/or be influenced by feelings of low motivation. This analysis from ACTION-IO data identified factors associated with PwO motivation to lose weight. Methods: PwO completed an online survey in 11 countries. Exploratory multinomial logistic regression analyses identified independent variables associated with self-report of feeling motivated versus not motivated to lose weight. Results: Data from 10,854 PwO were included (5,369 motivated; 3,312 neutral; 2,173 not motivated). Variables associated with feeling motivated versus not motivated included (odds ratio [95% confidence interval]): acknowledgement of healthcare professional (HCP) responsibility to contribute to weight loss (2.32 [1.86-2.88]), comfort in talking to their HCP about weight (1.46 [1.24-1.72]), agreement that it is easy to lose weight (1.73 [1.30-2.31]), and a goal of reducing risks from excess weight (1.45 [1.22-1.73]). Conversely, if PwO considered obesity less important than other diseases they were less likely to report feeling motivated (0.49 [0.41-0.58]). PwO who reported being motivated to lose weight were more likely to exercise ≥ 5 times a week versus <1 time a week (2.77 [2.09-3.68]) than those who reported they were not motivated. Conclusions: Positive interactions with HCPs, self-efficacy, setting goals and knowledge of the importance of weight management, in addition to regular exercising, may increase PwO motivation for weight loss. Appropriate HCP support may help PwO who are ready to engage in weight management. Clinical trial registration: : NCT03584191.

DOI: 10.1080/03004430.2022.2116431

Accession Number: WOS:000858056500001

Abstract: During the COVID-19 pandemic, German early childhood education and care (ECEC) institutions had to limit their provision of ECEC, implement protective measures, and handle new organizational tasks. Data from two longitudinal surveys (October 2020 to July 2021) among ECEC managers and pedagogical staff were analysed. Limited staff resources, limited access, and high pandemic-related challenges (i.e. difficulties and conflicts related to implementing protective measures), were negatively associated with the frequency of pedagogical practices (Models 1, 2). Manager ratings suggested increased developmental needs for children with low socio-economic status; also higher frequency of pedagogical practices at early stages of the pandemic (T1) was associated with lower increase of developmental needs at a later stage (T2, about 5 months later). In sum, this contribution provides evidence about how the COVID-19 pandemic might have affected quality in ECEC provision on both the structural and interaction level and how this, subsequently, impacted child outcomes.

Title: Behind the scenes of the PRIME intervention: designing a complex intervention to improve malaria care at public health centres in Uganda

Journal: Global Health Action

Volume: 8

Short Title: Behind the scenes of the PRIME intervention: designing a complex intervention to improve malaria care at public health centres in Uganda

DOI: 10.3402/gha.v8.29067

Article Number: 29067

Accession Number: WOS:000363400100001

Abstract: Background: In Uganda, health system challenges limit access to good quality healthcare and contribute to slow progress on malaria control. We developed a complex intervention (PRIME), which was designed to improve quality of care for malaria at public health centres. Objective: Responding to calls for increased transparency, we describe the PRIME intervention's design process, rationale, and final content and reflect on the choices and challenges encountered during the design of this complex intervention. Design: To develop the intervention, we followed a multistep approach, including the following: 1) formative research to identify intervention target areas and objectives; 2) prioritization of intervention components; 3) review of relevant evidence; 4) development of intervention components; 5) piloting and refinement of workshop modules; and 6) consolidation of the PRIME intervention theories of change to articulate why and how the intervention was hypothesized to produce desired outcomes. We aimed to develop an intervention that was evidence-based, grounded in theory, and appropriate for the study context; could be evaluated within a randomized controlled trial; and had the potential to be scaled up sustainably. Results: The process of developing the PRIME intervention package was lengthy and dynamic. The final intervention package consisted of four components: 1) training in fever case management and use of rapid diagnostic tests for malaria (mRDTs); 2) workshops in health centre management; 3) workshops in patient-centred services; and 4) provision of mRDTs and antimalarials when stocks ran low.

Conclusions: The slow and iterative process of intervention design contrasted with the continually shifting study context. We highlight the considerations and choices made at each design stage, discussing elements we included and why, as well as those that were ultimately excluded. Reflection on and reporting of 'behind the scenes' accounts of intervention design may improve the design, assessment, and generalizability of complex interventions and their evaluations.

Title: Perspectives of people with late age-related macular
degeneration on mental health and mental wellbeing programmes: a
qualitative study

Journal: Ophthalmic and Physiological Optics

Volume: 41

Issue: 2

Pages: 255-265

Date: Mar

Short Title: Perspectives of people with late age-related macular
degeneration on mental health and mental wellbeing programmes: a
qualitative study

ISSN: 0275-5408

DOI: 10.1111/opo.12779

Accession Number: WOS:000606516600001

Abstract: Purpose: People with age-related macular degeneration
(AMD) experience high rates of depression, but rarely engage in or
have access to tailored mental wellbeing programmes. This
qualitative study investigated the perspectives of those primarily
with late AMD on mental health and mental wellbeing programmes.
Methods: Twenty-eight people with late AMD in at least one eye, and
one person with early AMD in both eyes, aged 56-87 years (mean age
78 years) attending a private eye clinic between December 2019 and
January 2020 in Sydney, New South Wales, Australia, participated.
Individual semi-structured interviews were conducted and analysed
deductively using content analysis, following the individual level
factors for health promotion interventions in the behaviour change
wheel: Capability (Physical & Psychological), Opportunity (Physical
& Social), and Motivation (Reflective & Automatic). Results; Six
major themes were identified: Capability: (1) Impact of vision loss
on mobility and leisure pursuits; (2) Adjustment to living with
vision loss; Opportunity: (3) Program considerations for those with
AMD; (4) Stigma and self-perception of vision loss and mental
health; Motivation: (5) Accumulation of vision-related issues as a
barrier to participation; (6) Examples of others living with vision
loss. General personal factors relevant to delivery of a programme
in this age group were also identified: Comorbidities; Limitations
using technology; Isolation; Financial concerns and Beliefs that
undesired effects of aging are inevitable. Conclusions: Complex
individual, environmental and social factors influence the
perspectives of people with late AMD on mental health, and potential
participation in mental wellbeing programmes. These factors should
be considered when developing and implementing mental wellbeing
programmes to improve the emotional and functional rehabilitation

outcomes for people with AMD.

DOI: 10.1007/s40593-021-00263-1

Accession Number: WOS:000687925900002

Abstract: Video-based learning is widely used today in both formal education and informal learning in a variety of contexts. Videos are especially powerful for transferable skills learning (e.g. communicating, negotiating, collaborating), where contextualization in personal experience and ability to see different perspectives are crucial. With the ubiquity of widely available video content, video-based learning is seen as one of the main strategies to provide engaging learning environments. However, numerous studies show that to learn effectively while watching videos, students need to engage actively with video content. We have developed an active video watching platform (AVW-Space) to facilitate engagement with video content by providing means for constructive learning. The initial studies with AVW-Space on presentation skills show that only students who commented on videos and who rated comments written by their peers have improved their understanding of the target transferable skill. In order to foster deeper engagement, we designed a choice architecture and a set of nudges to encourage students to engage deeper. We conducted two studies investigating the effect of nudges. The results provide evidence that the initial set of implemented nudges is effective: the students who received nudges wrote more comments, used different aspects, and there were more students who wrote comments. The nudges were particularly helpful for undergraduate students who were less experienced in self-regulated learning. Future work includes designing additional nudges to enhance student engagement by improving the quality of

comments and by encouraging participation in collaborative activities.

Abstract: Videos can be a powerful medium for acquiring soft skills, where learning requires contextualisation in personal experience and ability to see different perspectives. However, to learn effectively while watching videos, students need to actively engage with video content. We implemented interactive notetaking during video watching in an active video watching system (AVW) as a means to encourage engagement. This paper proposes a systematic approach to utilise learning analytics for the introduction of adaptive intervention – a choice architecture for personalised nudges in the AVW to extend learning. A user study was conducted and used as an illustration. By characterising clusters derived from user profiles, we identify different styles of engagement, such as parochial learning, habitual video watching, and self-regulated learning (which is the target ideal behaviour). To find opportunities for interventions, interaction traces in the AVW were used to identify video intervals with high user interest and relevant behaviour patterns that indicate when nudges may be triggered. A prediction model was developed to identify comments that are likely to have high social value, and can be used as examples in nudges. A framework for interactive personalised nudges was then conceptualised for the case study.

Title: "As soon as you've had the baby that's it..." a qualitative study of 24 postnatal women on their experience of maternal obesity care pathways

Journal: BMC Public Health

Volume: 16

Date: Jul

Short Title: "As soon as you've had the baby that's it..." a qualitative study of 24 postnatal women on their experience of maternal obesity care pathways

Accession Number: WOS:000380230000013

Abstract: Background: Maternal obesity is associated with risks to mother and infant, and has implications for healthcare costs. United Kingdom (UK) levels of maternal obesity are rising, with higher prevalence in North East (NE) England, where this study was set. Pregnancy is often seen as an opportune time for intervention – a 'teachable moment' – which is ripe for promoting behaviour change. In response to rising obesity levels, a National Health Service (NHS) Foundation Trust in NE England implemented three maternal obesity care pathways contingent on Body Mass Index (BMI) at time of booking: pathway 1 for those with BMI ≥ 30 kg/m²; pathway 2 for BMI ≥ 35 kg/m²; and pathway 3 for BMI ≥ 40 kg/m². These incorporated relevant antenatal, intrapartum and postnatal clinical requirements, and included a focus on weight management intervention. This evaluation explored the accounts of postnatal women who had been through one of these pathways in pregnancy. Methods: The study used a generic qualitative approach. Semi-structured interviews were carried out to explore the views and experiences of 24 recent mothers (aged 20–42), living in NE England, who had commenced on one of the pathways during pregnancy. Interviews explored experiences of weight management support during and after pregnancy, and perceived gaps in this support. Data were analysed using thematic content analysis. Results: Three main themes emerged reflecting women's views and experiences of the pathways: communication about the pathways; treating obese pregnant women with sensitivity and respect; and appropriate and accessible lifestyle services and information for women during and after pregnancy. An overarching theme: differences in care, support and advice, was evident when comparing the experiences of women on pathways 1 or 2 with those on pathway 3. Conclusions: This study indicated that women were not averse to risk management and weight management intervention during and after pregnancy. However, in order to improve reach and effectiveness, such interventions need to be well communicated and offer constructive, individualised advice and support. The postnatal phase may also offer an opportune moment for intervention, suggesting that the simple notion of seeing pregnancy alone as a window of opportunity or a 'teachable moment' should be reconsidered.

Short Title: Paediatric Active Enhanced Disease Surveillance (PAEDS) 2019: Prospective hospital-based surveillance for serious paediatric conditions

ISSN: 0725-3141

DOI: 10.33321/cdi.2021.45.53

Accession Number: WOS:000716842000001

Abstract: Introduction The Paediatric Active Enhanced Disease Surveillance (PAEDS) network is an Australian hospital-based active surveillance system employing prospective case ascertainment for selected serious childhood conditions, particularly vaccine preventable diseases and potential adverse events following immunisation (AEFI). This report presents surveillance data for 2019. Methods Specialist nurses screened hospital admissions, emergency department records, laboratory and other data on a daily basis in seven paediatric tertiary referral hospitals across Australia, to identify children with the conditions under surveillance. Standardised protocols and case definitions were used across all sites. In 2019, the conditions under surveillance comprised: acute flaccid paralysis (AFP; a syndrome associated with poliovirus infection), acute childhood encephalitis (ACE), influenza, intussusception (IS; a potential AEFI with rotavirus vaccines), pertussis, varicella-zoster virus infection (varicella and herpes zoster), invasive meningococcal and invasive Group A streptococcus diseases and two new conditions, Kawasaki disease and gram-negative bloodstream infections. An additional social research component continued to evaluate parental attitudes to influenza vaccination. Results PAEDS captured 2,701 cases for 2019 across all conditions under surveillance. Key outcomes of PAEDS included: contribution to national AFP surveillance to reach the World Health Organization reporting targets for detection of poliomyelitis cases; demonstration of high influenza activity in 2019 and influenza-associated deaths in ACE cases; identification of key barriers to

influenza vaccination of children hospitalised for acute respiratory illness; reporting of all IS cases associated with vaccine receipt to relevant state health department; and showing a further reduction nationally in varicella cases. Enhanced pertussis surveillance continued to capture controls to support vaccine efficacy estimation. Invasive meningococcal disease surveillance showed predominance of serotype B and a reduction in cases nationally. Surveillance for invasive group A streptococcus captured severe cases in children. Monitoring of Kawasaki disease incidence and gram-negative bloodstream infections commenced. Conclusions PAEDS continues to provide unique policy-relevant data on serious paediatric conditions using sentinel hospital-based enhanced surveillance.

Title: Using behavioural theory to understand adherence to behaviours that reduce transmission of COVID-19; evidence from the CHARIS representative national study

Journal: British Journal of Health Psychology

Volume: 27

Issue: 1

Pages: 116-135

Date: Feb

Short Title: Using behavioural theory to understand adherence to behaviours that reduce transmission of COVID-19; evidence from the CHARIS representative national study

ISSN: 1359-107X

DOI: 10.1111/bjhp.12533

Accession Number: WOS:000651196500001

Abstract: Objectives. To examine the ability of four models of behaviour, namely, Protection Motivation Theory (PMT), the Common Sense Self-Regulation Model (CS-SRM), and Social Cognitive Theory and the Reasoned Action Approach (SCT and RAA) to understand adherence to transmission-reducing behaviours (TRBs) advised by national governments for suppression of SARS-CoV2. Design. A series of six cross-sectional telephone surveys of a random representative sample of adults living in Scotland. Methods. Self-reported adherence to three TRBs (physical distancing, wearing a face covering and handwashing), PMT, CS-SRM, and SCT/RAA constructs, and

sociodemographic variables were measured each week for 6 weeks (n = similar to 500 p/w; third June–15th July) via a 15 min telephone survey. Results. Adherence was high ('Always' or 'Most times') throughout for physical distancing and handwashing, and, when mandated, for wearing a face covering. Older people were more adherent to all TRBs. Constructs from all three models predicted all three TRBs. Intention and self-efficacy (SCT/RAA) were the only beliefs to predict to all three TRBs each week and for all groups equally; intention was the strongest predictor. The predictive utility of PMT and CS-SRM varied by TRB and by group. Of note was the observation that several illness beliefs were associated with adherence only for those who believed they had not had COVID-19. Conclusions. The CHARIS project has identified beliefs about specific behaviours, the illness and the risks associated with lower adherence rates that might be addressed in national interventions. It confirms previous findings that some groups show lower levels of adherence and might be specially targeted.

Title: MAP: A mnemonic for mapping BCTs to three routes to behaviour change

Journal: British Journal of Health Psychology

Volume: 25

Issue: 4

Pages: 1086-1101

Date: Nov

Short Title: MAP: A mnemonic for mapping BCTs to three routes to behaviour change

ISSN: 1359-107X

DOI: 10.1111/bjhp.12458

Accession Number: WOS:000552345300001

Abstract: Objective Over 90 behaviour change techniques (BCTs) have been specified but there is limited guidance to assist non-specialist practitioners in the choice of which BCTs to select for use with clients. This paper describes the development of MAP, a theory-based mnemonic designed to aid practitioners in their use of BCTs. Each BCT is MAPed to one or more of three recognized routes to behaviour change, namely Motivation development, Action control, and Prompted or cued route. Design A cross-sectional online discriminant content validity (DCV) questionnaire. Methods Fourteen judges participated, decided whether each BCT affects behaviour via each of the three routes, and provided a confidence rating for each judgement. Wilcoxon one-sample tests classified each BCT to a route or combination of routes. Intraclass correlation coefficients (ICC)

assessed agreement between judges. Results Fifty-eight BCTs were judged to affect behaviour via a single route; 28, 21, and nine BCTs were judged to act via the Motivation, Action, or Prompted routes, respectively. Judges did not agree on a route for 35 BCTs. Overall ICC (0.89) value was high and did not differ between routes.

Conclusions There was good agreement on candidate BCTs for interventions designed to operate through Motivation, Action, or Prompted/Cued psychological processes. MAP is a mnemonic that can be used by non-specialist practitioners who implement behaviour change with their clients. MAP is not a replacement for sophisticated theory-based organization of BCTs required for theory testing. While providing practical guidance, further work is necessary to establish effectiveness of BCTs tailored to each route.

Title: Gender, health and ageing in Fiji: a mixed methods analysis

Journal: International Journal for Equity in Health

Volume: 20

Issue: 1

Date: Sep

Short Title: Gender, health and ageing in Fiji: a mixed methods analysis

DOI: 10.1186/s12939-021-01529-9

Article Number: 205

Accession Number: WOS:000695833900001

Abstract: Background Women are disadvantaged by ageing: older women are more likely than older men to suffer from ill-health, have less access to health care and suffer discrimination within the health care system. Globally, there is a dearth of health research on gender and ageing with substantial knowledge gaps in low and middle-income country contexts. Part of a wider investigation on health and ageing in Fiji, our objective was to identify and describe gendered differences in healthy ageing in this Pacific Island context. We believe this to be the first such study in the Pacific region.

Methods Applying a health systems lens, we used a mixed-methods approach, encompassing analysis of cause of death data; focus group discussion to gather community and family attitudes to health services; and policy analysis, and then used data triangulation techniques to draw out key themes and insights. Results We found that gender affects health outcomes among older persons, attitudes towards and experience of healthy ageing, and an older person's access to and use of health services. We also found that while Fiji's policy response to ageing has recognised the importance of gender, to-date there has been limited action to address gender

differences. Gender (as oppose to sex differences) has direct and indirect implications for the health of older Fijians, while gendered inequalities and patriarchal norms appear to affect both men and women's experience of ageing and the health system response. Further, gender and age discrimination may be intersecting, intensifying their separate effects. Conclusion This study demonstrates the feasibility and importance of applying a gender lens to the study of healthy ageing. Our findings from Fiji may be relevant to other island nations in the south Pacific which share similar challenges of population ageing, a constrained health budget and geographically-dispersed populations. The data triangulation methodology may be considered an efficient and insightful way to examine gendered responses to healthy ageing elsewhere.

Title: Discussing HPV with oropharyngeal cancer patients: A cross-sectional survey of attitudes in health professionals

Journal: Oral Oncology

Volume: 68

Pages: 67-73

Date: May

Short Title: Discussing HPV with oropharyngeal cancer patients: A cross-sectional survey of attitudes in health professionals

ISSN: 1368-8375

DOI: 10.1016/j.oraloncology.2017.03.014

Accession Number: WOS:000402469100011

Abstract: Background: Human papillomavirus (HPV) is now known to cause a significant proportion of head and neck cancers (HNC). Qualitative research has shown that some health professionals find it difficult to discuss HPV with patients due to its sexually transmitted nature, and have concerns about their own knowledge of the virus. We used a survey to quantify attitudes towards discussing HPV among HNC health professionals. Methods: We carried out a cross-sectional survey of HNC health professionals (n = 260) in the UK and Ireland, assessing participants' knowledge of HPV, their experiences of and attitudes towards discussing HPV with patients, and their willingness to discuss HPV with their patients in the future.

Results: Overall, health professionals had good knowledge of HPV (mean score: 9.97 out of 12). Oncologists had significantly greater knowledge than specialist nurses, speech and language therapists and

'other' health professionals. Most were willing to discuss HPV with patients (mean = 4.3 out of 5). Willingness to discuss HPV in the future was associated with higher HPV knowledge ($r = 0.35$, $p < 0.001$), fewer negative and more positive attitudes towards discussing HPV ($r = -0.23$ and $r = 0.20$ respectively, both $p < 0.001$), fewer personal barriers ($r = -0.49$, $p < 0.001$) and greater confidence ($r = 0.58$, $p < 0.001$). Conclusion: Knowledge, experiences and attitudes to discussing HPV varied across HNC health professionals. Addressing gaps in health professionals' HPV knowledge and improving their confidence in discussing HPV with patients may increase their willingness to have such conversations. This may help minimise the negative psychosocial consequences of an HPV diagnosis in this patient group. (C) 2017 The Author(s).

Volume: 1

Short Title: A manifesto for increasing access to data in engineering

DOI: 10.1017/dce.2020.3

Article Number: e5

Accession Number: WOS:000851324300005

Abstract: This paper introduces a set of principles that articulate a shared vision for increasing access to data in the engineering and related sectors. The principles are intended to help guide progress toward a data ecosystem that provides sustainable access to data, in ways that will help a variety of stakeholders in maximizing its value while mitigating potential harms. In addition to being a manifesto for change, the principles can also be viewed as a means for understanding the alignment, overlaps and gaps between a range of existing research programs, policy initiatives, and related work on data governance and sharing. After providing background on the growing data economy and relevant recent policy initiatives in the United Kingdom and European Union, we then introduce the nine key principles of the manifesto. For each principle, we provide some additional rationale and links to related work. We invite feedback on the manifesto and endorsements from a range of stakeholders.

Accession Number: WOS:000720784600012

Abstract: Objective: There are numerous health effects associated with excess sugar-sweetened beverage (SSB) consumption.

Interventions aimed at reducing population-level consumption require understanding of the relevant barriers and facilitators. This study aimed to identify the variables with the strongest relationship with intentions to reduce SSB consumption from a suite of variables

derived from the literature. Design: Random-digit dialling of landline and mobile phones was used to survey adults using computer-assisted telephone interviews. The outcome variable was 'likelihood of reducing SSB consumption in next 6 months', and the predictor variables were demographics, SSB attitudes and behaviour, health risk perceptions and social/environmental exposure. Setting: Australia. Participants: A subsample of 1630 regular SSB consumers from a nationally representative sample of 3430 Australian adults (38 % female, 51 % aged 18-45 years, 56 % overweight or obese). Results: Respondents indicated that they were 'not at all' (30 center dot 1 %), 'somewhat' (43 center dot 9 %) and 'very likely' (25 center dot 3 %) to reduce SSB consumption. Multivariate nominal logistic regressions showed that perceiving future health to be 'very much' at risk was the strongest predictor of intention to reduce SSB consumption (OR = 8 center dot 1, 95 % CI 1 center dot 8, 37 center dot 0, P < 0 center dot 01). Other significant predictors (P < 0 center dot 01) included self-perceptions about too much consumption, habitual consumption, difficulty reducing consumption and likelihood of benefitting from reduced consumption. Conclusions: Health risk perceptions had the strongest relationship with intentions to reduce consumption. Age and consumption perceptions were also predictors in the multivariate models, whereas social/environmental exposure variables were not. Interventions may seek to incorporate strategies to denormalise consumption practices and increase knowledge about perceived susceptibility to health risks. Notes: Dono, Joanne Ettridge, Kerry A. Short Title: Influencing medication taking behaviors using automated two-way digital communication: A narrative synthesis systematic review informed by the Behavior Change Wheel

ISSN: 1359-107X

DOI: 10.1111/bjhp.12580

Accession Number: WOS:000746898100001

Abstract: Purpose Around half of prescribed medications for long-term conditions are not taken as directed. Automated two-way digital communication, such as text messaging and interactive voice response technology, could deliver interventions to improve medication adherence, and subsequently health. However, exploration of how such interventions may improve medication adherence is limited. This review aimed to explore how automated two-way digital communication can improve medication taking with or without using non-digital intervention components, such as phone calls with healthcare professionals. Methods A theory-informed narrative synthesis systematic review. Several databases were searched including CINAHL, Embase, Medline, and Web of Science using key words relating to 'medication adherence' and digital communication technologies. The Behavior Change Technique (BCT) coding using the BCT Taxonomy V1 and the Behavior Change Wheel were used to identify BCTs delivered within the included interventions. Results A total of 3,018 records were screened with 43 study reports included in the review. Four medication-taking behaviors: taking medication, obtaining medication, self-testing, and asking for support were identified as targets for behavior change within the included interventions. Most BCTs within the digital communication component aimed to increase motivation for medication adherence, with non-digital intervention components included to address other medication taking barriers, such as physical and psychological capability. Conclusion Automated two-way digital communication can detect barriers to medication adherence by monitoring performance of the taking medication behavior. Monitoring outcomes from taking medication may increase reflective motivation to take medicines. Addressing physical opportunity to taking medication by facilitating the behavior obtaining medication may also increase adherence.

Title: Two-way Automated Text Messaging Support From Community Pharmacies for Medication Taking in Multiple Long-term Conditions: Human-Centered Design With Nominal Group Technique Development Study
Journal: Jmir Formative Research

Volume: 6

Issue: 12

Date: Dec

Short Title: Two-way Automated Text Messaging Support From Community

Pharmacies for Medication Taking in Multiple Long-term Conditions:
Human-Centered Design With Nominal Group Technique Development Study
DOI: 10.2196/41735

Article Number: e41735

Accession Number: WOS:000968623100034

Abstract: Background: Reviews of digital communication technologies suggest that they can be effective in supporting medication use; however, their use alongside nondigital components is unclear. We also explored the delivery of a digital communication intervention in a relatively novel setting of community pharmacies and how such an intervention might be delivered to patients with multiple long-term conditions. This meant that despite the large number of intervention examples available in the literature, design questions remained, which we wanted to explore with key stakeholders. Examples of how to involve stakeholders in the design of complex health care interventions are lacking; however, human-centered design (HCD) has been suggested as a potential approach. **Objective:** This study aimed to design a new community pharmacy text messaging intervention to support medication use for multiple long-term conditions, with patient and health care professional stakeholders in primary care. **Methods:** HCD was used to map the intervention "journey" and identify design questions to explore with patients and health care professionals. Six prototypes were developed to communicate the intervention concept, and a modified version of the Nominal Group Technique was used to gather feedback. Nominal group meetings generated qualitative data using questions about the aspects that participants liked for each prototype and any suggested changes. The discussion was analyzed using a framework approach to transform feedback into statements. These statements were then ranked using a web-based questionnaire to establish a consensus about what elements of the design were valued by stakeholders and what changes to the design were most important. **Results:** A total of 30 participants provided feedback on the intervention design concept over 5 nominal group meetings (21 health care professionals and 9 patients) with a 57% (17/30) response rate to the ranking questionnaire. Furthermore, 51 proposed changes in the intervention were generated from the framework analysis. Of these 51 changes, 27 (53%) were incorporated into the next design stage, focusing on changes that were ranked highest. These included suggestions for how text message content might be tailored, patient information materials, and the structure for pharmacist consultation. All aspects that the participants liked were retained in the future design and provided evidence that the proposed intervention concept had good acceptability. **Conclusions:** HCD incorporating the Nominal Group Technique is an appropriate and successful approach for obtaining feedback from key stakeholders as part of an iterative design process. This was particularly helpful for our intervention, which combined digital and nondigital components for delivery in the novel setting of a community pharmacy. This approach enabled the collection and prioritization of useful multiperspective feedback to inform further development and testing of our intervention. This model has the potential to minimize research waste by gathering feedback early in the complex intervention design process.

Abstract: There currently exists worldwide concern around obesity,
inactivity and sedentary school curricula. EduMove (Education
through Movement) offers physically active and movement-based
teaching and learning promoting cross-curricula delivery in schools.
This research assessed effectiveness of mechanisms and processes
underpinning the claims of EduMove, stakeholder relationships and
Student Practitioner delivery. Semi-structured interviews were
undertaken with Teachers and Student Practitioners relating to
physical activity, delivery methods and enjoyment levels to gauge
understanding and engagement with the EduMove philosophy. Findings
demonstrated increases in pupil concentration and confidence,
although wider outcomes relating to school-wide physical activity,
health and educational attainment need further exploration. Students
as delivery agents was positive in relation to stakeholder
interaction, although further training is required to achieve more
sustainable outcomes. Embedding movement within cross-curricula
planning has potential after evidence of enthusiasm and acceptance
although further professional development is required to deliver
activities that address complex societal and curricula issues.

