Abstract: Introduction Previous trials of dietary interventions to prevent gestational diabetes mellitus (GDM) have yielded only limited success. Low-carbohydrate diets have shown promise for the treatment of type 2 diabetes, but there is no evidence to support their use in pregnancy. The aim of this study is to explore the feasibility of a moderately reduced-carbohydrate dietary intervention delivered from mid-pregnancy alongside routine antenatal care. Methods and analysis This is a feasibility randomised controlled trial (RCT) with embedded qualitative study. Sixty women who are pregnant <20 weeks' gestation, with body mass index ≥ 30 kg/m² at their antenatal booking appointment, will be randomised 2:1 intervention or control (usual care) and followed up until delivery. The intervention is a moderately reduced-carbohydrate diet (similar to 130-150 g total carbohydrate/day), designed to be delivered alongside routine antenatal appointments. Primary outcomes are measures of adoption of the diet and retention of participants. Secondary outcomes include incidence of GDM, change in markers of glycaemic control, gestational weight gain, total carbohydrate and energy intake. Process outcomes will examine resources and management issues. Exploratory outcomes include further dietary changes, quality of life, maternal and neonatal outcomes, and qualitative measures. Ethics and dissemination This trial was reviewed and approved by the South-Central Oxford B Research Ethics Committee NHS National Research Ethics Committee and the Health Research Authority (Reference: 20/SC/0442). The study results will inform whether to progress to a full-scale RCT to test the clinical effectiveness of the RECORD programme to prevent GDM in women at high risk. The findings will be published in peer-reviewed journals and presented at conferences.

Abstract: Understanding the behaviour surrounding vaccine uptake involves issues of capability, opportunity and motivation. Despite the advice of social scientists with a long history of research in understanding behaviour, many policy makers have so far paid too little attention to the role of opportunity issues such as accessibility and cost, instead focusing on capability and motivation issues, such as knowledge and desire to get vaccinated, respectively.

Accession Number: WOS:000321580800012

Abstract: CONSORT guidelines call for precise reporting of behavior change interventions: we need rigorous methods of characterizing active content of interventions with precision and specificity. The objective of this study is to develop an extensive, consensually agreed hierarchically structured taxonomy of techniques [behavior change techniques (BCTs)] used in behavior change interventions. In a Delphi-type exercise, 14 experts rated labels and definitions of 124 BCTs from six published classification systems. Another 18 experts grouped BCTs according to similarity of active ingredients in an open-sort task. Inter-rater agreement amongst six researchers coding 85 intervention descriptions by BCTs was assessed. This resulted in 93 BCTs clustered into 16 groups. Of the 26 BCTs occurring at least five times, 23 had adjusted kappas of 0.60 or above. "BCT taxonomy v1," an extensive taxonomy of 93 consensually agreed, distinct BCTs, offers a step change as a method for specifying interventions, but we anticipate further development and evaluation based on international, interdisciplinary consensus.

Short Title: Behaviour change techniques: the development and evaluation of a taxonomic method for reporting and describing behaviour change interventions (a suite of five studies involving consensus methods, randomised controlled trials and analysis of qualitative data)
ISSN: 1366-5278
DOI: 10.3310/hta19990
Accession Number: WOS:000365971500001
Abstract: Background: Meeting global health challenges requires effective behaviour change interventions (BCIs). This depends on advancing the science of behaviour change which, in turn, depends on accurate intervention reporting. Current reporting often lacks

detail, preventing accurate replication and implementation. Recent developments have specified intervention content into behaviour change techniques (BCTs) –the 'active ingredients', for example goal-setting, self-monitoring of behaviour. BCTs are 'the smallest components compatible with retaining the postulated active ingredients, i.e. the proposed mechanisms of change. They can be used alone or in combination with other BCTs' (Michie S, Johnston M. Theories and techniques of behaviour change: developing a cumulative science of behaviour change. *Health Psychol Rev* 2012; 6: 1–6). Domain-specific taxonomies of BCTs have been developed, for example healthy eating and physical activity, smoking cessation and alcohol consumption. We need to build on these to develop an internationally shared language for specifying and developing interventions. This technology can be used for synthesising evidence, implementing effective interventions and testing theory. It has enormous potential added value for science and global health. Objective: (1) To develop a method of specifying content of BCIs in terms of component BCTs; (2) to lay a foundation for a comprehensive methodology applicable to different types of complex interventions; (3) to develop resources to support application of the taxonomy; and (4) to achieve multidisciplinary and international acceptance for future development. Design and participants: Four hundred participants (systematic reviewers, researchers, practitioners, policy-makers) from 12 countries engaged in investigating, designing and/or delivering BCIs. Development of the taxonomy involved a Delphi procedure, an iterative process of revisions and consultation with 41 international experts; hierarchical structure of the list was developed using inductive 'bottom-up' and theory-driven 'top-down' open-sort procedures (n = 36); training in use of the taxonomy (1-day workshops and distance group tutorials) (n = 161) was evaluated by changes in intercoder reliability and validity (agreement with expert consensus); evaluating the taxonomy for coding interventions was assessed by reliability (intercoder; test-retest) and validity (n = 40 trained coders); and evaluating the taxonomy for writing descriptions was assessed by reliability (intercoder; test-retest) and by experimentally testing its value (n = 190). Results: Ninety-three distinct, non-overlapping BCTs with clear labels and definitions formed Behaviour Change Technique Taxonomy version 1 (BCTTv1). BCTs clustered into 16 groupings using a 'bottom-up' open-sort procedure; there was overlap between these and groupings produced by a theory-driven, 'top-down' procedure. Both training methods improved validity (both $p < 0.05$), doubled the proportion of coders achieving competence and improved confidence in identifying BCTs in workshops (both $p < 0.001$) but did not improve intercoder reliability. Good intercoder reliability was observed for 80 of the 93 BCTs. Good within-coder agreement was observed after 1 month ($p < 0.001$). Validity was good for 14 of 15 BCTs in the descriptions. The usefulness of BCTTv1 to report descriptions of observed interventions had mixed results. Conclusions: The developed taxonomy (BCTTv1) provides a methodology for identifying content of complex BCIs and a foundation for international cross-disciplinary collaboration for developing more effective interventions to improve health. Further work is needed to examine its usefulness for reporting interventions.

Short Title: Triage, treatment and transfer of patients with stroke in emergency department trial (the T-3 Trial): a cluster randomised trial protocol

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0503-6

Article Number: 139

Accession Number: WOS:000385594200001

Abstract: Background: Internationally recognised evidence-based guidelines recommend appropriate triage of patients with stroke in emergency departments (EDs), administration of tissue plasminogen activator (tPA), and proactive management of fever, hyperglycaemia and swallowing before prompt transfer to a stroke unit to maximise outcomes. We aim to evaluate the effectiveness in EDs of a theory-informed, nurse-initiated, intervention to improve multidisciplinary triage, treatment and transfer (T-3) of patients with acute stroke to improve 90-day death and dependency. Organisational and contextual factors associated with intervention uptake also will be evaluated. Methods: This prospective, multicentre, parallel group, cluster randomised trial with blinded outcome assessment will be conducted in EDs of hospitals with stroke units in three Australian states and one territory. EDs will be randomised 1: 1 within strata defined by state and tPA volume to receive either the T-3 intervention or no additional support (control EDs). Our T-3 intervention comprises an evidence-based care bundle targeting: (1) triage: routine assignment of patients with suspected stroke to Australian Triage Scale category 1 or 2; (2) treatment: screening for tPA eligibility and administration of tPA where applicable; instigation of protocols for management of fever, hyperglycaemia and swallowing; and (3) transfer: prompt admission to the stroke unit. We will use implementation science behaviour change methods informed

by the Theoretical Domains Framework [1, 2] consisting of (i) workshops to determine barriers and local solutions; (ii) mixed interactive and didactic education; (iii) local clinical opinion leaders; and (iv) reminders in the form of email, telephone and site visits. Our primary outcome measure is 90 days post-admission death or dependency (modified Rankin Scale >2). Secondary outcomes are health status (SF-36), functional dependency (Barthel Index), quality of life (EQ-5D); and quality of care outcomes, namely, monitoring and management practices for thrombolysis, fever, hyperglycaemia, swallowing and prompt transfer. Outcomes will be assessed at the patient level. A separate process evaluation will examine contextual factors to successful intervention uptake. At the time of publication, EDs have been randomised and the intervention is being implemented. Discussion: This theoretically informed intervention is aimed at addressing important gaps in care to maximise 90-day health outcomes for patients with stroke.

Short Title: Evaluating the influence of nature connection and values on conservation attitudes at a tropical deforestation frontier

ISSN: 0888-8892

DOI: 10.1111/cobi.14067

Accession Number: WOS:000975585600001

Abstract: Inner phenomena, such as personal motivations for pursuing sustainability, may be critical levers for improving conservation outcomes. Most conservation research and policies, however, focus on external phenomena (e.g., ecological change or economic processes).

We explored the factors shaping 9 conservation attitudes toward forest and wildlife protection among colonist farmers around an Amazonian deforestation frontier. Our data comprised 241 face-to-face quantitative surveys, complemented with qualitative insights from open-ended questionnaire responses and opportunistic semistructured interviews. To account for the full spectrum of possible inner motivations, we employed measures of nature connection (indicating biospheric motivation) and personal values organized around the traditionalism (traditionalist through to high openness to change) and universalism dimensions (egoistic through to altruistic motivations). We used averaged beta-binomial generalized linear models to assess the role of external factors (socioeconomic, sociodemographic, and environmental) and personal (inner) motivations on the variation in attitudes. Each attitude was modeled separately. The relative importance of each predictor was judged by the proportion of models where it appeared as significant. Proconservation views were expressed by the majority (at least 65%) of the respondents in 7 out of the 9 attitude models. The most consistent predictors were emotional nature connection and personal values (significant in 4–6 out of 9 models), rather than external phenomena (significant in 0–5 models). However, the poorest farmers had lower scores on the agreement with prioritizing nature over development ($\beta = -0.52$, 95% CI: -0.96 to -0.07). Qualitative data also indicated that economic barriers hinder forest conservation on farms. These results suggest that biospheric, traditionalistic, and altruistic motivations promote people's proconservation attitudes, but nurturing these latent motivations is unlikely to improve conservation outcomes if material poverty remains unaddressed. Integrating the inner-outer perspective into conservation thinking and practical interventions could foster environmental stewardship and increase human well-being.

Short Title: Do pharmacy practice standards effectively describe

behaviour? Reviewing practice standards using a behavioural specificity framework

DOI: 10.1186/s12913-021-07358-4

Article Number: 71

Accession Number: WOS:000742659400004

Abstract: Background Guidelines and practice standards exist to communicate the conduct and behaviour expected of health care professionals and ensure consistent quality practice. It is important that they describe behaviours explicitly so they can be interpreted, enacted and measured with ease. The AACTT framework specifies behaviour in terms of the: Action to be performed, Actor who performs the action, Context where the action occurs, Target who the action is performed with/for and Time when the action is performed (AACTT). It provides the most up to date framework for specifying behaviours and is particularly relevant to complex behavioural problems that involve sequences of behaviours performed by different people. Behavioural specificity within pharmacy practice standards has not been explored. Aim To determine if behaviours described in the Professional Practice Standards for Australian Pharmacists specify Action, Actor, Context, Target and Time. Methods Two researchers independently reviewed the scope and structure of the practice standards and one extracted action statements (behaviours) verbatim. Through an iterative process, the researchers modified and developed the existing AACTT definitions to operationalise them for application to review of the action statements in the practice standards. The operational definitions, decision criteria and curated examples were combined in a codebook. The definitions were consistently applied through a directed content analysis approach to evaluate all extracted action statements by one researcher. For consistency 20% was independently checked for agreement by a second researcher. Results A novel codebook to apply AACTT criteria to evaluate practice standards was developed. Application of this codebook identified 768 independent behaviours. Of these, 300 (39%) described at least one discrete observable action, none specified an actor, 25 (3%) specified context, 131 (17%) specified target and 88 (11%) specified time. Conclusion(s) The behaviours detailed in practice standards for Australian pharmacists do not consistently specify behaviours in terms of Action, Actor, Context, Target and Time. Developers in the pharmacy profession, and beyond, should consider the behavioural specificity of their documents to improve interpretability, usability and adherence to the behaviours detailed. This also has implications for the development and evaluation of interventions to change such behaviours and improve quality of care.

Accession Number: WOS:000705765500001

Abstract: Parental presence at the bedside (PPB) of critically ill children in the pediatric intensive care unit (PICU) is necessary for operationalizing family-centred care. Previous evidence syntheses emphasize parent-healthcare provider interactions at rounds and resuscitation; our focus is the parent-child dyad. Prior to embarking on further study, we performed a scoping review to determine the breadth and scope of the literature addressing PPB of critically ill children in the PICU. We searched five online databases (MEDLINE, EMBASE, CINAHL, Cochrane Library, and PSYCHINFO) and the grey literature to identify English and French reports from January 1960 to June 2020 addressing physical parental presence with children (birth to 18 years) in intensive care units, without limitation by methodology. Screening, reference selection, and data extraction were performed by two independent reviewers. Data were extracted into a researcher-designed tool. We identified 204 publications (81 quantitative, 68 qualitative, 22 mixed methods, and 9 descriptive case or practice change studies, and a further 24 non-study reports). PPB was directly assessed in 78 (38%) reports, and was the primary objective in 64 (31%). Amount or quality of presence was addressed by 114 reports, barriers and enablers by 152 sources, and impacts and outcomes by 134 sources. While only 6 reports were published in the first two decades of our search (1960-1980), 17 reports were published in 2019 alone. Conclusions: A relatively large body of literature exists addressing PPB of critically ill children. Separate systematic evidence syntheses to assess each element of PPB are warranted. Scoping review protocol registration: Open science framework, protocol nx6v3, registered 9-September-2019. What is Known: center dot Parental presence at the bedside of critically ill children must be enabled to facilitate family centeredness in care. center dot Systematic evidence syntheses have focused on parental presence at rounds or resuscitation, rather than with the child throughout the intensive care journey. What is New: center dot Many reports (n=204) address parental presence at the

bedside in the pediatric intensive care unit, though most do as incidental findings center dot Identifies studies addressing key elements of parental presence in the PICU including barriers and enablers to, amount and quality of, and impact and outcomes of parental presence, and demonstrates trends over time and geography. Article Number: pzac121

Accession Number: WOS:000914629400002

Abstract: Objective The purpose of this study was to examine telehealth physical therapy utilization 1 year into the COVID-19 pandemic and identify factors that influence physical therapists' delivery of telehealth in an urban academic medical center. Methods Electronic medical record data were extracted within the dates of interest (March 22, 2021 to May 15, 2021), the proportion of physical therapy sessions delivered via telehealth were identified, and patient characteristics were compared by telehealth volume (0 vs >= 1 session, 1 vs >1 session). Qualitative data also were collected from physical therapists via semi-structured interviews, and a directed content analysis was conducted, informed by the Capability, Opportunity, Motivation, and Behavior model, to identify factors influencing telehealth delivery. Results Telehealth was used for 3793 of 8038 (47.2%) physical therapist sessions, and 1028 unique patients had at least 2 physical therapist sessions (without telehealth: 6.6% [n = 68], telehealth once: 39.1% [n = 402], telehealth more than once: 54.3% [n = 558]). Patients without telehealth were older, non-English speaking, had non-commercial insurance, and had at least 1 chronic health condition. Patients with telehealth more than once had a neurologic diagnosis and lived farther from the treating clinic. Capabilities that influenced telehealth delivery were physical therapist clinical skills and knowledge, technical proficiency, telehealth-specific interpersonal skills, and cognitive flexibility. Factors external to physical

therapists—including the environment, patient equipment and technology proficiency, physical therapist equipment, clinic factors, and patient and referring provider perspectives—also influenced telehealth delivery. Finally, patient needs and telehealth as a beneficial tool guided physical therapist intention to use telehealth. Conclusion Sustained telehealth utilization outcomes 1 year into the COVID-19 pandemic and an interaction among physical therapist, patient, and environmental factors support the long-term potential of telehealth physical therapy in an urban academic medical center. Impact These findings support the long-term potential of telehealth approaches and can be used to inform telehealth physical therapist training programs and clinical implementation, future research, and health policy.

Abstract: Simple Summary Effective and ethical management of problem animal behaviour requires the translation of scientific research into practice. However, to do this we must appreciate different scientific perspectives and their limitations. There are serious limitations to the application of population level effects to the care of the individual. Factors such as p-values relating to difference, or lack thereof, appear to be frequently misunderstood and may be of less value than widely appreciated. Clinical significance can be very different to statistical significance. There is also a growing concern over the way in which an approach supposedly based on evidence medicine is being applied to treatment recommendations. This is in danger of creating unhelpful biases that can undermine the delivery of personalized care which is at the heart of clinical animal behaviour practice. In order to address this, increased open access and data-sharing is to be encouraged. Evidence from scientific studies needs to be combined with critical reflection of its relevance on a case by case basis by clinicians. Accordingly it is imperative that they have a high level of

scientific literacy. Both the public and clinicians are interested in the application of scientific knowledge concerning problem animal behaviour and its treatment. However, in order to do this effectively it is essential that individuals have not only scientific literacy but also an appreciation of philosophical concepts underpinning a particular approach and their practical implications on the knowledge generated as a result. This paper highlights several common misunderstandings and biases associated with different scientific perspectives relevant to clinical animal behaviour and their consequences for how we determine what may be a useful treatment for a given patient. In addition to more reflective evaluation of results, there is a need for researchers to report more information of value to clinicians; such as relevant treatment outcomes, effect sizes, population characteristics. Clinicians must also appreciate the limitations of population level study results to a given case. These challenges can however be overcome with the careful critical reflection using the scientific principles and caveats described.

Title: Exploring the Role of Enforcement in Promoting Adherence with Protective Behaviours during COVID-19

Journal: Policing—a Journal of Policy and Practice

Volume: 16

Issue: 4

Pages: 580-590

Date: Dec

Short Title: Exploring the Role of Enforcement in Promoting Adherence with Protective Behaviours during COVID-19

ISSN: 1752-4512

DOI: 10.1093/police/paab079

Accession Number: WOS:000764668800001

Abstract: The aim of this narrative review was to explore the conditions under which enforcement likely is, or is not, an effective strategy to increase adherence to recommended protective behaviours during COVID-19. Relevant search terms were entered into four key databases (Google, Google Scholar, medXriv, and psyArXiv) to identify both academic and non-academic papers relating to the use of enforcement. Primary research, reviews, blogs, newspaper reports, and theoretical descriptions were included. This review suggests that enforcement is less effective when: it is applied inconsistently; rules are ambiguous; and behaviours are unobservable. Providing food and financial support, creating social norms, and increasing trust are more effective in addressing specific barriers and fostering voluntary adherence. Where enforcement forms part of the strategy for policing COVID-19 regulations, rules must be clear and local responders must be given

time and opportunity to plan their response as new rules are implemented. Due to the narrative nature of the review, and the rapidly changing nature of the COVID-19 pandemic, some evidence may have been inadvertently excluded. Findings inform an understanding of the impact of the public narrative of enforcement on adherence and facilitate the development of recommendations for increasing adherence to protective behaviours during COVID-19. Given the importance of public adherence, these recommendations are not only useful in the context of COVID-19 but also for future public health emergencies. This narrative review is the first to explore the circumstances under which enforcement can increase or reduce adherence with COVID-19 guidelines, generating recommendations for improved public adherence.

DOI: 10.1186/s13195-021-00885-6

Article Number: 173

Accession Number: WOS:000706150900005

Abstract: Brain Health Services are a novel approach to the personalized prevention of dementia. In this paper, we consider how such services can best reflect their social, cultural, and economic context and, in doing so, deliver fair and equitable access to risk reduction. We present specific areas of challenge associated with the social context for dementia prevention. The first concentrates on how Brain Health Services engage with the "at-risk" individual, recognizing the range of factors that shape an individual's risk of dementia and the efficacy of risk reduction measures. The second emphasizes the social context of Brain Health Services themselves and their ability to provide equitable access to risk reduction. We then elaborate proposals for meeting or mitigating these challenges. We suggest that considering these challenges will enable Brain Health Services to address two fundamental questions: the balance between an individualized "high-risk" and population focus for public health prevention and the ability of services to meet ethical standards of justice and health equity.

Title: Associations Between Behavior Change Techniques and
Engagement With Mobile Health Apps: Protocol for a Systematic Review

Journal: Jmir Research Protocols

Volume: 11

Issue: 3

Date: Mar

Short Title: Associations Between Behavior Change Techniques and
Engagement With Mobile Health Apps: Protocol for a Systematic Review

ISSN: 1929-0748

DOI: 10.2196/35172

Article Number: e35172

Accession Number: WOS:000779992200022

Abstract: Background: Digitally enabled care along with an emphasis on self-management of health is steadily growing. Mobile health apps provide a promising means of supporting health behavior change; however, engagement with them is often poor and evidence of their impact on health outcomes is lacking. As engagement is a key prerequisite to health behavior change, it is essential to understand how engagement with mobile health apps and their target health behaviors can be better supported. Although the importance of engagement is emphasized strongly in the literature, the understanding of how different components of engagement are associated with specific techniques that aim to change behaviors is lacking. Objective: The purpose of this systematic review protocol is to provide a synthesis of the associations between various behavior change techniques (BCTs) and the different components and measures of engagement with mobile health apps. Methods: The review protocol was structured using the PRISMA-P (Preferred Reporting Items for Systematic Reviews and Meta-Analyses Protocols) and the PICOS (Population, Intervention, Comparator, Outcome, and Study type) frameworks. The following seven databases will be systematically searched: PubMed, Embase, Cumulative Index to Nursing and Allied Health Literature, APA PsycInfo, ScienceDirect, Cochrane Library, and Web of Science. Title and abstract screening, full-text review, and data extraction will be conducted by 2 independent reviewers. Data will be extracted into a predetermined form, any disagreements in screening or data extraction will be discussed, and

a third reviewer will be consulted if consensus cannot be reached. Risk of bias will be assessed using the Cochrane Collaboration Risk of Bias 2 and the Risk Of Bias In Non-Randomized Studies – of Interventions (ROBINS-I) tools; descriptive and thematic analyses will be conducted to summarize the relationships between BCTs and the different components of engagement. Results: The systematic review has not yet started. It is expected to be completed and submitted for publication by May 2022. Conclusions: This systematic review will summarize the associations between different BCTs and various components and measures of engagement with mobile health apps. This will help identify areas where further research is needed to examine BCTs that could potentially support effective engagement and help inform the design and evaluation of future mobile health apps.