Title: Perceptions of Antibiotic Use and Resistance: Are Antibiotics the Dentists' Anxiolytics?

Journal: Antibiotics-Basel

Volume: 10

Issue: 6

Date: Jun

Short Title: Perceptions of Antibiotic Use and Resistance: Are Antibiotics the Dentists' Anxiolytics?

ISSN: 2079-6382

DOI: 10.3390/antibiotics10060735

Article Number: 735

Accession Number: WOS:000665401700001

Abstract: Background: Antibiotic resistance is a global health crisis. The aim of this study was to explore dentists' perceptions of antibiotic resistance. Methods: A qualitative method was used. Seventeen dentists practising in the Nancy (Lorraine, France) region were surveyed. They were general practitioners or specialised in oral surgery, implantology, or periodontology. The practitioners took part in semi-structured interviews between September 2019 and July 2020. All of the interviews were transcribed in full and analysed thematically. Results: Four major themes have been selected: attitudes of the dentists in regard to the guidelines, clinical factors that influence prescriptions, non-clinical factors that influence prescriptions, and the perception of antibiotic resistance. The dentists stated that they were very concerned regarding the public health issue of antibiotic resistance. However, they often prescribe according to their own interests and habits rather than according to the relevant guidelines. Conclusions: Although dentists are generally well aware of antibiotic resistance, they often do not adequately appreciate the link between their prescribing habits and the phenomenon of antibiotic resistance. Regular updating of practitioners' knowledge in this regard is necessary, but patients and the general public should also be made more aware of the issue.

Short Title: Acting wisely in complex clinical situations: 'Mutual

safety' for clinicians as well as patients

ISSN: 0142-159X

DOI: 10.1080/0142159x.2021.1951693

Accession Number: WOS:000683203400001

Abstract: Purpose The hope that reliably testing clinicians' competencies would improve patient safety is unfulfilled and clinicians' psychosocial safety is deteriorating. Our purpose was to conceptualise 'mutual safety', which could increase benefit as well as reduce harm. Methods A cultural-historical analysis of how medical education has positioned the patient as an object of benefit guided implementation research into how mutual safety could be achieved. Results Educating doctors to abide by moral principles and use rigorous habits of mind and scientific technologies made medicine a profession. Doctors' complex attributes addressed patients' complex diseases and personal circumstances, from which doctors benefited too. The patient safety movement drove reforms, which reorientated medical education from complexity to simplicity: clinicians' competencies should be standardised and measurable, and clinicians whose 'incompetence' caused harm remediated. Applying simple standards to an increasingly complex, and therefore inescapably risky, practice could, however, explain clinicians' declining psychosocial health. We conducted a formative intervention to examine how 'acting wisely' could help clinicians benefit patients amidst complexity. We chose the everyday task of insulin therapy, where benefit and harm are precariously balanced. 247 students, doctors, and pharmacists used a thought tool to plan how best to perform this risky task, given their current clinical capabilities, and in the sometimes-hostile clinical milieus where they practised. Analysis of 1000 commitments to behaviour change and 600 learning points showed that addressing complexity called for a skills-set that defied standardisation. Clinicians gained confidence, intrinsic motivation, satisfaction, capability, and a sense of legitimacy from finding new ways of benefiting patients. Conclusion Medical education needs urgently to acknowledge the complexity of practice and synergise doctors' and patients' safety. We have shown how this is possible.

Date: Aug

Short Title: The importance of animal welfare and Veterinary Services in a changing world

ISSN: 0253-1933

DOI: 10.20506/rst.40.2.3238

Accession Number: WOS:000707067100010

Abstract: Animal welfare is an essential component of the future of sustainable agriculture and the United Nations Sustainable Development Goals. There is growing global recognition of the importance of animal welfare, which must always be considered as part of the decision-making around food and nutrition security. Veterinary Services, encompassing public and private veterinarians and para-veterinarians, are custodians of animal welfare and key players in future actions to improve it. The welfare of animals is everyone's responsibility, from the individual farmer and practitioner to policymakers at the national and intergovernmental level. In this paper, after providing background information about current animal welfare issues and identifying animal welfare risks, the authors make a number of recommendations for action at the institutional and individual level. They do so because while the former is essential to generate change at scale and effective resourcing, the latter can create immediate action at a local level and drive change from the ground up. Without coordinated action from Veterinary Services, opportunities to improve animal welfare, alongside human and environmental health and well-being, may very well be lost, and animal welfare may fail to improve or even be at risk of decline.

Title: Risk-need-responsivity: Evaluating need-to-service matching with reach, effectiveness, adoption, implementation, maintenance

Journal: Behavioral Sciences & the Law

Volume: 39

Issue: 1

Pages: 106-122

Date: Feb

Short Title: Risk-need-responsivity: Evaluating need-to-service matching with reach, effectiveness, adoption, implementation, maintenance

ISSN: 0735-3936

DOI: 10.1002/bsl.2502

Accession Number: WOS:000614235800001

Abstract: With a sample of 125 adults under community supervision (71.20% male, 76.00% White, mean age = 33.17 years), this study evaluated need-to-service matching using an evaluation framework from implementation science. Need-to-service matching is a case management strategy intended to align service referrals in case plans with justice-involved persons' criminogenic needs. The results indicated that need-to-service matching reached a high percentage of its target population at 81.70%. Within criminogenic need areas, good match frequencies ranged from 80.00% in family/marital problems to 98.29% in alcohol/drug problems. Clinical staff also met the adherence benchmark applied by the current study, which required a 75.00% match between individuals' criminogenic needs and the services they received. Justice-involved persons had, on average, 90.46% of their criminogenic needs matched with at least one service referral. Over-prescription of services (i.e., recommendation of services that were not needed) was high, with frequencies in need areas ranging from 60.98% in education/employment to 82.21% in antisocial patterns. Methods from implementation science are useful for structuring evaluations of need-to-service matching, understanding implementation success and failure, and generating recommendations for improving implementation practice. The field would benefit greatly from benchmarks for need-to-service matching evaluation elements.

Title: Understanding consumer behavior patterns in antibiotic usage for upper respiratory tract infections: A study protocol based on the COM-B framework

Journal: Research in Social & Administrative Pharmacy

Volume: 17

Issue: 5

Pages: 978-985

Date: May

Short Title: Understanding consumer behavior patterns in antibiotic usage for upper respiratory tract infections: A study protocol based on the COM-B framework

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2020.07.033

Accession Number: WOS:000633997800017

Abstract: Background: Irrational use of antibiotics is prevalent

worldwide. But our understanding on consumer behaviors in the use of antibiotics is very limited. This study aims to identify consumer behavior patterns in the use of antibiotics for upper respiratory tract infections (URTIs). Methods: The study will employ a mixed methods approach based on the 'Capacity & Opportunity & Motivation ? Behavior' (COM-B) framework. The COM-B attributes of consumers in relation to the use of antibiotics will be extracted from a systematic literature review. Semi-structured in-depth interviews will be conducted on 20-25 community residents with URTI symptoms over the past three months to illustrate the meaning and implications of the thematic categories of COM-B attributes for the purpose of measurement development. The measurement instruments will be modified and validated through Delphi consultations with 15 experts and a survey of 300 adult residents in Wuhan. A cross-sectional survey using the finalised measurement instruments will be conducted on 2700 adult residents randomly selected from 18 residential communities across 9 municipalities in 3 provinces in China. Multi-level latent class analyses will be performed to categorise the respondents based on the indicators measuring the behavioral features (need recognition, information searching, alternative assessment, purchase, use, and post-use evaluation) of consumers in purchasing, consuming and disposing antibiotics for URTIs. Multi-nominal regression analyses will be performed to determine the predictors of different behavior patterns. Discussion: This study aims to classify consumers into distinguished categories of behavior patterns toward the use of antibiotics for URTIs. Such a classification system categories the consumers with similar behavior features into the same group so that better targeted interventions can be developed. The COM-B model adopted in this study can also help us better understand the underlying mechanisms of different behavior patterns of consumers.

intervention

ISSN: 1413-8123

DOI: 10.1590/1413-81232022273.05372021

Accession Number: WOS:000775556700009

Abstract: This study reports on the qualitative phase of a study that seeks to design a digital intervention for the prevention of STI / HIV and promotion of sexual health in university students. The experience and perception that university students have about sexuality, risk and prevention campaigns are addressed through focus groups. Semi-structured interviews are conducted with key informants. The results reveal that sexual education is limited and restricted to the biological aspect, as well as loaded with prejudices and gender biases, which narrows the information provided to the student population. Wavering prevention strategies that fail to motivate students or offer them opportunities for making informed and independent decisions about their sexual health are apparent. The STI / HIV campaigns assessed are distant, fear-based and not inclusive. Interventions in sexual health do not weigh experiential aspects of youth sexuality, as they are based on models of ideal and stereotyped behavior, discarding first-person narratives and their rich complexity. It is imperative to innovate in the prevention of STI/HIV, formulating interventions based on an integrative, multidisciplinary and contextualized design that values the theory and experience of the target populations.

Short Title: Appraising Evidence-Based Mental Health and Psychosocial Support (MHPSS) Guidelines-PART II: A Content Analysis with Implications for Disaster Risk Reduction

DOI: 10.3390/ijerph19137798

Article Number: 7798

Accession Number: WOS:000823953000001

Abstract: High quality mental health and psychosocial support (MHPSS) guidelines are indispensable for policy and practice to

address the mental health consequences of disasters. This contribution complements a review that assessed the methodological quality of 13 MHPSS guidelines. We analyzed the content of the four highest-ranking guidelines and explored implications for disaster risk reduction (DRR). A qualitative explorative thematic analysis was conducted. The four guidelines proved largely similar, overlapping or at least complementary in their MHPSS definitions, stated purpose of the guidelines, user and target groups, terminology, and models used. Many recommended MHPSS measures and interventions were found in all of the guidelines and could be assigned to five categories: basic relief, information provision, emotional and social support, practical support, and health care. The guidelines stress the importance of monitoring needs and problems, evaluating the effect of service delivery, deliberate implementation and preparation, and investments in proper conditions and effective coordination across professions, agencies, and sectors. The MHPSS knowledge base embedded in the guidelines is comprehensive, coherent, and sufficiently universal to serve as the "overarching framework" considered missing yet vital for the integration of MHPSS approaches in DRR. Although application contexts differ geographically, this common ground should allow policymakers and practitioners globally to plan, implement, and evaluate MHPSS actions contributing to DRR, ideally together with target groups.

Short Title: Quality improvement collaboratives and the wisdom of crowds: spread explained by perceived success at group level

ISSN: 1748-5908

DOI: 10.1186/s13012-014-0091-2

Article Number: 91

Accession Number: WOS:000340795900001

Abstract: Background: Many studies have been conducted to evaluate the impact of quality improvement collaboratives (QICs) on the quality of healthcare. This article addresses an underexplored topic, namely the use of QICs as 'intentional spread strategy.' Its objective is to predict the dissemination of projects within hospitals participating a change programme based on several QICs. We tested whether the average project success at QIC level (based on opinions of individual project team leaders) explains the dissemination of projects one year later. Findings: After one year,

148 project team leaders of 16 hospitals participating in the two-year programme were asked to rate the success of their improvement project on a scale from 1 to 10. At the end of the second year, the programme coordinator of each hospital provided information on the second-year dissemination. Average success scores and dissemination statistics were calculated for each QIC (N = 12). The non-parametric correlation between team leader judgment and dissemination rate at QIC level is 0.73 (P < 0.01). Conclusions: Previous work, focusing on the team and hospital level, showed which factors contributed to local success stories. It also illustrated how successes play a role in dissemination processes within programme. The current study suggests that we cannot ignore the extent to which the dissemination potential of individual projects is defined by their QIC. Aggregated team leader judgments at the QIC level might predict the future dissemination in participating organizations. The findings, however, need to be replicated in larger, independent samples.

Short Title: Six-Month Results on Treatment Adherence, Physical Activity, Spinal Appearance, Spinal Deformity, and Quality of Life in an Ongoing Randomised Trial on Conservative Treatment for Adolescent Idiopathic Scoliosis (CONTRAIS)

DOI: 10.3390/jcm10214967

Article Number: 4967

Accession Number: WOS:000777190700011

Abstract: Adolescents with idiopathic scoliosis (AIS) often receive conservative treatments aiming to prevent progression of the spinal deformity during puberty. This study aimed to explore patient adherence and secondary outcomes during the first 6 months in an ongoing randomised controlled trial of three treatment interventions. Interventions consisted of physical activity combined with either hypercorrective Boston brace night shift (NB), scoliosis-specific exercise (SSE), or physical activity alone (PA). Measures at baseline and 6 months included angle of trunk rotation (ATR), Cobb angle, International Physical Activity Questionnaire short form (IPAQ-SF), pictorial Spinal Appearance Questionnaire

(pSAQ), Scoliosis Research Society (SRS-22r), EuroQol 5-Dimensions Youth (EQ-5D-Y) and Visual Analogue Scale (EQ-VAS). Patient adherence, motivation, and capability in performing the intervention were reported at 6 months. The study included 135 patients (111 females) with AIS and >1-year estimated remaining growth, mean age 12.7 (1.4) years, and mean Cobb angle 31 (+/- 5.3). At 6 months, the proportion of patients in the groups reporting high to very high adherence ranged between 72 and 95%, while motivation ranged between 65 and 92%, with the highest proportion seen in the NB group ($p = 0.014$, $p = 0.002$). IPAQ-SF displayed significant between group main effects regarding moderate activity ($F = 5.7$; $p = 0.004$; $\eta^2(p) = 0.10$), with a medium-sized increase favouring the SSE group compared to NB. Walking showed significant between group main effects, as did metabolic equivalent (MET-min/week), with medium ($F = 6.8$, $p = 0.002$; $\eta^2(p) = 0.11$, and large ($F = 8.3$, $p = < 0.001$, $\eta^2(p) = 0.14$) increases, respectively, for the SSE and PA groups compared to NB. From baseline to 6 months, ATR showed significant between group medium-sized main effects ($F = 1.2$, $p = 0.019$, $\eta^2(p) = 0.007$) favouring the NB group compared to PA, but not reaching a clinically relevant level. In conclusion, patients reported high adherence and motivation to treatment, especially in the NB group. Patients in the SSE and PA groups increased their physical activity levels without other clinically relevant differences between groups in other clinical measures or patient-reported outcomes. The results suggest that the prescribed treatments are viable first-step options during the first 6 months.

Short Title: 2014 consensus statement on improving pelvic floor muscle training adherence: International Continence Society 2011 State-of-the-Science Seminar

ISSN: 0733-2467

DOI: 10.1002/nau.22796

Accession Number: WOS:000359710200002

Abstract: Aims To summarize the findings and expert-panel consensus of the State-of-the-Science Seminar on pelvic floor muscle training (PFMT) adherence held prior to the 41st International Continence Society scientific meeting, Glasgow, 2011. Methods Summaries of research and theory about PFMT adherence (based on a comprehensive literature search) were presented by subject experts at the 2011 Seminar to generate discussion and guidance for clinical practice and future research. Supplemental research, post-seminar, resulted in, three review papers summarizing: (1) relevant behavioral theories, (2) adherence measurement, determinants and effectiveness of PFMT adherence interventions, and (3) patients' PFMT experiences. A fourth, reported findings from an online survey of health professionals and the public. Results Few high-quality studies were found. Paper I summarizes 12 behavioral frameworks relevant to theoretical development of PFMT adherence interventions and strategies. Findings in Paper II suggest both PFMT self-efficacy and intention-to-adhere predict PFMT adherence. Paper III identified six potential adherence modifiers worthy of further investigation. Paper IV found patient-related factors were the biggest adherence barrier to PFMT adherence. Conclusion Given the lack of high-quality studies, the conclusions were informed by expert opinion. Adherence is central to short- and longer-term PFMT effect. More attention and explicit reporting is needed regarding: (1) applying health behavior theory in PFMT program planning; (2) identifying adherence determinants; (3) developing and implementing interventions targeting known adherence determinants; (4) using patient-centred approaches to evaluating adherence barriers and facilitators; (5) measuring adherence, including refining and testing instruments; and (6) testing the association between adherence and PFMT outcome. *Neurourol. Short Title: Motivation is not enough: A qualitative study of lung cancer screening uptake in Australia to inform future implementation

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0275361

Article Number: e0275361

Accession Number: WOS:000933365700050

Abstract: Introduction Participation in lung cancer screening (LCS) trials and real-world programs is low, with many people at high-risk for lung cancer opting out of baseline screening after registering interest. We aimed to identify the potential drivers of participation in LCS in the Australian setting, to inform future implementation. Methods Semi-structured telephone interviews were conducted with individuals at high-risk of lung cancer who were eligible for screening and who had either participated ('screeners') or declined to participate ('decliners') in the International Lung Screening Trial from two Australian sites. Interview guide development was informed by the Precaution Adoption Process Model. Interviews were audio-recorded, transcribed and analysed using the COM-B model of behaviour to explore capability, opportunity and motivation related to screening behaviour. Results Thirty-nine participants were interviewed (25 screeners; 14 decliners).

Motivation to participate in screening was high in both groups driven by the lived experience of lung cancer and a belief that screening is valuable, however decliners unlike their screening counterparts reported low self-efficacy. Decliners in our study reported challenges in capability including ability to attend and in knowledge and understanding. Decliners also reported challenges related to physical and social opportunity, in particular location as a barrier and lack of family support to attend screening.

Conclusion Our findings suggest that motivation alone may not be sufficient to change behaviour related to screening participation, unless capability and opportunity are also considered. Focusing strategies on barriers related to capability and opportunity such as online/telephone support, mobile screening programs and financial assistance for screeners may better enhance screening participation. Providing funding for clinicians to support individuals in decision-making and belief in self-efficacy may foster motivation. Targeting interventions that connect eligible individuals with the LCS program will be crucial for successful implementation.

Article Number: 63

Accession Number: WOS:000704688900005

Abstract: Background: While existing psychological treatments for depression are effective for many, a significant proportion of depressed individuals do not respond to current approaches and few remain well over the long-term. Anhedonia (a loss of interest or pleasure) is a core symptom of depression which predicts a poor prognosis but has been neglected by existing treatments. Augmented Depression Therapy (ADepT) has been co-designed with service users to better target anhedonia alongside other features of depression. This mixed methods pilot trial aims to establish proof of concept for ADepT and to examine the feasibility and acceptability of a future definitive trial evaluating the clinical and cost-effectiveness of ADepT, compared to an evidence-based mainstream therapy (Cognitive Behavioural Therapy; CBT) in the acute treatment of depression, the prevention of subsequent depressive relapse, and the enhancement of wellbeing. Methods: We aim to recruit 80 depressed participants and randomise them 1:1 to receive ADepT (15 weekly acute and 5 booster sessions in following year) or CBT (20 weekly acute sessions). Clinical and health economic assessments will take place at intake and at 6-, 12-, and 18-month follow-up. Reductions in PHQ-9 depression severity and increases in WEMWBS wellbeing at 6-month assessment (when acute treatment should be completed) are the co-primary outcomes. Quantitative and qualitative process evaluation will assess mechanism of action, implementation issues, and contextual moderating factors. To evaluate proof of concept, intake-post effect sizes and the proportion of individuals showing reliable and clinically significant change on outcome measures in each arm at each follow-up will be reported. To evaluate feasibility and acceptability, we will examine recruitment, retention, treatment completion, and data completeness rates and feedback from patients and therapists about their experience of study participation and therapy. Additionally, we will establish the cost of delivery of ADepT. Discussion: We will proceed to definitive trial if any concerns about the safety, acceptability, feasibility, and proof of concept of ADepT and trial procedures can be rectified, and we recruit, retain, and collect follow-up data on at least 60% of the target sample.

Short Title: Psycho-oncology and primary prevention in cancer control plans: an absent voice?

ISSN: 1057-9249

DOI: 10.1002/pon.3917

Accession Number: WOS:000362915000016

Abstract: Background One third of cancer deaths are attributable to modifiable lifestyle, behaviour and psychosocial risk factors. Psycho-oncology can contribute significantly to prevention initiatives such as those described in national cancer control plans (NCCPs), to reduce or eliminate these risk factors. However, the extent to which psycho-oncology expertise has informed prevention objectives in plans is unclear. Methods Accordingly, 35 English language NCCPs were located via existing databases and were searched using Adobe text searches (psycho', social', behav' and intervention') to identify (a) representations of psycho-oncology, its dimensions (psychological, social and behavioural) and roles (e.g. psychologist); and (b) behaviour/lifestyle change interventions. Results A third of NCCPs included the term psycho- or psychosocial-oncology; approximately half referred to a psycho-oncology dimension regarding prevention and early detection and half included actions/objectives relating to health professionals and provision of psychosocial care. The majority of cancer plans included prevention outcomes and focussed primarily on smoking cessation and alcohol reduction. Interventions commonly proposed were education, regulation and service provision; however, many were aspirational statements of intent rather than specific interventions. Psycho-oncology was represented in NCCPs but was limited in reference to prevention with few behavioural

interventions utilised. Conclusions Psycho-oncology input is needed to prescribe evidence-based interventions in cancer plans that not only educate, regulate and provide resources but also motivate, empower and create a supportive normative environment for behaviour change. In this manuscript, and throughout this Special Issue on Cancer Prevention, important principles, ideas and evidence within psycho-oncology are outlined which, if properly implemented, can help reduce the global cancer burden. Title: Feasibility randomised controlled trial comparing TRAK-ACL digital rehabilitation intervention plus treatment as usual versus treatment as usual for patients following anterior cruciate ligament reconstruction

Journal: Bmj Open Sport & Exercise Medicine

Volume: 7

Issue: 2

Short Title: Feasibility randomised controlled trial comparing TRAK-ACL digital rehabilitation intervention plus treatment as usual versus treatment as usual for patients following anterior cruciate ligament reconstruction

DOI: 10.1136/bmjsem-2020-001002

Article Number: e001002

Accession Number: WOS:000764182200001

Abstract: Objectives To evaluate the feasibility of trialling taxonomy for the rehabilitation of knee conditions-ACL (TRAK-ACL), a digital health intervention that provides health information, personalised exercise plans and remote clinical support combined with treatment as usual (TAU), for people following ACL reconstruction. Methods The study design was a two-arm parallel randomised controlled trial (RCT). Eligible participants were English-speaking adults who had undergone ACL reconstruction within the last 12 weeks, had access to the internet and could provide informed consent. Recruitment took place at three sites in the UK. TRAK-ACL intervention was an interactive website informed by behaviour change technique combined with TAU. The comparator was TAU. Outcomes were: recruitment and retention; completeness of outcome measures at follow-up; fidelity of intervention delivery and engagement with the intervention. Individuals were randomised using a computer-generated random number sequence. Blinded assessors allocated groups and collected outcome measures. Results Fifty-nine people were assessed for eligibility at two of the participating

sites, and 51 were randomised; 26 were allocated to TRAK-ACL and 25 to TAU. Follow-up data were collected on 44 and 40 participants at 3 and 6 months, respectively. All outcome measures were completed fully at 6 months except the Client Service Receipt Inventory. Two patients in each arm did not receive the treatment they were randomised to. Engagement with TRAK-ACL intervention was a median of 5 logins (IQR 3-13 logins), over 18 weeks (SD 12.2 weeks). Conclusion TRAK-ACL would be suitable for evaluation of effectiveness in a fully powered RCT.

Title: Telerehabilitation to Address the Rehabilitation Gap in Anterior Cruciate Ligament Care: Survey of Patients

Journal: Jmir Formative Research

Volume: 4

Issue: 9

Date: Sep

Short Title: Telerehabilitation to Address the Rehabilitation Gap in Anterior Cruciate Ligament Care: Survey of Patients

DOI: 10.2196/19296

Article Number: e19296

Accession Number: WOS:000853384900009

Abstract: Background: Evidence shows that after anterior cruciate ligament (ACL) reconstruction, patients may have varied access to physical therapy. In particular, physical therapy input may end many months before patients reach full recovery. Telerehabilitation may provide an opportunity to address this rehabilitation gap and improve access to evidence-based rehabilitation alongside physical therapy at all stages of care. Objective: This study aims to understand the opinions of patients who have undergone ACL surgery and rehabilitation on the use of telerehabilitation as part of ACL care and define the population and explore their experiences and views on the acceptability of telerehabilitation after ACL reconstruction. Methods: This study was a cross-sectional, voluntary, web-based survey combining both closed and open questions. Ethical approval was obtained from the Yale School of Medicine Institutional Review Board. Participants were aged 16 years or older at the time of recruitment and had undergone ACL reconstruction within the past 5 years. A 26-item survey was developed using the Qualtrics survey platform. No items were mandatory. Responses were multiple choice, binary, and qualitative. The CHERRIES (Checklist for Reporting Results of Internet E-Surveys) was used to ensure the quality of reporting of surveys in the medical literature. Data were analyzed using Stata version 15. Qualitative data were analyzed using NVivo 11. The theoretical

framework for this analysis is based on the Capability, Opportunity, and Motivation–Behavior model of behavior change. Results: A total of 100 participants opened the survey. All completers were unique. The participation and completion rates were each 96% (96/100). Patients reported their physical therapy care ended at an average of 6.4 months and that they felt fully recovered at an average of 13.2 months. Only 26% (25/96) of patients felt fully recovered at the end of physical therapy. Of these 96 patients, 54 (60%) were younger than 30 years, 71 (74%) were recreational athletes, 24 (24%) were competitive athletes, 72 (75%) had private insurance, 74 (77%) were not familiar at all with telerehabilitation, and 89% (85/96) felt capable. They preferred to use telerehabilitation at different stages of care. Reported benefits included resource saving, improved access to care, improved learning, and greater engagement. Concerns included incorrect performance of exercises or unmanaged pain being missed and less access to manual therapy, motivation, and opportunities to ask questions. Participants' priorities for a future telerehabilitation intervention included its use as an adjunct to physical therapy rather than a replacement, with content available for each stage of care, especially return to sports. Participants stressed that the intervention should be personalized to them and include measures of progress. Conclusions: These findings helped understand and define the ACL reconstruction population. Participants found telerehabilitation acceptable in principle and highlighted the key user requirements and scope of future interventions.

Title: What influences adherence to guidance for postoperative instillation of intravesical chemotherapy to patients with bladder cancer?

Journal: Bju International

Volume: 128

Issue: 2

Pages: 225-235

Date: Aug

Short Title: What influences adherence to guidance for postoperative instillation of intravesical chemotherapy to patients with bladder cancer?

ISSN: 1464-4096

DOI: 10.1111/bju.15336

Accession Number: WOS:000633809400001

Abstract: Objective To understand the barriers and facilitators to

single instillation of intravesical chemotherapy (SI-IVC) use after resection of non-muscle-invasive bladder cancer (NMIBC) in Scotland and England using a behavioural theory-informed approach. Subjects and Methods In a cross-sectional descriptive study of practices at seven hospitals, we investigated care pathways, policies, and interviewed 30 urology staff responsible for SI-IVC. We used the Theoretical Domains Framework (TDF) to organise our investigation and conducted deductive thematic analyses, while inductively coding emergent beliefs. Results Barriers to SI-IVC were present at different organisational levels and professional roles. In four hospitals, there was a policy to not instil SI-IVC in theatre. Six hospitals' staff reported delays in mitomycin C (MMC) ordering and/or local storage. Lack of training, skills and perceived workload affected motivation. Facilitators included access to modern instilling devices (four hospitals) and incorporating reminders in operation proforma (four hospitals). Performance targets (with audit and feedback) within a national governance framework were present in Scotland but not England. Differences in coordinated leadership, sharing best practices, and disliking being perceived as underperforming, were evident in Scotland. Conclusions High-certainty evidence shows that SI-IVC, such as MMC, after NMIBC resection reduces recurrences. This evidence underpins international guidance. The number of eligible patients receiving SI-IVC is variable indicating suboptimal practice. Improving SI-IVC adherence requires modifications to theatre instilling policies, delivery and storage of MMC, staff training, and documentation. Centralising care, with bladder cancer expert leadership and best practices sharing with performance targets, likely led to improvements in Scotland. National quality improvement, incorporating audit and feedback, with additional implementation strategies targeted to professional role could improve adherence and patient outcomes elsewhere. This process should be controlled to clarify implementation intervention effectiveness.

Issue: 2
Pages: 345-360
Date: May
Short Title: Predictors and Measures of Adherence to Core Treatments for Osteoarthritis
ISSN: 0749-0690
DOI: 10.1016/j.cger.2021.11.007
Accession Number: WOS:000793409700011
Abstract: Adherence to core treatments for OA remains a challenge for researchers, clinicians, and patients. Adherence is influenced by multiple factors, both intrinsic and extrinsic. These factors differ between individuals, and within an individual over time, making predicting adherence difficult and unreliable. Measurement and reporting of adherence are essential. The measurement of adherence should be standardized for various OA interventions, and developing a tool to measure adherence is a priority. Identifying the barriers and enablers to treatments by using existing frameworks such as the Behaviour Change Wheel and implementing behavior change techniques known to improve adherence, such as booster sessions, should be used to assist in improving adherence in clinical trials and practice. All prescribed interventions should include patient education and consider patient barriers, abilities, and preferences to maximize adherence long term.

Article Number: e0277143
Accession Number: WOS:000924525200005
Abstract: Improving outcomes for people undergoing major surgery, specifically reducing perioperative morbidity and mortality remains a global health challenge. Prehabilitation involves the active

preparation of patients prior to surgery, including support to tackle risk behaviours that mediate and undermine physical and mental health and wellbeing. The majority of prehabilitation interventions are delivered in person, however many patients express a preference for remotely-delivered interventions that provide them with tailored support and the flexibility. Digital prehabilitation interventions offer scalability and have the potential to benefit perioperative healthcare systems, however there is a lack of robustly developed and evaluated digital programmes for use in routine clinical care. We aim to systematically develop and test the feasibility of an evidence and theory-informed multibehavioural digital prehabilitation intervention 'iPREPWELL' designed to prepare patients for major surgery. The intervention will be developed with reference to the Behaviour Change Wheel, COM-B model, and the Theoretical Domains Framework. Codesign methodology will be used to develop a patient intervention and accompanying training intervention for healthcare professionals. Training will be designed to enable healthcare professionals to promote, support and facilitate delivery of the intervention as part of routine clinical care. Patients preparing for major surgery and healthcare professionals involved with their clinical care from two UK National Health Service centres will be recruited to stage 1 (systematic development) and stage 2 (feasibility testing of the intervention). Participants recruited at stage 1 will be asked to complete a COM-B questionnaire and to take part in a qualitative interview study and co-design workshops. Participants recruited at stage 2 (up to twenty healthcare professionals and forty participants) will be asked to take part in a single group intervention study where the primary outcomes will include feasibility, acceptability, and fidelity of intervention delivery, receipt, and enactment. Healthcare professionals will be trained to promote and support use of the intervention by patients, and the training intervention will be evaluated qualitatively and quantitatively. The multifaceted and systematically developed intervention will be the first of its kind and will provide a foundation for further refinement prior to formal efficacy testing.

Short Title: Human-Nature Interactions during and after the COVID-19 Pandemic in Moscow, Russia: Exploring the Role of Contact with Nature and Main Lessons from the City Responses
DOI: 10.3390/land11060822
Article Number: 822
Accession Number: WOS:000816055900001
Abstract: Urban green spaces (UGS) as essential elements of the urban environment provide multiple ecosystem services including benefits for physical and mental health. Impacts of the COVID-19 pandemic and related restrictions have influenced human relationships with nature. Based on empirical research, this article explores the pathways and implications of human-nature interactions during and after COVID-19 and how human health and well-being could be supported by contact with nature. The article discusses the reasons that attract people to visit UGS (value of UGS, their perceptions, ways of contact with urban nature, etc.). It also analyses the effects of social isolation on the usage and perception of UGS during and after the COVID-19 pandemic. The research revealed current needs for UGS and their role in adaptation of urban development and greening strategy. For this purpose, an online questionnaire survey among residents of Moscow was conducted in April-July of 2020 when restrictive measures were imposed in the city in response to the COVID-19 pandemic. Additionally, non-participatory observations and photo documentation were used to supplement the data on UGS visitation and use. The GIS mapping method was applied to analyze the UGS provision (availability and accessibility of UGS). Moreover, expert interviews were conducted

aiming to explore the implications of the COVID-19 pandemic on the urban fabric and life of the citizens. The aim was to reveal the main tendencies that can be used in the adaptation of urban development plans, especially regarding UGS and human-nature interactions. The results show that citizens (both survey respondents and experts) highly value urban nature as a tool for coping with COVID-19 challenges. They underlined a need for accessible UGS, most notably for breathing fresh air, reducing stress, relaxing, and observing and enjoying nature. The survey also revealed the particular health effects resulting from the reduction of UGS visitations due to COVID-19 restrictions. Several changes in human-nature interactions were also observed: many respondents especially missed spending time outdoors and meeting other people. That highlights the fact that while UGS normally provides places for social integration and socializing, during the COVID-19 isolation UGS were especially valued in regard to physical health and well-being (self-recovery). Both respondents and experts expressed their opinions regarding the future development of UGS network and how the UGS's structure and design should be adapted to the current challenges. The claimed interests/preferences included the need for providing all residents equal access to UGS in a time of pandemics and post pandemics. A set of limitations and directions for future research of UGS was suggested.

Abstract: Introduction. Insufficient cultural competences among health care professionals (HCPs) working with ethnic minorities may result in poorer quality of care. This study aimed to develop a cultural intervention for HCPs. Method. The intervention was designed using the Behavior Change Wheel. The development phase contained empirical studies of patients with HIV and African background, literature review, observations from a migrant health clinic, and transcultural care theory. Results. Systematic development will facilitate an intervention tailored to focus on nurses' sensitivity and awareness, and aims to give them tools to identify narratives about patients' life situation and self-management as well as provide effective, compassionate, and culturally competent care. Discussion. Higher cultural competence among nurses may improve their support of patients to manage their disease.

Short Title: How is the Theoretical Domains Framework applied in designing interventions to support healthcare practitioner behaviour change? A systematic review

ISSN: 1353-4505

DOI: 10.1093/intqhc/mzab106

Article Number: mzab106

Accession Number: WOS:000768151000001

Abstract: Background The use of theory is recommended to support interventions to promote implementation of evidence-based practices. However, there are multiple models of behaviour change which can be complex and lack comprehensiveness and are therefore difficult to understand and operationalize. The Theoretical Domains Framework sought to address these problems by synthesizing 33 models of behaviour or behaviour change. Given that it is 15 years since the first publication of the Theoretical Domains Framework (TDF), it is timely to reflect on how the framework has been applied in practice. Objective The objective of this review is to identify and

narratively synthesize papers in which the TDF, (including frameworks that incorporate the TDF) have been used have been used to develop implementation interventions. Methods We searched MEDLINE, PsychINFO, CINAHL and the Cochrane databases using the terms: 'theoretical domains framework*' or TDF or Capability, Opportunity, Motivation to Behaviour (COM-B) or 'behav* change wheel' or 'BCW' AND implement* or improv* or quality or guideline* or intervention* or practice* or EBP or 'evidence based practice' and conducted citation and key author searches. The included papers were those that used any version of the TDF published from 2005 onwards. The included papers were subject to narrative synthesis. Results A total of 3540 papers were identified and 60 were included. Thirty-two papers reported intervention design only and 28 reported intervention design and testing. Despite over 3000 citations there has been limited application to the point of designing interventions to support the best practice. In particular use of the framework has not been tried or tested in non-western countries and barely used in non-primary or acute care settings. Authors have applied the framework to assess barriers and facilitators successfully but reporting of the process of selection of behaviour change techniques and intervention design thereafter was variable. Conclusion Despite over three thousand citations of the framework there has been limited application to the point of designing interventions to support best practice. The framework is barely used in non-western countries or beyond primary or acute care settings. A stated purpose of the framework was to make psychological theory accessible to researchers and practitioners alike; if this is to be fully achieved, further guidance is needed on the application of the framework beyond the point of assessment of barriers and facilitators.

Short Title: Implementing the NICE osteoarthritis guidelines: a mixed methods study and cluster randomised trial of a model osteoarthritis consultation in primary care - the Management of OsteoArthritis In Consultations (MOSAICS) study protocol

ISSN: 1748-5908

DOI: 10.1186/s13012-014-0095-y

Article Number: 95

Accession Number: WOS:000345433700001

Abstract: Background: There is as yet no evidence on the feasibility of implementing recommendations from the National Institute of Health and Care Excellence (NICE) osteoarthritis (OA) guidelines in primary care, or of the effect these recommendations have on the condition. The primary aim of this study is to determine the clinical and cost effectiveness of a model OA consultation (MOAC), implementing the core recommendations from the NICE OA guidelines in primary care. Secondary aims are to investigate the impact, feasibility and acceptability of the MOAC intervention; to develop and evaluate a training package for management of OA by general practitioners (GPs) and practice nurses; test the feasibility of deriving 'quality markers' of OA management using a new consultation template and medical record review; and describe the uptake of core NICE OA recommendations in participants aged 45 years and over with joint pain. Design: A mixed methods study with a nested cluster randomised controlled trial. Method: This study was developed according to a defined theoretical framework (the Whole System Informing Self-management Engagement). An overarching model (the Normalisation Process Theory) will be employed to undertake a comprehensive 'whole-system' evaluation of the processes and outcomes of implementing the MOAC intervention. The primary outcome is general physical health (Short Form-12 Physical component score [PCS]) (Ware 1996). The impact, acceptability and feasibility of the MOAC intervention at practice level will be assessed by comparing intervention and control practices using a Quality Indicators template and medical record review. Impact and acceptability of the intervention for patients will be assessed via self-completed outcome measures and semi-structured interviews. The impact, acceptability and feasibility of the MOAC intervention and training for GPs and practice nurses will be evaluated using a variety of methods including questionnaires, semi-structured interviews, and observations. Discussion: The main output from the study will be to determine whether the MOAC intervention is clinically and cost effective. Additional outputs will be the development of the MOAC for patients consulting with joint pain in primary care, training and educational materials, and resources for patients and professionals regarding supported self-management and uptake of NICE guidance.

Short Title: Social norms as a predictor of smoking uptake among youth: a systematic review, meta-analysis and meta-regression of prospective cohort studies

ISSN: 0965-2140

DOI: 10.1111/add.15427

Accession Number: WOS:000631694100001

Abstract: Background and aims Social norms towards smoking are a key concept in tobacco control policy and research. However, the influence and strength of different types of social norms on youth smoking uptake is unclear. This study aimed to examine, quantify and compare evidence of the longitudinal associations between different types of social norms towards smoking and youth smoking uptake (initiation and escalation). Methods Systematic review searching four databases (MEDLINE, EMBASE, PsycInfo, CINAHL) from January 1998 to October 2020. Evidence synthesis via narrative review, meta-analysis pooling unadjusted associations (initiation only, due to heterogeneity in escalation outcomes) and meta-regression comparing effect sizes by norm type and study characteristics. Studies included observational prospective cohort studies using survey methodology with youth aged ≤ 24 years. Measurements included longitudinal associations between descriptive norms (perceived smoking behaviour) and injunctive norms (perceived approval/disapproval of smoking) among social network(s) and subsequent smoking initiation or escalation. Results Thirty articles were identified. In the narrative review, smoking initiation (but not escalation) was consistently predicted by two norms: parental and close friend smoking. Associations between smoking uptake and other descriptive norms (smoking among siblings, family/household, partner, peers, adults) and all injunctive norms (perceived approval of smoking among parents, siblings, close friends/peers, partner, teachers, people important to you, the public) were less consistent or inconclusive. In the meta-analysis pooling unadjusted associations, 17 articles were included ($n = 27\ 767$). Smoking initiation was predicted by the following descriptive norms: smoking among parents [Odds Ratio (OR) = 1.88, 95% Confidence Interval (CI) = 1.56-2.28], close friends (OR = 2.53, 95% CI = 1.99-3.23), siblings (OR = 2.44, 95% CI = 1.93-3.08), family/household (OR =

1.55, 95% CI = 1.36–1.76) and adults (OR = 1.34, 95% CI = 1.02–1.75), but not peers (OR = 1.14, 95% CI = 0.92–1.42). Smoking initiation was also predicted by two injunctive norms, perceived approval of smoking among parents (OR = 1.74, 95% CI = 1.27–2.38) and the public (OR = 4.57, 95% CI = 3.21–6.49), but not close friends/peers (OR = 2.36, 95% CI = 0.86–6.53) or people important to the individual (OR = 1.24, 95% CI = 0.98–1.58). Conclusions In this systematic review (narrative and meta-analysis), descriptive norms of parents' and close friends' smoking behaviour appeared to be consistent predictors of youth smoking initiation, more so than the descriptive norms of more distal social networks and injunctive norms.

Short Title: Using Theory to Explore the Determinants of Medication

Adherence; Moving Away from a One-Size-Fits-All Approach

DOI: 10.3390/pharmacy5030050

Article Number: 50

Accession Number: WOS:000411985700017

Abstract: Non-adherence to prescribed medicines has been described as a worldwide problem of striking magnitude, diminishing treatment effects and wasting resources. Evidence syntheses report current adherence interventions achieve modest improvements at best, and highlight the poor progress toward the longstanding aim of a gold-standard intervention, tailored to meet individual need. Techniques such as motivational interviewing and health coaching, which aim to facilitate patient-centred care and improve patient resourcefulness, have shown promise in supporting adherence, especially in patients with psychological barriers to medicine-taking, such as illness perceptions and health beliefs. Despite a plethora of research, there is little recognition that the nature and complexity of non-adherence is such that a one-size-fits-all approach to interventions is never likely to suffice. This commentary re-visits the call for adherence interventions to be tailored to meet individual need, by considering what this means for day-to-day practice and how this can be achieved. It provides an update on advances in psychological theory to identify the root cause of an individual's non-adherence

to encourage matching of provided adherence support. It also provides a practical perspective by considering exemplars of innovative practice and evaluating the day-to-day practicalities of taking a novel approach.

Title: Factors affecting use of magnesium sulphate for pre-eclampsia or eclampsia: a qualitative evidence synthesis

Journal: Bjog-an International Journal of Obstetrics and Gynaecology

Volume: 129

Issue: 3

Pages: 379-391

Date: Feb

Short Title: Factors affecting use of magnesium sulphate for pre-eclampsia or eclampsia: a qualitative evidence synthesis

ISSN: 1470-0328

DOI: 10.1111/1471-0528.16913

Accession Number: WOS:000703343600001

Abstract: Background Hypertensive disorders account for 14% of global maternal deaths. Magnesium sulphate (MgSO₄) is recommended for prevention and treatment of pre-eclampsia/eclampsia. However, MgSO₄ remains underused, particularly in low- and middle-income countries (LMICs). Objective This qualitative evidence synthesis explores perceptions and experiences of healthcare providers, administrators and policy-makers regarding factors affecting use of MgSO₄ to prevent or treat pre-eclampsia/eclampsia. Search strategy We searched MEDLINE, EMBASE, Emcare, CINAHL, Global Health and Global Index Medicus, and grey literature for studies published between January 1995 and June 2021. Selection criteria Primary qualitative and mixed-methods studies on factors affecting use of MgSO₄ in healthcare settings, from the perspectives of healthcare providers, administrators and policy-makers, were eligible for inclusion. Data collection and analysis We applied a thematic synthesis approach to analysis, using COM-B behaviour change theory to map factors affecting appropriate use of MgSO₄. Main results We included 22 studies, predominantly from LMICs. Key themes included provider competence and confidence administering MgSO₄ (attitudes and beliefs, complexities of administering, knowledge and experience), capability of health systems to ensure MgSO₄ availability at point of use (availability, resourcing and pathways to care) and knowledge translation (dissemination of research and recommendations). Within each COM-B domain, we mapped facilitators and barriers to physical and psychological capability, physical and social opportunity, and how the interplay between these domains influences motivation. Conclusions These findings can inform policy and guideline development and improve implementation of MgSO₄ in

clinical care. Such action is needed to ensure this life-saving treatment is widely available and appropriately used. Tweetable abstract Global qualitative review identifies factors affecting underutilisation of MgSO4 for pre-eclampsia and eclampsia.

Abstract: Critical approaches may benefit epidemiological studies of sexual health. This article proposes a critical approach, reconcilable with social epidemiological enquiry. Key aims of critical epidemiology for sexual health are identified, from which three criticisms of practice emerge: (1) lack of attention to socio-cultural contexts, (2) construction of risk' as residing in the individual and (3) enactment of public health agendas which privilege and pathologise certain behaviours. These reflect and construct an apolitical understanding of population health. This article proposes features of a critical epidemiology that represent a morally driven re-envisioning of the focus, analysis and interpretation of epidemiological studies of sexual health.

Title: Reasons for using indoor tanning devices: A systematic review

of qualitative evidence
Journal: British Journal of Health Psychology
Volume: 28
Issue: 1
Pages: 22-46
Date: Feb
Short Title: Reasons for using indoor tanning devices: A systematic review of qualitative evidence
ISSN: 1359-107X
DOI: 10.1111/bjhp.12610
Accession Number: WOS:000822250600001
Abstract: Purpose: Despite the established causal links to skin cancer, skin ageing and eye inflammation, people continue to use indoor tanning devices (hereafter 'sunbeds'). Understanding the reasons underlying the use of sunbeds is essential for developing effective interventions. The purpose of this study was to collate all existing evidence from qualitative papers published to date that had assessed motivations for using sunbeds. Methods: Six databases were searched from inception to February 2020 for qualitative studies that explored adults' experiences of using sunbeds. Sixteen studies met the inclusion criteria, and a narrative evidence synthesis was used to collate findings from each primary study. Results: Users of sunbeds were motivated primarily by aesthetic concerns but also by perceived psychological benefits (well-being, confidence and 'fitting in') and physical benefits (improvement in skin conditions such as acne, acquiring vitamin D and preventing sunburn). People also chose indoor tanning over alternatives such as fake tans because they considered the alternatives unacceptable and did not consider indoor tanning a serious health risk. To date, no studies have explored alternatives to meeting non-aesthetic needs related to the use of sunbeds. Conclusions: This comprehensive explanation for the practice of indoor tanning provides the basis for development of complex interventions to reduce the harm caused by using sunbeds. Effective interventions should include promotion of alternatives, such as different methods of relaxing, to satisfy underlying motivations, changing social norms and correcting misperceptions about health benefits.

Short Title: Assessing the effect of interpretation design traits on

zoo visitor engagement

ISSN: 0733-3188

DOI: 10.1002/zoo.21759

Accession Number: WOS:000943725600001

Abstract: In the past few decades, zoos have undergone a transformation from places of entertainment to centers for conservation, with education becoming a particular focus. Interpretation in zoos is a near-universal method for delivering education in zoos and has been shown to prompt learning and pro-conservation behavior change. However, there is limited understanding on how interpretation design itself can influence visitor engagement. Using unobtrusive visitor observations (n = 3890), this study measures visitor engagement of multiple pieces of interpretation with various design "traits," to provide a comprehensive overview of the key traits related to increased visitor engagement. The proportion of visitors who stopped at the interpretation (attraction power), and how long they stopped for (holding power), were our two outcome variables. From our models, we found that attraction and holding power are most strongly influenced by the type of interpretation, with interactive interpretation seeing nearly four times as many visitors stop, and for more than six times longer, when compared to standard text and graphics interpretation. We also found that location was significantly related to attraction power, with visitors more likely to stop at interpretation in more immersive exhibits. Lastly, interpretation containing images of humans were related to a higher holding power. We hope our findings will be used as a guide for designing interpretation that is both attractive and interesting to zoo visitors, maximizing the conservation education value of zoo-based interpretation.

Short Title: Evaluation of the agreement, adoption, and adherence to the evidence-based guidelines for the nutritional management of adult patients with head and neck cancer among Australian dietitians

ISSN: 1446-6368

DOI: 10.1111/1747-0080.12702

Accession Number: WOS:000696150000001

Abstract: Aim Evidence-based guideline translation to practice can improve outcomes but is often impaired by poor implementation. This project aimed to evaluate the implementation of the Evidence-based guidelines for the nutritional management of adult patients with head and neck cancer among Australian dietitians providing clinical care to this population. Methods A questionnaire was developed, with face and content validity confirmed by an expert panel (n = 13), to gauge participant perceptions of the guidelines against an implementation evaluation framework. Dietitians were identified through Dietitians Australia and by contacting experts in the field. Eligibility was determined by questionnaire completion and prior guideline awareness. Responses were provided using a 5-point Likert scale. Results were analysed using descriptive statistics; with inferential analysis to determine if demographic information could reveal trends in guideline use and perception. Results Of the 43 initial respondents, n = 28 completed the questionnaire, with n = 24/28 (86%) meeting full eligibility criteria for analysis. Median (range) scores for all four domains were high: awareness (4.0 [3.2-4.8]), agreement (4.4 [4.1-4.7]), adoption (3.5 [3.1-3.9]), and adherence (4.3 [4.1-4.9]). However, perception of guideline awareness and use among multidisciplinary team colleagues was low (mean 3.2/5.0 and 3.1/5.0, respectively). Dietitians with <10 years' experience had significantly higher perceptions of the guidelines' ability to positively influence practice; support evidence-based practice; and enhance dietitian credibility (P = 0.04) vs dietitians with >= 10 years' experience. Conclusion Dietitians demonstrated high rates of guideline implementation and positive perceptions for its use in clinical practice. Future implementation strategies and evaluation should expand to engage the wider multidisciplinary team and more experienced clinicians.

Short Title: A Preoperative Spinal Education intervention for spinal fusion surgery designed using the Rehabilitation Treatment Specification System is safe and could reduce hospital length of stay, normalize expectations, and reduce anxiety A PROSPECTIVE COHORT STUDY

ISSN: 2633–1462

DOI: 10.1302/2633–1462.32.Bjo–2021–0160.R1

Accession Number: WOS:000794243400005

Abstract: Aims Psychoeducative prehabilitation to optimize surgical outcomes is relatively novel in spinal fusion surgery and, like most rehabilitation treatments, they are rarely well specified. Spinal fusion patients experience anxieties perioperatively about pain and immobility, which might prolong hospital length of stay (LOS). The aim of this prospective cohort study was to determine if a Preoperative Spinal Education (POSE) programme, specified using the Rehabilitation Treatment Specification System (RTSS) and designed to normalize expectations and reduce anxieties, was safe and reduced LOS. Methods POSE was offered to 150 prospective patients over ten months (December 2018 to November 2019) Some chose to attend (Attend-POSE) and some did not attend (DNA-POSE). A third independent retrospective group of 150 patients (mean age 57.9 years (SD 14.8), 50.6% female) received surgery prior to POSE (pre-POSE). POSE consisted of an in-person 60-minute education with accompanying literature, specified using the RTSS as psychoeducative treatment components designed to optimize cognitive/affective representations of thoughts/feelings, and normalize anxieties about surgery and its aftermath. Across-group age, sex, median LOS, perioperative complications, and readmission rates were assessed using appropriate statistical tests. Results In all, 65 (43%) patients (mean age 57.4 years (SD 18.2), 58.8% female) comprised the Attend-POSE, and 85 (57%) DNA-POSE (mean age 54.9 years (SD 15.8), 65.8% female). There were no significant between-group differences in age, sex, surgery type, complications, or readmission rates. Median LOS was statistically different across Pre-POSE (5 days ((interquartile range (IQR) 3 to 7)), Attend-POSE (3 (2 to 5)), and DNA-POSE (4 (3 to 7)), ($p = 0.014$). Pairwise comparisons showed statistically significant differences between Pre-POSE and Attend-POSE LOS ($p = 0.011$), but not between any other group comparison. In the Attend-POSE group, there was significant change toward greater surgical preparation, procedural familiarity, and less anxiety. Conclusion POSE was associated with a significant reduction in LOS for patients undergoing spinal fusion surgery. Patients reported being better prepared for, more familiar, and less anxious about their surgery. POSE did not affect complication or readmission rates, meaning its inclusion was safe. However, uptake (43%) was disappointing and future work should explore potential barriers and challenges to attending POSE.

Article Number: e069288

Accession Number: WOS:000861113500004

Abstract: OBJECTIVES To evaluate the effectiveness of an intervention, with and without a height adjustable desk, on daily sitting time, and to investigate the relative effectiveness of the two interventions, and the effectiveness of both interventions on physical behaviours and physical, biochemical, psychological, and work related health and performance outcomes. DESIGN Cluster three arm randomised controlled trial with follow-up at three and 12 months. SETTING Local government councils in Leicester, Liverpool, and Greater Manchester, UK. PARTICIPANTS 78 clusters including 756 desk based employees in defined offices, departments, or teams from two councils in Leicester, three in Greater Manchester, and one in Liverpool. INTERVENTIONS Clusters were randomised to one of three conditions: the SMART Work and Life (SWAL) intervention, the SWAL intervention with a height adjustable desk (SWAL plus desk), or control (usual practice). MAIN OUTCOMES MEASURES The primary outcome measure was daily sitting time, assessed by accelerometry, at 12 month follow-up. Secondary outcomes were accelerometer assessed sitting, prolonged sitting, standing and stepping time, and physical activity calculated over any valid day, work hours, workdays, and non-workdays, self-reported lifestyle behaviours, musculoskeletal problems, cardiometabolic health markers, work related health and performance, fatigue, and psychological measures. RESULTS Mean age of participants was 44.7 years, 72.4% (n=547) were women, and 74.9% (n=566) were white. Daily sitting time at 12 months was significantly lower in the intervention groups (SWAL-22.2 min/ day, 95% confidence interval-38.8 to-5.7 min/day, P=0.003; SWAL plus desk-63.7 min/day,-80.1 to-47.4 min/day, P(0.001) compared with the control group. The SWAL plus desk intervention was found to be more effective than SWAL at changing sitting time (-41.7 min/day,-56.3 to-27.0 min/day, P(0.001). Favourable differences in sitting and prolonged sitting time at three and 12 month follow-ups for both

intervention groups and for standing time for the SWAL plus desk group were observed during work hours and on workdays. Both intervention groups were associated with small improvements in stress, wellbeing, and vigour, and the SWAL plus desk group was associated with improvements in pain in the lower extremity, social norms for sitting and standing at work, and support. CONCLUSIONS Both SWAL and SWAL plus desk were associated with a reduction in sitting time, although the addition of a height adjustable desk was found to be threefold more effective.