DOI: 10.1371/journal.pone.0152903

Article Number: e0152903

Accession Number: WOS:000373592100041

Abstract: Background In hospitals around the world, there has been no consensus regarding which clinical activities a pharmacist should focus on until recently. In 2011, a Canadian clinical pharmacy key performance indicator (cpKPI) collaborative was formed. The goal of the collaborative was to advance pharmacy practice in order to improve patient outcomes and enhance the quality of care provided to patients by hospital pharmacists. Following a literature review, which indicated that pharmacists can improve patient outcomes by carrying out specific activities, and an evidence-informed consensus process, a final set of eight cpKPIs were established. Canadian hospitals leading the cpKPI initiative are currently in the early stages of implementing these indicators. Objective To explore pharmacists' perceptions of the barriers and facilitators to the

implementation of cpKPIs. Methods Clinical pharmacists employed by the Nova Scotia Health Authority were invited to participate in focus groups. Focus group discussions were audio-recorded and transcribed, and data was analyzed using thematic analysis. Findings Three focus groups, including 26 pharmacists, were conducted in February 2015. Three major themes were identified. Resisting the change was comprised of documentation challenges, increased workload, practice environment constraints, and competing priorities. Embracing cpKPIs was composed of seeing the benefit, demonstrating value, and existing supports. Navigating the unknown was made up of quality versus quantity battle, and insights into the future. Conclusions Although pharmacists were challenged by documentation and other changes associated with the implementation of cpKPIs, they demonstrated significant support for cpKPIs and were able to see benefits of the implementation. Pharmacists came up with suggestions for overcoming resistance associated with the implementation of cpKPIs and provided insights into the future of pharmacy practice. The identification of barriers and facilitators to cpKPI implementation will be used to inform the implementation process on a local and national level.

Abstract: The advent of smart infrastructure or Internet of Things (IoT) has enabled scenarios in which objects with unique identifiers can communicate and transfer data over a network without human to human/computer interactions. Incorporating hardware in such networks is so cheap that it has opened the possibility of connecting just about anything from simple nodes to complex, remotely-monitored sensor networks. In the paper, we describe a low-cost scalable and

potentially ubiquitous system for indoor remote health monitoring using low energy bluetooth beacons and a smartwatch. Our system was implemented in a rehabilitation facility in Los Angeles and the overall assessments revealed promising results.

Short Title: Examining the influences on the use of behavioural science within UK local authority public health: Qualitative thematic analysis and deductive mapping to the COM-B model and Theoretical Domains Framework

DOI: 10.3389/fpubh.2022.1016076

Article Number: 1016076

Accession Number: WOS:000879423600001

Abstract: Background Behavioural science and its contribution towards improving public health is receiving increased recognition. Yet, the translation of these insights into public health practice is under-researched. This study explored the factors influencing the use of behavioural science within public health at a local authority level. Methods Fourteen local authority staff (n = 13 female) in the south of England participated in semi-structured interviews, which were analysed inductively to identify key themes. These were later mapped deductively to the COM-B model and Theoretical Domains Framework.

Findings Nine themes were identified as factors that influence the use of behavioural science in local authority public health: (1) "Limited past experience," (2) "Narrow understanding," (3) "Perceived value of behavioural science," (4) "Translational gap from theory-to-practice," (5) "No protected time," (6) "Old ways of working," (7) "Political influence and organisational culture," (8) "Relationships with key stakeholders," (9) "Access to behavioural science resources". Deductive mapping of these themes revealed that five of the COM constructs (excluding Physical Capability) and eleven of the TDF domains influenced behavioural science use, with "Social influences" and "Knowledge" being the most prominent.

Discussion Use of behavioural science within local authority public health practice is limited and inconsistent. For it to be successfully implemented, there must be an understanding of its role and value, alongside strategies to overcome a translational gap from theory to practice. Public health teams would benefit from protected time to enable application and strategies to break old habits of

using a common-sense approach. System-wide buy-in, particularly related to senior leadership and system partners is needed, which would benefit from organisational and political culture change. Training opportunities, practical resources and expert in-house support should be considered a priority across public health teams. Article Number: e045084

Accession Number: WOS:000632921900025

Abstract: Introduction Fewer than half of all people in the USA have a documented advance care plan (ACP). Hospitalisation offers an opportunity for physicians to initiate ACP conversations. Despite expert recommendations, hospital-based physicians (hospitalists) do not routinely engage in these conversations, reserving them for the critically ill. The objective of this study is to test the effect of a novel behavioural intervention on the incidence of ACP conversations by hospitalists practicing at a stratified random sample of hospitals drawn from 220 US acute care hospitals staffed by a large, nationwide acute care physician practice with an ongoing ACP quality improvement initiative. Methods and analysis We developed Hopewell Hospitalist, a theory-based adventure video game, to modify physicians' attitudes towards ACP conversations and to increase their motivation for engaging in them. The planned study is a pragmatic stepped-wedge crossover phase III trial, testing the efficacy of Hopewell Hospitalist for increasing ACP conversations. We will randomise 40 hospitals to the month (step) in which they receive the intervention. We aim to recruit 30 hospitalists from up to eight hospitals each step to complete the intervention, playing Hopewell Hospitalist for at least 2 hours. The primary outcome is ACP billing for patients aged 65 and older managed by participating hospitalists. We hypothesise that the intervention will increase ACP billing in the quarter after dissemination, and have 80% power to detect a 1% absolute increase and 99% power to detect a 3.5% absolute increase. Ethics and dissemination Dartmouth's Committee

for the Protection of Human Subjects has approved the study protocol, which is registered on clinicaltrials.gov. We will disseminate the results through manuscripts and the trials website. Hopewell Hospitalist will be made available on the iOS Application Store for download, free of cost, at the conclusion of the trial.

Article Number: 63
Accession Number: WOS:000561261500001

Abstract: **Background:** The US Preventive Services Task Force (USPSTF) recommends out-of-office blood pressure (BP) testing to exclude white coat hypertension prior to hypertension diagnosis. Despite improved availability and coverage of home and 24-h ambulatory BP monitoring (HBPM, ABPM), both are infrequently used to confirm diagnoses. We used the Behavior Change Wheel (BCW) framework, a multi-step process for mapping barriers to theory-informed behavior change techniques, to develop a multi-component implementation strategy for increasing out-of-office BP testing for hypertension diagnosis. Informed by geographically diverse provider focus groups (n = 63) exploring barriers to out-of-office testing and key informant interviews (n = 12), a multi-disciplinary team (medicine, psychology, nursing) used rigorous mixed methods to develop, refine, locally adapt, and finalize intervention components. The purpose of this report is to describe the protocol of the Effects of a Multi-faceted intervention on Blood Pressure Actions in the primary Care Environment (EMBRACE) trial, a cluster randomized control trial evaluating whether a theory-informed multi-component strategy increased out-of-office testing for hypertension diagnosis. **Methods/design:** The EMBRACE Trial patient sample will include all adults ≥ 18 years of age with a newly elevated office BP ($\geq 140/90$ mmHg) at a scheduled visit with a primary care provider from a study clinic. All providers with scheduled visits with adult primary care patients at enrolled ACN primary care clinics were included. We determined that the most feasible, effective implementation strategy would include delivering education about out-of-office testing, demonstration/instruction on how to perform out-of-office HBPM and ABPM testing, feedback on completion rates of out-of-office testing, environmental prompts/cues via computerized clinical decision support (CDS) tool, and a culturally tailored, locally accessible ABPM testing service. We are currently comparing the effect of this locally adapted multi-component strategy with usual care on the change in the proportion of eligible patients who complete out-of-office BP testing in a 1:1 cluster randomized trial across 8 socioeconomically diverse clinics. **Conclusions:** The EMBRACE trial is the first trial to test an implementation strategy for improving out-of-office testing for hypertension diagnosis. It will elucidate the degree to which targeting provider behavior via education, reminders, and decision support in addition to providing an ABPM testing service will improve referral to and completion of ABPM and HBPMs.

DOI: 10.26633/rpsp.2022.180

Accession Number: WOS:000877823500001

Abstract: Objectives. To evaluate the association between knowledge, attitudes, and behavior (KAB) towards sodium use and sodium intake measured by 24-hour urinary collection in an adult cohort from Uruguay (Genotype Phenotype and Environment of Hypertension Study, GEFA-HT-UY). Methods. In a cross-sectional study (n = 159), a single 24-hour urinary sample, participants' physical, bio-chemical and blood pressure measurements and questionnaire data were collected. The association between KAB and 24-hour urinary sodium excretion was assessed using general linear models. Results. Mean age of participants was 49.8 +/- 15.5 years, 67.9% were women, and mean 24-hour urinary sodium excretion was 3.6 +/- 1.7 g/day. Although 90.6% of participants exceeded the maximum recommended intake as indicated by urinary sodium excretion, more than half misperceived their actual intake, reporting consuming "the right amount." Almost three-quarters of the participants reported being concerned about the amount of sodium in their diet, but only 52.8% reported taking action to control it. Lack of procedural knowledge was observed. There was no association between KAB and sodium use and intake assessed by 24-hour urinary sodium excretion. Conclusions. The lack of association between KAB towards the use of sodium and intake measured by 24-hour urinary excretion reflects the need to support people with opportunities and motivations to reduce sodium consumption. Structural actions to promote an adequate food environment, such as the effective implementation of the front-of-package nutrition labeling in Uruguay, are positive steps.

Title: Prescription contraception use: a cross-sectional population
study of psychosocial determinants

Journal: Bmj Open

Volume: 5

Issue: 8

Short Title: Prescription contraception use: a cross-sectional
population study of psychosocial determinants

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2015-007794

Article Number: e007794

Accession Number: WOS:000363479100020

Abstract: Objective: Many forms of contraception are available on
prescription only for example, the oral contraceptive pill (OCP) and
long-acting reversible contraceptives (LARCs). In this analysis we
aim to identify key determinants of prescription contraceptive use.
Design: Cross-sectional population survey. Data on sociodemographic
indices, concerns about the OCP and perceived barriers to access
were collected. Setting: Data set constructed from a representative
population-based telephone survey of community dwelling adults in
the Republic of Ireland (RoI) Participants: 1515 women aged between
18 and 45 years Main outcome measure: Self-reported user of the OCP
or LARCs (intrauterine contraception, contraceptive injections or
subdermal contraceptive implants) in the previous 12 months.

Results: For at least some of the previous year, 35% had used the
OCP and 14% had used LARCs, while 3% had used two or more of these
methods. OCP users were significantly younger, more likely to be
unmarried and had higher income than non-users. Overall, 68% agreed
with the statement 'that taking a break from long-term use of the
contraceptive pill is a good idea' and 37% agreed with the statement
that 'the OCP has dangerous side effects' and this was the strongest
predictor variable of non-use of the OCP. Intrauterine contraception
users were significantly older, more likely to be married and had
lower income than non-users. Injections or subdermal contraceptive
implant users were significantly younger, less likely to be married,
had lower income and were less likely to agree that taking a break
from long-term use of the pill is a good idea than non-users.

Conclusions: Prescription contraceptive use is sociodemographically

patterned, with LARCs in particular being associated with lower incomes in the RoI. Concerns about the safety of the OCP remain prevalent and are important and modifiable determinants of contraceptive-related behaviour.

Short Title: A study to assess the feasibility of using a novel digital animation to increase physical activity levels in asylum seeking communities

ISSN: 0966-0410

DOI: 10.1111/hsc.13575

Accession Number: WOS:000697624100001

Abstract: The mental health benefits of physical activity and exercise are well-documented and asylum seekers who may have poor mental health could benefit from undertaking recommended levels of physical activity or exercise. Digital mobile applications are increasingly seen as feasible to precipitate behaviour change and could be a means to encourage asylum seekers to increase their levels of physical activity and exercise. This paper reports on a study that aimed to assess the feasibility of asylum seekers using the digital animation as a tool to change behaviour and increase their physical activity and exercise levels. A feasibility study underpinned by the principles of the COM-B behaviour change model was undertaken in West Yorkshire, UK, in 2019. Thirty participants were purposively recruited and interviewed. Peer interpreters were used as necessary. Deductive thematic analysis was undertaken to analyse the data. Overall, participants were positive about the feasibility of asylum seekers using the application as a behaviour change intervention. All expressed the view that it was easy to follow and would motivate them to increase their physical activity levels. Participants identified facilitators to this as the simplicity of the key messages, the cultural neutrality of the graphics and the availability of the mobile application in different languages. Identified barriers related to the dialect and accents in the translations and the over-simplicity of the application. This study has identified that a targeted digital animation intervention could help asylum seekers change their behaviour and hence improve their health and well-being. In designing such interventions, however, researchers must strongly consider co-design from an early stage as this is an important way to ensure that the development of an intervention is fit for purpose for different groups.

Title: Knowledge Translation in Audiology: Promoting the Clinical Application of Best Evidence

Journal: Trends in Amplification

Volume: 15

Issue: 1-2

Pages: 5-22

Date: Mar-Jun

Short Title: Knowledge Translation in Audiology: Promoting the Clinical Application of Best Evidence

ISSN: 1084-7138

DOI: 10.1177/1084713811420740

Accession Number: WOS:000310681300002

Abstract: The impetus for evidence-based practice (EBP) has grown

out of widespread concern with the quality, effectiveness (including cost-effectiveness), and efficiency of medical care received by the public. Although initially focused on medicine, EBP principles have been adopted by many of the health care professions and are often represented in practice through the development and use of clinical practice guidelines (CPGs). Audiology has been working on incorporating EBP principles into its mandate for professional practice since the mid-1990s. Despite widespread efforts to implement EBP and guidelines into audiology practice, gaps still exist between the best evidence based on research and what is being done in clinical practice. A collaborative dynamic and iterative integrated knowledge translation (KT) framework rather than a researcher-driven hierarchical approach to EBP and the development of CPGs has been shown to reduce the knowledge-to-clinical action gaps. This article provides a brief overview of EBP and CPGs, including a discussion of the barriers to implementing CPGs into clinical practice. It then offers a discussion of how an integrated KT process combined with a community of practice (CoP) might facilitate the development and dissemination of evidence for clinical audiology practice. Finally, a project that uses the knowledge-to-action (KTA) framework for the development of outcome measures in pediatric audiology is introduced.

Short Title: Factors Influencing Pregnancy and Postpartum Weight Management in Women of African and Caribbean Ancestry Living in High Income Countries: Systematic Review and Evidence Synthesis Using a Behavioral Change Theoretical Model

DOI: 10.3389/fpubh.2021.637800

Article Number: 637800

Accession Number: WOS:000624485800001

Abstract: Background: Women of black African heritage living in high income countries (HIC) are at risk of obesity and weight-related complications in pregnancy. This review aimed to synthesize evidence concerning attitudes to weight management-related health behaviors in pregnancy and postpartum, in women of black African ancestry,

living in high-income countries. Methods: A systematic review of the literature and thematic evidence synthesis using the Capability-Opportunity-Motivation Behavioral change theoretical model (COM-B). Databases searched included MEDLINE, EMBASE, Web of Science, and Scopus. The CASP tool was used to assess quality. Results: Twenty-four papers met the selection criteria, most of which were from the US. Motivational factors were most commonly described as influencers on behavior. Normative beliefs about "eating for two," weight gain being good for the baby, the baby itself driving food choice, as well as safety concerns about exercising in pregnancy, were evident and were perpetuated by significant others. These and other social norms, including a cultural acceptance of larger body shapes, and daily fast food, created a challenge for healthy behavior change. Women also had low confidence in their ability to lose weight in the postpartum period. Behavior change techniques, such as provision of social support, use of credible sources, and demonstration may be useful to support change. Conclusions: The women face a range of barriers to engagement in weight-related health behaviors at this life-stage. Using a theoretical behavior change framework can help identify contextual factors that may limit or support behavior change.

Title: Tennessee Healthcare Provider Practices, Attitudes, and Knowledge Around HIV Pre-Exposure Prophylaxis

Journal: Journal of Primary Care and Community Health

Volume: 11

Date: Dec

Short Title: Tennessee Healthcare Provider Practices, Attitudes, and Knowledge Around HIV Pre-Exposure Prophylaxis

ISSN: 2150-1319

DOI: 10.1177/2150132720984416

Article Number: 2150132720984416

Accession Number: WOS:000603553100001

Abstract: Introduction/Objectives: Pre-exposure prophylaxis (PrEP) use in the southern United States is low despite its effectiveness in preventing HIV acquisition and high regional HIV prevalence. Our objectives were to assess PrEP knowledge, attitudes, and prescribing practices among Tennessee primary care providers. Methods: We developed an anonymous cross-sectional electronic survey from March to November 2019. Survey development was guided by the Capability, Opportunity, Motivation, and Behavior framework and refined through piloting and interviews. Participants included members of professional society and health center listservs licensed to practice in Tennessee. Respondents were excluded if they did not complete the question regarding PrEP prescription in the previous year or were not in a position to prescribe PrEP (e.g., hospital medicine). Metrics included PrEP prescription in the preceding year, PrEP knowledge scores (range 0-8), provider attitudes about PrEP, and provider and practice characteristics. Knowledge scores and categorical variables were compared across PrEP prescriber status with Wilcoxon rank-sum and Fisher's exact tests, respectively. Results: Of 147 survey responses, 99 were included and 43 (43%) reported PrEP prescription in the preceding year. Compared with non-prescribers: prescribers had higher median PrEP knowledge scores (7.3 vs 5.6, $P < .01$), a higher proportion had self-reported patient PrEP inquiries (95% vs 21%, $P < .01$), and a higher proportion had self-reported good or excellent ability to take a sexual history (83% vs 58%, $P = .01$) and comfort taking a sexual history (92% vs 63%, $P < .01$) from men who have sex with men, a subgroup with high HIV risk. Most respondents felt obligated to provide PrEP (65%), and felt all primary care providers should provide PrEP (63%). Conclusion: PrEP provision is significantly associated with PrEP knowledge, patient PrEP inquiries, and provider sexual history taking ability and comfort. Future research should evaluate temporal relationships between these associations and PrEP prescription as

potential routes to increase PrEP provision.

Short Title: Supporting the implementation of stroke quality-based procedures (QBPs): a mixed methods evaluation to identify knowledge translation activities, knowledge translation interventions, and determinants of implementation across Ontario

DOI: 10.1186/s12913-018-3220-9

Article Number: 466

Accession Number: WOS:000435487400008

Abstract: Background: In 2013, Health Quality Ontario introduced stroke quality-based procedures (QBPs) to promote use of evidence-based practices for patients with stroke in Ontario hospitals. The study purpose was to: (a) describe the knowledge translation (KT) interventions used to support stroke QBP implementation, (b) assess differences in the planned and reported KT interventions by region, and (c) explore determinants perceived to have affected outcomes.

Methods: A mixed methods approach was used to evaluate: activities, KT interventions, and determinants of stroke QBP implementation. In Phase 1, a document review of regional stroke network work plans was conducted to capture the types of KT activities planned at a regional level; these were mapped to the knowledge to action framework. In Phase 2, we surveyed Ontario hospital staff to identify the KT interventions used to support QBP implementation at an organizational level. Phase 3 involved qualitative interviews with staff to elucidate deeper understanding of survey findings.

Results: Of the 446 activities identified in the document review, the most common were 'dissemination' (24.2%; n = 108), 'implementation' (22.6%; n = 101), 'implementation planning' (15.0%; n = 67), and 'knowledge tools' (10.5%; n = 47). Based on survey data (n = 489), commonly reported KT interventions included: staff educational meetings (43.1%; n = 154), champions (41.5%; n = 148),

and staff educational materials (40.6%; n = 145). Survey participants perceived stroke QBP implementation to be successful (median = 5/7; interquartile range = 4-6; range = 1-7; n = 335). Forty-four people (e.g., managers, senior leaders, regional stroke network representatives, and frontline staff) participated in interviews/focus groups. Perceived facilitators to QBP implementation included networks and collaborations with external organizations, leadership engagement, and hospital prioritization of stroke QBP. Perceived barriers included lack of funding, size of the hospital (i.e., too small), lack of resources (i.e., staff and time), and simultaneous implementation of other QBPs. Conclusions: Information on the types of activities and KT interventions used to support stroke QBP implementation and the key determinants influencing uptake of stroke QBPs can be used to inform future activities including the development and evaluation of interventions to address barriers and leverage facilitators.