Issue: 1

Date: Aug

Short Title: Barriers and enablers of weight management after breast cancer: a thematic analysis of free text survey responses using the COM-B model

DOI: 10.1186/s12889-022-13980-6

Article Number: 1587

Accession Number: WOS:000842157200004

Abstract: Background Weight gain is common after breast cancer. The aim of this study was to identify and describe the barriers to and enablers of successful weight management for women with breast cancer. Methods This was a combined inductive and deductive framework analysis of free text responses to an anonymous cross-sectional survey on weight after breast cancer. Women were recruited mainly through the Breast Cancer Network Australia Review and Survey Group. We applied deductive thematic analysis to free text responses to questions on barriers, enablers, research priorities, and one open-ended question at the end of the survey using the Capability, Opportunity, Motivation and Behaviour (COM-B) model as a framework. Subthemes that arose from the inductive analysis were mapped onto the COM-B model framework. Findings were used to identify behaviour

change intervention functions. Results One hundred thirty-three women provided free text responses. Most women were of Caucasian origin and had been diagnosed with non-metastatic breast cancer, with a mean age of 59.1 years. Women's physical capability to adopt and sustain healthy lifestyle habits was significantly affected by treatment effects and physical illness, and some lacked psychological capability to self-regulate the face of stress and other triggers. Limited time and finances, and the social impact of undergoing cancer treatment affected the ability to control their diet. Frustration and futility around weight management were prominent. However, some women were confident in their abilities to self-regulate and self-monitor lifestyle behaviours, described support from friends and health professionals as enablers, and welcomed the physical and psychological benefits of being active in the context of embracing transformation and self-care after cancer. Conclusion Women need specific advice and support from peers, friends and families and health professionals. There is a substantial gap in provision of supportive care to enable women to adopt and sustain healthy lifestyles. Environmental restructuring (including financial support), incentivization (creating an expectation of looking and feeling better), persuasion and coercion (aiming to prevent recurrence), and equipping women with specific knowledge and skills, would also facilitate optimal lifestyle behaviours and weight management.

Title: Providing lifestyle advice to women with PCOS: an overview of practical issues affecting success

Journal: BMC Endocrine Disorders

Volume: 21

Issue: 1

Date: Nov

Short Title: Providing lifestyle advice to women with PCOS: an overview of practical issues affecting success

DOI: 10.1186/s12902-021-00890-8

Article Number: 234

Accession Number: WOS:000721878600002

Abstract: Polycystic Ovary Syndrome (PCOS) is a common endocrine disorder affecting up to 13 % of women. Lifestyle interventions are first-line treatments, however attrition in women with PCOS is high. This review summarises current evidence on barriers to lifestyle management in PCOS and suggested strategies for overcoming these challenges, mapped to the Capability, Opportunity, Motivation and Behaviour model. Physical capability for lifestyle changes may be impacted by altered gut hormone regulation and energy expenditure in PCOS. This may contribute to difficulties with weight management. The higher prevalence of eating disorders, disordered eating,

fatigue and sleep disturbances are further barriers. Psychological capability may be reduced due psychological symptoms and lack of critical health literacy. Women with PCOS face similar challenges in terms of Opportunity to make lifestyle changes as other women of reproductive age. However, these are complicated by features more common in PCOS including body dissatisfaction. Motivation to adopt healthy lifestyles may be impacted by suboptimal risk perception and intrinsic motivation. To address these barriers, screening for and management of eating disorders, disordered eating, depression, and Obstructive Sleep Apnoea should be undertaken as per international evidence-based guidelines. A weight-neutral approach may be appropriate with disordered eating. Building capability among health professionals to better partner with women with PCOS on their management is essential in addressing health literacy gaps. Behavioural strategies that target risk perception and build intrinsic motivation should be utilised. More research is required to understand optimal self-management strategies, risk perception, energy homeostasis and overcoming attrition in women with PCOS.

Short Title: Comparative effect of two educational videos on self-efficacy and kinesiophobia in people with knee osteoarthritis: an online randomised controlled trial

ISSN: 1063-4584

DOI: 10.1016/j.joca.2022.05.010

Accession Number: WOS:000860940200010

Abstract: Objective: To compare change in self-efficacy for managing knee osteoarthritis (OA) pain and kinesiophobia after watching an educational video based on an empowerment and participatory discourse with a video based on a disease and impairment discourse. Design: Two-arm randomised controlled trial with participants aged ≥ 45 years with knee pain ($n = 589$). Participants completed both baseline and follow-up outcomes and watched one randomly-allocated video (12-minute duration) during one 30-45-minute session within a single online survey. The experimental video presented evidence-based knee OA information using design and

language that aimed to empower people and focus on activity participation to manage OA, while the control video presented similar information but with a disease and impairment focus. Primary outcome measures were Arthritis Self-Efficacy Scale pain subscale (range 0–10) and Brief Fear of Movement Scale for OA (range 6–24). Secondary outcomes were expectations about prognosis and physical activity benefits, perceived importance and motivation to be physically active, knee OA knowledge, hopefulness for the future, level of concern and perceived need for surgery. Results: Compared to control (n = 293), the experimental group (n = 296) showed improved self-efficacy for managing OA pain (mean difference 0.4 [95%CI 0.2, 0.6] units) and reduced kinesiophobia (1.6 [1.1, 2.0] units). The experimental group also demonstrated greater improvements in all secondary outcomes apart from hopefulness, which was high in both groups. Conclusion: An educational video based on an empowerment and participatory discourse improved pain self-efficacy and reduced kinesiophobia in people with knee OA more than a video based on a disease and impairment discourse. Article Number: e040423

Accession Number: WOS:000583298100004

Abstract: Objective Implementation strategies, such as new models of service delivery, are needed to address evidence practice gaps. This paper describes the process of developing and operationalising a new model of service delivery to implement recommended care for people with knee osteoarthritis (OA) in a primary care setting. Methods Three development stages occurred concurrently and iteratively. Each stage considered the healthcare context and was informed by stakeholder input. Stage 1 involved the design of a new model of

service delivery (PARTNER). Stage 2 developed a behavioural change intervention targeting general practitioners (GPs) using the behavioural change wheel framework. In stage 3, the 'Care Support Team' component of the service delivery model was operationalised. Results The focus of PARTNER is to provide patients with education, exercise and/or weight loss advice, and facilitate effective self-management through behavioural change support. Stage 1 model design: based on clinical practice guidelines, known evidence practice gaps in current care, chronic disease management frameworks, input from stakeholders and the opportunities and constraints afforded by the Australian primary care context, we developed the PARTNER service-delivery model. The key components are: (1) an effective GP consultation and (2) follow-up and ongoing care provided remotely (telephone/email/online resources) by a 'Care Support Team'. Stage 2 GP behavioural change intervention: a multimodal behavioural change intervention was developed comprising a self-audit/feedback activity, online professional development and desktop software to provide decision support, patient information resources and a referral mechanism to the 'Care Support Team'. Stage 3 operationalising the 'care support team'-staff recruited and trained in evidence-based knee OA management and behavioural change methodology. Conclusion The PARTNER model is the result of a comprehensive implementation strategy development process using evidence, behavioural change theory and intervention development guidelines. Technologies for scalable delivery were harnessed and new primary evidence was generated as part of the process. Notes: Egerton, Thorlene Hinman, Rana S. Hunter, David J. Bowden, Jocelyn L. Title: General practitioners' views on managing knee osteoarthritis: a thematic analysis of factors influencing clinical practice guideline implementation in primary care

Journal: BMC Rheumatology

Volume: 2

Issue: 1

Short Title: General practitioners' views on managing knee osteoarthritis: a thematic analysis of factors influencing clinical practice guideline implementation in primary care

DOI: 10.1186/s41927-018-0037-4

Article Number: 30

Accession Number: WOS:000648483200029

Abstract: BackgroundOsteoarthritis (OA) is diagnosed and managed primarily by general practitioners (GPs). OA guidelines recommend using clinical criteria, without x-ray, for diagnosis, and advising strengthening exercise, aerobic activity and, if appropriate, weight loss as first-line treatments. These recommendations are often not implemented by GPs. To facilitate GP uptake of guidelines, greater understanding of GP practice behaviour is required. This qualitative study identified key factors influencing implementation of these recommendations in the primary-care setting. **Methods**Semi-structured interviews with eleven GPs were conducted, transcribed verbatim, coded by two independent researchers and analysed with an interpretive thematic approach using the COM-B model (Capability/Opportunity/Motivation-Behaviour) as a framework. **Results**Eleven themes were identified. Psychological capability themes: knowledge gaps, confidence to effectively manage OA, and skills to facilitate lifestyle change. Physical opportunity themes: system-related factors including time limitations, and patient resources. Social opportunity theme: influences from patients. Reflective motivation themes: GP's perceived role, and assumptions about people with knee OA. Automatic motivation themes: optimism, habit, and unease discussing weight. The findings demonstrated diverse and interacting influences on GPs' practice. **Conclusion**The identified themes provide insight into potential interventions to improve OA management in primary-care settings. Key suggestions include: improvements to OA clinical guidelines; targeting GP education to focus on identified knowledge gaps, confidence, and communication skills; development and implementation of new models of service delivery; and utilising positive social influences to facilitate best-practice behaviours. Complex, multimodal interventions that address multiple factors (both barriers and facilitators) are likely to be necessary.

Article Number: 105469

Accession Number: WOS:000683545000022

Abstract: The aim of the present work was twofold: (i) to evaluate the effect of nutritional warnings and health-related packaging cues (nutrient claim and images of natural foods) on consumers' food choices, and (ii) to evaluate the influence of two types of messages (gain-framed and loss-framed) aimed at encouraging the use of such warnings and packaging cues on food choices. A total of 510 participants were recruited using an advertisement on Facebook and Instagram targeted at Uruguayan adult users. Participants were randomly allocated to one of three experimental groups: control (n = 167), loss-framed messages (n = 177) and gain-framed messages (n = 166). Then, they completed a choice-conjoint task involving packages of crackers differing in three variables: nutritional warnings (present vs. absent), nutrient claim (present vs. absent) and images of seeds and wheat (present vs. absent). Warnings were the most relevant package element driving choices, even when participants were not exposed to any type of message. Exposure to loss-framed messages led to changes in the relative importance attached to the package characteristics, whereas gain-framed messages did not. Graphic pieces conveying messages encouraging the use of nutritional warnings by stressing the negative consequences of excessive consumption of sugar, fat, and sodium increased the relative importance attached to nutritional warnings and decreased the relative importance attached to health-related cues (nutrient claims and images of seeds and wheat). These results suggest that public awareness campaigns aimed at encouraging citizens to use nutritional warnings should emphasize the negative health consequences of excessive intake of sugar, fat, and sodium.

Abstract: Objectives In a previously published Delphi exercise the European Pediatric Dialysis Working Group (EPDWG) reported widely variable counteractive responses to COVID-19 during the first week of statutory public curfews in 12 European countries with case loads of 4-680 infected patients per million. To better understand these wide variations, we assessed different factors affecting countermeasure implementation rates and applied the capability, opportunity, motivation model of behaviour to describe their determinants. Design We undertook this international mixed methods study of increased depth and breadth to obtain more complete data and to better understand the resulting complex evidence. Setting This study was conducted in 14 paediatric nephrology centres across 12 European countries during the COVID-19 pandemic. Participants The 14 participants were paediatric nephrologists and EPDWG members from 12 European centres. Main outcome measures 52 countermeasures clustered into eight response domains (access control, patient testing, personnel testing, personal protective equipment policy, patient cohorting, personnel cohorting, suspension of routine care, remote work) were categorised by implementation status, drivers (expert opinion, hospital regulations) and resource dependency. Governmental strictness and media attitude were independently assessed for each country and correlated with relevant countermeasure implementation factors. Results Implementation rates varied widely among response domains (median 49.5%, range 20%-71%) and centres (median 46%, range 31%-62%). Case loads were insufficient to explain response rate variability. Increasing case loads resulted in shifts from expert opinion-based to hospital regulation-based decisions to implement additional countermeasures despite increased resource dependency. Higher governmental strictness and positive media attitude towards countermeasure implementation were associated with higher implementation rates. Conclusions COVID-19 countermeasure implementation by paediatric tertiary care centres did not reflect case loads but rather reflected heterogeneity of local rules and of perceived resources. These data highlight the need of ongoing reassessment of current practices, facilitating rapid change in 'institutional behavior' in response to emerging evidence of countermeasure efficacy.

Short Title: A Mobile Education and Social Support Group Intervention for Improving Postpartum Health in Northern India: Development and Usability Study

DOI: 10.2196/34087

Article Number: e34087

Accession Number: WOS:000854080300066

Abstract: Background: Structural and cultural barriers limit Indian women's access to adequate postnatal care and support despite their importance for maternal and neonatal health. Targeted postnatal education and support through a mobile health intervention may improve postnatal recovery, neonatal care practices, nutritional status, knowledge and care seeking, and mental health. Objective: We sought to understand the feasibility and acceptability of our first pilot phase, a flexible 6-week postnatal mobile health intervention delivered to 3 groups of women in Punjab, India, and adapt our intervention for our next pilot phase, which will formally assess intervention feasibility, acceptability, and preliminary efficacy.

Methods: Our intervention prototype was designed to deliver culturally tailored educational programming via a provider-moderated, voice- and text-based group approach to connect new mothers with a social support group of other new mothers, increase their health-related communication with providers, and refer them to care needed. We targeted deployment using feature phones to include participants from diverse socioeconomic groups. We held moderated group calls weekly, disseminated educational audios, and created SMS text messaging groups. We varied content delivery, group discussion participation, and chat moderation. Three groups of postpartum women from Punjab were recruited for the pilot through community health workers. Sociodemographic data were collected at baseline.

Intervention feasibility and acceptability were assessed through weekly participant check-ins (N=29), weekly moderator reports, structured end-line in-depth interviews among a subgroup of participants (15/29, 52%), and back-end technology data. Results: The participants were aged 24 to 28 years and 1 to 3 months postpartum. Of the 29 participants, 17 (59%) had their own phones. Half of the participants (14/29, 48%) attended \geq 3 of the 6 calls;

the main barriers were childcare and household responsibilities and network or phone issues. Most participants were very satisfied with the intervention (16/19, 84%) and found the educational content (20/20, 100%) and group discussions (17/20, 85%) very useful. The participants used the SMS text messaging chat, particularly when facilitator-moderated. Sustaining participation and fostering group interactions was limited by technological and sociocultural challenges. Conclusions: The intervention was considered generally feasible and acceptable, and protocol adjustments were identified to improve intervention delivery and engagement. To address technological issues, we engaged a cloud-based service provider for group calls and an interactive voice response service provider for educational recordings and developed a smartphone app for the participants. We seek to overcome sociocultural challenges through new strategies for increasing group engagement, including targeting midlevel female community health care providers as moderators. Our second pilot will assess intervention feasibility, acceptability, and preliminary effectiveness at 6 months. Ultimately, we seek to support the health and well-being of postpartum women and their infants in South Asia and beyond through the development of efficient, acceptable, and effective intervention strategies.

Article Number: 55

Accession Number: WOS:000764693000002

Abstract: Background and objectives This study assessed the frequency of reporting suspected abuse by Egyptian dentists who have examined patients with manifestations of abuse and factors associated with this reporting within the framework of the Capability, Opportunity, Motivation, and Behaviour (COM-B) model. **Methods** A cross-sectional study included dentists practicing in Egypt in 2019. A questionnaire collected information about personal and professional background, and whether: participants received training to manage abuse, reported suspected abuse, were aware of the presence of hotlines for reporting and agencies supporting abuse victims, and eight items assessing attitude towards reporting suspected abuse. Principal Component Analysis (PCA) was used to assess the structure of attitude items. Logistic regression assessed the relationship between the dependent variable (reporting suspected abuse) and independent factors: receiving training (capability), attitude components (motivation), and awareness of the presence of hotlines and support agencies (opportunity). **Results** The response rate was 68.2% (821/ 1203), mean age (SD) = 29.7 (10.0) years, 43.1% had examined patients with suspected abuse last year and 4.3% reported their suspicions. PCA identified two attitude components scored out of 10: professional attitude towards reporting (mean (SD) = 6.7 (2.2)) and negative perception of workplace commitment to reporting (mean (SD) = 7.2 (2.1)). Higher odds of reporting suspected abuse were associated with better professional attitude towards reporting (AOR = 1.87, P = 0.003) and less negative perception of workplace commitment to reporting (AOR = 0.77, P = 0.04), but not with previous training (P = 0.74), awareness of the presence of victims' support agencies (P = 0.68) or a hotline (P = 0.88). **Conclusions** Only a minority of dentists reported suspected abuse. Dentists who reported their suspicions had better professional attitude towards reporting and better perception of their workplace commitment to reporting. Thus, the motivation component of the COM-B framework was significantly associated with reporting suspected abuse. The present training methods to manage abuse, and dentists' unawareness of national efforts to manage the problem do not seem to encourage reporting.

Abstract: Mood problems are common after stroke, and screening is recommended. Training may support staff knowledge and implementation of screening, but the feasibility of training programmes in the Australian healthcare system has not been formally established. This study aimed to assess the feasibility of a mood screening training for a multidisciplinary team (MDT) of stroke clinicians working in a post-acute inpatient rehabilitation service. Twelve staff from a rehabilitation service at a major hospital in Sydney, Australia participated in a 3-h interactive training session. The feasibility of running the course, assessment of knowledge gained via a consolidation exercise and quiz and acceptability of the training were assessed via focus groups. The in-person modality of the training hindered recruitment and assessment of participants' knowledge, though the actual measures themselves appeared appropriate. Nine participants provided feedback in two focus groups. Thematic analysis identified positive reactions to the training. However, low self-efficacy persisted and organisational/ socio-cultural barriers to implementation emerged. Following training, the medical officers of the MDT had successfully implemented routine screening. Overall, the training appeared acceptable and to foster knowledge in staff. However, limitations to recruitment and administering evaluations were identified. The development of flexible online training may improve future evaluations of screening training programmes/pathways.

Short Title: Researchers' perspectives on adverse event reporting in resistance training trials: a qualitative study

ISSN: 1715-5312

DOI: 10.1139/apnm-2022-00121

Accession Number: WOS:000868290500001

Abstract: The objectives of our study were to understand researchers' current practices and perspectives on adverse event (AE) reporting in clinical trials of resistance training (RT) and to identify barriers and facilitators of AE reporting. We conducted web conference or telephone-based one-on-one semistructured interviews

with 14 researchers who have published RT studies. We audio-recorded and transcribed the interviews and analyzed the data using the thematic framework method. Four themes were identified: (1) researchers lack guidance and/or motivation for rigorous AE reporting; (2) researchers who undertake AE reporting educate and value participants, use trained personnel, and implement standardized guidelines; (3) suboptimal implementation of existing AE reporting standards and the perception that available guidelines do not apply to exercise trials; and (4) acceptability and feasibility of an exercise-specific guide for AE reporting depend on its content and format. In conclusion, AE reporting methods in the field of exercise science do not align with best practice. Strategies to reduce inconsistent and suboptimal AE reporting in RT trials are urgently needed and could be based on the barriers and facilitators identified in this study.

ISSN: 1715-5312

DOI: 10.1139/apnm-2022-0117

Accession Number: WOS:000957615800001

Abstract: The objective of this study was to explore the experiences and perspectives of individuals with chronic health conditions who had an adverse event (AE) as a result of resistance training (RT). We conducted web conference or telephone-based one-on-one semi-structured interviews with 12 participants with chronic health conditions who had an AE as a result of RT. Interview data were analyzed using the thematic framework method. Six themes were identified: (1) personal experiences with aging influence perceptions of RT; (2) physical and emotional consequences of AEs limit activities and define future RT participation; (3) injury recovery defines the severity of AE; (4) health conditions influence the perceived risks and benefits of participating in RT; (5) RT setting and trained supervision influence exercise behaviors and risk perceptions; and (6) experiencing a previous AE influences future exercise behavior. Despite participant awareness of the value and benefits of RT in both the context of aging and chronic health conditions, there is concern about experiencing exercise-related

AEs. The perceived risks of RT influenced the participants' decision to engage or return to RT. Consequently, to promote RT participation, the risks, not just the benefits, should be properly reported in future studies, translated, and disseminated to the public.

Short Title: Clinical interventions, implementation interventions, and the potential greyness in between –a discussion paper

DOI: 10.1186/s12913-016-1958-5

Article Number: 16

Accession Number: WOS:000391923400001

Abstract: Background: There is increasing awareness that regardless of the proven value of clinical interventions, the use of effective strategies to implement such interventions into clinical practice is necessary to ensure that patients receive the benefits. However, there is often confusion between what is the clinical intervention and what is the implementation intervention. This may be caused by a lack of conceptual clarity between 'intervention' and 'implementation', yet at other times by ambiguity in application. We suggest that both the scientific and the clinical communities would benefit from greater clarity; therefore, in this paper, we address the concepts of intervention and implementation, primarily as in clinical interventions and implementation interventions, and explore the grey area in between. Discussion: To begin, we consider the similarities, differences and potential greyness between clinical interventions and implementation interventions through an overview of concepts. This is illustrated with reference to two examples of clinical interventions and implementation intervention studies, including the potential ambiguity in between. We then discuss strategies to explore the hybridity of clinical-implementation intervention studies, including the role of theories, frameworks, models, and reporting guidelines that can be applied to help clarify the clinical and implementation intervention, respectively.

Conclusion: Semantics provide opportunities for improved precision in depicting what is 'intervention' and what is 'implementation' in health care research. Further, attention to study design, the use of

theory, and adoption of reporting guidelines can assist in distinguishing between the clinical intervention and the implementation intervention. However, certain aspects may remain unclear in analyses of hybrid studies of clinical and implementation interventions. Recognizing this potential greyiness can inform further discourse.

Article Number: 1757913920972739

Accession Number: WOS:000677784300001

Abstract: Aim: Foodborne illnesses have a significant global burden and can be life-threatening, with higher risk in vulnerable groups such as children. SafeConsume is an EU-funded, transdisciplinary project aiming to improve consumers' food safety behaviour. Developing educational resources on food safety for use in schools has potential to improve teaching of our young consumers. The aim of this study was to explore school educators' attitudes, behaviours and knowledge towards food hygiene, safety and education. Methods: Focus groups and interviews in England, France, Portugal and Hungary explored educator knowledge, skills, intentions and beliefs around educating young people (11-18 years) about food safety. Data were analysed using NVivo and emerging themes were applied to the Theoretical Domains Framework. Results: A total of 48 educators participated. Knowledge, confidence and skills to teach food safety to young people varied depending on background and training. Educators reported they had a role to teach food safety to young people, were positive about delivering education and optimistic they

could improve students' food safety behaviour. Barriers to teaching included lack of national curriculum coverage, limited time and money, and lack of facilities. Educators reported that social influences (family, celebrity chefs, public health campaigns and social media) were important opportunities to improve young peoples' awareness of food safety and consequences of foodborne illness. Conclusion: Educator food safety expertise varied; training could help to optimise educator knowledge, confidence and skills.

Ministries of Health and Education need encouragement to get food safety incorporated further into school curricula across Europe, so schools will be motivated to prioritise these topics.

Short Title: Is sharing the TARGET respiratory tract infection leaflet feasible in routine general practice to improve patient education and appropriate antibiotic use? A mixed methods study in England with patients and healthcare professionals

ISSN: 1757-1774

DOI: 10.1177/1757177420907698

Accession Number: WOS:000775094600003

Abstract: Background: Patient education on treatment choices for common respiratory tract infections (RTIs) is important to encourage appropriate antibiotic use. Evidence shows that use of leaflets about RTIs can help reduce antibiotic prescribing. TARGET leaflets facilitate patient-clinician communication in consultations. Aim: To explore patient, healthcare professional (HCP) and general practice (GP) staff views on the current Treating Your Infection (TYI)-RTI leaflet and proposed new 'antibiotic effect' column aimed at sharing information on the limited effect antibiotics have on the duration of RTIs. Methods: Service evaluation underpinned by Com-B

behavioural framework, using patient and HCP questionnaires, and GP staff interviews/focus groups. Results: Patients completed 83 questionnaires in GP waiting rooms. A lack of patient understanding about usual illness duration influenced their use of antibiotics for some RTIs. Patients provided positive feedback about the leaflet, reporting it increased their capability to self-care, re-consult when necessary and increase understanding of illness duration. Patients indicated they would value information on the difference antibiotics can make to illness duration. In total, 43 HCP questionnaires were completed and 16 GP staff participated in interviews/focus groups. Emerging themes included: barriers and facilitators to leaflet use; modifications; and future dissemination of the leaflet. GP staff stated that the 'antibiotic effect' column should not be included in the leaflet. Conclusion: Patient education around usual illness duration, side effects of antibiotics and back-up prescriptions gives patients a greater control of their infection management. As GP staff opposed the extra information about benefits of antibiotics on illness duration, this will not be added.

Title: Barriers to adequate nutrition care for child malnutrition in a low-resource setting: Perspectives of health care providers

Journal: Frontiers in Public Health

Volume: 11

Date: Mar

Short Title: Barriers to adequate nutrition care for child malnutrition in a low-resource setting: Perspectives of health care providers

DOI: 10.3389/fpubh.2023.1064837

Article Number: 1064837

Accession Number: WOS:000967507400001

Abstract: IntroductionSeveral studies in developing countries found that more need-based training is required for health care providers (HCPs) in child malnutrition management. MethodsAn exploratory cross-sectional study was conducted to explore barriers to providing adequate nutrition care as perceived by the healthcare providers (HCPs) in the child malnutrition clinic at a Children's University Hospital in Egypt. Participants were selected using the purposive sampling technique. Five out of seven HCPs in the clinic were included (two male physicians, one female physician, and two female nurses). Qualitative data were collected through in-depth interviews. The interview guide consisted of semi-structured open-

ended questions. Quantitative data were the resulting scores from the scoring system used to assess the understandability and actionability of the patient education materials (PEMs) that are available in the clinic. The Patient Education Materials Assessment Tool for Printable Materials (PEMAT-P) for the scoring. Statistical analysis: The thematic content analysis technique was employed for qualitative data. The percent score was generated for the PEM actionability and understandability for quantitative data.

Results Most common child malnutrition conditions encountered by HCPs were nutritional deficiencies. Barriers to the delivery of adequate nutrition care to children were physician-centered: limited nutrition education in the medical school, health system-centered: an insufficient number of HCPs, lack of nutritional supplements, lack of patient education materials (PEMs) that suit the characteristics of the served community, lack of updated standard of practice (SOP) and guidelines, inadequate nutrition training of HCPs, and insufficient time for each patient, and caregivers-centered: the low socioeconomic status and false cultural, nutritional beliefs.

Conclusion There are different barriers to adequate nutrition care for child malnutrition in low-resource healthcare settings. Mainly nutritional deficiencies. Most of the barriers were health system-related in the form of insufficient resources (shortage of workforce; concerning the high caseload, nutritional supplements, and PEMs) and inadequate management of resources (lack of skill-based training, lack of updated SOP and guidelines, and lack of properly designed PEMs that facilitate communication with the target caregivers).