DOI: 10.1186/s13012-014-0160-6

Article Number: 160

Accession Number: WOS:000209607800001

Abstract: Background: As evidence-informed implementation interventions spread, they need to be tailored to address the unique needs of each setting, and this process should be well documented to facilitate replication. To facilitate the spread of the Mobilization of Vulnerable Elders in Ontario (MOVE ON) intervention, the aim of the current study is to develop a mapping guide that links identified barriers and intervention activities to behaviour change theory. Methods: Focus groups were conducted with front line health-care professionals to identify perceived barriers to implementation

of an early mobilization intervention targeted to hospitalized older adults. Participating units then used or adapted intervention activities from an existing menu or developed new activities to facilitate early mobilization. A thematic analysis was performed on the focus group data, emphasizing concepts related to barriers to behaviour change. A behaviour change theory, the 'capability, opportunity, motivation-behaviour (COM-B) system', was used as a taxonomy to map the identified barriers to their root causes. We also mapped the behaviour constructs and intervention activities to overcome these. Results: A total of 46 focus groups were conducted across 26 hospital inpatient units in Ontario, Canada, with 261 participants. The barriers were conceptualized at three levels: health-care provider (HCP), patient, and unit. Commonly mentioned barriers were time constraints and workload (HCP), patient clinical acuity and their perceived 'sick role' (patient), and lack of proper equipment and human resources (unit level). Thirty intervention activities to facilitate early mobilization of older adults were implemented across hospitals; examples of unit-developed intervention activities include the 'mobility clock' communication tool and the use of staff champions. A mapping guide was created with barriers and intervention activities matched through the lens of the COM-B system. Conclusions: We used a systematic approach to develop a guide, which maps barriers, intervention activities, and behaviour change constructs in order to tailor an implementation intervention to the local context. This approach allows implementers to identify potential strategies to overcome local-level barriers and to document adaptations.

Title: Navigating barriers: two-year follow up on recommendations to improve the use of maternal health guidelines in Kosovo

Journal: BMC Public Health

Volume: 16

Date: Sep

Short Title: Navigating barriers: two-year follow up on recommendations to improve the use of maternal health guidelines in Kosovo

DOI: 10.1186/s12889-016-3641-5

Article Number: 987

Accession Number: WOS:000383228600012

Abstract: Background: Although there are a growing number of initiatives aimed at supporting guideline implementation in resource-constrained settings, few studies assess progress on

achieving next steps and goals after the initial activities are completed and the initial funding period has ended. The aim of the current study was to conduct a qualitative process evaluation of progress, barriers, facilitators, and proposed solutions to operationalize nine recommendations to prepare Kosovo to implement the 2012 World Health Organization (WHO) prevention and treatment of postpartum haemorrhage guideline. Methods/Design: In 2012, we co-created nine recommendations designed to support implementing the WHO's guideline on the prevention and treatment of postpartum haemorrhage in Kosovo. The current study uses a realist evaluation approach to assess activities and progress two years after the recommendations were developed. The study involved conducting qualitative focus groups and one-on-one interviews with participants from the first meeting to evaluate the activities and progress on the nine recommendations. Results: Forty-three participants provided insights into the barriers and opportunities experienced to date and proposed future directions. Although progress has been made towards implementation of a number of the recommendations, scaling up has been limited by barriers, such as lack of awareness, limited resources, and evaluation challenges. Participants proposed addressing these barriers by building within-and between-country partnerships to facilitate guideline implementation. In addition, participants reported less progress on implementing recommendations related to broader cultural changes, which indicates a need for specific and actionable recommendations to operationalize implementation efforts. Conclusions: In the two years since the initial meeting, there has been mixed progress on the recommendations. Based on participant feedback, we refined the recommendations so that they can be operationalized by health care system stakeholders in Kosovo to further support implementation efforts. It is beneficial to share these lessons learned throughout the implementation process to inform next steps in Kosovo and offer ideas for use in other settings.

Article Number: 282

Accession Number: WOS:000656195300005

Abstract: Background Communities of Practice (CoPs) focus on learning, knowledge sharing, and creation, and research indicates they can improve healthcare performance. This article describes the development of a CoP that focused on synthesizing and adapting evidence in Physical Medicine and Rehabilitation (PM&R). This study aimed to investigate the CoP members' experiences and perceived barriers and enablers of CoP success in the early phase of a CoP. **Methods** Physical therapists and a physician (n=10) volunteered for a CoP that synthesized literature of PM&R evidence. CoP members participated in education and training on critical appraisal and knowledge synthesis, practiced critical appraisal skills, and summarized literature. Three months after CoP initiation, semi-structured interviews were conducted to understand the CoP members' experiences and reflections. Members also completed an online survey that included the Evidence-Based Practice Confidence scale (EPIC), questions related to CoP activities, and demographics before CoP initiation. We utilized the Capability, Opportunity, and Motivation Model of Behaviour (COM-B) to explore how these experiences related to the behavioral adaptation and participation. **Results** Ten themes related to the potential contributors to CoP success and failure were identified. These included project management, technological solutions, efficacy, organizational support, interaction, the bigger picture, self-development, time, and motivation. **Conclusions** Contributors to CoP success may include clearly articulated project goals and participant expectations, education and training, reliable technology solutions, organizational support, face-to-face communication, and good project management. Importantly, CoP members need time to participate in activities.

Short Title: Are meal kits health promoting? Nutritional analysis of

meals from an Australian meal kit service

ISSN: 0957-4824

DOI: 10.1093/heapro/daaa095

Accession Number: WOS:000693258500007

Abstract: Meal kits are popular for consumers seeking greater convenience in preparing meals at home. The market share for meal kit subscription services (MKSSs) is growing in developed nations including Australia, however, literature about their health promoting qualities, e.g. nutritional composition, is scarce. This study aimed to assess the characteristics and nutritional composition of meals offered from an MKSS over 12 months.

Nutritional data were extracted from recipes available to order from HelloFresh in Australia from 1 July 2017 to 30 June 2018. In total, 346 (251 unique) recipes were retrieved. Per serve (median size 580 g), meals contained a median of 2840 kJ (678 kcal) of energy, 58 g carbohydrate (14 g sugar), 44 g protein, 28 g total fat (8 g saturated fat) and 839 mg sodium. Median energy from macronutrients was total fat (38%), carbohydrates (34%), protein (25%) and saturated fat (11%). This paper is the first to describe characteristics of recipes available from an MKSS over a 12month period of time. With their growing popularity, meal kit delivery services have the capacity to influence consumer food behaviours, diets and subsequently population health. MKSSs may function to promote health through education, training, and enabling home cooking behaviours, and may be a powerful commitment device for home cooking behaviour change. However, it is important for health professionals, including dietitians and nutritionists, to understand the nutritional risks, benefits and suitability of this contemporary mealtime option before recommending them to clients and members of the public as part of health promotion. Lay summary Meal kit delivery services are growing in popularity in developed countries, complementing busy lifestyles with pre-measured ingredients and recipe instructions delivered to the home. These meal kits have the ability to influence consumer diets and population health, and may support health promoting diet behaviours, e.g. eating vegetables, and enable home cooking. In this study, we reviewed a years' worth of recipes from a popular meal kit service. We report that a typical recipe contained approximately nine different ingredients, comprising three vegetables and required three ingredients from the home pantry. Meals took similar to 35 min to prepare and were found to be relatively high in energy from fat and protein, and relatively low in energy from carbohydrates. The level of sodium varied widely and some meals exceeded the Australian Suggested Dietary Target for sodium (<2000 mg). Meal kit recipes were found to have health promoting qualities, frequently including vegetable ingredients, however, improvements to recipes would make these meal kits more health promoting. Current diet intakes and the nutritional composition of meal kits recipes should be reviewed before being recommended by health professionals.

ISSN: 1741-3842

DOI: 10.1093/pubmed/fdab070

Accession Number: WOS:000754035300031

Abstract: Background Physical distancing, wearing face masks and hand hygiene are evidence-based methods to protect the public from coronavirus disease 2019 (COVID-19) infection. There has been a proliferation of research examining characteristics that can be targeted by public health interventions. This rapid review sought to identify predictors of attitudes toward and adherence to COVID-19 public health guidelines, and identify interventions aiming to improve adherence. Methods Articles were retrieved from multiple databases (e.g. MEDLINE, CINAHL and medRxiv) on 6 August 2020. Studies were limited to samples collected from Western countries. Studies were classified according to the types of factor (s) examined as independent variables. The consistency of evidence for each factor was scored by two reviewers. Results In total, 1323 unique articles were identified in the initial search, resulting in 29 studies in the final synthesis. The available evidence suggests individuals who are older, identify as women, trust governments, perceive COVID-19 as threatening and access information through traditional news media are more likely to adhere with COVID-19 public health guidelines. Interventions for improving adherence have not yet been investigated thoroughly, and this review identified only three experimental studies. Conclusions This review has identified several characteristics that impact attitudes and adherence to COVID-19 public health guidelines.

Short Title: The content, experiences and outcomes of interventions designed to increase early skin-to-skin contact in high-income settings: A mixed-methods systematic review

ISSN: 0803-5253

DOI: 10.1111/apa.16575

Accession Number: WOS:000878237700001

Abstract: Aim To explore the content, experiences and outcomes of interventions designed to increase early skin-to-skin contact (SSC) in high-income settings. Methods A mixed-methods systematic review was undertaken across six bibliographic databases. References of all included studies were hand-searched. All papers were quality appraised using a mixed-method appraisal tool. A narrative synthesis was used to synthesise both quantitative and qualitative findings. Results Database searches generated 1221 hits, and two studies were identified via hand-searching. Ten studies were included; most (n = 7) were designed to improve SSC following a caesarean section, and half were of low/poor quality. Outcomes related to SSC prevalence and/or duration (n = 7), breastfeeding prevalence, (n = 4) and six explored mothers' and/or health professionals' experiences of the intervention. While the interventions had 'some' impact on the prevalence of SSC, the duration was often limited and not in line with WHO recommendations. Breastfeeding rates (exclusive/any) were found to improve but generally not to a significant extent. Mother and healthcare professionals were positive about the interventions, with barriers to implementation noted. Most interventions targeted healthcare professionals, rather than mothers. Conclusion High-quality interventions that increase SSC in line with WHO recommendations, and that target both health professionals and parents are needed.

Short Title: Benefits of Incentives for Breastfeeding and Smoking cessation in pregnancy (BIBS): a mixed-methods study to inform trial design

ISSN: 1366-5278

DOI: 10.3310/hta19300

Accession Number: WOS:000353573000001

Abstract: Background: Smoking in pregnancy and/or not breastfeeding have considerable negative health outcomes for mother and baby. Aim: To understand incentive mechanisms of action for smoking cessation in pregnancy and breastfeeding, develop a taxonomy and identify promising, acceptable and feasible interventions to inform trial design. Design: Evidence syntheses, primary qualitative survey, and discrete choice experiment (DCE) research using multidisciplinary, mixed methods. Two mother-and-baby groups in disadvantaged areas collaborated throughout. Setting: UK. Participants: The qualitative study included 88 pregnant women/recent mothers/partners, 53 service providers, 24 experts/decision-makers and 63 conference attendees. The surveys included 1144 members of the general public and 497 health professionals. The DCE study included 320 women with a history of smoking. Methods: (1) Evidence syntheses: incentive effectiveness (including meta-analysis and effect size estimates), delivery processes, barriers to and facilitators of smoking cessation in pregnancy and/or breastfeeding, scoping review of incentives for lifestyle behaviours; (2) qualitative research: grounded theory to understand incentive mechanisms of action and a framework approach for trial design; (3) survey: multivariable ordered logit models; (4) DCE: conditional logit regression and the log-likelihood ratio test. Results: Out of 1469 smoking cessation and 5408 breastfeeding multicomponent studies identified, 23 smoking cessation and 19 breastfeeding studies were included in the review. Vouchers contingent on biochemically proven smoking cessation in pregnancy were effective, with a relative risk of 2.58 (95% confidence interval 1.63 to 4.07) compared with non-contingent incentives for participation (four studies, 344 participants). Effects continued until 3 months post partum. Inconclusive effects were found for breastfeeding incentives compared with no/smaller incentives (13 studies) but provider commitment contracts for breastfeeding show promise. Intervention intensity is a possible confounder. The acceptability of seven promising incentives was mixed. Women (for vouchers) and those with a lower level of education (except for breastfeeding incentives) were more likely to disagree. Those aged \leq 44 years and ethnic minority groups were more likely to agree. Agreement was greatest for a free breast pump and least for vouchers for breastfeeding. Universal incentives were preferred to those targeting low-income women. Initial daily text/telephone support, a quitting pal, vouchers for >20.00 pound per month and values up to 80.00 pound increase the likelihood of smoking cessation. Doctors disagreed with provider incentives. A 'ladder' logic model emerged through data synthesis and had face

validity with service users. It combined an incentive typology and behaviour change taxonomy. Autonomy and well-being matter. Personal difficulties, emotions, socialising and attitudes of others are challenges to climbing a metaphorical 'ladder' towards smoking cessation and breastfeeding. Incentive interventions provide opportunity 'rungs' to help, including regular skilled flexible support, a pal, setting goals, monitoring and outcome verification. Individually tailored and non-judgemental continuity of care can bolster women's capabilities to succeed. Rigid, prescriptive interventions placing the onus on women to behave 'healthily' risk them feeling pressurised and failing. To avoid 'losing face', women may disengage.' Limitations: Included studies were heterogeneous and of variable quality, limiting the assessment of incentive effectiveness. No cost-effectiveness data were reported. In surveys, selection bias and confounding are possible. The validity and utility of the ladder logic model requires evaluation with more diverse samples of the target population. Conclusions: Incentives provided with other tailored components show promise but reach is a concern. Formal evaluation is recommended. Collaborative service-user involvement is important.

DOI: 10.1016/j.rmed.2023.107191

Article Number: 107191

Accession Number: WOS:000961912200001

Abstract: Objectives: Chronic Obstructive Pulmonary Disease (COPD) is complicated by chronic pain. People with COPD report higher pain prevalence than the general population. Despite this, chronic pain management is not reflected in current COPD clinical guidelines and pharmacological treatments are often ineffective. We conducted a systematic review that aimed to establish the efficacy of existing non-pharmacological and non-invasive interventions on pain and identify behaviour change techniques (BCTs) associated with effective pain management. Methods: A systematic review was conducted with reference to Preferred Reporting Items for Systematic Review (PRISMA) [1], Systematic review without Meta analysis (SWIM) standards [2] and Grading of Recommendations Assessment, Development and Evaluation (GRADE) guidelines [3]. We searched 14 electronic databases for controlled trials of non-pharmacological and non-invasive interventions where the outcome measure assessed pain or contained a pain subscale. Results: Twenty-nine studies were identified involving 3,228 participants. Seven interventions reported a minimally important clinical difference in pain outcomes, although only two of these reached statistical significance ($p < 0.05$). A third study reported statistically significant outcomes, but this was not clinically significant ($p = 0.0273$). Issues with intervention reporting prevented identification of active intervention ingredients (i.e., BCTs). Conclusions: Pain appears to be a meaningful issue for many individuals with COPD. However, intervention heterogeneity and issues with methodological quality limit certainty about the effectiveness of currently available non-pharmacological interventions. An improvement in reporting is required to enable identification of active intervention ingredients associated with effective pain management.

Accession Number: WOS:000648452200001

Abstract: There is an urgent need for population-based interventions to slow the growth of the diabetes epidemic in low-and middle-income countries. We tested the effectiveness of a population-based mHealth voice messaging intervention for T2DM prevention and control in rural Bangladesh through a cluster randomised controlled trial. mHealth improved knowledge and awareness about T2DM but there was no detectable effect on T2DM occurrence. We conducted mixed-methods research to understand this result. Exposure to messages was limited by technological faults, high frequency of mobile phone number changes, message fatigue and (mis)perceptions that messages were only for those who had T2DM. Persistent social norms, habits and desires made behaviour change challenging, and participants felt they would be more motivated by group discussions than mHealth messaging alone. Engagement with mHealth messages for T2DM prevention and control can be increased by (1) sending identifiable messages from a trusted source (2) using participatory design of mHealth messages to inform modelling of behaviours and increase relevance to the general population (3) enabling interactive messaging. mHealth messaging is likely to be most successful if implemented as part of a multi-sectoral, multi-component approach to address T2DM and non-communicable disease risk factors.

Title: Management of plantar heel pain: a best practice guide informed by a systematic review, expert clinical reasoning and patient values

Journal: British Journal of Sports Medicine

Volume: 55

Issue: 19

Pages: 1106-+

Date: Oct

Short Title: Management of plantar heel pain: a best practice guide informed by a systematic review, expert clinical reasoning and patient values

ISSN: 0306-3674

DOI: 10.1136/bjsports-2019-101970

Accession Number: WOS:000698431300011

Abstract: Objective To develop a best practice guide for managing people with plantar heel pain (PHP). Methods Mixed-methods design including systematic review, expert interviews and patient survey. Data sources Medline, Embase, CINAHL, SPORTDiscus, Cochrane Central Register of Controlled Trials, trial registries, reference lists and citation tracking. Semi-structured interviews with world experts and a patient survey. Eligibility criteria Randomised controlled trials (RCTs) evaluating any intervention for people with PHP in any language were included subject to strict quality criteria. Trials with a sample size greater than $n=38$ were considered for proof of efficacy. International experts were interviewed using a semi-structured approach and people with PHP were surveyed online. Results Fifty-one eligible trials enrolled 4351 participants, with 9 RCTs suitable to determine proof of efficacy for 10 interventions. Forty people with PHP completed the online survey and 14 experts were interviewed resulting in 7 themes and 38 subthemes. There was good agreement between the systematic review findings and interview data about taping (SMD: 0.47, 95% CI 0.05 to 0.88) and plantar fascia stretching (SMD: 1.21, 95% CI 0.78 to 1.63) for first step pain in the short term. Clinical reasoning advocated combining these interventions with education and footwear advice as the core self-management approach. There was good expert agreement with systematic review findings recommending stepped care management with focused shockwave for first step pain in the short-term (OR: 1.89, 95% CI 1.18 to 3.04), medium-term (SMD 1.31, 95% CI 0.61 to 2.01) and long-term (SMD 1.67, 95% CI 0.88 to 2.45) and radial shockwave for first step pain in the short term (OR: 1.66, 95% CI 1.00 to 2.76) and long term (OR: 1.78, 95% CI 1.07 to 2.96). We found good agreement to 'step care' using custom foot orthoses for general pain in the short term (SMD: 0.41, 95% CI 0.07 to 0.74) and medium term (SMD: 0.55, 95% CI 0.09 to 1.02). Conclusion Best practice from a mixed-methods study synthesising systematic review with expert opinion and patient feedback suggests core treatment for people with PHP should include taping, stretching and individualised education. Patients who do not optimally improve may be offered shockwave therapy, followed by custom orthoses.

Article Number: 186

Accession Number: WOS:000707827900001

Abstract: Background Self-management of type 1 diabetes (T1D) is complex and can be particularly challenging for young adults. This is reflected in the high blood glucose values and rates of clinic non-attendance in this group. There is a gap for a theory-based intervention informed by key stakeholder opinions to support and improve self-management in young adults with T1D. Purpose The aim of the work was to systematically co-develop an evidence-based and stakeholder-led intervention to support self-management and clinic engagement in young adults living with T1D in Ireland. Co-development was led by the Young Adult Panel. Methods The Behaviour Change Wheel was used to guide the development. Five evidence sources were used to inform the process. An iterative co-design process was used with the Young Adult Panel. Initial intervention components were refined and feasibility tested using qualitative methods. Results Environmental restructuring, education and training were selected as appropriate intervention functions. The co-design process, along with qualitative refinement and feasibility work, led to the final intervention content which consisted of 17 behaviour change techniques. The final D1 Now intervention consists of three components: a support worker, an agenda setting tool and an interactive messaging service. Conclusions The D1 Now intervention is now at pilot evaluation stage. Its transparent and systematic development will facilitate evaluation and future replications.

Abstract: Adherence to inhaled steroids is suboptimal in many children with asthma and can lead to poor disease control. Many previous studies in paediatric populations have used subjective and inaccurate adherence measurements, reducing their validity.

Adherence studies now often use objective electronic monitoring, which can give us an accurate indication of the extent of non-adherence in children with asthma. A review of the studies using electronic adherence monitoring shows that half of them report mean adherence rates of 50% or below, and the majority report rates below 75%. Reasons for non-adherence are both intentional and non-intentional, incorporating illness perceptions, medication beliefs and practical adherence barriers. Interventions to improve adherence in the paediatric population have had limited success, with the most effective containing both educational and behavioural aspects.

Short Title: What works to reduce sedentary behavior in the office, and could these intervention components transfer to the home working environment?: A rapid review and transferability appraisal

DOI: 10.3389/fspor.2022.954639

Article Number: 954639

Accession Number: WOS:000840737700001

Abstract: Background: Working patterns have changed dramatically due to COVID-19, with many workers now spending at least a portion of their working week at home. The office environment was already associated with high levels of sedentary behavior, and there is emerging evidence that working at home further elevates these levels. The aim of this rapid review (PROSPERO CRD42021278539) was to build on existing evidence to identify what works to reduce sedentary behavior in an office environment, and consider whether these could be transferable to support those working at home.

Methods: The results of a systematic search of databases CENTRAL, MEDLINE, Embase, PsycInfo, CINHALL, and SportDiscus from 10 August 2017 to 6 September 2021 were added to the references included in a

2018 Cochrane review of office based sedentary interventions. These references were screened and controlled peer-reviewed English language studies demonstrating a beneficial direction of effect for office-based interventions on sedentary behavior outcomes in healthy adults were included. For each study, two of five authors screened the title and abstract, the full-texts, undertook data extraction, and assessed risk of bias on the included studies. Informed by the Behavior Change Wheel, the most commonly used intervention functions and behavior change techniques were identified from the extracted data. Finally, a sample of common intervention strategies were evaluated by the researchers and stakeholders for potential transferability to the working at home environment. Results: Twenty-two studies including 29 interventions showing a beneficial direction of effect on sedentary outcomes were included. The most commonly used intervention functions were training (n = 21), environmental restructuring (n = 21), education (n = 15), and enablement (n = 15). Within these the commonly used behavior change techniques were instructions on how to perform the behavior (n = 21), adding objects to the environment (n = 20), and restructuring the physical environment (n = 19). Those strategies with the most promise for transferring to the home environment included education materials, use of role models, incentives, and prompts. Conclusions: This review has characterized interventions that show a beneficial direction of effect to reduce office sedentary behavior, and identified promising strategies to support workers in the home environment as the world adapts to a new working landscape. Abstract: Purpose Sedentary behaviour (SB) is associated with negative health outcomes and is prevalent post-stroke. This study

explored SB after stroke from the perspective of stroke service staff. Methods Qualitative mixed-methods study. Non-participant observations in two stroke services (England/Scotland) and semi-structured interviews with staff underpinned by the COM-B model of behaviour change. Observations were analysed thematically; interviews were analysed using the Framework approach. Results One hundred and thirty-two observation hours (October – December 2017), and 31 staff interviewed (January –June 2018). Four themes were identified: (1) Opportunities for staff to support stroke survivors to reduce SB; (2) Physical and psychological capability of staff to support stroke survivors to reduce SB; (3) Motivating factors influencing staff behaviour to support stroke survivors to reduce SB; (4) Staff suggestions for a future intervention to support stroke survivors to reduce SB. Conclusions Staff are aware of the consequences of prolonged sitting but did not relate to SB. Explicit knowledge of SB was limited. Staff need training to support stroke survivors to reduce SB. Sedentary behaviour in the community was not reported to change markedly, highlighting the need to engage stroke survivors in movement from when capable in hospital, following through to home.

Short Title: Describing capability, opportunity, and motivation for food safety practices among actors in the Cambodian informal vegetable market

DOI: 10.3389/fsufs.2023.1060876

Article Number: 1060876

Accession Number: WOS:000950171500001

Abstract: Introduction: Several Cambodian initiatives seek to improve nutritional outcomes via increased production and consumption of nutrient-dense foods, including vegetables. However, food safety gaps in informal markets, where most vegetables are purchased, allow for the transmission of foodborne pathogens and threaten the positive nutritional outcomes associated with vegetable

consumption. Methods: This study describes a tool used to measure perceptions of Cambodians involved with informal vegetable markets regarding their capabilities, opportunities, and motivations to implement food safety practices. The quantitative tool could also be used to assess capability, opportunity, and motivation to adopt a behavior in a wide range of development contexts. To these ends, a questionnaire assessing these perceptions was developed using the Capability, Opportunity, Motivation-Behavior (COM-B) model of behavior and the Theoretical Domains Framework (TDF). Results: The questionnaire was piloted with vegetable vendors in Phnom Penh (N = 55), revised, and subsequently implemented in the provinces of Battambang and Siem Reap with vegetable producers, distributors, and vendors (N = 181). Confirmatory factor analysis resulted in a nine-factor model corresponding to TDF constructs with a comparative fit index of 0.91, a Tucker-Lewis index of 0.89, and a root mean square error of similar to 0.05. Further analysis indicated that vegetable vendors and distributors typically had significantly higher ($p < 0.05$) levels of perceived motivation and capability to implement the target food safety practice (washing surfaces that come in contact with vegetables with soap and water every day) compared to their perceived opportunity to do so. Among farmers, however, levels of perceived motivation were significantly higher ($p < 0.05$) than levels of perceived opportunity and capability. In addition, vendors in Battambang had significantly higher ($p < 0.05$) levels of perceived capability, opportunity, and motivation to implement the target food safety practice in comparison to farmers in either province. Vendors in Battambang had significantly higher ($p < 0.05$) levels of perceived opportunity and motivation than vendors in Siem Reap. Conclusions: These data suggest that efforts to bolster vegetable vendors' and distributors' perceived opportunity and vegetable farmers' perceived opportunity and capability to implement food safety practices could increase the likelihood of adoption of the target food safety practice.

Title: Developing a theory-based multimedia intervention for schools to improve young people's asthma: my asthma in school (MAIS)

Journal: Pilot and Feasibility Studies

Volume: 6

Issue: 1

Short Title: Developing a theory-based multimedia intervention for schools to improve young people's asthma: my asthma in school (MAIS)

DOI: 10.1186/s40814-020-00670-6

Article Number: 122

Accession Number: WOS:000729238200131

Abstract: BackgroundAsthma control in adolescents is low with half

of the young people in a London study identified as having suboptimal control when measured using the Asthma Control Test. Control of asthma symptoms can be improved by addressing barriers to good self-management, such as poor understanding of asthma and adherence to medication. The aim of this study was therefore to develop the My Asthma in School (MAIS) intervention for the improvement of asthma control and self-management in adolescents and to test its initial feasibility. The intervention intended to combine a strong focus on theory with a design specifically aimed to engage adolescents. Methods The intervention development was based on previous qualitative and quantitative findings, and on guidelines from the Medical Research Council for the development of complex interventions. The COM-B (Capability, Opportunity, Motivation-Behaviour) model was applied to inform the design of intervention elements. Behavioural targets were identified from existing barriers to good asthma self-management and were then used to guide the development of engaging intervention elements, which were described using the Behavioural Change Technique (BCT) Taxonomy version 1. Adolescents were involved throughout this process. The MAIS intervention was tested in a feasibility phase in London secondary schools with adolescents aged between 11 and 13. Results The complex school-based MAIS intervention comprised a first school visit from a theatre group, who conducted a workshop with all year 7-8 students and addressed peer understanding and attitudes to asthma. The second visit included four self-management workshops for adolescents with asthma, including games, short-films and role play activities. Forty different types of techniques to change behaviour were applied, totalling 163 instances of BCT use across intervention elements, addressing all areas of capability, opportunity and motivation. In this initial feasibility study, 1814 adolescents with and without asthma from nine schools received the theatre intervention visit; 23 adolescents with asthma from one of the schools attended the workshop visit. The intervention was found acceptable and engaging, and 91.4% of participants agreed that the workshops changed how they think or feel about asthma. Conclusion This study demonstrates development and initial feasibility of a complex theory-based intervention, and how it can combine engaging media and interactive elements, to achieve a multi-directional approach to behavioural change. However more work is needed to assess the feasibility of trial processes, including recruitment and delivery format of the workshops.

Title: Collaborative patient-provider communication and uptake of adolescent vaccines

Journal: Social Science & Medicine

Volume: 159

Pages: 100-107

Date: Jun

Short Title: Collaborative patient-provider communication and uptake of adolescent vaccines

ISSN: 0277-9536

DOI: 10.1016/j.socscimed.2016.04.030

Accession Number: WOS:000377838000012

Abstract: Rationale: Recommendations from healthcare providers are one of the most consistent correlates of adolescent vaccination, but few studies have investigated other elements of patient-provider communication and their relevance to uptake. Objective: We examined competing hypotheses about the relationship of patient-driven versus provider driven communication styles with vaccination. Methods: We gathered information about vaccine uptake from healthcare provider-verified data in the 2010 National Immunization Survey-Teen for tetanus, diphtheria, and pertussis (Tdap) booster, meningococcal vaccine, and human papillomavirus (HPV) vaccine (initiation among females) for adolescents ages 13-17. We categorized communication style in parents' conversations with healthcare providers about vaccines, based on parents' reports (of whether a provider recommended a vaccine and, if so, if conversations were informed, shared, or efficient) (N = 9021). Results: Most parents reported either no provider recommendation (Tdap booster: 35%; meningococcal vaccine: 46%; and HPV vaccine: 31%) or reported a provider recommendation and shared patient provider communication (43%, 38%, and 49%, respectively). Provider recommendations were associated with increased odds of vaccination (all ps < 0.001). In addition, more provider-driven communication styles were associated with higher rates of uptake for meningococcal vaccine (efficient style: 82% vs. shared style: 77% vs. informed style: 68%; p < 0.001 for shared vs.. informed) and HPV vaccine (efficient style: 90% vs. shared style: 70% vs. informed style: 33%; p < 0.05 for all comparisons). Conclusion: Efficient communication styles were used rarely (<= 2% across vaccines) but were highly effective for encouraging meningococcal and HPV vaccination. Intervention studies are needed to confirm that efficient communication approaches increase HPV vaccination among adolescents. (C) 2016 Elsevier Ltd. All rights reserved.

Title: Policy approaches to nutrition-focused food banking in

industrialized countries: a scoping review

Journal: Nutrition Reviews

Date: 2023 Mar

Short Title: Policy approaches to nutrition-focused food banking in industrialized countries: a scoping review

ISSN: 0029-6643

DOI: 10.1093/nutrit/nuad004

Accession Number: WOS:000968121600001

Abstract: Objective: This review aims to synthesize the literature describing policy approaches to nutrition-focused food banking in industrialized countries, spanning the period 2000 to October 2021. Background: The charitable food system provides food assistance to increasing numbers of people experiencing food insecurity in industrialized countries. Calls to improve the nutrition quality of foods provided by food banks, pantries, and shelves have increased, yet little is known about the challenges faced when initiating policy in this setting. Methods: A protocol based on the Preferred Reporting Items for Systematic Reviews and Meta-analyses extension for Scoping Reviews Guidelines was developed and registered with Open Science Framework. Four electronic databases (MEDLINE [Ovid], Global Health, ProQuest, and Scopus) were searched for peer-reviewed articles published in English. A gray literature search was conducted using Google Advanced Search. Results: Of 642 peer-reviewed articles screened, 15 were eligible for inclusion. In addition, 24 gray literature documents were included. These 39 papers were assessed against the Iron Triangle of Hunger Relief and the Campbell et al framework of organizational factors. Six themes were identified: (1) there is a moral imperative to take action to ensure the provision of appropriate and nutritious food for vulnerable clients; (2) nutrition policies are unlikely to be formalized; (3) the unpredictability of donated food is a barrier to providing healthy foods; (4) reliance on donations affects the sector's willingness to reduce the unhealthy inventory for fear of losing donors, and the challenges of managing donor relationships were emphasized; (5) organizational capacity (volunteer workforce, executive leadership support) must be considered; (6) the existing measure of success is a weight-based metric that does not support food banks' prioritizing of healthy foods. These, and other characteristics, were incorporated into an adapted framework. Conclusion: There is a need and opportunity for nutrition-focused food banking. A priority action area is the adoption of an outcome metric that is based on nutritional quality, to reorient the charitable food system.

Article Number: pzab266

Accession Number: WOS:000776759900012

Abstract: There is an increasing focus on health promotion in physical therapist research and practice. A clinical model (Health-Focused Physical Therapy Model) was developed for identifying major steps in the delivery of health promotion focusing on adoption of healthy lifestyle behaviors. One of the primary steps within this model is the design and delivery of behavior change interventions. Such interventions involve coordinated sets of activities that target change in a specific pattern of unhealthy behavior (eg, physical inactivity, smoking). This Perspective contends that the science and practice of behavior change interventions can be significantly advanced in the field of physical therapy (implementation science) through the integration of behavior change frameworks and techniques within the context of an experimental medicine approach for health behavior change. This perspective presents the integration of the Theoretical Domains Framework, the Behavior Change Wheel, including the Capability Opportunity Motivation-Behavior core system, and the Behavior Change Technique Taxonomy as a comprehensive approach for designing and delivering behavior change interventions in physical therapy. An experimental medicine approach is described, outlining a 4-step process in the design, delivery, and evaluation of behavior change interventions that can be applied to health promotion in physical therapist research and practice. The proposed integrative approach can advance public health and health promotion through healthy lifestyle behavior change in the field of physical therapy.

DOI: 10.1080/14737175.2020.1796640

Accession Number: WOS:000555147600001

Abstract: Introduction The science supporting the application of exercise training and physical activity in persons with multiple sclerosis (MS) has expanded considerably in strength and scope over the past 25+ years. Exercise training is now a strategy that is commonly recommended for management of MS in clinical practice. Yet, there are still many opportunities for expanding the breadth and strength of research on exercise training in MS. Areas covered This paper provides the authors' perspective on eight emerging areas of research involving exercise and physical activity behavior in persons living with MS. Those areas include behavior change interventions, research across the activity continuum, telerehabilitation, neuroplasticity, heterogeneity of outcomes, inclusion of targeted samples, combined interventions involving exercise training, and multi-site trials. Expert opinion Additional research addressing those areas will greatly expand the opportunity for translation of exercise and physical activity into the clinical care of persons with MS.

Title: Qualitative study on the implementation of professional pharmacy services in Australian community pharmacies using framework analysis

Journal: BMC Health Services Research

Volume: 16

Date: Aug

Short Title: Qualitative study on the implementation of professional pharmacy services in Australian community pharmacies using framework analysis

DOI: 10.1186/s12913-016-1689-7

Article Number: 439

Accession Number: WOS:000382446400001

Abstract: Background: Multiple studies have explored the implementation process and influences, however it appears there is no study investigating these influences across the stages of implementation. Community pharmacy is attempting to implement professional services (pharmaceutical care and other health services). The use of implementation theory may assist the

achievement of widespread provision, support and integration. The objective was to investigate professional service implementation in community pharmacy to contextualise and advance the concepts of a generic implementation framework previously published. Methods: Purposeful sampling was used to investigate implementation across a range of levels of implementation in community pharmacies in Australia. Twenty-five semi-structured interviews were conducted and analysed using a framework methodology. Data was charted using implementation stages as overarching themes and each stage was thematically analysed, to investigate the implementation process, the influences and their relationships. Secondary analyses were performed of the factors (barriers and facilitators) using an adapted version of the Consolidated Framework for Implementation Research (CFIR), and implementation strategies and interventions, using the Expert Recommendations for Implementing Change (ERIC) discrete implementation strategy compilation. Results: Six stages emerged, labelled as development or discovery, exploration, preparation, testing, operation and sustainability. Within the stages, a range of implementation activities/steps and five overarching influences (pharmacies' direction and impetus, internal communication, staffing, community fit and support) were identified. The stages and activities were not applied strictly in a linear fashion. There was a trend towards the greater the number of activities considered, the greater the apparent integration into the pharmacy organization. Implementation factors varied over the implementation stages, and additional factors were added to the CFIR list and definitions modified/contextualised for pharmacy. Implementation strategies employed by pharmacies varied widely. Evaluations were lacking. Conclusions: The process of implementation and five overarching influences of professional services implementation in community pharmacy have been outlined. Framework analysis revealed, outside of the five overarching influences, factors influencing implementation varied across the implementation stages. It is proposed at each stage, for each domain, the factors, strategies and evaluations should be considered. The Framework for the Implementation of Services in Pharmacy incorporates the contextualisation of implementation science for pharmacy. Notes: Moullin, Joanna C. Title: An intervention to promote self-management, independence and self-efficacy in people with early-stage dementia: the Journeying through Dementia RCT

Journal: Health Technology Assessment

Volume: 26

Issue: 24

Pages: 1-151

Date: May

Short Title: An intervention to promote self-management, independence and self-efficacy in people with early-stage dementia: the Journeying through Dementia RCT

ISSN: 1366-5278

DOI: 10.3310/khha0861

Accession Number: WOS:000798522000001

Abstract: Background: There are few effective interventions for dementia. Aim: To determine the clinical effectiveness and cost-effectiveness of an intervention to promote self-management, independence and self-efficacy in people with early-stage dementia. Objectives: To undertake a randomised controlled trial of the Journeying through Dementia intervention compared with usual care, conduct an internal pilot testing feasibility, assess intervention delivery fidelity and undertake a qualitative exploration of participants' experiences. Design: A pragmatic two-arm individually randomised trial analysed by intention to treat. Participants: A total of 480 people diagnosed with mild dementia, with capacity to make informed decisions, living in the community and not participating in other studies, and 350 supporters whom they identified, from 13 locations in England, took part. Intervention: Those randomised to the Journeying through Dementia intervention (n = 241) were invited to take part in 12 weekly facilitated groups and four one-to-one sessions delivered in the community by secondary care staff, in addition to their usual care. The control group (n = 239) received usual care. Usual care included drug treatment, needs assessment and referral to appropriate services. Usual care at each site was recorded. Main outcome measures: The primary outcome was Dementia-Related Quality of Life score at 8 months post randomisation, with higher scores representing higher quality of life. Secondary outcomes included resource use, psychological well-being, self-management, instrumental activities of daily living and health-related quality of life. Randomisation and blinding: Participants were randomised in a 1: 1 ratio. Staff conducting outcome assessments were blinded. Data sources: Outcome measures were administered in participants' homes at baseline and at 8 and 12 months post randomisation. Interviews were conducted with participants, participating carers and interventionalists. Results: The mean Dementia-Related Quality of Life score at 8 months was 93.3 (standard deviation 13.0) in the intervention arm (n = 191) and 91.9 (standard deviation 14.6) in the control arm (n = 197), with a difference in means of 0.9 (95% confidence interval -1.2 to 3.0; p = 0.380) after adjustment for covariates. This effect size (0.9) was less than the 4 points defined as clinically meaningful. For other outcomes, a difference was found only for Diener's Flourishing Scale (adjusted mean difference 1.2, 95% confidence interval 0.1 to 2.3), in favour of the intervention (i.e. in a positive direction). The

Journeying through Dementia intervention cost 608 pound more than usual care (95% confidence interval 105 pound to 1179) pound and had negligible difference in quality-adjusted life-years (-0.003, 95% confidence interval -0.044 to 0.038). Therefore, the Journeying through Dementia intervention had a mean incremental cost per quality-adjusted life-year of -202,857 pound (95% confidence interval -534,733 pound to 483,739); pound however, there is considerable uncertainty around this. Assessed fidelity was good. Interviewed participants described receiving some benefit and a minority benefited greatly. However, negative aspects were also raised by a minority. Seventeen per cent of participants in the intervention arm and 15% of participants in the control arm experienced at least one serious adverse event. None of the serious adverse events were classified as related to the intervention. Limitations: Study limitations include recruitment of an active population, delivery challenges and limitations of existing outcome measures. Conclusions: The Journeying through Dementia programme is not clinically effective, is unlikely to be cost-effective and cannot be recommended in its existing format. Future work: Research should focus on the creation of new outcome measures to assess well-being in dementia and on using elements of the intervention, such as enabling enactment in the community. Trial registration: This trial is registered as ISRCTN17993825. Funding: This project was funded by the National Institute for Health and Care Research (NIHR) Health Technology Assessment programme and will be published in full in Health Technology Assessment; Vol. 26, No. 24. See the NIHR Journals Library website for further project information.

Article Number: 14816

Accession Number: WOS:000887185100001

Abstract: Physical inactivity is prevalent in older adults and contributes to age-related decline in function, health, well-being, and quality of life. Recreational football for older adults has shown promise for promoting health benefits. This study explores the lived experiences of older adults engaging in a walking and recreational football intervention and identifies factors that affect behaviours and can encourage change in this population. A purposive sample (n = 14; aged 67 +/- 5 years) of the lived experiences of those participating in a recreational football intervention took part in two focus groups. The participants' responses were grouped into three-time reflecting specific points in their lives: what stopped them from playing football, what got them playing, and what is needed for them to continue playing in the future. Within each of these time points in their lives, themes were identified. The key findings and practical recommendations were that football needs to be adapted and local, that the priority to play football changes over time, and that football itself is a fundamentally intrinsic motivator; 'it's in your blood'. The findings can be used to inform future interventions, encourage participation, and advise on the best practices for key stakeholders in the physical activity domain.

Article Number: 699

Accession Number: WOS:000801135500001

Abstract: Objectives To adapt a World Health Organization HEARTS-based implementation strategy for hypertension (HTN) control at a large urban HIV clinic in Uganda and determine six-month HTN and HIV outcomes among a cohort of adult persons living with HIV (PLHIV). **Methods** Our implementation strategy included six elements: health education, medication adherence, and lifestyle counseling; routine HTN screening; task shifting of HTN treatment; evidence-based HTN treatment protocol; consistent supply of HTN medicines free to patients; and inclusion of HTN-specific monitoring and evaluation tools. We conducted a pre-post study from October 2019 to March 2020 to determine the effect of this strategy on HTN and HIV outcomes at baseline and six months. Our cohort comprised adult PLHIV diagnosed with HTN who made at least one clinic visit within two months prior to study onset. **Findings** We enrolled 1,015 hypertensive PLHIV. The mean age was 50.1 +/- 9.5 years and 62.6% were female. HTN outcomes improved between baseline and six months: mean systolic BP (154.3 +/- 20.0 to 132.3 +/- 13.8 mmHg, $p < 0.001$); mean diastolic BP (97.7 +/- 13.1 to 85.3 +/- 9.5 mmHg, $p < 0.001$) and proportion of patients with controlled HTN (9.3% to 74.1%, $p < 0.001$). The HTN care cascade also improved: treatment initiation (13.4% to 100%), retention in care (16.2% to 98.5%), monitoring (16.2% to 98.5%), and BP control among those initiated on HTN treatment (2.2% to 75.2%). HIV cascade steps remained high (> 95% at baseline and six months) and viral suppression was unchanged (98.7% to 99.2%, $p = 0.712$). Taking ART for more than two years and HIV viral suppression were independent predictors of HTN control at six months. **Conclusions** A HEARTS-based implementation strategy at a large, urban HIV center facilitates integration of HTN and HIV care and improves HTN outcomes while sustaining HIV control. Further implementation research is needed to study HTN/HIV integration in varied clinical settings among diverse populations.