Pages: 533-542

Date: Oct

Short Title: 'Never change a winning team': GPs' perspectives on discontinuation of long-term antidepressants

ISSN: 0281-3432

DOI: 10.1080/02813432.2021.2006487

Accession Number: WOS:000729351600001

Abstract: Background Long-term antidepressant use, much longer than recommended by guidelines, can harm patients and generate unnecessary costs. Most antidepressants are prescribed by general practitioners (GPs) but it remains unclear why they do not

discontinue long-term use. Aim To explore GPs' views and experiences of discontinuing long-term antidepressants, barriers and facilitators of discontinuation and required support. Design and setting Qualitative study in Belgian GPs. Method 20 semi-structured face-to-face interviews with GPs. Interviews were analysed thematically. Results The first theme, 'Success stories' describes three strong motivators to discontinue antidepressants: patient health issues, patient requests and a new positive life event. Second, not all GPs consider long-term antidepressant use a 'problem' as they perceive antidepressants as effective and safe. GPs' main concern is the risk of relapse. Third, GPs foresee that discontinuation of antidepressants is not an easy and straightforward process. GPs weigh up whether they have the necessary skills and whether it is worth the effort to start this process. Conclusion Discontinuation of long-term antidepressants is a difficult and uncertain process for GPs, especially in the absence of a facilitating life-event or patient demand. The absence of a compelling need for discontinuation and fear of relapse of symptoms in a stable patient are important barriers for GPs when considering discontinuation. In order to increase GPs' motivation to discontinue long-term antidepressants, more emphasis on the futility of the actual effect and on potential harms related to long-term use is needed.

Short Title: Interventions to Improve Safer Sleep Practices in Families With Children Considered to Be at Increased Risk for Sudden Unexpected Death in Infancy: A Systematic Review

ISSN: 2296-2360

DOI: 10.3389/fped.2021.778186

Article Number: 778186

Accession Number: WOS:000880138200001

Abstract: Background: Advice to families to follow infant care practices known to reduce the risks of Sudden Unexpected Death in Infancy (SUDI) has led to a reduction in deaths across the world. This reduction has slowed in the last decade with most deaths now occurring in families experiencing social and economic deprivation. A systematic review of the literature was commissioned by the

National Child Safeguarding Practice Review Panel in England. The review covered three areas: interventions to improve engagement with support services, parental decision-making for the infant sleep environment, and interventions to improve safer sleep practices in families with infants considered to be at risk of SUDI. Aim: To describe the safer sleep interventions tested with families with infants at risk of SUDI and investigate what this literature can tell us about what works to reduce risk and embed safer sleep practices in this group. Methods: Eight online databases were systematically searched in December 2019. Intervention studies that targeted families with infants (0-1 year) at increased risk of SUDI were included. Studies were limited to those from Western Europe, North America or Australasia, published in the last 15 years. The Quality Assessment Tool for Studies with Diverse Designs was applied to assess quality. Data from included studies were extracted for narrative synthesis, including mode of delivery using Michie et al.'s Mode of Delivery Taxonomy. Results: The wider review returned 3,367 papers, with 23 intervention papers. Five types of intervention were identified: (1) infant sleep space and safer sleep education programs, (2) intensive or targeted home visiting services, (3) peer educators/ambassadors, (4) health education/raising awareness interventions, (5) targeted health education messages using digital media. Conclusion: Influencing behavior in families with infants at risk of SUDI has traditionally focused on "getting messages across," with interventions predominantly using education and awareness raising mechanisms. This review found evidence of interventions moving from "information giving" to "information exchange" models using personalized, longer term relationship-building models. This shift may represent an improvement in how safer sleep advice is implemented in families with infants at risk, but more robust evidence of effectiveness is required.

Short Title: Geographic differences in community oncology provider and practice location characteristics in the central United States

ISSN: 0890-765X

DOI: 10.1111/jrh.12663

Accession Number: WOS:000778420100001

Abstract: Purpose How care delivery influences urban-rural disparities in cancer outcomes is unclear. We sought to understand community oncologists' practice settings to inform cancer care delivery interventions. Methods We conducted secondary analysis of a national dataset of providers billing Medicare from June 1, 2019 to May 31, 2020 in 13 states in the central United States. We used Kruskal-Wallis rank and Fisher's exact tests to compare physician characteristics and practice settings among rural and urban community oncologists. Findings We identified 1,963 oncologists practicing in 1,492 community locations; 67.5% practiced in exclusively urban locations, 11.3% in exclusively rural locations, and 21.1% in both rural and urban locations. Rural-only, urban-only, and urban-rural spanning oncologists practice in an average of 1.6, 2.4, and 5.1 different locations, respectively. A higher proportion of rural community sites were solo practices (11.7% vs 4.0%, $P<.001$) or single specialty practices (16.4% vs 9.4%, $P<.001$); and had less diversity in training environments (86.5% vs 67.8% with <2 medical schools represented, $P<.001$) than urban community sites. Rural multispecialty group sites were less likely to include other cancer specialists. Conclusions We identified 2 potentially distinct styles of care delivery in rural communities, which may require distinct interventions: (1) innovation-isolated rural oncologists, who are more likely to be solo providers, provide care at few locations, and practice with doctors with similar training experiences; and (2) urban-rural spanning oncologists who provide care at a high number of locations and have potential to spread innovation, but may face high complexity and limited opportunity for care standardization.

Short Title: The Importance of Nutrition as a Lifestyle Factor in Chronic Pain Management: A Narrative Review

DOI: 10.3390/jcm11195950

Article Number: 5950

Accession Number: WOS:000866829800001

Abstract: In everyday clinical practice, healthcare professionals often meet chronic pain patients with a poor nutritional status. A poor nutritional status such as malnutrition, unhealthy dietary behaviors, and a suboptimal dietary intake can play a significant role in the occurrence, development, and prognosis of chronic pain. The relationship between nutrition and chronic pain is complex and may involve many underlying mechanisms such as oxidative stress, inflammation, and glucose metabolism. As such, pain management requires a comprehensive and interdisciplinary approach that includes nutrition. Nutrition is the top modifiable lifestyle factor for chronic non-communicable diseases including chronic pain. Optimizing one's dietary intake and behavior needs to be considered in pain management. Thus, this narrative review reports and summarizes the existing evidence regarding (1) the nutrition-related health of people experiencing pain (2) the underlying potential mechanisms that explain the interaction between nutrition and chronic pain, and (3) the role of nutrition screening, assessment and evaluation for people experiencing pain and the scope of nutrition practice in pain management. Future directions in the nutrition and chronic pain field are also discussed.

DOI: 10.1016/j.sapharm.2016.06.002

Accession Number: WOS:000400229800003

Abstract: Background: There is evidence that the transfer of information on medication changes on patient discharge summaries is poor. By considering the completion of an electronic discharge summary as a behavior, the various components of the behavior can be targeted to improve their completion so that they consistently include information on medication changes. Objectives: Study objectives were to identify the barriers and facilitators to junior doctors completing information on medication changes on electronic discharge summaries, including why these occurred. Methods: In this qualitative study, 12 semi-structured interviews were conducted with junior doctors. An interview topic guide based around the COM-B model (Capability, Opportunity, Motivation, Behavior) within the Behavior Change Wheel (BCW) was used. Transcripts of the interviews were analyzed using framework analysis to identify key categories emerging from the data. Barriers and facilitators to completing information on medication changes on discharge summaries were identified. These were then mapped to behavioral components within the COM-B model to help design tailored interventions to affect change. Results: Nine categories were identified that encompassed the identified barriers and facilitators. The identified barriers and facilitators influenced all aspects of the COM-B model. Conclusions: Use of the BCW as a theoretical lens for this study enabled interventions to be identified that targeted specific components of behavior. It is the implementation of all these interventions that may be required to influence behavior change and ensure all electronic discharge summaries contain information on medication changes. All intervention functions were relevant but key functions were education, enablement and persuasion. Other institutions can use the BCW and the COM-B model to develop their own tailored interventions to achieve these functions. (C) 2016 Elsevier Inc. All rights reserved.

Accession Number: WOS:000353919600001

Abstract: Background and purpose: A biopsychosocial approach and behaviour change strategies have long been proposed to serve as a basis for addressing current multifaceted health problems. This emphasis has implications for clinical reasoning of health professionals. This study's aim was to develop and validate a conceptual model to guide physiotherapists' clinical reasoning focused on clients' behaviour change. Methods: Phase 1 consisted of the exploration of existing research and the research team's experiences and knowledge. Phases 2a and 2b consisted of validation and refinement of the model based on input from physiotherapy students in two focus groups (n = 5 per group) and from experts in behavioural medicine (n = 9). Results: Phase 1 generated theoretical and evidence bases for the first version of a model. Phases 2a and 2b established the validity and value of the model. The final model described clinical reasoning focused on clients' behaviour change as a cognitive, reflective, collaborative and iterative process with multiple interrelated levels that included input from the client and physiotherapist, a functional behavioural analysis of the activity-related target behaviour and the selection of strategies for behaviour change. Conclusions: This unique model, theory- and evidence-informed, has been developed to help physiotherapists to apply clinical reasoning systematically in the process of behaviour change with their clients.

Short Title: Changes in Physical Activity and Sedentary Behavior before and during the COVID-19 Pandemic: A Swedish Population Study

DOI: 10.3390/ijerph19052558

Article Number: 2558

Accession Number: WOS:000768816800001

Abstract: Governments have enforced measures to limit the spread of COVID-19 with varying degrees of success, which could affect people's physical activity (PA) and sedentary behavior. This study aimed to examine changes in PA levels, types of PA, and sedentary behavior in the Swedish population before and during the COVID-19 pandemic. Associations between changed PA levels and demographical and behavioral determinants were also investigated. In December 2020, 1035 individuals (18-79 years old) completed a survey about their PA and sedentary behavior before and during the pandemic. Factors influencing their PA were also explored. Fifty-one percent of the sample reported reduced total PA, 18% had no change, and 31% increased their PA. Overall, organized PA decreased the most and sedentary behavior increased. The youngest and oldest age groups reported the greatest reduction in PA, while middle-aged groups reported the most increased PA. Men reported a larger increase in sedentary behavior than women. Mental and physical capability was associated with change in PA. In conclusion, this study indicates that, during the COVID-19 pandemic, the majority of the Swedish population have decreased PA levels with a concurrent increase in sedentary behavior, which may have negative health consequences. Interventions are recommended to address both PA and sedentary behavior, specifically to strengthen people's ability to perform PA and focusing on the youngest and oldest age groups.

Title: Development and Content Validation of a Questionnaire for Measuring Beliefs About Using Nicotine Replacement Therapy for Smoking Cessation in Pregnancy

Journal: Nicotine & Tobacco Research

Date: 2023 Mar

Short Title: Development and Content Validation of a Questionnaire for Measuring Beliefs About Using Nicotine Replacement Therapy for Smoking Cessation in Pregnancy

ISSN: 1462-2203

DOI: 10.1093/ntr/ntad030

Accession Number: WOS:000952655100001

Abstract: Introduction Improving adherence to nicotine replacement therapy (NRT) in pregnancy may result in higher smoking cessation rates. Informed by the Necessities and Concerns Framework, we developed an intervention targeting pregnancy NRT adherence. To evaluate this, we derived the NRT in pregnancy necessities and concerns questionnaire (NiP-NCQ), which measures perceived need for NRT and concerns about potential consequences. Aims and Methods Here we describe the development and content validation of NiP-NCQ. From qualitative work, we identified potentially modifiable determinants of pregnancy NRT adherence and classed these as necessity beliefs or concerns. We translated these into draft self-report items and piloted items on 39 pregnant women offered NRT and a prototype NRT adherence intervention, assessing distributions and sensitivity to change. After removing poorly performing items, smoking cessation experts (N = 16) completed an online discriminant content validation (DCV) task to determine whether retained items measure a necessity belief, concern, both, or neither construct. Results Draft NRT concern items encompassed safety for the baby, side effects, too much or insufficient nicotine, and addictiveness. Draft necessity belief items included perceived need for NRT for short- and longer-term abstinence, and desire to minimize or cope without NRT. Of 22 out of 29 items retained after piloting, four were removed following the DCV task: three were judged to measure neither construct and one possibly both. The final NiP-NCQ comprised nine items per construct (18 total). Conclusions The NiP-NCQ measures potentially modifiable determinants of pregnancy NRT adherence within two distinct constructs and may have research and clinical utility for evaluating interventions targeting these. Implications Poor adherence to NRT in pregnancy may result from low perceived need and concerns about consequences; interventions challenging these beliefs may yield higher smoking cessation rates. To evaluate an NRT adherence intervention informed by the Necessities and Concerns Framework, we developed the NiP-NCQ. Through the content development and refinement processes described in this paper, we derived an evidence-based, 18-item questionnaire measuring two distinct constructs within two nine-item subscales. Higher concerns and lower necessity beliefs indicate more negative NRT beliefs; NiP-NCQ may have research and clinical utility for interventions targeting these.

Short Title: On Technology and the Prospects for Good Practice in the Human Services: Donald Schon, Martin Heidegger, and the Case for Phronesis and Praxis

ISSN: 0037-7961

DOI: 10.1086/692117

Accession Number: WOS:000402302900006

Abstract: Technology is fundamental to and embedded in the way practice is conceptualized and institutionalized in social service work. Many scholars assume and expect that good practices of care are achieved with the correct application of theory produced by rigorous scientific research. However, there are significant critiques of this viewpoint. We examine the work of Donald Schon and Martin Heidegger and agree with these authors' suggestions that technical rationality and modern technology are not the way to achieve good practice in the human services. At the same time, we are not convinced that the alternatives offered by Schon (artistry) and Heidegger (techne) provide what good practice requires. We draw on Aristotle's account of the intellectual virtues and make the case for phronesis and praxis as other possibilities for inspiring new kinds of social welfare practice in the twenty-first century.

Title: Secondary Prevention of Stroke: Study Protocol for a Telehealth-Delivered Physical Activity and Diet Pilot Randomized Trial (ENABLE-Pilot)

Journal: Cerebrovascular Diseases

Volume: 50

Issue: 5

Pages: 605-611

Date: Sep

Short Title: Secondary Prevention of Stroke: Study Protocol for a Telehealth-Delivered Physical Activity and Diet Pilot Randomized Trial (ENABLE-Pilot)

ISSN: 1015-9770

DOI: 10.1159/000515689

Accession Number: WOS:000645267500001

Abstract: Background: Increasing physical activity (PA) and improving diet quality are opportunities to improve secondary stroke prevention, but access to appropriate services is limited.

Interventions co-designed with stroke survivors and delivered by telehealth are a potential solution. Aim: The aim of this study is to test the feasibility, safety, and potential efficacy of a 6-month, telehealth-delivered PA and/or dietary (DIET) intervention.

Methods: Pilot randomized trial. 80 adults with previous stroke who are living at home with Internet access and able to exercise will be randomized in a 2 x 2 factorial (4-arm) pilot randomized, open-label, blinded outcome assessment trial to receive PA, DIET, PA + DIET, or control interventions via telehealth. The PA intervention aims to support participants to meet the minimum recommended levels of PA (150 min/week moderate exercise), and the DIET intervention aims to support participants to follow the AusMed (Mediterranean-style) diet. The control group receives usual care plus education about PA and healthy eating. The co-primary outcomes are feasibility (proportion and characteristics of eligible participants enrolled and proportion of scheduled intervention sessions attended) and safety (adverse events) at 6 months. The secondary outcomes include recurrent stroke risk factors (blood pressure, physical activity levels, and diet quality), fatigue, mood, and quality of life.

Outcomes are measured at 3, 6, and 12 months. Conclusion: This trial will produce evidence for the feasibility, safety, and potential effect of telehealth-delivered PA and DIET interventions for people with stroke. Results will inform development of an appropriately powered trial to test effectiveness to reduce major risk factors for recurrent stroke.

Short Title: Designing a theory-informed, contextually appropriate intervention strategy to improve delivery of paediatric services in Kenyan hospitals

ISSN: 1748-5908

DOI: 10.1186/1748-5908-8-39

Article Number: 39

Accession Number: WOS:000318419200001

Abstract: Background: District hospital services in Kenya and many low-income countries should deliver proven, effective interventions that could substantially reduce child and newborn mortality. However such services are often of poor quality. Researchers have therefore been challenged to identify intervention strategies that go beyond addressing knowledge, skill, or resource inadequacies to support health systems to deliver better services at scale. An effort to develop a system-oriented intervention tailored to local needs and context and drawing on theory is described. Methods: An intervention was designed to improve district hospital services for children based on four main strategies: a reflective process to distill root causes for the observed problems with service delivery; developing a set of possible intervention approaches to address these problems; a search of literature for theory that provided the most appropriate basis for intervention design; and repeatedly moving backwards and forwards between identified causes, proposed interventions, identified theory, and knowledge of the existing context to develop an overarching intervention that seemed feasible and likely to be acceptable and potentially sustainable. Results and discussion: In addition to human and resource constraints key problems included failures of relevant professionals to take responsibility for or ownership of the challenge of pediatric service delivery; inadequately prepared, poorly supported leaders of service units (mid-level managers) who are often professionally and geographically isolated and an almost complete lack of useful information for routinely monitoring or understanding service delivery practice or outcomes. A system-oriented intervention recognizing the pivotal role of leaders of service units but addressing the outer and inner setting of hospitals was designed to help shape and support an appropriate role for these professionals. It aims to foster a sense of ownership while providing the necessary understanding, knowledge, and skills for mid-level managers to work effectively with senior managers and frontline staff to improve services. The intervention

will include development of an information system, feedback mechanisms, and discussion fora that promote positive change. The vehicle for such an intervention is a collaborative network partnering government and national professional associations. This case is presented to promote discussion on approaches to developing context appropriate interventions particularly in international health.

Article Number: 4

Accession Number: WOS:000395915700002

Abstract: Background: The creation of a clinical network was proposed as a means to promote implementation of a set of recommended clinical practices targeting inpatient paediatric care in Kenya. The rationale for selecting a network as a strategy has been previously described. Here, we aim to describe network activities actually conducted over its first 2.5 years, deconstruct its implementation into specific components and provide our 'insider' interpretation of how the network is functioning as an intervention. Methods: We articulate key activities that together have constituted network processes over 2.5 years and then utilise a recently published typology of implementation components to give greater granularity to this description from the perspective of those delivering the intervention. Using the Behaviour Change Wheel we then suggest how the network may operate to achieve change and offer examples of change before making an effort to synthesise our understanding in the form of a realist context-mechanism-outcome configuration. Results: We suggest our network is likely to comprise 22 from a total of 73 identifiable intervention components, of which 12 and 10 we consider major and minor components, respectively. At the policy level, we employed clinical guidelines, marketing and communication strategies with intervention characteristics operating through incentivisation, persuasion, education, enablement, modelling and environmental restructuring. These might influence behaviours by enhancing psychological capability, creating social

opportunity and increasing motivation largely through a reflective pathway. Conclusions: We previously proposed a clinical network as a solution to challenges implementing recommended practices in Kenyan hospitals based on our understanding of theory and context. Here, we report how we have enacted what was proposed and use a recent typology to deconstruct the intervention into its elements and articulate how we think the network may produce change. We offer a more generalised statement of our theory of change in a context-mechanism-outcome configuration. We hope this will complement a planned independent evaluation of 'how things work', will help others interpret results of change reported more formally in the future and encourage others to consider further examination of networks as means to scale up improvement practices in health in lower income countries.

Abstract: Objective In global health considerable attention is focused on the search for innovations; however, reports tracking their adoption in routine hospital settings from low-income countries are absent. Design and setting We used data collected on a consistent panel of indicators during four separate cross-sectional, hospital surveys in Kenya to track changes over a period of 11 years (2002-2012). Main outcome measures Basic resource availability, use of diagnostics and uptake of recommended practices. Results There appeared little change in availability of a panel of 28 basic resources (median 71% in 2002 to 82% in 2012) although availability of specific feeds for severe malnutrition and vitamin K improved. Use of blood glucose and HIV testing increased but remained inappropriately low throughout. Commonly (malaria) and uncommonly (lumbar puncture) performed diagnostic tests frequently failed to inform practice while pulse oximetry, a simple and cheap technology, was rarely available even in 2012. However, increasing adherence to

prescribing guidance occurred during a period from 2006 to 2012 in which efforts were made to disseminate guidelines. Conclusions Findings suggest changes in clinical practices possibly linked to dissemination of guidelines at reasonable scale. However, full availability of basic resources was not attained and major gaps likely exist between the potential and actual impacts of simple diagnostics and technologies representing problems with availability, adoption and successful utilisation. These findings are relevant to debates on scaling up in low-income settings and to those developing novel therapeutic or diagnostic interventions.

Accession Number: WOS:000842972200001

Abstract: Attention has turned to improving the quality and safety of healthcare within health facilities to reduce avoidable mortality and morbidity. Interventions should be tested in health system environments that can support their adoption if successful. To be successful, interventions often require changes in multiple behaviours making their consequences unpredictable. Here, we focus on this challenge of change at the mesolevel or microlevel. Drawing on multiple insights from theory and our own empirical work, we highlight the importance of engaging managers, senior and frontline staff and potentially patients to explore foundational questions examining three core resource areas. These span the physical or material resources available, workforce capacity and capability and team and organisational relationships. Deficits in all these resource areas may need to be addressed to achieve success. We also argue that as inertia is built into the complex social and human

systems characterising healthcare facilities that thought on how to mobilise five motive forces is needed to help achieve change. These span goal alignment and ownership, leadership for change, empowering key actors, promoting responsive planning and procurement and learning for transformation. Our aim is to bridge the theory-practice gap and offer an entry point for practical discussions to elicit the critical tacit and contextual knowledge needed to design interventions. We hope that this may improve the chances that interventions are successful and so contribute to better facility-based care and outcomes while contributing to the development of learning health systems.

Short Title: Dog Owners' Ideas and Strategies Regarding Dental Health in Their Dogs-Thematic Analysis of Free Text Survey Responses

DOI: 10.3389/fvets.2022.878162

Article Number: 878162

Accession Number: WOS:000798836500001

Abstract: Periodontal disease is the most common disease in dogs over 3 years of age. In dogs, as in humans, daily tooth brushing, as a means of active dental home care, is considered the gold standard for prophylaxis and prevention of periodontal disease progression. However, the performance of adequate tooth brushing is insufficient in dogs. There is no full account as to why dog owners fail to comply with this routine, but in order to facilitate better practice, a further understanding of dog owner's perspectives is needed. The aim of this study was to investigate dog owners' ideas and strategies regarding their dogs' dental health. In a large-scale Swedish survey regarding dental health in dogs, dog owners' free text comments (n = 8,742) from a concluding open-ended query were analyzed using qualitative methods. Many different notions concerning dental health in dogs were identified, of which perceived importance of different diets and chewing being the most prominent. Five common themes represented dog owners' ideas and strategies regarding dental health in their dogs: what is considered to cause dental problems; what is deemed not to promote dental health; how to prevent dental problems; what impedes proper dental care, and; needs for increased knowledge and support. Contrary to existing research and knowledge in the field, the respondents commonly trusted that

diet procure good dental health in the dog, as does chewing on bones. Seemingly, a range of misconceptions flourish among dog owners, indicating a need to share information and experiences, as well as support to bridge barriers to tooth brushing and other aspects that can enhance dog owners' knowledge and practice. In addition, this study highlights the need for randomized controlled trials on effects of diets and supplements on different aspects of dental health; calculus, periodontal disease, and dental fractures, including dogs of different breeds, sizes and ages. Further research is also needed with respect to which strategies that best aid dog owners, by whom the support is best provided, when, and at what time point.

Abstract: Objective: To assess and share learnings on the motivators and behavioural adherence across sex and age to evolving strategies in public policy to prevent the spread of SARS-CoV-2 at the end of a first COVID-19 wave and the beginning of a second COVID-19 wave in Australia. Design and Setting: A national longitudinal survey using a framework based on evidence-based behaviour change models. The survey was administered to a national sample representative across sex, age and location was undertaken at two time points: May 1st to 5th, 2020, and July 1st to 7th, 2020. Results: Overall 2,056 surveys were completed across the first and second rounds, with 63% (1,296/2,056) completing both. Age range was 18-99 years (median 53, IQR: 34-64). Suboptimal physical distancing and self-quarantining if unwell/diagnosed was reported in one in four respondents and not getting a test at onset of symptoms reported in one in three. Those non-adherent to all three behaviours (19%, 60/323), were mainly male, younger, lived in major cities and reported fewer concerns or motivators to change behaviour. Overall, government lockdown measures were considered very important by 81% (835/1,032) and appropriate by 75% (772/1,029). Conclusions: Prior to the

suppression of a second COVID-19 wave, a significant minority of Australians reported suboptimal behavioural adherence to vital policy strategies to limit SARS-CoV-2 spread, mostly young adults and men. Successful wave 2 suppression required consistent communication from political and health leaders and supportive public health and economic strategies. Additional lockdown and punitive strategies were needed in Victoria and were generally well-supported and adhered to. To limit subsequent lockdown, this work reinforces the need for a mix of communication around saving lives of the vulnerable, and other strategies targeting high risk groups, facilitation of easy testing and minimisation of financial impacts. Accession Number: WOS:000806722600009

Abstract: Objectives: Physical distancing, defined as keeping 1-2m apart when co-located, can prevent cases of droplet or aerosol transmitted infectious diseases such as SARS-CoV2. During the COVID-19 pandemic, distancing was a recommendation or a requirement in many countries. This systematic review aimed to determine which interventions and behavior change techniques (BCTs) are effective in promoting adherence to distancing and through which potential mechanisms of action (MOAs). Methods: Six databases were searched. The review included studies that were (a) conducted on humans, (b) reported physical distancing interventions, (c) included any comparator (e.g., pre-intervention versus post intervention;

randomized controlled trial), and (d) reported actual distancing or predictors of distancing behavior. Risk of bias was assessed using the Mixed Methods Appraisal Tool. BCTs and potential MoAs were identified in each intervention. Results: Six articles (with seven studies and 19 comparisons) indicated that distancing interventions could successfully change MoAs and behavior. Successful BCTs (MoAs) included feedback on behavior (e.g., motivation); information about health consequences, salience of health consequences (e.g., beliefs about consequences), demonstration (e.g., beliefs about capabilities), and restructuring the physical environment (e.g., environmental context and resources). The most promising interventions were proximity buzzers, directional systems, and posters with loss framed messages that demonstrated the behaviors. Conclusions: The evidence indicates several BCTs and potential MoAs that should be targeted in interventions and highlights gaps that should be the focus of future research.

Abstract: Rates of obesity and related non-communicable diseases are on the rise in sub-Saharan Africa, associated with sub-optimal diet and physical inactivity. Implementing evidence-based interventions targeting determinants of unhealthy eating and physical inactivity in children and adolescents' immediate environments is critical to the fight against obesity and related non-communicable diseases. Setting priorities requires a wide range of stakeholders, methods, and context-specific data. This paper reports on a novel participatory study design to identify and address contextual drivers of unhealthy eating and physical inactivity of children and adolescents in school and in their home neighborhood food and built environments. We developed a three-phase mixed-method study in Cameroon (Yaounde) and South Africa (Johannesburg and Cape Town) from 2020-2021. Phase one focused on identifying contextual drivers of unhealthy eating and physical inactivity in children and adolescents in each setting using secondary analysis of qualitative data. Phase two matched identified drivers to evidence-based interventions. In phase three, we worked with stakeholders using the Delphi technique to prioritize interventions based on perceived importance and feasibility. This study design provides a rigorous method to identify and prioritize interventions that are tailored to local contexts, incorporating expertise of diverse local stakeholders.