Short Title: Drivers of Solid Waste Segregation and Recycling in Kampala Slums, Uganda: A Qualitative Exploration Using the Behavior Centered Design Model

DOI: 10.3390/ijerph191710947

Article Number: 10947

Accession Number: WOS:000851124700001

Abstract: Solid-waste management is a challenge in many cities, especially in low-income countries, including Uganda. Simple and inexpensive strategies such as solid-waste segregation and recycling have the potential to reduce risks associated with indiscriminate waste management. Unfortunately, these strategies have not been studied and adopted in slums in low-income countries. This cross-sectional qualitative study, therefore, used the behavioral-centered design model to understand the drivers of recycling in Kampala slums. Data were coded using ATLAS ti version 7.0, and content analysis was used for interpreting the findings. Our findings revealed that the study practices were not yet habitual and were driven by the presence of physical space for segregation containers, and functional social networks in the communities. Additionally, financial rewards and awareness related to the recycling benefits, and available community support were found to be critical drivers. The availability of infrastructure and objects for segregation and recycling and the influence of politics and policies were identified. There is, therefore, need for both the public and private sector to engage in developing and implementing the relevant laws and policies on solid waste recycling, increase community awareness of the critical behavior, and create sustainable markets for waste segregated and recycled products.

Short Title: Design and evaluation of strategies to implement HIV prevention interventions for pregnant women in community pharmacy settings in western Kenya: a mixed-methods study protocol

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2021-052311

Article Number: e052311

Accession Number: WOS:000731101300013

Abstract: Introduction Community pharmacies play an important role in the healthcare system: they are frequently accessed and have increasing capacity to deliver HIV prevention services. In communities where the prevalence of HIV is high and access to antenatal care clinics is delayed or irregular, there is a unique opportunity to leverage pharmacies to enhance early and sustained access to HIV prevention among pregnant women. This study will identify women's preferences for delivery of HIV prevention services and provider-level and system-level strategies to design a new pharmacy-based model of care for pregnant women. The overall objective of this study is to design and evaluate strategies to implement HIV prevention interventions for pregnant women in community pharmacy settings in western Kenya. Methods and analysis We propose to conduct a discrete choice experiment to quantify preferences for delivery of HIV prevention interventions (including pre-exposure prophylaxis, partner testing and sexually transmitted infection screening and treatment) for pregnant women in community pharmacy settings. Latent class analysis will be used to quantify women's stated preferences and identify packages of intervention components that will optimise uptake among different subgroups of women. We will apply the Theoretical Domains Framework to identify provider-level and system-level factors that might influence the implementation of the optimal intervention packages. We will then use the Behaviour Change Wheel and survey a panel of experts to select and gain consensus on strategies to improve implementation. Finally, we will evaluate the potential costs of extending the implementation of HIV prevention interventions from the clinic to community pharmacy settings. Ethics and dissemination The protocol was approved by the Kenyatta National Hospital-University of Nairobi Ethics Research Committee and the University of Washington Institutional Review Board. The results of this research will be published in peer-reviewed journals and shared with various stakeholders, including community members, policymakers and researchers, through local and international conferences.

Date: Apr
Short Title: Rapid Evidence Review of Community Engagement and Resources in the UK during the COVID-19 Pandemic: How Can Community Assets Redress Health Inequities?
DOI: 10.3390/ijerph19074086
Article Number: 4086
Accession Number: WOS:000780632900001
Abstract: Community engagement, such as participating in arts, nature or leisurely activities, is positively associated with psychological and physiological wellbeing. Community-based engagement during the COVID-19 pandemic facilitated informal and local mutual aid between individuals. This rapid evidence review assesses the emergence of community-based arts, nature, music, theatre and other types of cultural engagement amongst UK communities in response to the COVID-19 pandemic. Here, we focus on all community engagement with a sub-focus on provisions accessed by and targeted towards vulnerable groups. Two hundred and fifty-six resources were included that had been created between February 2020 and January 2021. Resources were identified through Google Scholar, PubMed, Web of Science, MedRxiv, PsycharXiv and searches for grey literature and items in the public domain. The majority reported services that had been adapted to become online, telephone-based or delivered at a distance from doorsteps. Several quality assessment frameworks were used to evaluate the quality of data. Whilst a number of peer-reviewed, grey literature and public domain articles were identified, less than half of the identified literature met quality thresholds. The pace of the response to the pandemic may have meant that robust evaluation procedures were not always in place.

Title: Behavior Change Training for Health Professionals: Evaluation of a 2-Hour Workshop
Journal: Jmir Formative Research
Volume: 6
Issue: 11
Date: Nov
Short Title: Behavior Change Training for Health Professionals:

Evaluation of a 2-Hour Workshop

DOI: 10.2196/42010

Article Number: e42010

Accession Number: WOS:000904521800054

Abstract: Background: Rates of noncommunicable diseases continue to rise worldwide. Many of these diseases are a result of engaging in risk behaviors. Without lifestyle and behavioral intervention, noncommunicable diseases can worsen and develop into more debilitating diseases. Behavioral interventions are an effective strategy to reduce the burden of disease. Behavior change techniques can be described as the "active ingredients" in behavior change and address the components that need to be altered in order for the target behavior to change. Health professionals, such as pharmacists and nurses, can engage in opportunistic behavior change with their patients, to encourage positive health behaviors. Objective: We aimed to develop, implement, and evaluate a behavior change workshop targeted at health professionals in Australia, with the goal of increasing knowledge of behavior change techniques and psychological variables. Methods: A prospective study design was used to develop and evaluate a 2-hour behavior change workshop targeted at health professionals. The workshop was developed based on the Capability, Opportunity, Motivation, and Behavior Model and had five core objectives: (1) to detail the role of health professionals in delivering optimal care, (2) to demonstrate opportunities to change behavior, (3) to describe principles of behavior change, (4) to explain behavior change techniques, and (5) to determine the most appropriate behavior change techniques to use and when to use them. A total of 10 workshops were conducted. To evaluate the workshops and identify any potential long-term changes in behavior, we collected pre- and postworkshop data on knowledge and psychological constructs from the attendees. Results: A final sample of 41 health professionals comprising general practitioners, nurses, and pharmacists completed the pre- and postworkshop surveys. Following the workshops, there were significant improvements in knowledge of behavior change techniques ($t(40)=-5.27$, $P<.001$), subjective norms ($t(40)=-3.49$, $P=.001$), descriptive norms ($t(40)=-3.65$, $P<.001$), perceived behavioral control ($t(40)=-3.30$, $P=.002$), and intention ($t(36)=-3.32$, $P=.002$); each had a large effect size. There was no significant difference in postworkshop attitude ($t(40)=0.78$, $P=.44$). The participants also found the workshops to be highly acceptable. Conclusions: A 2-hour, theoretically informed workshop designed to facilitate the use of behavior change techniques by health professionals was shown to be largely effective. The workshops resulted in increases in knowledge, descriptive and subjective norms, perceived behavioral control, and intention, but not in attitude. The intervention was also shown to be highly acceptable, with the large majority of participants deeming the intervention to be needed, useful, appropriate, and applicable, as well as interesting and worth their time. Future research should examine the lasting impacts of the workshop on health professionals' practices. Notes: Mullan, Barbara Liddelow, Caitlin Haywood, Darren Breare, Hayley

Title: Implementation of COVID-19 Infection Control Measures by
German Dentists: A Qualitative Study to Identify Enablers and
Barriers

Journal: International Journal of Environmental Research and Public
Health

Volume: 18

Issue: 11

Date: Jun

Short Title: Implementation of COVID-19 Infection Control Measures
by German Dentists: A Qualitative Study to Identify Enablers and
Barriers

DOI: 10.3390/ijerph18115710

Article Number: 5710

Accession Number: WOS:000659941500001

Abstract: Objectives: COVID-19 infection control measures have been
recommended for dental practices worldwide. This qualitative study
explored barriers and enablers for the implementation of these
measures in German dental practices. Methods: Semi-structured phone
interviews were conducted in November/December 2020 (purposive/
snowball sampling). The Theoretical Domains Framework (TDF) and the
Capabilities, Opportunities and Motivations influencing Behaviors
model (COM-B) were used to guide interviews. Mayring's content
analysis was employed to analyze interviews. Results: All dentists
(28-71 years, 4/8 female/male) had implemented infection control
measures. Measures most frequently not adopted were FFP2 masks, face
shields (impractical), the rotation of teams (insufficient staffing)
and the avoidance of aerosol-generating treatments. Dentists with
personal COVID-19 experience or those seeing themselves as a role
model were more eager to adopt measures. We identified 34 enablers
and 20 barriers. Major barriers were the lack of knowledge,
guidelines and recommendations as well as limited availability and
high costs of equipment. Pressure by staff and patients to ensure
infection control was an enabler. Conclusions: Dentists are
motivated to implement infection control measures, but lacking
opportunities limited the adoption of certain measures. Policy
makers and equipment manufacturers should address these points to
increase the implementation of infection control measures against
COVID-19 and potential future pandemics.

Short Title: Barriers and Enablers for Artificial Intelligence in Dental Diagnostics: A Qualitative Study

DOI: 10.3390/jcm10081612

Article Number: 1612

Accession Number: WOS:000644461700001

Abstract: The present study aimed to identify barriers and enablers for the implementation of artificial intelligence (AI) in dental, specifically radiographic, diagnostics. Semi-structured phone interviews with dentists and patients were conducted between the end of May and the end of June 2020 (convenience/snowball sampling). A questionnaire developed along the Theoretical Domains Framework (TDF) and the Capabilities, Opportunities and Motivations influencing Behaviors model (COM-B) was used to guide interviews. Mayring's content analysis was employed to point out barriers and enablers. We identified 36 barriers, conflicting themes or enablers, covering nine of the fourteen domains of the TDF and all three determinants of behavior (COM). Both stakeholders emphasized chances and hopes for AI. A range of enablers for implementing AI in dental diagnostics were identified (e.g., the chance for higher diagnostic accuracy, a reduced workload, more comprehensive reporting and better patient-provider communication). Barriers related to reliance on AI and responsibility for medical decisions, as well as the explainability of AI and the related option to de-bug AI applications, emerged. Decision-makers and industry may want to consider these aspects to foster implementation of AI in dentistry.

DOI: 10.1136/bmjopen-2020-045583

Article Number: e045583

Accession Number: WOS:000625358900021

Abstract: Introduction Eczema care requires management of triggers and various treatments. We developed two online behavioural interventions to support eczema care called ECO (Eczema Care Online) for young people and ECO for families. This protocol describes two randomised controlled trials (RCTs) aimed to evaluate clinical and cost-effectiveness of the two interventions. Methods and analysis Design: Two independent, pragmatic, unmasked, parallel group RCTs with internal pilots and nested health economic and process evaluation studies. Setting: Participants will be recruited from general practitioner practices in England. Participants: Young people aged 13-25 years with eczema and parents and carers of children aged 0-12 years with eczema, excluding inactive or very mild eczema (five or less on Patient-Oriented Eczema Measure (POEM)). Interventions: Participants will be randomised to online intervention plus usual care or to usual eczema care alone. Outcome measures: Primary outcome is eczema severity over 24 weeks measured by POEM. Secondary outcomes include POEM 4-weekly for 52 weeks, quality of life, eczema control, itch intensity (young people only), patient enablement, health service and treatment use. Process measures include treatment adherence, barriers to adherence and intervention usage. Our sample sizes of 303 participants per trial are powered to detect a group difference of 2.5 (SD 6.5) in monthly POEM scores over 24 weeks (significance 0.05, power 0.9), allowing for 20% loss to follow-up. Cost-effectiveness analysis will be from a National Health Service and personal social service perspective. Qualitative and quantitative process evaluation will help understand the mechanisms of action and participant experiences and inform implementation. Ethics and dissemination The study has been approved by South Central Oxford A Research Ethics Committee (19/SC/0351). Recruitment is ongoing, and follow-up will be completed by mid-2022. Findings will be disseminated to participants, the public, dermatology and primary care journals, and policy makers.

Title: Development of an intervention to facilitate dissemination of community-based training to respond to out-of-hospital cardiac arrest: FirstCPR

Journal: Plos One

Volume: 17

Issue: 8

Date: Aug

Short Title: Development of an intervention to facilitate dissemination of community-based training to respond to out-of-hospital cardiac arrest: FirstCPR

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0273028

Article Number: e0273028

Accession Number: WOS:000860991100002

Abstract: Background and aim Out-of-hospital cardiac arrest (OHCA) is a significant public health issue with low survival rates. Prompt bystander action can more than double survival odds. OHCA response training is primarily pursued due to work-related mandates, with few programs targeting communities with lower training levels. The aim of this research was to describe the development process of a targeted multicomponent intervention package designed to enhance confidence and training among laypeople in responding to an OHCA. Methods An iterative, three-phase program development process was employed using a mixed methods approach. The initial phase involved establishment of a multidisciplinary panel that informed decisions on key messages, program content, format, and delivery modes. These decisions were based on scientific evidence and guided by behavioural theories. The second phase comprised the development of the intervention package, identifying existing information and developing new material to fill identified gaps. The third phase involved refining and finalising the material via feedback from panel members, stakeholders, and community members. Results Through this approach, we collaboratively developed a comprehensive

evidence-based education and training package consisting of a digital intervention supplemented with free access to in-person education and training. The package was designed to teach community members the specific steps in recognising and responding to a cardiac arrest, while addressing commonly known barriers and fears related to bystander response. The tailored program and delivery format addressed the needs of individuals of diverse ages, cultural backgrounds, and varied training needs and preferences.

Conclusion The study highlights the importance of community engagement in intervention development and demonstrates the need of evidence-based and collaborative approaches in creating a comprehensive, localised, relatively low-cost intervention package to improve bystander response to OHCA.

Article Number: e057175

Accession Number: WOS:000810010000019

Abstract: Introduction Out-of-hospital cardiac arrest (OHCA) is associated with poor survival outcomes, but prompt bystander action can more than double survival rates. Being trained, confident and willing-to-perform cardiopulmonary resuscitation (CPR) are known predictors of bystander action. This study aims to assess the effectiveness of a community organisation targeted multicomponent education and training initiative on being willing to respond to OHCA's. The study employs a novel approach to reaching community members via social and cultural groups, and the intervention aims to address commonly cited barriers to training including lack of

availability, time and costs. Methods and analysis FirstCPR is a cluster randomised trial that will be conducted across 200 community groups in urban and regional Australia. It will target community groups where CPR training is not usual. Community groups (clusters) will be stratified by region, size and organisation type, and then randomly assigned to either immediately receive the intervention programme, comprising digital and in-person education and training opportunities about CPR and OHCA over 12 months, or a delayed programme implementation. The primary outcome is self-reported 'training and willingness-to-perform CPR' at 12 months. It will be assessed through surveys of group members that consent in intervention versus control groups and administered prior to control groups receiving the intervention. The primary analysis will follow intention-to-treat principles, use log binomial regression accounting for baseline covariates and be conducted at the individual level, while accounting for clustering within communities. Focus groups and interviews will be conducted to examine barriers and enablers to implementation and costs will also be examined. Ethics and dissemination Ethical approval was obtained from The University of Sydney. Findings from this study will be disseminated via presentations at scientific conferences, publications in peer-reviewed journals, scientific and lay reports. Short Title: Improving Support for Parents of Children with Hearing Loss: Provider Training on Use of Targeted Communication Strategies

ISSN: 1050-0545

DOI: 10.3766/jaaa.26.2.2

Accession Number: WOS:000349269100002

Abstract: Background: When proper protocols are followed, children who are identified with a permanent hearing loss early in life have opportunities to develop language on par with their typical hearing

peers. Young children with hearing loss are dependent on their parents to manage intervention during early years critical to their development, and parents' ability to effectively integrate recommendations in daily life is foundational for intervention success. Audiologists and early intervention professionals not only need to provide current evidence-based services, but also must address parents' emotional and learning needs related to their child's hearing loss. Purpose: This study explored practice patterns related to education and support provided to parents of children with hearing loss and the influence of an in-service training on provider attitudes. Research Design: This study used a prepost design with a self-report questionnaire to identify practice patterns related to communication skills and support used by providers when working with parents of children with hearing loss. Study Sample: A total of 45 participants (21 professionals and 24 graduate students) currently working with children completed the pretraining questionnaire, and 29 participants (13 professionals and 16 graduate students) completed the postquestionnaire. Data Collection and Analysis: Data were collected using an online questionnaire before the training and 1 mo after training. Descriptive analyses were done to identify trends, and paired-samples t-tests were used to determine changes pretraining to posttraining. Results: Findings revealed that professionals most frequently teach skills to mothers (91%) and infrequently teach skills to fathers (19%) and other caregivers (10%). Professionals reported frequently collaborating with other intervention providers (76%) and infrequently collaborating with primary care physicians (19%). One-third of the professionals reported addressing symptoms of depression and anxiety as an interfering factor with the ability to implement management recommendations. For providers who completed both the prequestionnaires and postquestionnaires, an increase in confidence was reported for several areas of communication; however, as expected, practices remained similar, and all of the practicing professionals and 94% of the graduate students indicated a desire for more training on how to be effective in supporting parents with implementing intervention recommendations. Conclusions: Providers do not necessarily use effective methods of communication, needed to adequately help parents, requiring additional focused training to change how providers interact with parents and how support is provided.

Short Title: Optimising implementation of a patient-assessment framework for emergency nurses: A mixed-method study

ISSN: 0962-1067

DOI: 10.1111/jocn.13932

Accession Number: WOS:000418871000054

Abstract: Aims and objectives To determine potential facilitators and barriers and tailor interventions to optimise future implementation of a patient-assessment framework into emergency nursing practice.

Background An evidence-informed patient-assessment framework HIRAID (History, Identify Red flags, Assessment, Interventions,

Diagnosics, communication and reassessment) improves the quality of patient assessments performed by emergency nurses. Facilitators and barriers must be understood and tailored interventions selected to optimise implementation.

Design A mixed-method convergent study design was used.

Methods Thirty eight early career emergency nurses from five Australian hospitals participated in an education workshop on the HIRAID assessment framework. Simulated clinical scenarios enabled participants to experience conducting a patient assessment with and without using the framework. All participants completed surveys, interviews and focus groups to identify potential facilitators and barriers. Twenty three participants completed follow-up telephone surveys 4-6 months later. Quantitative and qualitative data were analysed separately using descriptive statistics and inductive content analysis, prior to integration.

Implementation interventions were selected using the Behaviour Change Wheel. Results Nine facilitators and nine barriers were identified to potentially effect implementation of the HIRAID assessment framework. Twelve of the 23 participants (52.2%) who completed follow-up surveys reported using the framework in the clinical setting. To optimise future implementation, the education workshop needs refinement, and environmental restructuring, modelling and social support are required.

Conclusion A multimodal strategy is needed to promote future successful implementation of the HIRAID assessment framework into emergency nursing practice.

Relevance for clinical practice The successful implementation of the HIRAID assessment framework has the potential to improve nursing assessments of patients in emergency and other acute care settings. This study demonstrates how to systematically identify facilitators and barriers to behaviour change and select interventions to optimise implementation of evidence-informed nursing practices.

Short Title: Increasing accuracy in documentation through the application of a structured emergency nursing framework: A multisite quasi-experimental study

ISSN: 0962-1067

DOI: 10.1111/jocn.16115

Accession Number: WOS:000719659700001

Abstract: Aims and Objectives To determine if the use of an emergency nursing framework improves the accuracy of clinical documentation. Background Accurate clinical documentation is a nursing professional responsibility essential for high-quality and safe patient care. The use of the emergency nursing framework "HIRAID" (History, Identify Red flags, Assessment, Interventions, Diagnostics, reassessment and communication) improves emergency nursing care by reducing treatment delays and improving escalation of clinical deterioration. The effect of HIRAID on the accuracy of nursing documentation is unknown. Design A quasi-experimental pre-post study was conducted and the report was guided by the strengthening the reporting of observational studies in epidemiology (STROBE) checklist. Methods HIRAID was implemented in four regional/rural Australian emergency departments (ED) using a range of behaviour change strategies. The blinded electronic healthcare records of 120 patients with a presenting problem of shortness of breath, abdominal pain or fever were reviewed. Quantity measures of completeness and qualitative measures of completeness and linguistic correctness of documentation adapted from the D-Catch tool were used to assess accuracy. Differences between pre-post groups were analysed using Wilcoxon rank-sum and two-sample t-tests for continuous variables. Pearson's Chi-square and Fisher exact tests were used for the categorical data. Results The number of records containing the essential assessment components of emergency care increased significantly from pre- to post-implementation of HIRAID. This overall improvement was demonstrated in both paediatric and adult populations and for all presentation types. Both the quantitative and qualitative measures of documentation on patient history and physical assessment findings improved significantly. Conclusion Use of HIRAID improves the accuracy of clinical documentation of the patient history and physical assessment in both adult and paediatric populations. Relevance to Clinical Practice The emergency nursing framework "HIRAID" is recommended for use in clinical practice to increase the documentation accuracy performed by emergency nurses.