Abstract: Introduction: The description of the contents and underlying theoretical principles of a behaviour change intervention is a fundamental step to allow the reproduction of success factors of effective interventions. The objective of this article is to describe the scientifically-based construction of a multimodal media campaign implemented by the National institute for prevention and health education to promote physical activity and more particularly walking among physically inactive women. Methods: The first five stages of this intervention are described. They include definition of the objectives, identification of target populations, the behaviour change theories used, identification of the effective behaviour change techniques and the modes of delivery of the campaign. Results: The main objective of the media campaign is to encourage inactive women to walk by means of a mass media campaign and a mobile application. It also targets the general population by the development of a specific section about physical activity on the mangerbougerfr website. It is based on the COM-B system- a framework for understanding behaviour, on the theory of planned behaviour and on effective behaviour change techniques. Conclusion: This paper demonstrates the feasibility of developing a multimodal media campaign-based intervention to promote physical activity using theory, evidence and media campaign construction expertise. An evaluation of this media campaign and its various components is the next stage of this work.

Accession Number: WOS:000912132500001

Abstract: Objective To explore how personal characteristics and social engagement impact the physical activity levels of chronic stroke survivors. Design A mixed-methods study comprising in-depth semi-structured interviews and objective 24-h physical activity monitoring. Interviews were thematically analysed, and activity diaries were compared to activity monitor data to attain a complete picture of physical activity. Triangulation explored the relationship between perceptions, beliefs, activity levels and social engagement. Setting Community. Participants Community-dwelling, independently mobile, adult stroke survivors (n = 19). The mean age was 74 (11 SD) years, 52% female, mean time post-stroke 41 (SD 61) months. Main measures Qualitative and quantitative measures including individual semi-structured interviews, accelerometry, activity diaries, self-efficacy, Frenchay Activities Index and Barthel Index. Results Individual identity had the greatest perceived influence on post-stroke physical activity. Pre-stroke identity, meaningful activities and family culture contributed to identity; while social and community activities, self-efficacy, comorbidities, stroke symptoms and exercise, also impacted physical activity. Participants averaged 5365 (IQR 3378–7854) steps per day and reported a mean self-efficacy for exercise score of 51 (SD 20). Triangulation showed convergent relationships between post-stroke physical activity levels and participant motivation, comorbidities, level of social and community participation, self-efficacy and pre-stroke activity levels. Conclusion Personal identity, social engagement and community participation are important factors to consider when implementing a person-centred approach to increasing physical activity participation post-stroke.

Abstract: Introduction: As part of the third European Commission's Joint Action on Cancer (Innovative Partnership for Action Against Cancer, iPAAC), the International Agency for Research on Cancer (IARC) was commissioned to produce a report on recommendations to sustain and monitor future updates of the European Code Against Cancer (ECAC). Materials and methods: A co-creational consultation process, including a virtual workshop, was carried out. More than 100 experts in cancer prevention, public health, communication and representatives of European authorities provided input on the scope of future editions of the ECAC, including updating the scientific evidence and its maintenance, and on strategies for its implementation and dissemination across Europe. Results and discussion: Overwhelming support for the need of the ECAC and its continuous updating, optimization and wider dissemination was expressed by all the stakeholders. Eight recommendations and four research needs summarise the assessment and pave the way for the future of the ECAC.

ISSN: 1368-5031

DOI: 10.1111/ijcp.12335

Accession Number: WOS:000326935300002

Abstract: Antibiotic resistance has become a critical health issue on a global scale, with much of the problem resulting from inappropriate use of antibiotics in primary care. To change this practice, the global respiratory infection partnership has formulated a pentagonal (five P) framework for the non-antibiotic management of upper respiratory tract infections (URTIs) – one of the most common conditions in primary care for which antibiotics are

prescribed. The framework presents the rationale for focusing on URTIs to promote antibiotic stewardship in primary care and elaborates on five key areas to focus on to bring about change: policy, prevention, prescribers, pharmacy and patients. The ultimate aim is to adopt a patient-centred symptomatic management strategy using a flexible framework that can be adapted across countries to create a consistent global approach to change behaviour.

Abstract: Background By 2050, worldwide dementia prevalence is expected to triple. Affordable, scalable interventions are required to support protective behaviours such as physical activity, cognitive training and healthy eating. This paper outlines the theory-, evidence- and person-based development of 'Active Brains': a multi-domain digital behaviour change intervention to reduce cognitive decline amongst older adults. Methods During the initial planning phase, scoping reviews, consultation with PPI contributors and expert co-investigators and behavioural analysis collated and recorded evidence that was triangulated to inform provisional 'guiding principles' and an intervention logic model. The following optimisation phase involved qualitative think aloud and semi-structured interviews with 52 older adults with higher and lower cognitive performance scores. Data were analysed thematically and informed changes and additions to guiding principles, the behavioural analysis and the logic model which, in turn, informed changes to intervention content. Results Scoping reviews and

qualitative interviews suggested that the same intervention content may be suitable for individuals with higher and lower cognitive performance. Qualitative findings revealed that maintaining independence and enjoyment motivated engagement in intervention-targeted behaviours, whereas managing ill health was a potential barrier. Social support for engaging in such activities could provide motivation, but was not desirable for all. These findings informed development of intervention content and functionality that appeared highly acceptable amongst a sample of target users. Conclusions A digitally delivered intervention with minimal support appears acceptable and potentially engaging to older adults with higher and lower levels of cognitive performance. As well as informing our own intervention development, insights obtained through this process may be useful for others working with, and developing interventions for, older adults and/or those with cognitive impairment.

Volume: 7

Issue: 10

Pages: E853-E865

Date: Oct

Short Title: Accelerated partner therapy contact tracing for people with chlamydia (LUSTRUM): a crossover cluster-randomised controlled trial

ISSN: 2468-2667

Accession Number: WOS:000890281300013

Abstract: Background Accelerated partner therapy has shown promise in improving contact tracing. We aimed to evaluate the effectiveness of accelerated partner therapy in addition to usual contact tracing compared with usual practice alone in heterosexual people with chlamydia, using a biological primary outcome measure. Methods We did a crossover cluster-randomised controlled trial in 17 sexual health clinics (clusters) across England and Scotland. Participants were heterosexual people aged 16 years or older with a positive *Chlamydia trachomatis* test result, or a clinical diagnosis of conditions for which presumptive chlamydia treatment and contact tracing are initially provided, and their sexual partners. We allocated phase order for clinics through random permutation within strata. In the control phase, participants received usual care (health-care professional advised the index patient to tell their sexual partner[s] to attend clinic for sexually transmitted infection screening and treatment). In the intervention phase, participants received usual care plus an offer of accelerated partner therapy (health-care professional assessed sexual partner[s] by telephone, then sent or gave the index patient antibiotics and sexually transmitted infection selfsampling kits for their sexual partner[s]). Each phase lasted 6 months, with a 2-week washout at crossover. The primary outcome was the proportion of index patients with a positive *C trachomatis* test result at 12–24 weeks after contact tracing consultation. Secondary outcomes included proportions and types of sexual partners treated. Analysis was done by intention-to-treat, fitting random effects logistic regression models. This trial is registered with the ISRCTN registry, 15996256. Findings Between Oct 24, 2018, and Nov 17, 2019, 1536 patients were enrolled in the intervention phase and 1724 were enrolled in the control phase. All clinics completed both phases. In total, 4807 sexual partners were reported, of whom 1636 (34%) were steady established partners. Overall, 293 (19%) of 1536 index patients chose accelerated partner therapy for a total of 305 partners, of whom 248 (81%) accepted. 666 (43%) of 1536 index patients in the intervention phase and 800 (46%) of 1724 in the control phase were tested for *C trachomatis* at 12–24 weeks after contact tracing consultation; 31 (4.7%) in the intervention phase and 53 (6.6%) in the control phase had a positive *C trachomatis* test result (adjusted odds ratio [OR] 0.66 [95% CI 0.41 to 1.04]; $p=0.071$; marginal absolute difference -2.2% [95% CI -4.7 to 0-3]). Among index patients with treatment status recorded, 775 (88.0%) of 881 patients in the intervention phase and 760 (84.6%) of 898 in the control phase had at least one treated sexual partner at 2–4 weeks after contact tracing consultation (adjusted OR 1.27 [95% CI 0.96 to 1.68]; $p=0.10$; marginal absolute difference 2.7% [95% CI -0.5 to 6.0]). No clinically significant harms were reported. Interpretation Although the evidence that the intervention reduces repeat infection was not conclusive, the trial results suggest that accelerated partner therapy can be safely offered as a contact tracing option and is also likely to be cost saving. Future research should find ways to increase uptake of accelerated partner therapy and develop alternative interventions for one-off sexual partners. Copyright (C) 2022 The Author(s). Abstract: Introduction Stroke survivors, once in the community, face challenges with their long-term rehabilitation care and present higher levels of loneliness, depression and anxiety than the rest of the population. A community-based performance arts programme, Stroke Odysseys (SO), has been devised to tackle the challenges of living with stroke in the UK. In this study, we aim to evaluate the implementation, impact and experiences of SO for stroke survivors.

Methods and analysis Scaling-up Health Arts Programmes:

Implementation and Effectiveness Research (SHAPER)-SO aims to scale-up SO to 75 participants and 47 stakeholders, while simultaneously evaluating the effectiveness and implementation of the programme.

The main research aim is to evaluate the implementation, effectiveness, impact and experiences of a community-based performance arts programme (SO for stroke survivors). This mixed-methods study will evaluate the experience and impact of SO on those participating using mixed methods (interviews, observations and surveys) before and after each stage and carry out non-participant observations during a percentage of the workshops, training and tour. Data will be analysed using quantitative and qualitative approaches. This is a study within the SHAPER programme. Ethics and dissemination Ethical approval has been granted by the King's College London PNM Research Ethics Panel, REC reference: LRS/

DP-20/21-21549. Written informed consent will be sought for participants and stakeholders. The results of the study will be reported and disseminated at international conferences and in peer-reviewed scientific journals.

Title: A randomised feasibility trial of an intervention to support sharing of HIV status for 18-25-year olds living with perinatally acquired HIV compared with standard care: HIV Empowering Adults' Decisions to Share-UK/Uganda Project (HEADS-UP)

Journal: Pilot and Feasibility Studies

Volume: 6

Issue: 1

Short Title: A randomised feasibility trial of an intervention to support sharing of HIV status for 18-25-year olds living with perinatally acquired HIV compared with standard care: HIV Empowering Adults' Decisions to Share-UK/Uganda Project (HEADS-UP)

DOI: 10.1186/s40814-020-00688-w

Article Number: 141

Accession Number: WOS:000729238200149

Abstract: BackgroundYoung adults with perinatally acquired HIV (PAH) face several challenges, including adhering to antiretroviral therapy (ART), managing the risk of onward HIV transmission and maintaining positive well-being. Sharing one's HIV status with others (onward HIV disclosure) may assist with these challenges by facilitating emotional and practical support. Rates of HIV status sharing are, however, low in this population. There are no existing interventions focused on sharing one's HIV status for young adults living with PAH. The HEADS-UP study is designed to develop and test the feasibility of an intervention to help the sharing of HIV status for young adults with PAH. MethodsThe study is a 30-month multi-site randomised feasibility study across both a high-income/low-HIV prevalence country (UK) and a low-income/high-HIV prevalence country (Uganda). Phase 1 (12months) will involve developing the intervention using qualitative interviews with 20 young people living with PAH (ten in the UK-18 to 29years; ten in Uganda-18 to 25years), 20 of their social network (friends, family, sexual partners as defined by the young person; ten in the UK, ten in Uganda) and ten professionals with experience working with young adults with PAH (five in the UK, five in Uganda). Phase 2 (18months)

involves conducting a randomised feasibility parallel group trial of the intervention alongside current standard of care condition in each country (main study) with 18- to 25-year olds with PAH. A sample size of 94 participants per condition (intervention or standard of care; 188 participants in total: 47 in each condition in each country) with data at both the baseline and 6-month follow-up time points, across UK and Ugandan sites will be recruited. Participants in the intervention condition will also complete measures immediately post-intervention. Face-to-face interviews will be conducted with ten participants in both countries immediately post-intervention and at 6-month follow-up (sub-study). Discussion This study will be the first trial that we are aware of to address important gaps in understanding acceptable and feasible ways of delivering HIV status sharing support for young people living with PAH. Trial registration ISRCTN Registry, ISRCTN31852047, Registered on 21 January, 2019. Study sponsor: Royal Holloway University of London. Sponsor contact: alicen.nickson@rhul.ac.uk. Date and version: April 2020. Protocol version 3.5.

Title: Developing a mHealth intervention to promote uptake of HIV testing among African communities in the conditions: a qualitative study

Journal: BMC Public Health

Volume: 16

Date: Jul

Short Title: Developing a mHealth intervention to promote uptake of HIV testing among African communities in the conditions: a qualitative study

DOI: 10.1186/s12889-016-3278-4

Article Number: 656

Accession Number: WOS:000381003100005

Abstract: Background: HIV-related mHealth interventions have demonstrable efficacy in supporting treatment adherence, although the evidence base for promoting HIV testing is inconclusive. Progress is constrained by a limited understanding of processes used to develop interventions and weak theoretical underpinnings. This paper describes a research project that informed the development of a theory-based mHealth intervention to promote HIV testing amongst city-dwelling African communities in the conditions. Methods: A

community-based participatory social marketing design was adopted. Six focus groups (48 participants in total) were undertaken and analysed using a thematic framework approach, guided by constructs from the Health Belief Model. Key themes were incorporated into a set of text messages, which were pre-tested and refined. Results: The focus groups identified a relatively low perception of HIV risk, especially amongst men, and a range of social and structural barriers to HIV testing. In terms of self-efficacy around HIV testing, respondents highlighted a need for communities and professionals to work together to build a context of trust through co-location in, and co-involvement of, local communities which would in turn enhance confidence in, and support for, HIV testing activities of health professionals. Findings suggested that messages should: avoid an exclusive focus on HIV, be tailored and personalised, come from a trusted source, allay fears and focus on support and health benefits. Conclusions: HIV remains a stigmatized and de-prioritized issue within African migrant communities in the UK, posing barriers to HIV testing initiatives. A community-based participatory social marketing design can be successfully used to develop a culturally appropriate text messaging HIV intervention. Key challenges involved turning community research recommendations into brief text messages of only 160 characters. The intervention needs to be evaluated in a randomized control trial. Future research should explore the application of the processes and methodologies described in this paper within other communities.

Short Title: Friendship quality and ethnocultural boys: An exploratory evaluation of the WiseGuyz Program

ISSN: 0033-3085

DOI: 10.1002/pits.22566

Accession Number: WOS:000655879100001

Abstract: Tier 1 school mental health programs for middle school youth often focus on healthy relationships promotion. However, the vast majority of these programs take a gender- and race-neutral approach (i.e., content that does not focus on the way that gender,

race, and ethnicity intersect to shape relationships and mental health). Embedding these intersections into Tier 1 programs is critical to equitably advancing mental health for middle school youth. This article specifically explores associations between participation in a Tier 1 gender-transformative healthy relationships program and friendship quality for Ethnocultural boys. Data were drawn from 278 White and Ethnocultural boys who participated in the program in 2016–2017 or 2017–2018 in a Western Canadian province. Data were analyzed using three-level multilevel models. In these data, we found that Ethnocultural boys who participated in WiseGuyz reported improved friendship quality with their closest same-sex friend following the end of the program. We also found that Ethnocultural boys who reported a positive change in male role norms related to emotional restriction reported significant improvements to friendship quality from pre- to post-test. Findings suggest the importance of embedding equity into Tier 1 school mental health programming through a specific focus on intersections between gender, race, and ethnicity.

Accession Number: WOS:000618411000001

Abstract: Gender-transformative approaches (i.e., approaches that support male-identified individuals to critique and resist stereotypical male gender role norms that negatively affect health and well-being) are increasingly recognized as a key health promotion strategy. However, there is limited evidence to date on gender-transformative interventions for male-identified adolescents. In addition, given the dynamic and socially constructed nature of gender, methods beyond quantitative data collection are needed to gain a holistic understanding of promising gender-transformative health promotion approaches. One newer method to capture lived

experiences with adolescents is photo-based evaluation, where youth program participants take pictures to represent their knowledge, attitudes, and/or behaviors before and after a program. The present study presents findings from the photo-based evaluation of a gender-transformative health promotion program called WiseGuyz. WiseGuyz is offered to mid-adolescent, male-identified youth in school and community settings, and is designed to promote mental and sexual health and prevent violence. Six youth photographers from a rural Canadian setting took part in this evaluation, taking photos to represent what being a guy in their world meant before and after WiseGuyz. Youth then participated in an individual visual storytelling interview and a group-based photovoice process. Key themes in relation to masculinities that emerged from these data were around changes to (1) social norms and (2) emotionality following program participation, and the need for a safe program space to support these changes. This study adds to literature demonstrating the promise of gender-transformative approaches with adolescents, with implications for future health promotion research and practice with male-identified youth.

Article Number: 100424

Accession Number: WOS:000709742200020

Abstract: Introduction: There is a need for effective, inexpensive and scalable interventions in the treatment of substance use disorder (SUD). An adjunct intervention that warrants exploration is exercise. Objective: To examine the acceptability of exercise as an adjunct treatment for individuals in residential treatment for SUD. The secondary objective is to guide exercise intervention development for this population. Methods: After an acclimatization period where the first author spent four weeks volunteering at the treatment facility, semi-structured interviews were conducted with

adult individuals (mean = 38.93, range 23–58) with SUD in residential treatment (n = 15) to assess the acceptability of exercise as an adjunct treatment. A thematic analysis was conducted using deductive and inductive methods. The interview guide and analysis were informed by the Capability, Opportunity, Motivation–Behaviour (COM–B) model and the Theoretical Domains Framework (TDF). Results: Exercise was considered an acceptable adjunct treatment for SUD. Three themes were identified as prudent for informing intervention development. Participants were 1) receptive to exercise but some lacked the knowledge and skills to participate; 2) aware of opportunities to exercise but these are often underutilized, and 3) looking ahead to life after treatment. Conclusions: This study provides insight into the acceptability and receptiveness of residential SUD treatment to exercise programming. Our results provide direction for developing an exercise counselling intervention embedded within the residential treatment context. DOI: 10.3390/nu15051082

Article Number: 1082

Accession Number: WOS:000946899200001

Abstract: Female endurance athletes are considered a high-risk group for developing Relative Energy Deficiency in Sport (REDS). Due to the lack of educational and behavioral intervention studies, targeting and evaluating the effects of the practical daily management of REDs, we developed the Food and nUtrition for Endurance athletes—a Learning (FUEL) program, consisting of 16 weekly online lectures and individual athlete-centered nutrition counseling every other week. We recruited female endurance athletes from Norway (n = 60), Sweden (n = 84), Ireland (n = 17), and Germany (n = 47). Fifty athletes with symptoms of REDs and with low risk of eating disorders, with no use of hormonal contraceptives and no chronic diseases, were allocated to either the FUEL intervention (n = 32) (FUEL) or a 16-week control period (n = 18) (CON). All but one completed FUEL, while 15 completed CON. We found strong evidence for improvements in sports nutrition knowledge, assessed via interviews, and moderate to strong evidence in the ratings concerning self-perceived sports nutrition knowledge in FUEL versus CON. Analyses of the seven-day prospective weighed food record and questions related to sports nutrition habits, suggested weak evidence for improvements in FUEL versus CON. The FUEL intervention improved sports nutrition knowledge and suggested weak evidence for improved sports nutrition behavior in female endurance athletes with symptoms of REDs.

Title: Implementation of a Real-Time Medication Intake Monitoring Technology Intervention in Community Pharmacy Settings: A Mixed-Method Pilot Study
Journal: Pharmacy
Volume: 9
Issue: 2
Date: Jun
Short Title: Implementation of a Real-Time Medication Intake Monitoring Technology Intervention in Community Pharmacy Settings: A Mixed-Method Pilot Study
DOI: 10.3390/pharmacy9020105
Article Number: 105
Accession Number: WOS:000665265900001
Abstract: Innovative dispensing products offering real-time medication intake monitoring are being developed to address medication non-adherence. However, implementation of these interventions within the workflow of a community pharmacy is unknown. The purpose of this study was to explore factors affecting implementation of a real-time adherence-monitoring, multidose-dispensing system in community pharmacies. A mixed-method study was conducted with pharmacy staff, who packaged and dispensed medications in smart multidose packages and monitored real-time medication intake via web-portal. Pharmacy staff participated in semi-structured interviews. The Technology Acceptance Model, Theory of Planned Behaviour and Capability, Opportunity, Motivation, Behaviour Model informed the interview guide. Interview transcripts were analyzed thematically and findings were mapped back to the frameworks. The usability was assessed by the System Usability Scale (SUS). Three pharmacists and one pharmacy assistant with a mean of 19 years of practice were interviewed. Three themes and 12 subthemes were generated. Themes included: pharmacy workflow factors, integration factors, and pharmacist-perceived patient factors. The mean SUS was found to be 80.63. Products with real-time adherence monitoring capabilities are valued by pharmacists. A careful assessment of infrastructure-including pharmacy workload, manpower and financial resources-is imperative for successful implementation of such interventions in a community pharmacy setting.

DOI: 10.1371/journal.pone.0262012

Article Number: e0262012

Accession Number: WOS:000791072800083

Abstract: Smart adherence products are marketed to assist with medication management. However, little is known about their in-home integration by older adults. It is necessary to investigate the facilitators and barriers older adults face when integrating these products into their medication taking routines before effectiveness can be examined. The aim of this study was to (a) examine the integration of a smart multidose blister package and (b) understand medication intake behaviour of adults with chronic diseases using an integrated theoretical model comprised of the Technology Acceptance Model (TAM), Theory of Planned Behaviour (TPB) and Capacity, Opportunity, Motivation and Behaviour (COM-B) Model. An ethnographic-informed study was conducted with older adults using the smart multidose blister package to manage their medications for eight weeks. Data was collected quantitatively and qualitatively using in-home observations, photo-elicitation, field notes, semi-structured interviews, system usability scale (SUS) and net promoter scale (NPS). The interview guide was developed with constructs from the TAM, TPB and COM-B Model. Data were analyzed using the Qualitative Analysis Guide of Leuven (QUAGOL) framework to generate themes and sub-themes which were mapped back to TAM, TBP and COM-B Model. Ten older adults with an average age of 76 years, of which 80% were female, participated in the study. On average, participants reported five medical conditions, while the average number of medications was 11.1. The mean SUS was 75.50 and overall NPS score was 0. Qualitative analysis identified three themes; (1) factors influencing medication intake behaviour (2) facilitators to the product use and, (3) barriers to the product use. The smart blister package was found to be easy to use and acceptable by older adults. Clinicians should assess an older adult's medication intake behavior as well as barriers and facilitators to product use prior to recommending an adherence product for managing medications.

Short Title: Implementing Four Transitional Care Interventions for Older Adults: A Retrospective Collective Case Study

ISSN: 0016-9013

DOI: 10.1093/geront/gnac128

Accession Number: WOS:000863268800001

Abstract: Background and Objectives Four interventions to improve care transitions between hospital and home or community settings for older adults were implemented in Leuven, Belgium over the past 4 years. These complex interventions consist of multiple components that challenge their implementation in practice. This study examines the influencing factors, strategies used to address challenges in implementing these interventions, and implementation outcomes from the perspectives of health care professionals involved. Research Design and Methods This was a qualitative, collective case study that was part of the TRANS-SENIOR research network. Authors conducted semistructured interviews with health care professionals about their perceptions regarding the implementation. Thematic analysis was used, and the Consolidated Framework for Implementation Research guided the final data interpretation. Results Thirteen participants were interviewed. Participants reported major implementation bottlenecks at the organizational level (resources, structure, and information continuity), while facilitators were at the individual level (personal attributes and champions). They identified engagement as the primary strategy used, and suggested other important strategies for the future sustainability of the interventions (building strategic partnerships and lobbying for policies to support transitional care). They perceived the overall implementation favorably, with high uptake as a key outcome. Discussion and Implications This study highlights the strong role of health care providers, being motivated and self-driven, to foster the implementation of interventions in transitional care in a bottom-up way. It is important to use implementation strategies targeting both the individual-level factors as well as the organizational barriers for transitional care interventions in the future.

DOI: 10.1177/22840265221139909

Accession Number: WOS:000893180400001

Abstract: Aim: To identify and review the success of non-pharmaceutical, non-surgical biopsychosocial interventions in individuals with endometriosis, in managing pain and improving body image. Methods: Cochrane, EBSCO, IBSS, NICE, Open Grey, OVID, Proquest, Scopus and Science Direct were searched in April 2021, using inclusion and exclusion criteria. Data collection and analysis: Five randomised control trials, and one controlled clinical trial resulted from the search. Study quality was assessed using the Effective Public Health Practice Project (EPHPP) Quality Assessment Tool. Studies were synthesised by intervention type, into physical only, and physical and psychological. Results: Across the six papers, 323 participants were recruited, through medical records or self-referral, and treatments largely administered by specialist practitioners. From the EPHPP quality assessment, 2 weak quality papers, and four moderate quality papers found improvements to pain, with large effect sizes in four papers. No studies used established body image measures to examine intervention effects on body image, and all lacked health psychology theoretical basis. There were common issues in selection bias, confounders and blinding. Conclusion: Without gold-standard methodology, evidence of effectiveness cannot be concluded. However, there is promising rationale if these issues are addressed.

Abstract: Objective: Cardiovascular disease (CVD) continues to be a leading cause of morbidity in the U.S. Managing CVD risk factors, such as diabetes or hypertension, can be challenging for many individuals. We investigated the barriers experienced by patients who persistently struggled to reach their CVD risk factor control goals. Methods: This qualitative study examined patient, clinician, and researcher observations of individuals' experiences in a chronic disease management program. All participants (n = 332) were enrolled in a clinical trial testing a skills-based group intervention seeking to improve healthcare engagement. Data were analyzed through a general inductive approach and resulting themes were structured along the Capability Opportunity-Motivation-Behavior framework.

Results: Analyses identified care engagement barriers related to participants' communication skills and activation, care team relationship processes, and emotional factors. Although most participants reported benefitting from skills training, persistent barriers included distrust of their providers, shame about health challenges, and dissatisfaction with care team interactions that were described as impersonal or unresponsive. Conclusions and practice implications: Efforts to support engagement in CVD risk factor management programs should address whether patients and their care team have the necessary skills, opportunities and confidence to proactively communicate health needs and engage in non-judgmental interactions for goal setting, rapport-building, and shared decision-making. Short Title: Running App "Zombies, Run!" Users' Engagement with Physical Activity: A Qualitative Study

ISSN: 2161-783X

DOI: 10.1089/g4h.2021.0060

Accession Number: WOS:000722699500001

Abstract: Introduction: Sufficient physical activity (PA) is important for all aspects of health. Smartphone apps and the use of gamification, such as narrative-based augmented reality (AR), have a great potential to engage a variety of people in more PA. Zombies, Run! (ZR) is the world's most popular running exergame app and therefore a suitable model to understand what users find engaging. Objective: To understand people's motivation and experience of using a narrative-based AR exergame app ZR for PA. Materials and Methods: ZR users were randomly selected for interview from a quantitative ZR user's survey. Interviews which were guided by a semistructured topic guide were audio-recorded, transcribed, and analyzed using inductive and deductive thematic analysis. Results: Participants were 15 males and 15 females aged 16-53 years (mean = 36, SD = 10), from 13 countries, with the largest proportions from the United States (30%) and United Kingdom (23%). The majority (73%) used ZR while running, followed by cycling and walking. Four overarching themes that emerged were: "Reasons for starting and staying with ZR," "Preferred features," "Perceived effects of ZR," and "Pros and cons of the app." Sixteen subthemes included the attraction of gamification and narrative appeal, desire to add something fun to PA, or to distract from the negative physiological effects of PA. Users' favorite features were the feelings of immersion and presence through narrative, story line, and characters. The narrative motivated participants to engage in PA for longer sessions and encouraged long-term use. Conclusions: This study identified a number of factors that users found attractive in an AR running exergame, particularly narrative. Our findings suggest that ZR may engage people in exercise by modifying their perception of PA through a story line or narrative, dissociating the players from the effort of exertion. AR narrative-based apps may be an effective way of engaging people with health-related behaviors or habit-forming activities.

Short Title: Digital messaging to support control for type 2 diabetes (StAR2D): a multicentre randomised controlled trial

DOI: 10.1186/s12889-021-11874-7

Article Number: 1907

Accession Number: WOS:000709797800001

Abstract: Background: Failure to take medicines for diabetes as prescribed contributes to poor outcomes from the condition. Mobile phones are ubiquitous and short message service (SMS) texts have shown promise as a low-cost intervention. We tested the effectiveness of SMS-text messaging in improving outcomes in adults with type 2 diabetes. Methods: StAR2D was a 12-month two-arm randomised trial of SMS-text messaging and usual care in Cape Town, South Africa and Lilongwe, Malawi. Messages used behaviour change theory and were developed with patients and staff. The intervention group received four messages each week. The primary outcome was change in HbA1c. Secondary outcomes were the proportion of patients who collected > 80% medication and changes in systolic blood pressure, lipids, cardiovascular risk, and the proportion of the participants reaching treatment goals. Results: The trial took place between 1 October, 2016 and 1 October 2018, 1186 participants were randomised to intervention (593) and control (593) groups. 91% of participants completed follow-up. There was a reduction in HbA1c (DCCT) in both groups but not in mean change (95% CI) between groups (- 0.08% (- 0.31 to 0.16) (IFCC - 0.82 mmol/mol (- 3.44 to 1.79)). There was a small but not significant increase in the proportions of participants likely to have collected 80% or more of medication (Relative risk 1.11 (0.84 to 1.47; P = 0.47)). There was a significant difference between groups in change in systolic blood pressure from baseline of 3.46 mmHg (1.48 to 5.44, P = 0.001) in favour of the intervention group. The between group difference in change in 10-year risk of coronary heart disease was - 0.71% (- 1.46 to 0.04, P = 0.064). The proportion of participants meeting treatment goals in the intervention group was 36.0% and in the control group 26.8% (Relative risk 1.36 (1.13 to 1.63, P = 0.001)). Participants reported many challenges to adherence despite finding messages acceptable and useful. Conclusions: Whilst SMS text messages do not lead to improved glycaemia in these low-resource settings there appeared to be an impact on blood pressure and achievement of treatment goals but the mechanisms for this are unclear. Text messages alone, may be unsuccessful unless accompanied by health system strengthening and other forms of self-management support for type 2 diabetes.

DOI: 10.1111/dme.12987

Accession Number: WOS:000375119500002

Abstract: AimsTo assess the impact of interventions promoting the monitoring of medication use and brief messaging to support medication adherence in patients with Type 2 diabetes mellitus, and to investigate the extent of theory use to guide intervention development. MethodsWe systematically searched for controlled trials, published from 1990 onwards in Medline, Embase, CINAHL, PsycINFO and the Cochrane library, that evaluated interventions based on monitoring and brief messaging to support medication adherence in patients with Type 2 diabetes, to examine the effectiveness of such interventions. ResultsA total of 11 trials, comparing 15 interventions, were identified. Only a small minority presented a low risk of bias. Three interventions were based on delivering brief messages, six were based on monitoring medication adherence, and six used both strategies. Messaging interventions included the use of short message service text messages, web-based feedback, and messages delivered through monitoring devices. Monitoring interventions included remote self-reporting of medication and telephone calls with healthcare staff. Improvements in medication adherence were observed in six interventions, although effect sizes were generally moderate. Only two interventions improved both adherence and clinical outcomes. A meta-analysis of five trials (eight interventions) combining monitoring and messaging strategies showed that the pooled difference in medication adherence between intervention and control was moderate and not statistically significant [standardized mean difference=0.22 (95% CI -0.05; 0.49)]. Only four trials were based on explicit theoretical frameworks. ConclusionsAlthough interventions based on messaging and monitoring have the potential to improve medication adherence in patients with Type 2 diabetes, evidence of their efficacy is limited and additional high-quality, theory-based research is needed.

DOI: 10.1016/j.rvsc.2023.01.019

Accession Number: WOS:000945142300001

Abstract: Employing a theoretical model of human behaviour (COM-B), the current study explores the factors influencing veterinarians' engagement with antibiotic use stewardship on Irish dairy farms. One-to-one semi structured interviews were carried out by telephone with 12 veterinarians whose daily work focused on dairy cattle. A thematic analysis approach was undertaken. The identified themes and sub-themes were then mapped to the COM-B model. This study identified challenges faced by veterinarians when trying to prescribe responsibly which included lack of training to encourage farmer behaviour change, issues with laboratory testing, pressures from farmers to prescribe antimicrobials, concern for animal welfare and farmers going elsewhere for prescriptions. Having a good knowledge of AMR, peers as an advice source, potential financial benefits for farmers as a result of reduced antimicrobial costs and accepting a shared responsibility for AMR, facilitate veterinarians in their role as antimicrobial stewards. The barriers and facilitators identified as influencing veterinarians' capability, opportunity and motivation to responsibly prescribe antimicrobials formed the basis for a number of practical recommendations which should be considered by advisory and policy making teams. Recommendations include; continuous training for veterinarians on AMR and alternatives to overcome the barriers faced when trying to promote reduced AMU, veterinarian peer support groups to improve confidence in their knowledge and decision making to minimise the effect of client pressures/expectations, setting up collaborative

farmer and veterinarian working groups to promote a transparent working relationship and the development of affordable and efficient diagnostic and susceptibility testing.

Short Title: Consumer awareness and perceptions of arsenic exposure from rice and their willingness to change behavior

ISSN: 0956-7135

DOI: 10.1016/j.foodcont.2021.107875

Article Number: 107875

Accession Number: WOS:000632531500010

Abstract: Arsenic exposure from rice poses a potential chronic threat to human health. While research has been conducted on consumer risk perceptions of heavy metals in food, there is a paucity of research in relation to consumers' knowledge of and attitudes towards arsenic in rice. In order to fill this gap, the current study set out to explore consumer awareness and risk perceptions of this threat, and identify potential strategies to promote behavior change to reduce consumers' exposure to arsenic from rice. 47 participants took part in 6 focus groups. Discussions were transcribed verbatim and thematically analysed using NVivo 12. Three key themes emerged from the data: (1) consumer perceptions of risk information, (2) perceptions of food chain actors responsible for food safety and (3) factors influencing change in rice consumption behaviors. Consumers were found to lack evidence based risk information relating to arsenic exposure from rice. Consumer trust in food chain actors responsible for food safety is varied and contributes to individual risk perceptions. Consumer risk perception, as a result of risk awareness and trust in the food chain, combined with a range of factors such as cost, convenience and sensory quality all contribute to consumers' willingness to change their current behavior. In order to effectively promote behavior change resulting in reduced arsenic exposure from rice, the following recommendations are made: (1) increasing consumers' risk perception of arsenic in rice, (2) building trust in those responsible for the safety of food and communication of risk information and (3) addressing the individually reported factors influencing consumers' willingness to change their rice consumption and cooking behaviors.

Short Title: A Group-Facilitated, Internet-Based Intervention to
Promote Mental Health and Well-Being in a Vulnerable Population of
University Students: Randomized Controlled Trial of the Be Well Plan
Program

ISSN: 2368-7959

DOI: 10.2196/37292

Article Number: e37292

Accession Number: WOS:000816915600007

Abstract: Background: A growing literature supports the use of
internet-based interventions to improve mental health outcomes.
However, most programs target specific symptoms or participant
groups and are not tailored to facilitate improvements in mental
health and well-being or do not allow for needs and preferences of
individual participants. The Be Well Plan, a 5-week group-
facilitated, internet-based mental health and well-being group
intervention addresses these gaps, allowing participants to select a
range of activities that they can tailor to their specific
characteristics, needs, and preferences. Objective: This study aims
to test whether the Be Well Plan program was effective in improving
primary outcomes of mental well-being, resilience, anxiety, and
depression compared to a waitlist control group during the COVID-19
pandemic; secondary outcomes included self-efficacy, a sense of
control, and cognitive flexibility. The study further seeks to
examine participants' engagement and satisfaction with the program.
Methods: A randomized controlled trial (RCT) was conducted with 2
parallel arms, an intervention and a waitlist control group. The
intervention involved 5 weekly 2-hour sessions, which were
facilitated in group format using Zoom videoconferencing software.
University students were recruited via social media posts, lectures,
emails, flyers, and posters. Results: Using an intentional
randomization 2:1 allocation strategy, we recruited 215 participants
to the trial (n=126, 58.6%, intervention group; n=89, 41.4%,
waitlist control group). Of the 126 participants assigned to the
intervention group, 75 (59.5%) commenced the program and were
included in modified intention-to-treat (mITT) analyses. mITT
intervention participants attended, on average, 3.41 sessions (SD

1.56, median 4); 55 (73.3%) attended at least 4 sessions, and 25 (33.3%) attended all 5 sessions. Of the 49 intervention group participants who completed the postintervention assessment, 47 (95.9%) were either very satisfied (n=31, 66%) or satisfied (n=16, 34%). The mITT analysis for well-being ($F=1, F=162 =9.65, P=.002$, Cohen $d=0.48$) and resilience ($F=1, F=162 =7.85, P=.006$, Cohen $d=0.44$) showed significant time x group interaction effects, suggesting that both groups improved over time, but the Be Well Plan (intervention) group showed significantly greater improvement compared to the waitlist control group. A similar pattern of results was observed for depression and anxiety (Cohen $d=0.32$ and 0.37 , respectively), as well as the secondary outcomes (self-efficacy, Cohen $d=0.50$; sense of control, Cohen $d=0.42$; cognitive flexibility, Cohen $d=0.65$). Larger effect sizes were observed in the completer analyses. Reliable change analysis showed that the majority of mITT participants (58/75, 77.3%) demonstrated a significant reliable improvement in at least 1 of the primary outcomes. Conclusions: The Be Well Plan program was effective in improving mental health and well-being, including mental well-being, resilience, depression, and anxiety. Participant satisfaction scores and attendance indicated a high degree of engagement and satisfaction with the program. Notes: Fassnacht, Daniel B. Short Title: Evaluating remote facilitation intensity for multi-national translation of nurse-initiated stroke protocols (QASC Australasia): a protocol for a cluster randomised controlled trial

ISSN: 1748-5908

DOI: 10.1186/s13012-023-01260-9

Article Number: 2

Accession Number: WOS:000918538800001

Abstract: BackgroundFacilitated implementation of nurse-initiated protocols to manage fever, hyperglycaemia (sugar) and swallowing difficulties (FeSS Protocols) in 19 Australian stroke units resulted

in reduced death and dependency for stroke patients. However, a significant gap remains in translating this evidence-based care bundle protocol into standard practice in Australia and New Zealand. Facilitation is a key component for increasing implementation. However, its contribution to evidence translation initiatives requires further investigation. We aim to evaluate two levels of intensity of external remote facilitation as part of a multifaceted intervention to improve FeSS Protocol uptake and quality of care for patients with stroke in Australian and New Zealand acute care hospitals. Methods A three-arm cluster randomised controlled trial with a process evaluation and economic evaluation. Australian and New Zealand hospitals with a stroke unit or service will be recruited and randomised in blocks of five to one of the three study arms—high- or low-intensity external remote facilitation or a no facilitation control group—in a 2:2:1 ratio. The multicomponent implementation strategy will incorporate implementation science frameworks (Theoretical Domains Framework, Capability, Opportunity, Motivation – Behaviour Model and the Consolidated Framework for Implementation Research) and include an online education package, audit and feedback reports, local clinical champions, barrier and enabler assessments, action plans, reminders and external remote facilitation. The primary outcome is implementation effectiveness using a composite measure comprising six monitoring and treatment elements of the FeSS Protocols. Secondary outcome measures are as follows: composite outcome of adherence to each of the combined monitoring and treatment elements for (i) fever (n=5); (ii) hyperglycaemia (n=6); and (iii) swallowing protocols (n=7); adherence to the individual elements that make up each of these protocols; comparison for composite outcomes between (i) metropolitan and rural/remote hospitals; and (ii) stroke units and stroke services. A process evaluation will examine contextual factors influencing intervention uptake. An economic evaluation will describe cost differences relative to each intervention and study outcomes. Discussion We will generate new evidence on the most effective facilitation intensity to support implementation of nurse-initiated stroke protocols nationwide, reducing geographical barriers for those in rural and remote areas.

Short Title: Stakeholders' Perceptions of the Implementation of a Patient-Centric Digital Health Application for Primary Healthcare in India

ISSN: 2093-3681

DOI: 10.4258/hir.2021.27.4.315

Accession Number: WOS:000718094200007

Abstract: Objectives: Health systems are shifting from traditional methods of healthcare delivery to delivery using digital applications. This change was introduced at a primary care centre in Chandigarh, India that served a marginalised population. After establishing the digital health system, we explored stakeholders' perceptions regarding its implementation. Methods: Ethnographic methods were used to explore stakeholders' perceptions regarding the implementation of the Integrated Health Information System for Primary Health Care (IHIS4PHC), which was developed as a patient-centric digital health application. Data were collected using focus group discussions and in-depth interviews. Participatory observations were made of day-to-day activities including outpatient visits, outreach field visits, and methods of health practice. The collected information was analysed using thematic coding. Results: Healthcare workers highlighted that working with the digital health system was initially arduous, but they later realised its usefulness, as the digital system made it easier to search records and generate reports, rapidly providing evidence to make decisions. Auxiliary nurse midwives reported that recording information on computers saved time when generating reports; however, systematic and mandatory data entry made recording tedious. Staff were apprehensive about the use of computer-based data for monitoring their work performance. Patients appreciated that their previous records were now available on the computer for easy retrieval. Conclusions: The usefulness of the digital health application was appreciated by various primary healthcare stakeholders. Barriers persisted due to perceived needs for flexibility in delivering healthcare services, and apprehensions continued because of increased transparency, accountability, and dependence on computers and digital technicians.

Title: 'It's tough. It is hard': A qualitative interview study of staff and volunteers caring for hospice in-patients with delirium

Journal: Palliative Medicine

Date: 2023 May

Short Title: 'It's tough. It is hard': A qualitative interview study of staff and volunteers caring for hospice in-patients with delirium

ISSN: 0269-2163

DOI: 10.1177/02692163231170655

Accession Number: WOS:000980274800001

Abstract: Background: Delirium is a distressing condition often experienced by hospice in-patients. Increased understanding of current multidisciplinary care of delirium is needed to develop interventions in this setting. Aim(s): To explore hospice staff and volunteers' practice, its influences and what may need to change to improve hospice delirium care. Design: Qualitative interview study using behaviour change theory from a critical realist stance. Setting/participants: Thirty-seven staff, including different professional groups and roles, and volunteers were purposively sampled from two in-patient hospices. Results: We found that participants' practice focus was on managing hyperactive symptoms of delirium, through medication use and non-pharmacological strategies. Delirium prevention, early recognition and hypoactive delirium received less attention. Our theoretically-informed analysis identified this focus was influenced by staff and volunteers' emotional responses to the distress associated with hyperactive symptoms of delirium as well as understanding of delirium prevention, recognition and care, which varied between staff groups. Non-pharmacological delirium management was supported by adequate staffing levels, supportive team working and a culture of person-centred and family-centred care, although behaviours that disrupted the calm hospice environment challenged this. Conclusions: Our findings can inform hospice-tailored behaviour change interventions

that develop a shared team understanding and engage staff's emotional responses to improve delirium care. Reflective learning opportunities are needed that increase understanding of the potential to reduce patient distress through prevention and early recognition of delirium, as well as person-centred management. Organisational support for adequate, flexible staffing levels and supportive team working is required to support person-centred delirium care.

Title: Facilitators and barriers to clinicians' use of COPD action plans in self-management support: A qualitative study

Journal: Patient Education and Counseling

Volume: 103

Issue: 4

Pages: 693-701

Date: Apr

Short Title: Facilitators and barriers to clinicians' use of COPD action plans in self-management support: A qualitative study

ISSN: 0738-3991

DOI: 10.1016/j.pec.2019.11.002

Accession Number: WOS:000523305400004

Abstract: Objective: Written action plans for patients with chronic obstructive pulmonary disease (COPD) aim at early recognition of exacerbations and self-initiation of interventions. Previous research suggest underuse of COPD action plans. We wanted to 1) examine which factors clinicians in specialist healthcare perceived as influencing clinicians' use of written action plans in COPD-self management support and 2) propose a framework for understanding the factors affecting clinicians' use of action plans in routine practice. Methods: We performed a theory-driven retrospective qualitative study. Documentary data were collected to describe the COPD action plan in context. In-depth interviews with clinicians (n = 8) were carried out. Interview data were thematically analyzed, using a predetermined model for understanding behavior. Results: Our study revealed that a number of factors influenced clinicians' use of action plans, including their capabilities (knowledge and skills to identify "the right patient" and to individualize the plan template) and motivations (beliefs, reinforcements, and emotions s.a. frustration, fear, and distrust), together with organizational and social opportunities (resources, patient, and GP preferences). Conclusion: A multilevel understanding of factors that affect clinicians' use of action plans in self-management support is

needed. Practice implication: The proposed framework can be used to guide future initiatives to promote targeted self-management support. (C) 2019 The Author(s). Published by Elsevier B.V.

Title: Changing behavior: Can intervention design from the public health sector help solve the problem of fishing gear conflict?

Journal: Marine Policy

Volume: 151

Date: May

Short Title: Changing behavior: Can intervention design from the public health sector help solve the problem of fishing gear conflict?

ISSN: 0308-597X

DOI: 10.1016/j.marpol.2023.105527

Article Number: 105527

Accession Number: WOS:000950781000001

Abstract: Abandoned, lost, or otherwise discarded fishing gear is associated with significant environmental and socio-economic impacts. Gear loss can be attributed to environmental and operational factors. Gear conflict, which can result in the loss of gear due to interactions within or between fleet metiers, is a significant contributor to gear loss in some fisheries. Traditionally interventions aiming to reduce the occurrence of gear conflict have been designed without a systematic approach and with minimal analysis of the fisher behaviors which lead to gear conflict. This study uses the Behavioral Change Wheel (BCW), a well-established intervention design framework originating from the UK health sector, and applies it for the first time in a fisheries management context in an attempt to understand the specific intervention functions and policy categories which could be used to reduce or avoid the occurrence of gear loss through gear conflict. Through a series of open-ended interviews with static and mobile fishers, ten behaviors were identified which were associated with either the prevention or mitigation of gear conflict (communication between sectors/individuals, marking fishing gear, moving gear when/if requested, adjusting fishing patterns to account for known gear positions, adherence to spatial separation agreements, regular gear maintenance, regular hauling of static gear, reporting snagged static fishing gear, bringing snagged fishing gear back into harbor, and attempting to locate lost fishing gear). While some of these behaviors (such as sharing details of fishing activities and locations) were found in both static and mobile fleet metiers, other behaviors were unique to specific fleet segments (e.g. gear marking behavior from static gear fishers). Analysis of the behavioral

subcomponents of each behavior through the BCW framework reveal that intervention functions targeting fisher social and physical opportunities and automatic and reflexive motivations would be most effective when attempting to reduce the occurrence of gear loss between static and mobile metiers. Potential policy categories that would support this work include the introduction of guidelines, fiscal measures, regulation, legislation, environmental/social planning, and service provision—for example, the creation of behavioral contracts by fishers, enforced spatial management guidelines, and the creation of support structures for part-time fishers.

Title: Smoking behaviours and indoor air quality: a comparative analysis of smoking-permitted versus smoke-free homes in Dhaka, Bangladesh

Journal: Tobacco Control

Volume: 31

Issue: 3

Pages: 444-451

Date: May

Short Title: Smoking behaviours and indoor air quality: a comparative analysis of smoking-permitted versus smoke-free homes in Dhaka, Bangladesh

ISSN: 0964-4563

DOI: 10.1136/tobaccocontrol-2020-055969

Accession Number: WOS:000788583600010

Abstract: Introduction Exposure to secondhand smoke (SHS) is a health risk to non-smokers. Indoor particulate matter (PM_{2.5}) is associated with SHS exposure and is used as a proxy measure. However, PM_{2.5} is non-specific and influenced by a number of environmental factors, which are subject to geographical variation. The nature of association between SHS exposure and indoor PM_{2.5}—studied primarily in high-income countries (HICs) context—may not be globally applicable. We set out to explore this association in a low/middle-income country setting, Dhaka, Bangladesh. Methods A cross-sectional study was conducted among households with at least one resident smoker. We inquired whether smoking was permitted inside the home (smoking-permitted homes, SPH) or not (smoke-free homes, SFH), and measured indoor PM_{2.5} concentrations using a low-cost instrument (Dylos DC1700) for at least 22 hours. We describe and compare SPH and SFH and use multiple linear regression to evaluate which variables are associated with PM_{2.5} level among all households. Results We surveyed 1746 households between April and August 2018; 967 (55%) were SPH and 779 (45%) were SFH. The difference between PM_{2.5} values for SFH (median 27 μ g/m³), IQR

25) and SPH (median 32 $\mu\text{g}/\text{m}^3$, IQR 31) was 5 $\mu\text{g}/\text{m}^3$ ($p < 0.001$). Lead participant's education level, being a non-smoker, having outdoor space and smoke-free rule at home and not using kerosene oil for cooking were significantly associated with lower PM2.5.

Conclusions We found a small but significant difference between PM2.5 concentrations in SPH compared with SFH in Dhaka, Bangladesh—a value much lower than observed in HICs.

Volume: 67

Issue: 3

Pages: 210-216

Date: Jul

Short Title: Women report sustained benefits from attending group-based education about pelvic floor muscles: a longitudinal qualitative study

ISSN: 1836-9553

DOI: 10.1016/j.jphys.2021.06.010

Accession Number: WOS:000667681500010

Abstract: Question: Among women who have participated in group-based education about the pelvic floor, what are their perceptions of the program and the group format? Design: Exploratory longitudinal qualitative study. Participants: Community-dwelling women aged ≥ 18 years who participated in three or four sessions of pelvic floor education in a group format at a university clinic. Data extraction and analysis: Semi-structured group or individual interviews were conducted at three time points: 1 week, 3 months and ≥ 5 months after the education activity. Data were inductively content analysed and independently coded, with iterative theme development. Results: Women considered the content and delivery appropriate and useful. New knowledge was assimilated and shared with others, and many tried to adopt pelvic floor muscle training in daily life. The women felt that the education sessions might benefit other women, with and without pelvic floor dysfunction symptoms, and that such education would ideally be more widely available. A perception of the value of the education persisted over time, even though maintenance of some

health-promoting behaviours, such as pelvic floor muscle training, decreased. Conclusion: The pelvic floor group education sessions appeared to fulfil the purpose of increasing knowledge about pelvic floor (dys)function and applying this in daily life. Overall, the participants, who had completed three or four of the four sessions, found the program to be useful. A unique feature of this study was longitudinal data collection and it seemed that the perception of value persisted over time. (C) 2021 Australian Physiotherapy Association. Article Number: e047817

Accession Number: WOS:000713199900033

Abstract: Introduction Secondhand smoke exposure (SHSe) in childhood is linked with increased morbidity and mortality. Hospital or secondary care contact may present a 'teachable moment' to provide parents with support to change their home smoking behaviours to reduce children's SHSe. There is a lack of robust qualitative evidence around parents and healthcare professionals (HCPs) views on using this teachable moment to successfully initiate behavioural change. We aim to identify and understand what is important to stakeholders with a view to informing the development of a support package to help parents change their home smoking behaviours.

Methods and analysis This qualitative study will be theoretically underpinned by the Capability, Opportunity and Motivation Behaviour (COM-B) model of behavioural change. It will involve semistructured

interviews and/or discussion groups with up to 20 parents who smoke and up to 25 HCPs. Stakeholders will be recruited from a single National Health Service children's hospital in England. Interviews and/or discussion groups will be audio recorded, transcribed and anonymised. The transcripts and any field notes will be analysed using the framework method. Initially, we will apply COM-B to the data deductively and will then code inductively within each domain. Ethics and dissemination The protocol for this study received a favourable outcome from the East Midlands Leicester Central Research Ethics Committee (19/EM/0171). Results will be written up as part of a PhD thesis, submitted for publication in peer-reviewed journals and presentation at conferences.

Short Title: Adaptive learning algorithms to optimize mobile applications for behavioral health: guidelines for design decisions

ISSN: 1067-5027

DOI: 10.1093/jamia/ocab001

Accession Number: WOS:000671031900019

Abstract: Objective: Providing behavioral health interventions via smartphones allows these interventions to be adapted to the changing behavior, preferences, and needs of individuals. This can be achieved through reinforcement learning (RL), a sub-area of machine learning. However, many challenges could affect the effectiveness of these algorithms in the real world. We provide guidelines for decision-making. Materials and Methods: Using thematic analysis, we describe challenges, considerations, and solutions for algorithm design decisions in a collaboration between health services researchers, clinicians, and data scientists. We use the design process of an RL algorithm for a mobile health study "DIAMANTE" for increasing physical activity in underserved patients with diabetes and depression. Over the 1.5-year project, we kept track of the research process using collaborative cloud Google Documents, Whatsapp messenger, and video teleconferencing. We discussed, categorized, and coded critical challenges. We grouped challenges to

create thematic topic process domains. Results: Nine challenges emerged, which we divided into 3 major themes: 1. Choosing the model for decision-making, including appropriate contextual and reward variables; 2. Data handling/collection, such as how to deal with missing or incorrect data in real-time; 3. Weighing the algorithm performance vs effectiveness/implementation in real-world settings. Conclusion: The creation of effective behavioral health interventions does not depend only on final algorithm performance. Many decisions in the real world are necessary to formulate the design of problem parameters to which an algorithm is applied. Researchers must document and evaluate these considerations and decisions before and during the intervention period, to increase transparency, accountability, and reproducibility. Short Title: Daily Motivational Text Messages to Promote Physical Activity in University Students: Results From a Microrandomized Trial

ISSN: 0883-6612

DOI: 10.1093/abm/kaab028

Accession Number: WOS:000754035000009

Abstract: Sending motivational text-messages based on a cognitive-behavioral framework increases daily physical activity in university students, but the effect is short-lasting. Background Low physical activity is an important risk factor for common physical and mental disorders. Physical activity interventions delivered via smartphones can help users maintain and increase physical activity, but outcomes have been mixed. Purpose Here we assessed the effects of sending daily motivational and feedback text messages in a microrandomized clinical trial on changes in physical activity from one day to the next in a student population. Methods We included 93 participants who used a physical activity app, "DIAMANTE" for a period of 6 weeks. Every day, their phone pedometer passively tracked participants' steps. They were microrandomized to receive different

types of motivational messages, based on a cognitive-behavioral framework, and feedback on their steps. We used generalized estimation equation models to test the effectiveness of feedback and motivational messages on changes in steps from one day to the next. Results Sending any versus no text message initially resulted in an increase in daily steps (729 steps, $p = .012$), but this effect decreased over time. A multivariate analysis evaluating each text message category separately showed that the initial positive effect was driven by the motivational messages though the effect was small and trend-wise significant (717 steps; $p = .083$), but not the feedback messages (-276 steps, $p = .4$). Conclusion Sending motivational physical activity text messages based on a cognitive-behavioral framework may have a positive effect on increasing steps, but this decreases with time. Further work is needed to examine using personalization and contextualization to improve the efficacy of text-messaging interventions on physical activity outcomes. ClinicalTrials.gov Identifier NCT04440553.