Accession Number: WOS:000388865500006
Abstract: We present a taxonomy of choice architecture techniques that focus on intervention design, as opposed to the underlying cognitive processes that make an intervention work. We argue that this distinction will facilitate further empirical testing and will assist practitioners in designing interventions. The framework is inductively derived from empirically tested examples of choice architecture and consists of nine techniques targeting decision information, decision structure, and decision assistance. An inter-rater reliability test demonstrates that these techniques can be used in an intersubjectively replicable way to describe sample choice architectures. We conclude by discussing limitations of the framework and key issues concerning the use of the techniques in the development of new choice architectures. Copyright (C) 2015 John Wiley & Sons, Ltd.

Short Title: Pharmacists' performance in a telephone-based simulated patient study after a mental health capacity-building program

ISSN: 2210-7703

DOI: 10.1007/s11096-015-0171-7

Accession Number: WOS:000363490100011

Abstract: Background The More Than Meds program was developed to enhance community pharmacy based services for people with mental illness. Objective To evaluate the care of pharmacists who participated in this specific program using a telephone-based simulated patient with insomnia. Methods A trained actor used a simulated patient case scenario and telephoned pharmacists (i.e., intervention group pharmacists) and a control group of pharmacists approximately 6 months following training. Pharmacists were scored on their assessment of the patient and problem, guidance provided on both pharmacological and nonpharmacological care, communications, and overall quality. Results Sixty-three pharmacists (n = 29 intervention, n = 34 controls) were reached. Call duration was longer with intervention versus control group pharmacists [4.93 min (SD 2.3) vs. 4.00 min (SD 1.8)]. Medication recommendations were made by 76 and 100 % of intervention versus control pharmacists (p = 0.002), respectively. Intervention group pharmacists scored significantly higher on most components within communication and overall quality scores. Scores for assessing the patient, the problem, sleep, and medication supply were lower than expected for both groups. Conclusion Intervention group pharmacists performed better than controls on several components of a telephone-based simulated patient scenario for insomnia following More Than Meds training. More research is needed regarding telephone consultations in pharmacy practice.

Short Title: A theory-informed approach to mental health care
capacity building for pharmacists
ISSN: 1752-4458
DOI: 10.1186/1752-4458-8-46
Article Number: 46
Accession Number: WOS:000347199000001
Abstract: Background: Pharmacists are knowledgeable, accessible
health care professionals who can provide services that improve
outcomes in mental health care. Various challenges and opportunities
can exist in pharmacy practice to hinder or support pharmacists'
efforts. We used a theory-informed approach to development and
implementation of a capacity-building program to enhance
pharmacists' roles in mental health care. Methods: Theories and
frameworks including the Consolidated Framework for Implementation
Research, the Theoretical Domains Framework, and the Behaviour
Change Wheel were used to inform the conceptualization, development,
and implementation of a capacity-building program to enhance
pharmacists' roles in mental health care. Results: The More Than
Meds program was developed and implemented through an iterative
process. The main program components included: an education and
training day; use of a train-the-trainer approach from partnerships
with pharmacists and people with lived experience of mental illness;
development of a community of practice through email communications,
a website, and a newsletter; and use of educational outreach
delivered by pharmacists. Theories and frameworks used throughout
the program's development and implementation facilitated a means to
conceptualize the component parts of the program as well as its
overall presence as a whole from inception through evolution in
implementation. Using theoretical foundations for the program
enabled critical consideration and understanding of issues related
to trialability and adaptability of the program. Conclusions: Theory

was essential to the underlying development and implementation of a capacity-building program for enhancing services by pharmacists for people with lived experience of mental illness. Lessons learned from the development and implementation of this program are informing current research and evolution of the program.

Abstract: Background: Community pharmacists care for and support people with lived experience of mental illness in their communities. We developed a program called More Than Meds to facilitate enhancing capacity of community pharmacists' roles in mental health care.

Methods: We conducted a qualitative study and used a directed content analysis with application of the Theoretical Domains Framework as part of our underlying theory of behaviour change and our analytic framework. Results: Ten interviews (n = 6 pharmacists, n = 4 community members) were conducted with participants from the More Than Meds program. Three key themes were identified from the experiences of More Than Meds participants: networking and bridging, stigma, and expectations and permissions. The most frequently coded domains in the data from the Theoretical Domains Framework were social/professional role, skills, beliefs about capabilities, knowledge and environmental context and resources. Conclusions: The More than Meds Program enabled community pharmacists to increase their capabilities, opportunities and motivation in providing mental health care and support. Involving community pharmacists together with people with lived experience of mental illness was identified as an innovative component of the program.

Article Number: 569

Accession Number: WOS:000384937900004

Abstract: Background: The role of community pharmacists is changing globally with pharmacists engaging in more clinically-oriented roles, including in mental health care. Pharmacists' interventions have been shown to improve mental health related outcomes but various barriers can limit pharmacists in their care of patients. We aimed to explore the experiences of people with lived experience of mental illness and addictions in community pharmacies to generate findings to inform practice improvements. Methods: We used interpretive description methodology with analytic procedures of thematic analysis to explore the experiences of people with lived experience of mental illness and addictions with community pharmacy services. Participants were recruited through multiple mechanisms (e.g., paper and online advertisements), offered honorarium for their time, and given the option of a focus group or interview for participation in our study. Data were gathered during July to September of 2012. Interviews and focus groups were audio-recorded, transcribed verbatim, and analyzed by two researchers. Results: We collected approximately nine hours of audio data from 18 individuals in two focus groups (n = 12) and six individual interviews. Fourteen participants were female and the average age was 41 years (range 24 to 57 years). Expectations, decision-making, and supports were identified as central themes underlying the community pharmacy experiences of people with lived experience of mental illness and addictions. Eight subthemes were identified including: relationships with pharmacy staff; patient's role in the pharmacist-patient relationship; crisis and triage; privacy and confidentiality; time; stigma and judgment; medication-related and other services; and transparency. Conclusions: People with lived experience of mental illness and addictions demonstrate a high regard and respect for pharmacist's knowledge and abilities but hold conservative

expectations of pharmacy health services shaped by experience, observations, and assumptions. To some extent, expectation management occurs with the recognition of the demands on pharmacists and constraints inherent to community pharmacy practice. Relationships with pharmacy staff are critical to people with lived experience and influence their decision-making. Research in the area of pharmacists' roles in crises and triage, especially in the area of suicide assessment and mitigation, is needed urgently.

Short Title: Community pharmacists' experiences in mental illness and addictions care: a qualitative study

DOI: 10.1186/s13011-016-0050-9

Article Number: 6

Accession Number: WOS:000368888200001

Abstract: Background: Community pharmacists are accessible health care professionals who encounter people with lived experience of mental illness and addictions in daily practice. Although some existing research supports that community pharmacists' interventions result in improved patient mental health outcomes, gaps in knowledge regarding the pharmacists' experiences with service provision to this population remain. Improving knowledge regarding the pharmacists' experiences with mental illness and addictions service provision can facilitate a better understanding of their perspectives and be used to inform the development and implementation of interventions delivered by community pharmacists for people with lived experience of mental illness and addictions in communities. Methods: We conducted a qualitative study using a directed content analysis and the Theoretical Domains Framework as part of our underlying theory of behaviour change and our analytic framework for theme development. The Theoretical Domains Framework facilitates understanding of behaviours of health care professionals and implementation challenges and opportunities for interventions in health care. Thematic analysis co-occurred throughout the process of the directed content analysis. We recruited community pharmacists, with experience dispensing psychotropics, at a minimum, through

multiple mechanisms (e.g., professional associations) in a convenience sampling approach. Potential participants were offered the option of focus groups or interviews. Results: Data were collected from one focus group and two interviews involving six pharmacists. Theoretical Domains Framework coding was primarily weighted in two domains: social/professional role and identity and environmental context and resources. We identified five main themes in the experiences of pharmacists in mental illness and addictions care: competing interests, demands, and time; relationships, rapport, and trust; stigma; collaboration and triage; and role expectations and clarity. Conclusions: Pharmacists are not practicing to their full scope of practice in mental illness and addictions care for several reasons including limitations within the work environment and lack of structures and processes in place to be fully engaged as health care professionals. More research and policy work are needed to examine better integration of pharmacists as members of the mental health care team in communities.

Short Title: Primary care organisational interventions for secondary prevention of ischaemic heart disease: a systematic review and meta-analysis

ISSN: 0960-1643

DOI: 10.3399/bjgp15X685681

Accession Number: WOS:000356968500006

Abstract: Background Ischaemic heart disease (IHD) is the most common cause of death worldwide. Aim To determine the long-term impact of organisational interventions for secondary prevention of IHD. Design and setting Systematic review and meta-analysis of studies from CENTRAL, MEDLINE (R), Embase, and CINAHL published January 2007 to January 2013. Method Searches were conducted for randomised controlled trials of patients with established IHD, with long-term follow-up, of cardiac secondary prevention programmes

targeting organisational change in primary care or community settings. A random effects model was used and risk ratios were calculated. Results Five studies were included with 4005 participants. Meta-analysis of four studies with mortality data at 4.7-6 years showed that organisational interventions were associated with approximately 20% reduced mortality, with a risk ratio (RR) for all-cause mortality of 0.79 (95% confidence interval (CI) = 0.66 to 0.93), and a RR for cardiac-related mortality of 0.74 (95% CI = 0.58 to 0.94). Two studies reported mortality data at 10 years. Analysis of these data showed no significant differences between groups. There were insufficient data to conduct a meta-analysis on the effect of interventions on hospital admissions. Additional analyses showed no significant association between organisational interventions and risk factor management or appropriate prescribing at 4.7-6 years. Conclusion Cardiac secondary prevention programmes targeting organisational change are associated with a reduced risk of death for at least 4-6 years. There is insufficient evidence to conclude whether this beneficial effect is maintained indefinitely. Notes: Murphy, Edel Vellinga, Akke Byrne, Molly Cupples, Margaret E. Murphy, Andrew W. Article Number: 101943

Accession Number: WOS:000632550700004

Abstract: Domestic energy-efficiency retrofit is an essential component of achievement of UK decarbonisation policy targets. UK policy strategy however has tended to focus on technology and new-build, with the implication of inadequate engagement with issues relating to the practitioners in the repair-maintenance-improvement (RMI) sector who work on energy-efficiency retrofit of the existing building stock. Addressing a gap in the literature on deep understanding of what is important to these practitioners, the study

offers a novel application of a theoretical framework of behaviour change. Three datasets were aggregated, of semi-structured interviews with RMI practitioners around the UK. Template analysis was applied to the 31 transcripts. Focusing on motivation, evidence was found for motivations including pride in work, variety and challenge, working independently, maintaining a viable business, positive working relationships and customer satisfaction. Personal commitment to energy efficiency and co-benefits such as reduced condensation were additional motivating factors. Demotivations, which encouraged behaviour away from greater energy efficiency, included perceptions of increased cost, lack of confidence in technical standards, habit, and perceived burden of compliance. Implications for policy are proposed, including a reminder that profit is not necessarily a primary motivator for micro-enterprises, that changing attitudes is as important as providing information, and that all aspects of the context in which RMI practitioners operate must be considered in order to formulate effective policy.

Short Title: Engaging UK repair-maintain-improve practitioners in improved building performance

ISSN: 2398-4708

DOI: 10.1108/ijbpa-03-2021-0042

Accession Number: WOS:000705388900001

Abstract: Purpose To improve building performance and meet statutory carbon reduction targets, a radical transformation of existing UK building stock is needed. Much previous research on building performance has focussed on large-scale construction. However, retrofit of existing housing stock - which will contribute the majority of the requisite efficiency improvement - is carried out by practitioners in the repair-maintain-improve (RMI) subsector. These practitioners are the sole traders and micro-firms who constitute two-fifths of employment in the construction sector. The study aims to examine the factors influencing these practitioners in RMI work to understand how better to engage them with improved building performance. Design/methodology/approach A total of 31 semi-structured interviews were conducted with RMI professionals from around the UK and analysed using template analysis. Findings The analysis identified capabilities of the practitioners who influence

building performance, including knowledge and co-ordination of people and resources; opportunities including state action and customer demand; and motivations including pride in work, customer care and satisfaction, maintaining a viable business and working relationships. Research limitations/implications The participants were a small, mixed group in terms of firm size and specialisation. The qualitative approach adopted provided detailed insights but does not make claims for statistical generalisability or representativeness of the findings. Future work could look to extend the findings with a statistically representative survey. Practical implications For a successful transition to high standards of building performance, modelling is not enough. Initiatives are needed to address the multiple factors which determine engagement in energy-efficient retrofit: capacities, opportunities and motivations. The desire of RMI practitioners to meet customer expectations could be used to develop pragmatic building performance evaluation, guided by householder satisfaction criteria. Originality/value The study examined the attitudes and experiences of an under-researched sector who are essential to the delivery of improved building performance. This study makes a novel contribution by applying an established psychological model of behaviour change, the capability, opportunity, motivation - behaviour model, for the first time in this domain.

Title: Exploring the Experiences and Perceptions of Pediatric Therapists who use Functional Electrical Stimulation in their Clinical Practice

Journal: Physical & Occupational Therapy in Pediatrics

Date: 2023 Apr

Short Title: Exploring the Experiences and Perceptions of Pediatric Therapists who use Functional Electrical Stimulation in their Clinical Practice

ISSN: 0194-2638

DOI: 10.1080/01942638.2023.2197053

Accession Number: WOS:000975610300001

Abstract: Aim: This study aimed to 1) explore the experiences and perceptions of pediatric physical therapists (PTs) and occupational therapists (OTs) who use FES in their practice, and 2) provide recommendations for overcoming common barriers to FES implementation.

Methods: Eight Canadian PTs (n = 6) and OTs (n = 2), who use FES in their pediatric practice, participated in semi-structured interviews. Open-ended questions queried the motivation, goals, perceived benefits and challenges, and facilitators and barriers of FES use. Interviews were audio recorded and transcribed

verbatim. Interpretive description was used to analyze the transcripts. Results: One overarching theme emerged: FES is a useful adjunct to therapy for certain pediatric clients. Four sub-themes were identified: Participants described 1) motivation for incorporating FES into clinical practice, which led to 2) experiences with the implementation of FES in clinical practice, including strategies for overcoming implementation barriers. These experiences influenced 3) how FES is used in practice (e.g. for which populations and therapeutic goals), and informed 4) recommendations for pediatric FES practice (e.g. more educational opportunities, research, and access for families). Conclusions: Pediatric PTs and OTs who use FES in clinical practice view FES as a valuable adjunct, especially for motor training to improve functional skills.

Title: Integrating Gestational Diabetes Screening and Care and Type 2 Diabetes Mellitus Prevention After GDM Into Community Based Primary Health Care in South Africa-Mixed Method Study

Journal: International Journal of Integrated Care

Volume: 22

Issue: 3

Date: Jul-Sep

Short Title: Integrating Gestational Diabetes Screening and Care and Type 2 Diabetes Mellitus Prevention After GDM Into Community Based Primary Health Care in South Africa-Mixed Method Study

ISSN: 1568-4156

DOI: 10.5334/ijic.5600

Article Number: 20

Accession Number: WOS:000857290600002

Abstract: Background: Despite high gestational diabetes mellitus (GDM) prevalence in South Africa (9.1% in 2018), its screening and management are not well integrated into routine primary health care and poorly linked to post-GDM prevention of type 2 diabetes mellitus (T2DM) in South Africa's fragmented health system. This study explored women's, health care providers' and experts' experiences and perspectives on current and potential integration of GDM screening and prevention of T2DM post-GDM within routine, community-based primary health care (PHC) services in South Africa. Methods: This study drew on the Behaviour Change Wheel (BCW) framework and used a mixed method, sequential exploratory design for data collection, analysis and interpretation. Individual semi-structured interviews were conducted with key informants (n = 5) from both national and provincial levels and health care providers (n = 18) in the public health system of the Western Cape Province. Additionally,

focus group discussions (FGDs) with Community Health Workers (CHWs n = 15) working with clinics in the Western Cape province. A further four FGDs and brief individual exit interviews were conducted with women with GDM (n = 35) followed-up at a tertiary hospital: Groote Schuur Hospital (GSH). Data collection with women diagnosed and treated for GDM happened between March and August 2018. Thematic analysis was the primary analytical method with some content analysis as appropriate. Statistical analysis of quantitative data from the 35 exit interview questionnaires was conducted, and correlation with qualitative variables assessed using Cramer's V coefficient. Results: Shortage of trained staff, ill-equipped clinics, socio-economic barriers and lack of knowledge were the major reported barriers to successful integration of GDM screening and postnatal T2DM prevention. Only 43% of women reported receiving advice about all four recommendations to improve GDM and decrease T2DM risk (improve diet, reduce sugar intake, physical exercise and regularly take medication). All participants supported integrating services within routine, community-based PHC to universally screen for GDM and to prevent or delay development of T2DM after GDM. Conclusion: GDM screening and post-GDM prevention of T2DM are poorly integrated into PHC services in South Africa. Integration is desired by stakeholders (patients and providers) and may be feasible if PHC resource, training constraints and women's socio-economic barriers are addressed.

Title: Interventions for improving male involvement in maternal and child healthcare in Uganda: A realist synthesis

Journal: African Journal of Reproductive Health

Volume: 25

Issue: 1

Pages: 138-160

Date: Feb

Short Title: Interventions for improving male involvement in maternal and child healthcare in Uganda: A realist synthesis

ISSN: 1118-4841

DOI: 10.29063/ajrh2021/v25i1.16

Accession Number: WOS:000644661700018

Abstract: This study aimed at understanding how, when, and under what circumstances interventions succeed (or fail) to improve male involvement in maternal and child healthcare in Uganda. A realist synthesis approach was used to unpack the complexity of these health

interventions to explain their theories and applications in specific circumstances. Our review of 19 studies revealed that men were specifically approached as clients, partners or agents for behavioural change. Broadly, mechanisms of education, training, restriction, environmental restructuring, modeling, enablement, persuasion, incentivization and coercion were used to involve men in maternal and child healthcare. Education, training, modeling, enablement and environmental restructuring mechanisms were more effective in 'cultivating' a sustained will of men to get involved as couples. However, unintended outcomes were inevitable in circumstances where mechanisms did not match specific contexts. Using coercion, restriction or incentivization is more likely to result in short-term and negative outcomes because of context heterogeneities.

Title: Mail-out bowel cancer screening: Identifying the behavioural stumbling blocks

Journal: Psycho-Oncology

Volume: 31

Issue: 5

Pages: 816-823

Date: May

Short Title: Mail-out bowel cancer screening: Identifying the behavioural stumbling blocks

ISSN: 1057-9249

DOI: 10.1002/pon.5866

Accession Number: WOS:000735910300001

Abstract: Objective To describe the actions taken by recipients of mail-out faecal occult blood test (FOBT) kits and to identify the points at which progress towards kit completion typically stops. Differences according to gender, age, and screening intention were also examined. Methods 1599 people completed an online survey identifying the actions they took upon receiving an FOBT kit. Latent class analysis was conducted to identify latent subgroups of participants that reported similar actions. Differences between gender, age, and intention status were assessed using non-invariance testing. Results Four latent subgroups of FOBT invitees were identified: those who complete and return their FOBT kit ('completers'); those who bring the kit into their house but go no further ('ignorers'); those who open the package and read the bowel cancer information materials but go no further ('readers'); and those who read the instructions but do not place the kit near the toilet and do not complete their FOBT kit ('leavers'). Non-completers who intended to use the kit were most likely to be in the

'leavers' class, while those who had no intention were most likely to be in the 'readers' class. Conclusions Distinct subgroups of non-responders exist among bowel cancer screening invitees, suggesting different behaviour change interventions are needed to facilitate participation. Some invitees, especially those with high participatory intention, are likely to benefit from prompts to take the kit into the toilet, while others, with little participatory intention, often read the invitation materials presenting an opportunity to intervene with health messages.

Title: Cyclic workflow to improve implementation of learning points from morbidity and mortality meetings

Journal: BMC Health Services Research

Volume: 22

Issue: 1

Date: Oct

Short Title: Cyclic workflow to improve implementation of learning points from morbidity and mortality meetings

DOI: 10.1186/s12913-022-08639-2

Article Number: 1282

Accession Number: WOS:000871966400002

Abstract: Background Morbidity and mortality meetings (M&MMs) are organized in most hospital departments with an educational purpose to learn from adverse events (AEs) to improve patient care. M&MMs often lack effectiveness due to unsuccessful systematic follow-up of areas of improvement. This can have an effect on improving patient safety and care. Therefore, a new strategy that focuses on implementing areas of improvement into daily practice is necessary. The study aim is to see if we could improve the implementation of meeting outcomes from the M&MM by using a cyclic workflow, and which factors are important to achieve its implementation. Methods This prospective study took place at the department of gynecologic oncology of a university hospital. Research was conducted with a participatory action research (PAR) approach using 10 consecutive M&MMs in 2019 and 2020. The cyclical workflow consisted of an action list based on the PDCA-cycle, a check of the implementation of areas for improvement at the next M&MM and regular monitoring of tasks. Each M&MM was observed and each professional with an assigned task was interviewed and gave their informed consent. Thematic content analysis was performed with the program Atlas.ti 8.4.20. Results Out of the 39 tasks that resulted from 10 M&MMs, 37 (94.8%) followed all

the steps in the PDCA-cycle and were implemented. In total, 16 interviews were conducted with consultants, nurses, registrars and residents. Five main factors were important to achieve follow-up of areas for improvement: organizational culture, motivation, commitment, communication to mobilize employees and skills. Repetition of the cyclic workflow at the M&MM and an external person who reminded professionals of their assigned task(s) was important to change habits and motivate professionals. Conclusion Cyclical tools can support the implementation of areas for improvement to optimize the M&MM. A M&MM with an organizational culture where attendees can discuss openly and freely may motivate attendees to take on tasks successfully. A positive stimulant to reach commitment of professionals is team participation. Integrating new habits of reflection may lead to a deeper level of learning from the PDCA-cycle and of the M&MM. Creating a learning environment outside of the M&MM may support professionals to take on actions and engage in improvement practices. Future research may focus on including a comparative analysis to show a success rate of the implementation of learning points from the M&MM more clearly.