Abstract: From the experience at the Centre Hospitalier Universitaire (CHU) of Qu,bec, a reflection on training health care teams in screening for distress is proposed. Canadian and Quebec contexts as well as the initiative at the CHU of Quebec are first introduced. Screening for distress is proposed as a strategy and a process to facilitate access to supportive care, based on the needs of the person with cancer. Because the implementation of this person-centered care model is conducted systematically, it involves

both organizational and clinical practice changes. These issues must be considered in training programs. Thus, health care teams training in screening for distress are discussed as both an organizational change and a change in clinical practice. Organizational change is described as a series of steps, including the preparation and consolidation. The change in practice involves a change in clinician behaviors and includes several potential barriers. The person-centered care model also implies taking into account the preferences of the person being cared for, while considering the values of all stakeholders in the organization. In addition, this type of model requires skills in inter-professional collaboration. Training of health care teams in screening for distress goes far beyond clinical empowerment.

Article Number: 1801

Accession Number: WOS:000705854900003

Abstract: Background The COVID-19 pandemic and associated restrictions caused major global disruption. Individuals with long-term physical health conditions (LTCs) are at higher risk of severe illness and often subject to the strictest pandemic guidance, so may be disproportionately affected. The aim of this study was to qualitatively explore how living with a LTC during the COVID-19 pandemic affected people's mental health and wellbeing. Methods Participants were people living with LTCs who participated in telephone/video call interviews based on a semi-structured topic guide. Key themes and subthemes were determined using deductive and inductive thematic analysis. Results The sample included 32 participants with LTCs (most commonly cancer, respiratory conditions or cardiovascular diseases), mean age 57 (SD 13) years, 66% female and 72% white British. There were four overarching themes specific to living with a LTC. These were 1) high levels of fear and anxiety related to perceived consequences of catching COVID-19, 2) impact of shielding/isolation on mental health and wellbeing, 3) experience of

healthcare during the pandemic and 4) anxiety created by uncertainty about the future. Fourteen subthemes were identified, including concerns about accessing essential supplies and the importance of social support. Individuals who lived alone and were advised to shield could be profoundly negatively affected. Conclusions This study found that there were a number of aspects of living with a LTC during the pandemic that had a significant impact on mental health and well-being. There should be focus on how best to provide practical and social support to people with LTCs during a pandemic, particularly if they have to shield or isolate.

Accession Number: WOS:000432167600065

Abstract: While approximately half of all qualified hospital pharmacist independent prescribers (PIPs) in Scotland are active prescribers, there are major differences in prescribing activity across geographical areas. This study aimed to explore, through focus groups, interviews and a questionnaire, hospital PIPs' perceptions of factors associated with prescribing activity and to investigate the infrastructure required to better support active prescribing by PIPs. Findings reinforced the perceived positive impact of supportive pharmacy leadership within the organisation, recognition that prescribing is integral to the clinical pharmacist role and a work environment conducive to prescribing. DOI: 10.3389/fpsyg.2023.1098394

Article Number: 1098394

Accession Number: WOS:000986173000001

Abstract: Weight loss is a major motive for engaging in exercise, despite substantial evidence that exercise training results in compensatory responses that inhibit significant weight loss. According to the Laws of Thermodynamics and the CICO (Calories in, Calories out) model, increased exercise-induced energy expenditure (EE), in the absence of any compensatory increase in energy intake, should result in an energy deficit leading to reductions of body mass. However, the expected negative energy balance is met with both volitional and non-volitional (metabolic and behavioral) compensatory responses. A commonly reported compensatory response to exercise is increased food intake (i.e., Calories in) due to increased hunger, increased desire for certain foods, and/or changes in health beliefs. On the other side of the CICO model, exercise training can instigate compensatory reductions in EE that resist the maintenance of an energy deficit. This may be due to decreases in non-exercise activity thermogenesis (NEAT), increases in sedentary behavior, or alterations in sleep. Related to this EE compensation, the motivational states associated with the desire to be active tend to be overlooked when considering compensatory changes in non-exercise activity. For example, exercise-induced alterations in the wanting of physical activity could be a mechanism promoting compensatory reductions in EE. Thus, one's desires, urges or cravings for movement—also known as "motivation states" or "appetence for activity"—are thought to be proximal instigators of movement. Motivation states for activity may be influenced by genetic, metabolic, and psychological drives for activity (and inactivity), and such states are susceptible to fatigue-or reward-induced responses, which may account for reductions in NEAT in response to exercise training. Further, although the current data are limited, recent investigations have demonstrated that motivation states for physical activity are dampened by exercise and increase after periods of sedentarism. Collectively, this evidence points to additional compensatory mechanisms, associated with motivational states, by which impositions in exercise-induced changes in energy balance may be met with resistance, thus resulting in attenuated weight loss.

To use the findings to recommend intervention strategies for antimicrobial stewardship in LTCFs. Design: Qualitative semistructured interviews were conducted. The data were analysed by thematic content analysis. After the interviews, the emerging findings were mapped to the theoretical domains framework (TDF), and the behaviour change wheel and behaviour change technique (BCT) taxonomy were used to recommend future intervention strategies. Participants: Interviews were conducted with 37 healthcare professionals who work in LTCFs (10 general practitioners, 4 consultants, 14 nurses, 9 pharmacists) between December 2012 and March 2013. Setting: Interviews were conducted in the greater Cork region. Results: The main domains from the TDF which emerged were: 'Knowledge', 'Environmental context and resources', 'Social influences', 'Beliefs about consequences', 'Memory, attention and decision making', with the findings identifying a need for 'Behavioural regulation'. Many participants believed that antibiotic prescribing was satisfactory at their LTCF, despite the lack of surveillance activities. Conclusions: This study, using the TDF and BCT taxonomy, has found that antibiotic prescribing in LTCFs is influenced by many social and contextual factors. The challenges of the setting and patient population, the belief about consequences to the patient, and the lack of implementation of guidelines and knowledge regarding antibiotic prescribing patterns are significant challenges to address. On the basis of the study findings and the application of the TDF and BCT taxonomy, we suggest some practical intervention functions for antimicrobial stewardship in LTCFs.

ISSN: 0140-6736

DOI: 10.1016/s0140-6736(15)01020-x

Accession Number: WOS:000369837100028

Abstract: Variation in stillbirth rates across high-income countries and large equity gaps within high-income countries persist. If all high-income countries achieved stillbirth rates equal to the best performing countries, 19 439 late gestation (28 weeks or more) stillbirths could have been avoided in 2015. The proportion of unexplained stillbirths is high and can be addressed through improvements in data collection, investigation, and classification, and with a better understanding of causal pathways. Substandard care contributes to 20-30% of all stillbirths and the contribution is even higher for late gestation intrapartum stillbirths. National perinatal mortality audit programmes need to be implemented in all high-income countries. The need to reduce stigma and fatalism related to stillbirth and to improve bereavement care are also clear, persisting priorities for action. In high-income countries, a woman living under adverse socioeconomic circumstances has twice the risk of having a stillborn child when compared to her more advantaged counterparts. Programmes at community and country level need to improve health in disadvantaged families to address these inequities.

Abstract: The integration of realist evaluation principles within randomised controlled trials (realist RCTs') enables evaluations of complex interventions to answer questions about what works, for whom and under what circumstances. This allows evaluators to better develop and refine mid-level programme theories. However, this is only one phase in the process of developing and evaluating complex interventions. We describe and exemplify how social scientists can integrate realist principles across all phases of the Medical Research Council framework. Intervention development, modelling, and feasibility and pilot studies need to theorise the contextual conditions necessary for intervention mechanisms to be activated. Where interventions are scaled up and translated into routine practice, realist principles also have much to offer in facilitating knowledge about longer-term sustainability, benefits and harms. Integrating a realist approach across all phases of complex intervention science is vital for considering the feasibility and likely effects of interventions for different localities and population subgroups.

Short Title: Designing Videos With and for Adults With ADHD for an Online Intervention: Participatory Design Study and Thematic Analysis of Evaluation

ISSN: 2368-7959

DOI: 10.2196/30292

Article Number: e30292

Accession Number: WOS:000714012600014

Abstract: Background: Adults with attention deficit hyperactivity disorder (ADHD) represent a heterogeneous group with both strengths and difficulties associated with the diagnosis. An online intervention attuned to their needs may improve their everyday functioning. When designing online interventions, it is important to adapt the therapeutic content to the values and needs of the target group. Objective: This paper describes and evaluates a participatory process used to produce content for an online intervention for adults with ADHD by producing video vignettes clarifying core

training principles grounded in the participants' everyday experiences. Methods: We report on the qualitative data from 2 research phases: the design and evaluation of video vignettes for an online intervention. In the first phase, 12 adults with ADHD, 2 clinicians, and 2 research assistants participated in the production of video vignettes for the online intervention. In the second phase, participants (n=109) gave feedback on the videos as part of a clinical trial of the intervention. A subgroup (n=7) was interviewed in-depth regarding their experiences with the videos. The qualitative data were analyzed using thematic analysis. Results: In the first phase, the participants with ADHD contributed with experiences from challenging everyday situations. In the process, we navigated between therapeutic principles and the participants' experiential perspectives to create content relevant and consistent with the target group's values and experiences. In the second phase, we identified 3 themes related to the participants' experiences and interpretation of the video vignettes: (1) recognition of ADHD-related challenges, (2) connection with the characters and the situations, and (3) video protagonists as companions and role models for change. Conclusions: A participatory design process for designing online mental health interventions can be used to probe and balance between the therapeutic principles defined by clinicians and the participants' experiences with mental health issues in the production of therapeutic content. In our study, the inclusion of video vignettes in an online intervention enabled a contextualized and relevant presentation of everyday experiences and psycho social factors in the life of an adult with ADHD.

Title: Interventions to improve professional adherence to guidelines
for prevention of device-related infections

Journal: Cochrane Database of Systematic Reviews

Issue: 3

Short Title: Interventions to improve professional adherence to
guidelines for prevention of device-related infections

ISSN: 1469-493X

DOI: 10.1002/14651858.CD006559.pub2

Article Number: Cd006559

Accession Number: WOS:000316885700004

Abstract: Background Healthcare-associated infections (HAIs) are a major threat to patient safety, and are associated with mortality rates varying from 5% to 35%. Important risk factors associated with HAIs are the use of invasive medical devices (e. g. central lines,

urinary catheters and mechanical ventilators), and poor staff adherence to infection prevention practices during insertion and care for the devices when in place. There are specific risk profiles for each device, but in general, the breakdown of aseptic technique during insertion and care for the device, as well as the duration of device use, are important factors for the development of these serious and costly infections. Objectives To assess the effectiveness of different interventions, alone or in combination, which target healthcare professionals or healthcare organisations to improve professional adherence to infection control guidelines on device-related infection rates and measures of adherence. Search methods We searched the following electronic databases for primary studies up to June 2012: the Cochrane Effective Practice and Organisation of Care (EPOC) Group Specialised Register, the Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE, EMBASE, and CINAHL. We searched reference lists and contacted authors of included studies. We also searched the Cochrane Database of Systematic Reviews and Database of Abstracts of Reviews of Effectiveness (DARE) for related reviews. Selection criteria We included randomised controlled trials (RCTs), non-randomised controlled trials (NRCTs), controlled before-after (CBA) studies and interrupted time series (ITS) studies that complied with the Cochrane EPOC Group methodological criteria, and that evaluated interventions to improve professional adherence to guidelines for the prevention of device-related infections. Data collection and analysis Two review authors independently extracted data and assessed the risk of bias of each included study using the Cochrane EPOC 'Risk of bias' tool. We contacted authors of original papers to obtain missing information. Main results We included 13 studies: one cluster randomised controlled trial (CRCT) and 12 ITS studies, involving 40 hospitals, 51 intensive care units (ICUs), 27 wards, and more than 3504 patients and 1406 healthcare professionals. Six of the included studies targeted adherence to guidelines to prevent central line-associated blood stream infections (CLABSIs); another six studies targeted adherence to guidelines to prevent ventilator-associated pneumonia (VAP), and one study focused on interventions to improve urinary catheter practices. We judged all included studies to be at moderate or high risk of bias. The largest median effect on rates of VAP was found at nine months follow-up with a decrease of 7.36 (-10.82 to 3.14) cases per 1000 ventilator days (five studies and 15 sites). The one included cluster randomised controlled trial (CRCT) observed, improved urinary catheter practices five weeks after the intervention (absolute difference 12.2 percentage points), however, the statistical significance of this is unknown given a unit of analysis error. It is worth noting that N = 6 interventions that did result in significantly decreased infection rates involved more than one active intervention, which in some cases, was repeatedly administered over time, and further, that one intervention involving specialised oral care personnel showed the largest step change (-22.9 cases per 1000 ventilator days (standard error (SE) 4.0), and also the largest slope change (-6.45 cases per 1000 ventilator days (SE 1.42, P = 0.002)) among the included studies. We attempted to combine the results for studies targeting the same indwelling medical device (central line catheters

or mechanical ventilators) and reporting the same outcomes (CLABSI and VAP rate) in two separate meta-analyses, but due to very high statistical heterogeneity among included studies (I² up to 97%), we did not retain these analyses. Six of the included studies reported post-intervention adherence scores ranging from 14% to 98%. The effect on rates of infection were mixed and the effect sizes were small, with the largest median effect for the change in level (interquartile range (IQR)) for the six CLABSI studies being observed at three months follow-up was a decrease of 0.6 (-2.74 to 0.28) cases per 1000 central line days (six studies and 36 sites). This change was not sustained over longer follow-up times. Authors' conclusions The low to very low quality of the evidence of studies included in this review provides insufficient evidence to determine with certainty which interventions are most effective in changing professional behaviour and in what contexts. However, interventions that may be worth further study are educational interventions involving more than one active element and that are repeatedly administered over time, and interventions employing specialised personnel, who are focused on an aspect of care that is supported by evidence e. g. dentists/dental auxiliaries performing oral care for VAP prevention.

ISSN: 1359-107X

DOI: 10.1111/bjhp.12666

Accession Number: WOS:000981225500001

Abstract: Purpose: The aim of this study was to conduct a process evaluation of a whole-genome sequence report form (SRF) used to reduce nosocomial SARS-CoV-2 through changing infection prevention and control (IPC) behaviours within the COVID-19 pandemic. Methods: We used a three-staged design. Firstly, we described and theorized the purported content of the SRF using the behaviour change wheel

(BCW). Secondly, we used inductive thematic analysis of one-to-one interviews (n = 39) to explore contextual accounts of using the SRF. Thirdly, further deductive analysis gauged support for the intervention working as earlier anticipated. Results: It was possible to theorize the SRF using the BCW approach and visualize it within a simple logic model. Inductive thematic analyses identified the SRF's acceptability, ease of use and perceived effectiveness. However, major challenges to embedding it in routine practice during the unfolding COVID-19 crisis were reported. Notwithstanding this insight, deductive analysis showed support for the putative intervention functions 'Education', 'Persuasion' and 'Enablement'; behaviour change techniques '1.2 Problem solving', '2.6 Biofeedback', '2.7 Feedback on outcomes of behaviour' and '7.1 Prompts and cues'; and theoretical domains framework domains 'Knowledge' and 'Behavioural regulation'. Conclusions: Our process evaluation of the SRF, using the BCW approach to describe and theorize its content, provided granular support for the SRF working to change IPC behaviours as anticipated. However, our complementary inductive thematic analysis highlighted the importance of the local context in constraining its routine use. For SRFs to reach their full potential in reducing nosocomial infections, further implementation research is needed.

Short Title: Using the behaviour change wheel approach to optimize self-sampling packs for sexually transmitted infection and blood borne viruses

ISSN: 1359-107X

DOI: 10.1111/bjhp.12607

Accession Number: WOS:000818634700001

Abstract: Purpose This paper describes the process of optimizing a

widely offered intervention-self-sampling packs for sexually transmitted infections (STIs) and blood borne viruses (BBVs). We drew upon the behaviour change wheel (BCW) approach, incorporating the theoretical domains framework (TDF) and the behaviour change technique taxonomy (BCTTv1) to systematically specify potential intervention components that may optimize the packs. Methods A BCW analysis built upon prior thematic analyses of qualitative data collected through focus groups and interviews with members of the public and people recruited from sexual health clinics in Glasgow and London (n = 56). Salient barriers and facilitators to specific sequential behavioural domains associated with the wider behavioural system of pack use were subjected to further analyses, coding them in relation to the TDF, the BCW's intervention functions, and finally specifying potential optimisation using behaviour change techniques (BCTs). Results Our TDF analysis suggested that across the overall behavioural system of pack use, the most important theoretical domains were 'beliefs about consequences' and 'memory, attention and decision-making'. BCW analysis on the overall pack suggested useful intervention functions should focus on 'environmental restructuring', 'persuasion', 'enablement', 'education' and 'modelling'. Specific ways of optimizing the intervention were also described in relation to potentially useful BCTs. Conclusions Through a detailed behavioural analysis and the TDF and wider BCW approach built on earlier qualitative work, we provide a systematic approach to optimizing an existing intervention. The approach enabled the specification of highly specific, evidence-based, and theoretically informed recommendations for intervention optimization.

Short Title: Understanding the barriers and facilitators to using self-sampling packs for sexually transmitted infections and blood-

borne viruses: Thematic analyses for intervention optimization

ISSN: 1359-107X

DOI: 10.1111/bjhp.12617

Accession Number: WOS:000835132900001

Abstract: Purpose: Self-sampling packs for sexually transmitted infections (STIs) and blood-borne viruses (BBVs) are widely offered. There are ongoing problems with reach and sample return rates. The packs have arisen without formal intervention development. This paper illustrates initial steps of an intervention optimization process to improve the packs. Methods: Eleven focus groups and seven interviews were conducted with convenience samples of patients recruited from sexual health clinics and members of the public (n = 56). To enable intervention optimization, firstly, we conducted an inductive appraisal of the behavioural system of using the pack to understand meaningful constituent behavioural domains. Subsequently, we conducted a thematic analysis of barriers and facilitators to enacting each sequential behavioural domain in preparation for future behaviour change wheel analysis. Results: Overall, we found that self-sampling packs were acceptable. Participants understood their overall logic and value as a pragmatic intervention that simultaneously facilitated and reduced barriers to individuals being tested for STIs and BBVs. However, at the level of each behavioural domain (e.g., reading leaflets, returning samples) problems with the pack were identified, as well as a series of potential optimizations, which might widen the reach of self-sampling and increase the return of viable samples. Conclusions: This paper provides an example of a pragmatic approach to optimizing an intervention already widely offered globally. The paper demonstrates the added value health psychological approaches offer; conceptualizing interventions in behavioural terms, pinpointing granular behavioural problems amenable for systematic further improvement.

Abstract: Introduction Arts and cultural engagement are associated with a range of mental and physical health benefits, including promoting healthy aging and lower incidence of age-related disabilities such as slower cognitive decline and slower progression of frailty. This suggests arts engagement constitutes health-promoting behaviour in older age. However, there are no large-scale studies examining how the predictors of arts engagement vary with age. Methods Data from the Health and Retirement Study (2014) were used to identify sociodemographic, life satisfaction, social, and arts appreciation predictors of (1) frequency of arts engagement, (2) cultural attendance, (3) difficulty participating in the arts, and (4) being an interested non-attendeer of cultural events.

Logistic regression models were stratified by age groups [50-59, 60-69, >= 70] for the frequency of arts participation outcome and [50-69 vs >= 70] all other outcomes. Results Findings indicated a number of age-related predictors of frequent arts engagement, including gender, educational attainment, wealth, dissatisfaction with aging, and instrumental activities of daily living (iADL). For cultural event attendance, lower interest in the arts predicted lack of engagement across age groups, whereas higher educational attainment and more frequent religious service attendance became predictors in older age groups (>= 70). Adults in both age groups were less likely to report difficulties engaging in the arts if they had lower neighbourhood safety, whilst poor self-rated health and low arts appreciation also predicted reduced likelihood of this outcome, but only in the younger (50-69) age group. Adults in the older (>= 70) age group were more likely to be interested non-attendeers of cultural events if they had higher educational attainment and less likely if they lived in neighbourhoods with low levels of safety. Conclusions Our results suggest that certain factors become stronger predictors of arts and cultural engagement and barriers to engagement as people age. Further, there appear to be socioeconomic inequalities in engagement that may increase in older ages, with arts activities overall more accessible as individuals age compared to cultural engagement due to additional financial barriers and transportation barriers. Ensuring that these activities are accessible to people of all ages will allow older adults to benefit from the range of health outcomes gained from arts and cultural engagement.

Abstract: Implementing Evidence-Based Practice (EBP) in school settings can be challenging. This case study presents barriers and facilitators expressed by kindergarten teachers (N = 6) during the implementation of a theme-based cooperative learning project over the course of a semester. During three group interviews, at the start, mid-point, and end, the teachers expressed their thoughts and experiences about the project. The Theoretical Domains Framework (TDF) was used to identify and analyze barriers and facilitators throughout the project. The importance of organizational investment, collegial connection and collaboration, the pedagogical fit of the EBP, and plans for long-term change were highlighted as beneficial factors for successful implementation in this case study.

Abstract: Diabetic retinopathy (DR) complications can be prevented with regular screening and timely access to an ophthalmologist for treatment. But there are patient and health system barriers that can impact access to DR services. This study aims to identify enablers and barriers for accessing public DR eye care services in a low socio-economic urban area of Australia. We conducted a qualitative study using semi-structured interviews for patients with diabetes

aged 35 years and older attending public ophthalmology services. Interviews were analyzed to identify themes and subthemes; and the COM-B framework was used to interpret the complex behavioral mechanisms, including capability, opportunity, and motivation factors, to explain adherence to DR eye care. Three main themes and 7 sub-themes relating to patient experiences of DR care were derived. Patients were found to be passive actors in their DR eye care, but patients trusted clinicians and were determined to maintain their vision and quality of life. The barriers and facilitators of care related to the health system (service availability and recall-reminder systems) and patient experiences (choices, knowledge, and fear). The findings of this study will guide patient-centered initiatives to target and improve access to DR care. Strategies should focus on improving communication between eye care providers, and communication with patients to empower them to become more active players in healthcare decisions.

Abstract: Objective The Getting Recovery Right After Neck Dissection (GRRAND) intervention is a physiotherapy programme for patients with head and neck cancer who have undergone neck dissection. The aim of this qualitative study was to understand if the intervention was useful, acceptable and whether it was feasible to conduct a randomised controlled trial (RCT). Design This qualitative study was embedded within the GRRAND-Feasibility (GRRAND-F) Study. Setting Participants were recruited from four acute National Health Service hospitals in England between 2020 and 2021. Participants We

interviewed four usual care and four intervention patient-participants from a single study site (Oxford). Six were male, two were female. All were white British ethnicity. We interviewed two physiotherapists from Oxford who delivered the GRRAND-F intervention, and physiotherapists from Birmingham, Poole and Norwich who were trained to deliver the intervention but were not able to deliver it within the study time frame. Results The analysis identified five themes: (1) Acceptability, (2) Adherence, (3) Outcomes, (4) Feasibility and (5) Stand-alone themes (prehabilitation, video consultations, healthcare use). Patient-participants and physiotherapist-participants agreed that usual care was not meeting patients' rehabilitation needs. The GRRAND intervention provided biopsychosocial support. In comparison to the usual care group, patient-participants who received the intervention were more confident that they could perform rehabilitation exercises and were more motivated to engage in long-term adaptive behaviour change. Physiotherapists felt they needed more administrative support to participate in an RCT. Conclusion Participants felt that usual care was insufficient. GRRAND provided much needed, biopsychosocial support to patients. Participants were supportive that it would be feasible to test GRRAND in an RCT.

Abstract: Purpose: Children with mental health disorders have lower physical activity levels compared to their peers; however, minimal research has been conducted to date to understand their unique experiences of physical activity. We sought to better understand these experiences, along with contributing factors, through interviews with children with mental health disorders and their parents/guardians. Methods: Semi-structured interviews were conducted with 20 children (6-12 years, 17 males) and 18 parents/guardians from a metropolitan mental health service, and data were

analysed using a thematic analysis approach. Results and conclusions: Children predominantly participated in play-based, unstructured physical activities with their families. Aspects of social connection (or disconnection), children's movement skill and resilience, and a desire to experience success and enjoyment, were described as influencers of children's physical activity participation experiences (and levels). Children and parents/guardians also emphasised the importance of emotional and physical support surrounding physical activity participation, and the need for suitably tailored programmes and environments. Recommendations are offered to facilitate physical activity programming that meets the specific needs of children with mental health disorders and their families.

Abstract: Objectives The purpose of this study was to explore the experiences of people with multiple sclerosis (MS) who participated in iStep-MS, a feasibility randomised controlled trial of a behaviour change intervention that aimed to increase physical activity and reduce sedentary behaviour. Design A qualitative approach was undertaken embedded in the feasibility randomised controlled trial. One-to-one semi-structured interviews were conducted and analysed using Framework analysis. Setting

Participants were recruited from a single MS therapy centre in the southeast of England, UK. Participants Sixty people with MS were randomly allocated in a 1:1 ratio to the intervention or usual care. Following a purposive sampling strategy, 15 participants from the intervention arm undertook 1:1 semi-structured interviews.

Interventions The iStep-MS intervention consisted of four therapist-led sessions over 12 weeks, supported by a handbook and pedometer.

Results Three themes were identified from the data. "I can do this": developing competence in physical activity highlights the enhanced physical activity confidence gained through goal setting and accomplishment. "I felt valued": the nurturing culture provides an overview of the supportive and non-judgemental environment created by the programme structure and therapeutic relationship. Finally, "What can I do?": empowered enactment describes the transition from the supported iStep-MS intervention to intrinsically motivated physical activity enactment. Conclusions Overall, this study supports the acceptability of the iStep-MS intervention and identified key areas that supported participants to be physically active.

Abstract: Background: Increasing rates of type 2 diabetes mellitus place a substantial burden on health care services, communities, families and individuals living with the disease or at risk of developing it. Estimates of the combined prevalence of intermediate hyperglycaemia and diabetes in Bangladesh vary, and can be as high as 30% of the adult population. Despite such high prevalence,

awareness and control of diabetes and its risk factors are limited. Prevention and control of diabetes and its complications demand increased awareness and action of individuals and communities, with positive influences on behaviours and lifestyle choices. In this study, we will test the effect of two different interventions on diabetes occurrence and its risk factors in rural Bangladesh.