Short Title: Improving immunization uptake rates among Gypsies, Roma and Travellers: a qualitative study of the views of service providers

ISSN: 1741-3842

DOI: 10.1093/pubmed/fdaa100

Accession Number: WOS:000754035300015

Abstract: Background Gypsies, Roma and Travellers are at risk of low uptake of routine immunizations. Interventions to improve uptake in these communities are seldom evaluated. As part of a qualitative study exploring barriers and facilitators to immunization uptake in Travellers, we report service provider (SP) perspectives. Methods We interviewed immunization SPs working with six Traveller communities across four UK cities. Participants included frontline staff and those with strategic or commissioning roles. Semi-structured interviews explored perceived attitudes of Travellers to

vaccinations, local service delivery, and opportunities and challenges to improving uptake. Audio-recordings were transcribed, analyzed thematically and mapped to a socio-ecological model of health. Results 39 SPs participated. Four overarching themes were identified: building trusting relationships between SPs and Travellers; facilitating attendance at appointments; improving record keeping and monitoring and responding to local and national policy change. Travellers were perceived as largely supportive of immunizations, though system and organizational processes were recognized barriers to accessing services. Conclusions Findings were broadly consistent across Traveller groups and settings. The barriers identified could often be addressed within existing infrastructure, though require system or policy change. Development of a culturally competent system appears important to enable equity in access to immunizations for Travellers.

Article Number: 221093

Accession Number: WOS:000924337400003

Abstract: The Transparency and Openness Promotion (TOP) Guidelines provide a framework to help journals develop open science policies. Theories of behaviour change can guide understanding of why journals do (not) implement open science policies and the development of interventions to improve these policies. In this study, we used the Theoretical Domains Framework to survey 88 journal editors on their capability, opportunity and motivation to implement TOP. Likert-scale questions assessed editor support for TOP, and enablers and barriers to implementing TOP. A qualitative question asked editors to provide reflections on their ratings. Most participating editors supported adopting TOP at their journal (71%) and perceived other editors in their discipline to support adopting TOP (57%). Most editors (93%) agreed their roles include maintaining policies that reflect current best practices. However, most editors (74%) did not see implementing TOP as a high priority compared with other

editorial responsibilities. Qualitative responses expressed structural barriers to implementing TOP (e.g. lack of time, resources and authority to implement changes) and varying support for TOP depending on study type, open science standard, and level of implementation. We discuss how these findings could inform the development of theoretically guided interventions to increase open science policies, procedures and practices.

Title: Promoting physical activity-related health competencies in physical activity referral schemes - Development of the Intervention Concept in the BewegtVersorgt project

Journal: Bewegungstherapie Und Gesundheitssport

Volume: 38

Issue: 02

Pages: 44-54

Date: Apr

Short Title: Promoting physical activity-related health competencies in physical activity referral schemes - Development of the Intervention Concept in the BewegtVersorgt project

ISSN: 1613-0863

DOI: 10.1055/a-1745-2705

Accession Number: WOS:000789624700002

Abstract: Physician-initiated physical activity referral schemes (PARS) effectively promote physical activity among people with non-communicable diseases (NCD). Furthermore, promoting physical activity-related health competence (PAHCO) in the context of PARS exerts a positive influence on health outcomes, the copying process, and physical activity behavior. Accordingly, this article presents a physical activity promotion concept for a PARS developed within the BewegtVersorgt project. The research project BewegtVersorgt aims to develop, implement, and evaluate a PARS for people with NCD in Germany. Using a co-production approach, twelve organizations from different areas of the health care system (physicians, health insurance providers, physical activity providers, patient representatives) participated in developing the PARS. The starting point of the PARS is physicians, who refer their clients to trained exercise professionals for individualized physical activity promotion (IBF). This intervention is the core component of the PARS and was developed based on the PAHCO model. The PARS will be tested with the help of medical professionals, exercise professionals, and physical activity providers in routine care for one year. The legal basis for the model project is formed by the German Social Code V.

The concept has a modular structure, integrates specific methods and work materials and includes 1:1 support over a period of 24 weeks (6 units of 60 minutes and three assessments). After the trial phase, we will evaluate the success of implementing PARS in routine care and its effectiveness in increasing physical activity levels and PAHCO. If the new care concept proves to be effective, the development of a transfer and scaling concept for sustainable anchoring in the health care system is planned for the last phase of the project.

Title: Why Do Employers (Fail to) Hire People with Disabilities? A Systematic Review of Capabilities, Opportunities and Motivations

Journal: Journal of Occupational Rehabilitation

Volume: 33

Issue: 2

Pages: 329-340

Date: Jun

Short Title: Why Do Employers (Fail to) Hire People with Disabilities? A Systematic Review of Capabilities, Opportunities and Motivations

ISSN: 1053-0487

DOI: 10.1007/s10926-022-10076-1

Accession Number: WOS:000921665400002

Abstract: Purpose To increase the number of people with disabilities in employment, we need to understand what influences employers' hiring decisions. In this systematic review, we map out factors affecting employers' hiring decisions about people with disabilities. Methods This study is a systematic review that applies the COM-B model to identify factors that contribute to employers (not) hiring people with disabilities. The COM-B model proposes that employers will perform hiring behavior (B) if they have the capability (C), opportunity (O) and motivation (M) to do so. We also investigate if factors have a negative, positive or no effect. We report in accordance with the PRISMA guidelines. Results In a review of 47 studies, we find 32 factors. Most of these factors are barriers. The most frequently mentioned barriers are employers' (1) expectations that people with disabilities are unproductive, (2) expectations that people with disabilities cost a lot of money, and employers' (3) lack of knowledge about disabilities. The most researched facilitators for employers to hire people with disabilities include (1) the motivation to help others, (2) working in a large organization, and (3) expecting a competitive advantage. The effect of factors can differ depending on contextual

circumstances, including the type of organization, the type of disability and different policies. Conclusions We conclude that hiring decisions are influenced by an array of different barriers and facilitators. The effect of these factors can differ across organizations and disability types. Our study of factors affecting hiring can be used by scholars, policy makers, and organizations to create interventions to increase the hiring of people with disabilities.

Short Title: A School Intervention's Impact on Adolescents' Health-Related Knowledge and Behavior

DOI: 10.3389/fpubh.2022.822155

Article Number: 822155

Accession Number: WOS:000778515600001

Abstract: Background Many factors can influence health behavior during adolescence, and the lifestyle of adolescents is associated with health behavior during adulthood. Therefore, their behavior can determine not only present, but also later health status.

Objective We aimed to develop an intervention program to improve high school students' health behavior and to evaluate its effectiveness.

Methods We performed our study at a secondary school in a rural town in East Hungary between 2016 and 2020. Sessions about healthy lifestyles were organized regularly for the intervention group to improve students' knowledge, to help them acquire the right skills and attitudes, and to shape their behavior accordingly. Data collection was carried out via self-administered, anonymous questionnaires (n = 192; boys = 49.5%; girls = 50.5%; age range: 14-16). To determine the intervention-specific effect, we took into account the differences between baseline and post-intervention status, and between the intervention and control groups using individual follow-up data. We used generalized estimating equations to assess the effectiveness of our health promotion program.

Results Our health promotion program had a positive effect on the students' health-related knowledge and health behavior in the case of unhealthy eating, moderate to vigorous physical activity, and alcohol consumption. Conclusion Our findings suggest that school health promotion can be effective in knowledge transfer and lifestyle modification. To achieve a more positive impact on health behavior, preventive actions must use a complex approach during

implementation.

Short Title: A protocol paper: community engagement interventions for cardiovascular disease prevention in socially disadvantaged populations in the UK: an implementation research study

DOI: 10.1186/s41256-020-0131-1

Accession Number: WOS:000529187700001

Abstract: BackgroundCardiovascular disorders (CVD) are the single greatest cause of mortality worldwide. In the UK, the National Health Service (NHS) has launched an initiative of health checks over and above current care to tackle CVD. However, the uptake of Health Checks is poor in disadvantaged communities. This protocol paper sets out a UK-based study (Sussex and Nottingham) aiming to co-produce a community delivered CVD risk assessment and coaching intervention to support community members to reduce their risk of CVD.The overall aim of the project is to implement a tailored-to-context community engagement (CE) intervention on awareness of CVD risks in vulnerable populations in high, middle and low-income countries. The specific objectives of the study are to enhance stakeholder' engagement; to implement lifestyle interventions for cardiovascular primary prevention, in disadvantaged populations and motivate uptake of NHS health checks.MethodsThis study uses both qualitative and quantitative methods in three phases of evaluation, including pre-, per- and post-implementation. To ensure contextual appropriateness the 'Scaling-up Packages of Interventions for Cardiovascular disease prevention in selected sites in Europe and Sub-Saharan Africa: An implementation research' (SPICES) project will organize a multi-component community-engagement intervention. For the qualitative component, the pre-implementation phase will involve a contextual assessment and stakeholder mapping, exploring potentials for CVD risk profiling strategies and led by trained Community Health Volunteers (CHV) to identify accessibility and acceptability. The per-implementation phase will involve healthy lifestyle counselling provided by CHVs and evaluation of the outcome

to identify fidelity and scalability. The post-implementation phase will involve developing sustainable community-based strategies for CVD risk reduction. All three components will include a process evaluation. A stepped wedge cluster randomised trial of the roll out will focus on implementation outcomes including uptake and engagement and changes in risk profiles. The quantitative component includes pre and post-intervention surveys. The theory of the socio-ecological framework will be applied to analyse the community engagement approach. Discussion Based on the results ultimately a sustainable community engagement-based strategy for the primary prevention of CVD risk will be developed to enhance the performance of NHS health care in the UK. The Trial Registration number is ISRCTN68334579.

Short Title: Australian critical care nurses' knowledge, preparedness, and experiences of managing SARS-COV-2 and COVID-19 pandemic

ISSN: 1036-7314

DOI: 10.1016/j.aucc.2021.04.008

Accession Number: WOS:000746020200005

Abstract: Background: Coronavirus disease 2019 (COVID-19) has again highlighted the crucial role of healthcare workers in case management, disease surveillance, policy development, and healthcare education and training. The ongoing pandemic demonstrates the importance of having an emergency response plan that accounts for the safety of frontline healthcare workers, including those working in critical care settings. Objectives: The aim of the study was to explore Australian critical care nurses' knowledge, preparedness, and experiences of managing patients diagnosed with severe acute respiratory syndrome coronavirus 2 infection (SARS-CoV-2) and

COVID-19. Methods: An exploratory cross-sectional study of Australian critical care nurses was conducted between June and September 2020. An anonymised online survey was sent to Australian College of Critical Care Nurses' members to collect information about their knowledge, preparedness, and experiences during the COVID-19 pandemic. Descriptive statistics were used to summarise and report data. Results: A total of 157 critical care nurses participated, with 138 fully complete surveys analysed. Most respondents reported 'good' to 'very good' level of knowledge about COVID-19 and obtained up-to-date COVID-19 information from international and local sources. Regarding managing patients with COVID-19, 82.3% felt sufficiently prepared at the time of data collection, and 93.4% had received specific education, training, or instruction. Most participants were involved in assessing (89.3%) and treating (92.4%) patients with COVID-19. Varying levels of concerns about SARS-CoV-2 infection were expressed by respondents, and 55.7% thought the pandemic had increased their workload. The most frequent concerns expressed by participants were a lack of appropriate personal protective equipment (PPE) and fear of PPE shortage. Conclusions: While most nurses expressed sufficient preparedness for managing COVID-19 patients, specific education had been undertaken and experiential learning was evident. Fears of insufficient or lack of appropriate PPE made the response more difficult for nurses and the community. Preparedness and responsiveness are critical to successful management of the COVID-19 pandemic and future outbreaks of emerging infectious diseases. Short Title: Translating Strategies for Promoting Engagement in Mobile Health: A Proof-of-Concept Microrandomized Trial

ISSN: 0278-6133

DOI: 10.1037/hea0001101

Accession Number: WOS:000735239300001

Abstract: Objective: Mobile technologies allow for accessible and cost-effective health monitoring and intervention delivery. Despite these advantages, mobile health (mHealth) engagement is often insufficient. While monetary incentives may increase engagement, they can backfire, dampening intrinsic motivations and undermining intervention scalability. Theories from psychology and behavioral economics suggest useful nonmonetary strategies for promoting engagement; however, examinations of the applicability of these strategies to mHealth engagement are lacking. This proof-of-concept study evaluates the translation of theoretically-grounded engagement strategies into mHealth, by testing their potential utility in promoting daily self-reporting. Method: A microrandomized trial (MRT) was conducted with adolescents and emerging adults with past-month substance use. Participants were randomized multiple times daily to receive theoretically-grounded strategies, namely reciprocity (the delivery of inspirational quote prior to self-reporting window) and nonmonetary reinforcers (e.g., the delivery of meme/gif following self-reporting completion) to improve proximal engagement in daily mHealth self-reporting. Results: Daily self-reporting rates (62.3%; n = 68) were slightly lower than prior literature, albeit with much lower financial incentives. The utility of specific strategies was found to depend on contextual factors pertaining to the individual's receptivity and risk for disengagement. For example, the effect of reciprocity significantly varied depending on whether this strategy was employed (vs. not employed) during the weekend. The nonmonetary reinforcement strategy resulted in different outcomes when operationalized in various ways. Conclusions: While the results support the translation of the reciprocity strategy into this mHealth setting, the translation of nonmonetary reinforcement requires further consideration prior to inclusion in a full scale MRT.

ISSN: 1742-6405

DOI: 10.1186/s12981-023-00513-3

Article Number: 18

Accession Number: WOS:000960226100001

Abstract: BackgroundThe Joint United Nations Programme on HIV/AIDS through the 95-95-95 target requires 95% of people living with HIV (PLHIV) on antiretroviral treatment (ART) to be virally suppressed. Viral Load (VL) non-suppression has been found to be associated with suboptimal ART adherence, and Intensive Adherence Counselling (IAC) has been shown to lead to VL re-suppression by over 70% in PLHIV on ART. Currently, there is data paucity on VL suppression after IAC in adult PLHIV in Uganda. This study aimed to evaluate the proportion of VL suppression after IAC and associated factors among adult PLHIV on ART at Kiswa Health Centre in Kampala, Uganda. **Methods** Study was a retrospective cohort design and employed secondary data analysis to review routine program data. Medical records of adult PLHIV on ART for at least six months with VL non-suppression from January 2018 to June 2020 at Kiswa HIV clinic were examined in May 2021. Descriptive statistics were applied to determine sample characteristics and study outcome proportions. Multivariable modified Poisson regression analysis was employed to assess predictors of VL suppression after IAC. **Results** Analysis included 323 study participants of whom 204 (63.2%) were female, 137 (42.4%) were between the age of 30 and 39 years; and median age was 35 years (interquartile range [IQR] 29-42). Participant linkage to IAC was 100%. Participants who received the first IAC session within 30 days or less after unsuppressed VL result were 48.6% (157/323). Participants who received recommended three or more IAC sessions and achieved VL suppression were 66.4% (202/304). The percentage of participants who completed three IAC sessions in recommended 12 weeks was 34%. Receipt of three IAC sessions (ARR = 1.33, 95%CI: 1.15-1.53, $p < 0.001$), having baseline VL of 1,000-4,999 copies/ml (ARR = 1.47, 95%CI: 1.25-1.73, $p < 0.001$) and taking Dolutegravir containing ART regimen were factors significantly associated with VL suppression after IAC. **Conclusion** VL suppression proportion of 66.4% after IAC in this population was comparable to 70%, the percentage over which adherence interventions have been shown to cause VL re-suppression. However, timely IAC intervention is needed from receipt of unsuppressed VL results to IAC process completion.

Short Title: Tailored Education Increased Capability and Motivation for Fall Prevention in Older People After Hospitalization

DOI: 10.3389/fpubh.2021.683723

Article Number: 683723

Accession Number: WOS:000685475800001

Abstract: Recently hospitalized older people are at risk of falls and face barriers to undertaking fall prevention strategies after

they return home from hospital. The authors examined the effects of tailored education delivered by physiotherapists on the knowledge (capability) and the motivation of older people to engage in fall prevention after hospital discharge. Utilizing data gathered from a recent trial, data was analyzed from 390 people who were 60 years and over without impaired cognition ($>7/10$ abbreviated mental test score) and discharged from three Australian hospitals. Motivation and capability were measured at baseline in the hospital and at 6-months after hospital discharge by blinded assistants using structured surveys. Bivariate analysis using generalized linear modeling explored the impact of education on the capability and motivation. Engagement in fall prevention strategies was entered as an independent variable during analysis to determine associations with capability and motivation. The education significantly improved capability [-0.4, 95% CI (-0.7, -0.2), $p < 0.01$] and motivation [-0.8, 95% CI (-1.1, -0.5), $p < 0.01$] compared with social-control at the time of hospital discharge. In contrast, social-control participants gained capability and motivation over the 6-months, and no significant differences were found between groups in capability [0.001, 95% CI (-0.2, 0.2), $p = 0.9$] and motivation [-0.01, 95% CI (-0.3, 0.3), $p = 0.9$] at follow-up. Tailored fall prevention education is recommended around hospital discharge. Participants still needed to overcome barriers to falls prevention engagement post hospitalization. Thus, tailored education along with direct clinical services such as physiotherapy and social supports is warranted for older people to avoid falls and regain function following hospitalization.

DOI: 10.1080/00016357.2019.1577989

Accession Number: WOS:000467387400010

Abstract: Objective: Many patients with temporomandibular disorders (TMD) seem to go undetected within primary dental health care. Primarily we evaluated if the implemented intervention increased the clinical decision-making for TMD patients; secondarily we evaluated if other factors could be identified that predicted performed or recommended TMD treatment. Material and Methods: This case-control study was carried out within the Public Dental Health service in Vasterbotten County, Sweden. An intervention based on a decision-tree with three screening questions for TMD (3Q/TMD) was implemented during 2015 in four clinics and compared with the remaining county. A total of 400 individuals were selected-200 3Q-positives and 200 3Q-negatives. The 3Q/TMD consists of Q1-frequent jaw pain, Q2-frequent pain on function, and Q3-frequent catching and/or locking of jaw. The 3Q/TMD answers were analyzed in relation to TMD treatment and any TMD related decision that was collected from the digital dental records. Results: The intervention did not increase the frequencies of traceable clinical decisions among patients with TMD. Conclusions: Despite the implemented intervention aimed, the indicated undertreatment of patients with TMD remains. Future studies are still needed to gain a deeper understanding of the clinical decision-making process for TMD patients in general practice dentistry.

DOI: 10.1080/21679169.2020.1866663

Accession Number: WOS:000607918500001

Abstract: Purpose To design and test the feasibility of context-specific activities for improving physical activity (PA) levels

among Indian adults with stroke. Methods Context-specific activities were developed after a thorough literature search and inputs from five adults with stroke and five experts. Following which 17 adults with stroke were recruited. Participants were asked to choose at least three activities from the list of context-specific activities and to perform them every day for one month. Participants' pre and post-intervention PA levels and quality of life (QoL) were assessed using the physical activity scale for individuals with physical disabilities (PASIPD) and stroke specific quality of life (SSQoL). At the end of the program, participants were also interviewed to explore their experiences with the program. Results The list of context-specific activities included 45 activities under aerobic, strengthening, and balance domains. Fifteen participants [mean (SD) age 56.94 (9.87)] completed the one-month intervention. Intervention adherence rate was 86.6%. No adverse events were noted, and participants were satisfied with the program. PASIPD and SSQoL (MD - 6.52) scores showed significant improvement post-intervention. Conclusions Context-specific activities are designed for Indian adults with stroke. Context-specific activities are feasible, safe and help to improve PA and QoL.

Short Title: Exploring the predictors of physical inactivity in a university setting

DOI: 10.1186/s12889-022-14953-5

Article Number: 59

Accession Number: WOS:000913897300007

Abstract: Background Changes in lifestyle patterns and the dependence on technology have contributed to an increase in prevalence of inactivity. To address this there is a need to identify the predictors of physical inactivity using the Theoretical Domains Framework (TDF). Methods One hundred and twenty-one university administrative staff and 114 PhD students completed a

survey. Physical activity (PA) levels were assessed using the Global Physical Activity Questionnaire (GPAQ), with participants scoring below 600 MET-minutes/week of total PA regarded as inactive. The predictors of physical inactivity were assessed using the Determinants of Physical Activity Questionnaire (DPAQ). Multiple regression analyses were used to identify which domains of the TDF predicted physical inactivity in the study samples. Results The results indicated that 64% of administrative staff (Mean = 411.3 +/- 118.3 MET-minutes/week of total PA) and 62% of PhD students (Mean = 405.8 +/- 111.0 MET-minutes/week of total PA) did not achieve the recommended PA levels. The physical skills domain ($t(106) = 2.198, p = 0.030$) was the significant predictor of physical inactivity amongst the administrative staff. Knowledge ($t(99) = 2.018, p = .046$) and intentions ($t(99) = 4.240, p = 0.001$) domains were the significant predictors of physical inactivity amongst PhD students. Conclusions The results of this study should be used as a theoretical starting point in carrying out behavioural diagnosis, which could inform the design of effective interventions to increase PA levels in universities and other settings.

Accession Number: WOS:000678905300001

Abstract: Background Women receiving treatment for opioid use disorder have low levels of contraception use and high rates of unintended pregnancies, abortion and children being adopted or fostered. This paper aims to understand the relationship between contraceptive choice and power amongst women receiving Opioid Replacement Therapy (ORT). Methods During 2016/17, semi-structured interviews were undertaken with 40 women (aged 22-49 years) receiving ORT in the South of England. Data relating to the latent concept of power were inductively coded and analysed via Iterative Categorisation. Findings Power manifested itself through six interconnected 'fields': i. 'information about fertility and

contraception'; ii. 'access to contraception'; iii. 'relationships with professionals and services'; iv. 'relationships with male partners'; v. 'relationships with sex work clients'; and vi. 'life priorities and preferences'. Each field comprised examples of women's powerlessness and empowerment. Even when women appeared to have limited power or control, they sometimes managed to assert themselves. Conclusions Power in relation to contraceptive choice is multi-faceted and multi-directional, operating at both individual and structural levels. Informed decision-making depends on the provision of clear, non-judgemental information and advice alongside easy access to contraceptive options. Additional strategies to empower women to make contraceptive choices and prevent unplanned pregnancies are recommended.

Accession Number: WOS:000381035200012

Abstract: Objective: In recent years, there has been an increase in the application of behavioural models, such as social cognition models, to the promotion of hearing health. Despite this, there exists a well-developed body of literature that suggests such models may fail to consistently explain reliable amounts of variability in human behaviours. Design: This paper provides a summary of this research across selected models of health-related behaviour, outlining the current state of the evidence. Results: Recent work in the field of behaviour change is presented together with commentary on the design and reporting of behaviour change interventions. Conclusions: We propose that attempts to use unreliable models to explain and predict hearing health behaviours should now be replaced by work which integrates the latest in behaviour change science, such as the Behaviour Change Wheel and Theoretical Domains Framework.

Short Title: The mobile revolution—using smartphone apps to prevent cardiovascular disease

ISSN: 1759-5002

DOI: 10.1038/nrcardio.2015.34

Accession Number: WOS:000354961900006

Abstract: Cardiovascular disease (CVD) is the leading cause of morbidity and mortality globally. Mobile technology might enable increased access to effective prevention of CVDs. Given the high penetration of smartphones into groups with low socioeconomic status, health-related mobile applications might provide an opportunity to overcome traditional barriers to cardiac rehabilitation access. The huge increase in low-cost health-related apps that are not regulated by health-care policy makers raises three important areas of interest. Are apps developed according to evidenced-based guidelines or on any evidence at all? Is there any evidence that apps are of benefit to people with CVD? What are the components of apps that are likely to facilitate changes in behaviour and enable individuals to adhere to medical advice? In this Review, we assess the current literature and content of existing apps that target patients with CVD risk factors and that can facilitate behaviour change. We present an overview of the current literature on mobile technology as it relates to prevention and management of CVD. We also evaluate how apps can be used throughout all age groups with different CVD prevention needs.

Accession Number: WOS:000454337800015
Abstract: Purpose: Poor athlete buy-in and adherence to training-monitoring systems (TMS) can be problematic in elite sport. This is a significant issue, as failure to record, interpret, and respond appropriately to negative changes in athlete well-being and training status may result in undesirable consequences such as maladaptation and/or underperformance. This study examined the perceptions of elite athletes to their TMS and their primary reasons for noncompletion. Methods: Nine national-team sprint athletes participated in semistructured interviews on their perceptions of their TMS. Interview data were analyzed qualitatively, based on grounded theory, and TMS adherence information was collected. Results: Thematic analysis showed that athletes reported their main reason for poor buy-in to TMS was a lack of feedback on their monitoring data from key staff. Furthermore, training modifications made in response to meaningful changes in monitoring data were sometimes perceived to be disproportionate, resulting in dishonest reporting practices. Conclusions: Perceptions of opaque or unfair decision making on training-program modifications and insufficient feedback were the primary causes for poor athlete TMS adherence. Supporting TMS implementation with a behavioral-change model that targets problem areas could improve buy-in and enable limited resources to be appropriately directed.

Short Title: Barriers to and enablers of postpartum health behaviours among women from diverse cultural backgrounds with prior gestational diabetes: A systematic review and qualitative synthesis applying the theoretical domains framework

ISSN: 0742-3071

DOI: 10.1111/dme.14945

Article Number: e14945

Accession Number: WOS:000851435100001

Abstract: Aims Racial and ethnic disparities exist in gestational diabetes prevalence and risk of subsequent type 2 diabetes mellitus (T2DM). Postpartum engagement in healthy behaviours is recommended for prevention and early detection of T2DM, yet uptake is low among women from diverse cultural backgrounds. Greater understanding of factors impacting postpartum health behaviours is needed. Applying the Theoretical Domains Framework (TDF) and Capability, Opportunity, Motivation-Behaviour (COM-B) model, our aim was to synthesise barriers to and enablers of postpartum health behaviours among women from diverse cultural backgrounds with prior GDM and identify relevant intervention components. Methods Databases, reference lists and grey literature were searched from September 2017 to April 2021. Two reviewers screened articles independently against inclusion criteria and extracted data. Using an inductive-deductive model, themes were mapped to the TDF and COM-B model. Results After screening 5148 citations and 139 full texts, we included 35 studies (N = 787 participants). The main ethnicities included Asian (43%), Indigenous (15%) and African (11%). Barriers and enablers focused on Capability (e.g. knowledge), Opportunity (e.g. competing demands, social support from family, friends and healthcare professionals, culturally appropriate education and resources) and Motivation (e.g. negative emotions, perceived consequences and necessity of health behaviours, social/cultural identity). Five relevant intervention functions are identified to link the barriers and enablers to evidence-based recommendations for communications to support behaviour change. Conclusions We provide a conceptual model to inform recommendations regarding the development of messaging and interventions to support women from diverse cultural backgrounds in engaging in healthy behaviours to reduce risk of T2DM.

Short Title: Development of an Intervention to Increase Sexual Health Service Uptake by Young People

ISSN: 1524-8399

DOI: 10.1177/1524839916688645

Accession Number: WOS:000399751100010

Abstract: This study aimed to develop and implement an intervention, delivered via a website and Web app, to increase the uptake of sexual health services by young people. The intervention was co-designed with a group of 10 young people. Intervention mapping was used to guide development. To identify barriers and facilitators of access to sexual health services, three focus groups with 24 young people aged 13 to 19 years, and interviews with 12 professionals recruited from across a range of health and social services, were conducted. Data were analyzed using content analysis. Evidence was supplemented through a literature review. Barriers and facilitators were categorized as theoretical determinants and then suitable behavior change techniques (BCTs) for targeting them were selected. Targeted determinants were attitude, subjective norm, perceived behavioral control, and knowledge. Selected BCTs included information about others' approval, framing/reframing, and credible source. The website/app enable users to search for services, access key information about them, watch videos about what to expect, and have key concerns removed/addressed. This is the first known digital evidence-based intervention to target this behavior described in the literature. A clear and full description of intervention development and content, including of theorized causal pathways, is provided to aid interpretation of future outcome evaluations.

Short Title: Increasing young adults' condom use intentions and behaviour through changing chlamydia risk and coping appraisals: study protocol for a cluster randomised controlled trial of efficacy

DOI: 10.1186/1471-2458-13-528

Article Number: 528

Accession Number: WOS:000320127700001

Abstract: Background: Chlamydia is the most commonly diagnosed sexually transmitted infection (STI) in England and has serious public health consequences. Young people carry a disproportionate burden of infection. A number of social cognition models identify risk appraisal as a primary motivator of behaviour suggesting that changing risk appraisals for STIs may be an effective strategy in motivating protective behaviour. Meta-analytic evidence indicates that the relationship between risk appraisal and health behaviour is small, but studies examining this relationship have been criticised for their many conceptual and methodological weaknesses. The effect of risk appraisal on health behaviour may therefore be of larger size. The proposed study aims to examine the efficacy of an intervention to increase condom use intentions and behaviour amongst young people through changing chlamydia risk and coping appraisals. Coping appraisal is targeted to avoid the intervention being counterproductive amongst recipients who do not feel able to perform the behaviour required to reduce the threat. An experimental design with follow-up, a conditional measure of risk appraisal, and analysis which controls for past behaviour, enable the relationship between risk appraisal and protective behaviour to be accurately assessed. Methods/Design: The proposed study is a two-arm cluster randomised controlled trial using a waiting-list control design to test the efficacy of the intervention compared to a control group. Participants will be school pupils aged 13-16 years old recruited from approximately ten secondary schools. Schools will be randomised into each arm. Participants will receive their usual teaching on STIs but those in the intervention condition will additionally receive a single-session sex education lesson on chlamydia. Measures will be taken at baseline, post-intervention and at follow-up three months later. The primary outcome measure is intention to use condoms with casual sexual partners. Discussion: As far as the authors are aware, this is the first controlled trial testing the efficacy of an intervention to increase condom use intentions and behaviour through changing chlamydia risk appraisals. It is one of few experimental studies to accurately test the relationship between risk appraisal and precautionary sexual behaviour using a conditional measure of risk appraisal and controlling for past behaviour.

DOI: 10.1136/ejhpharm-2014-000483

Accession Number: WOS:000346923200008

Abstract: Objectives Avoiding harm when patients interact with healthcare services is a global issue. Guidelines are often produced to improve the prescribing and monitoring of medication with a narrow therapeutic index. Adherence to guidelines may not occur in clinical practice. This paper aims to explore the barriers faced by clinical pharmacists and junior doctors when using complex guidelines to support the prescribing and therapeutic drug monitoring of gentamicin and vancomycin. Methods Twenty-three junior doctors and 27 clinical pharmacists took part in focus groups at four hospital sites in four Scottish health boards between March and July 2011. Focus groups were run separately at each hospital site for the two clinical groups. The data were organised using the framework approach, validated, and a thematic analysis was conducted. Results Five themes emerged to explain barriers to effective initial prescribing and therapeutic drug monitoring, which were divided into two types. Barriers could be a direct result of the content of the guidelines specifically that clinicians required experience to use the guidelines effectively. Barriers also resulted from a failure in the context in which the guidelines function which was related to insufficient dissemination, communication issues within the hospital site, unmet educational needs and staffing issues. Conclusions Improved patient safety cannot be assumed due to the existence of gentamicin and vancomycin guidelines. The findings of this study highlight the complexities associated with their appropriate use. Future quality improvement strategies must consider where the guidelines will be implemented, and the context in which they will function.

Short Title: Barriers and facilitators of evidence-based management of patients with bacterial infections among general dental practitioners: a theory-informed interview study

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0372-z

Article Number: 11

Accession Number: WOS:000369030800001

Abstract: Background: General dental practitioners (GDPs) regularly prescribe antibiotics to manage dental infections although most infections can be treated successfully by local measures. Published guidance to support GDPs to make appropriate prescribing decisions exists but there continues to be wide variation in dental antibiotic prescribing. An interview study was conducted as part of the Reducing Antibiotic Prescribing in Dentistry (RAPiD) trial to understand the barriers and facilitators of using local measures instead of prescribing antibiotics to manage bacterial infections. Methods: Thirty semi-structured one-to-one telephone interviews were conducted using the Theoretical Domains Framework (TDF). Responses were coded into domains of the TDF and sub-themes. Priority domains (high frequency: $\geq 50\%$ interviewees discussed) relevant to behaviour change were identified as targets for future intervention efforts and mapped onto 'intervention functions' of the Behaviour Change Wheel system. Results: Five domains (behavioural regulation, social influences, reinforcement, environmental context and resources, and beliefs about consequences) with seven sub-themes were identified as targets for future intervention. All participants had knowledge about the evidence-based management of bacterial infections, but they reported difficulties in following this due to patient factors and time management. Lack of time was found to significantly influence their decision processes with regard to performing local measures. Beliefs about their capabilities to overcome patient influence, beliefs that performing local measures would impact on subsequent appointment times as well as there being no incentives for performing local measures were also featured. Though no knowledge or basic skills issues were identified, the participants suggested some continuous professional development

programmes (e.g. time management, an overview of published guidance) to address some of the barriers. The domain results suggest a number of intervention functions through which future interventions could change GPs' antibiotic prescribing for bacterial infections: imparting skills through training, providing an example for GPs to imitate (i.e. modelling) or creating the expectation of a reward (i.e. incentivisation). Conclusions: This is the first theoretically informed study to identify barriers and facilitators of evidence-based management of patients with bacterial infections among GPs. A pragmatic approach is needed to address the modifiable barriers in future interventions intended to change dentists' inappropriate prescribing behaviour.

Accession Number: WOS:000423111100006

Abstract: Objectives Effective strategies are needed to translate knowledge (evidence) into practice to improve the quality of community pharmacy services. We report the first step of a novel knowledge translation process which involved the systematic identification and prioritisation of community pharmacy services in Scotland which were perceived to require improvement and/or guideline development. Methods This process involved three stages and a stakeholder group comprising community pharmacists, policy makers, lay and pharmacy organisation representatives. A modified nominal group technique (NGT) was used for topic generation (August 2013) followed by an electronic Delphi survey (eDelphi), October-December 2013) and topic rationalisation (December 2013) based on feasibility, acceptability, and potential impact for practice improvement. Key findings In total, 63 items were identified during

the modified NGT which were categorised into 20 topics to form the starting point of the eDelphi. In total, 74 individuals (mostly community pharmacists) indicated an interest in the eDelphi, which achieved response rates of 63.5%, 67.6%, and 70.3%, respectively in Rounds 1, 2, and 3. Consensus was achieved with six topics: promoting the appropriate sale and supply of over-the-counter medicines; patient counselling for prescribed medication; pharmaceutical care to promote medication adherence; promotion and delivery of a Minor Ailment Scheme; pharmaceutical care of vulnerable patients; and effective use of community pharmacy workforce. Of these, the priority topic selected for the next stage of the programme was promoting the appropriate sale and supply of over-the-counter medicines. Conclusions This study adopted a systematic, inclusive, and rapid approach to identify priorities for community pharmacy practice improvement in Scotland.

Short Title: Managing oral hygiene as a risk factor for periodontal disease: a systematic review of psychological approaches to behaviour change for improved plaque control in periodontal management

ISSN: 0303-6979

DOI: 10.1111/jcpe.12356

Accession Number: WOS:000352225600004

Abstract: Background Plaque control in patients with periodontal disease is critically dependent upon self-care through specific oral hygiene-related behaviours. Objectives To determine the relationship between adherence to oral hygiene instructions in adult periodontal patients and psychological constructs. To determine the effect of interventions based on psychological constructs on oral health-related behaviour in adult periodontal patients. Data Sources The Cochrane Oral Health Group's Trials Register, MEDLINE, EMBASE and PsycINFO. Study Appraisal and Synthesis Methods Studies were grouped according to the study design, and appraised using an appropriate methodology, either the Newcastle-Ottawa assessment for observational studies, or the Cochrane criteria for trials.

Results Fifteen reports of studies were identified. Limitations There

was a low risk of bias identified for the observational studies. Older trials suffered from high risk of bias, but more recent trials had low risk of bias. However, the specification of the psychological intervention was generally poor. Conclusions and Implications of Key FindingsThe use of goal setting, self-monitoring and planning are effective interventions for improving oral hygiene-related behaviour in patients with periodontal disease. Understanding the benefits of behaviour change and the seriousness of periodontal disease are important predictors of the likelihood of behaviour change.

Accession Number: WOS:000407831900011

Abstract: Enhancing patients' oral health related behaviour is a critical component of the preventive approach which is central to the practice of minimally invasive dentistry. The first step in the process of behaviour change is creating capability to change behaviour through the provision of information and guidance. The second step involves enhancing the motivation to change through emphasising the benefits of behaviour change and emphasising the individual patients' susceptibility or risk of oral disease. The third step seeks to put motivation into action through creating opportunities to practice oral health behaviour. Planning interventions are one approach to achieving this. This article outlines the techniques for carrying out these steps in practice.

Short Title: Children's psychosocial factors of healthy meal preparation as predictors for nutritional status measures

ISSN: 0300-9831

DOI: 10.1024/0300-9831/a000655

Accession Number: WOS:000701997400016

Abstract: Involving school-age children in the preparation of healthy meals is shown to be associated with positive eating behavior. Yet, it remains unclear whether this can extend to their nutritional status. The present study aimed to determine the association of school-age children's psychosocial factors (knowledge, attitude, practice, self-efficacy) towards healthy meal preparation with their nutritional status (BMI-for-age, waist circumference, body fat percentage). Stratified random sampling was used to select primary schools ($n = 8$) in Kuala Lumpur, Malaysia. Two hundred school children aged between 9-11 years old were involved. Psychosocial factors towards healthy meal preparation were assessed using validated questionnaire. Anthropometry measures were determined using standard protocol. Almost half (46 %) of the school-age children were obese/overweight, 39 % were abdominally obese and 40 % were overfat. Approximately half had poor knowledge (49 %), poor practice (45 %), good attitude (56 %) and good self-efficacy (47 %) towards healthy meal preparation. Significant positive correlations were observed between knowledge with attitude ($r = 0.23$, $p < 0.001$); knowledge with self-efficacy ($r = 0.30$, $p < 0.001$); attitude with practice ($r = 0.34$, $p < 0.001$); attitude with self-efficacy ($r = 0.59$, $p < 0.001$) and practice with self-efficacy ($r = 0.50$, $p < 0.001$). Adjusted logistic regression revealed that school-age children with good attitude were less likely to be abdominally obese (OR = 0.87, 95 % CI = 0.78 to 0.96) and overfat (OR = 0.84, 95 % CI = 0.76 to 0.94). Children with good knowledge had lower risk of being abdominally obese (OR = 0.84, 95 % CI = 0.72 to 0.97). Findings revealed that children's psychosocial factors were interrelated, and improvements may have the potential in affecting nutritional status. Hands-on healthy meal preparation should be explored further as an innovative approach to address the obesity epidemic.

Abstract: (1) Background: Pharmacists play a pivotal role in tackling Antimicrobial resistance through antimicrobial stewardship (AMS) and are well placed to lead behaviour change interventions across the healthcare system; (2) Methods: A cross-sector AMS training initiative for pharmacists was implemented across England, with three cohorts between 2019-2021. Each cohort took part in an introductory workshop, followed by a workplace-based quality improvement project supported by peer-assisted learning sessions. Completion of training was determined by an end of training assessment after three to four months. Outcome data and learner survey results were collated, anonymised, and analysed by the training provider. (3) Results: In total, 118 pharmacists participated in the introductory workshop, 70% of these subsequently undertook an improvement project, and 48% engaged workplace stakeholders in the process. Interventions were designed by 57% of learners and 18% completed a at least one Plan-Do-Study-Act cycle. Approximately a quarter of learners met the requirements for a Certificate of Completion. Knowledge quiz scores were obtained from 115 learners pre-training and 28 learners post-training. Paired t-tests conducted for 28 learners showed a statistically significant improvement in mean score from 67.7% to 81.1% ($p < 0.0001$). Sixty-two learner survey responses were received during the training and 21 follow-up survey responses 6 to 12 months post training. Of the 21 responses to the follow-up survey, ongoing quality improvement work and improvement outcomes were reported by nine and six learners, respectively. (4) Conclusions: The delivery of workplace-based training at scale can be challenging, however this study demonstrates that coupling learning with workplace implementation and peer support can promote behaviour change in learners. Further study into the impact of providing pharmacists across sectors and

geographies with access to this type of training will help inform ongoing workforce development interventions.

Accession Number: WOS:000767120200001

Abstract: Marketing plays a critical role in addressing macro-level societal problems, one of which relates to the reduction of meat consumption and increased consumption of alternative proteins. Such consumption practices are gaining attention given the rising concerns about food sustainability, safety, security, nutrition, and animal welfare. This paper provides a framework-based systematic review of alternative protein consumption research, identifying relevant articles published between 2000 and 2020. Our framework combines the socio-ecological model and capability, opportunity, and motivation model of behavior (COM-B) to identify the various factors influencing alternative protein consumption. Antecedents - facilitators and barriers - of alternative protein consumption are organized, synthesized, and discussed using this combined model of behavioral influence. Our review outlines methodological approaches, identifies main variables of interest, highlights the opportunity for further theoretical development, and identifies gaps in research related to individual-level opportunities and system-level motivations. We conclude with theoretical, contextual, and methodological directions for marketing and consumer research to better understand and shape decisions and practices regarding the consumption of alternative proteins.

Title: Public Health Officers? Capability, Opportunity, Motivation, and Behavior after the COVID-19 Vaccination in Thailand

Journal: Journal of Health Research

Volume: 37

Issue: 5

Pages: 280-288

Short Title: Public Health Officers? Capability, Opportunity, Motivation, and Behavior after the COVID-19 Vaccination in Thailand

ISSN: 0857-4421

DOI: 10.56808/2586-940x.1021

Accession Number: WOS:000953871800001

Abstract: Background: Public health officers (PHOs) are the frontline health workforce against the Coronavirus disease 2019 (COVID-19) and therefore need high immunity for protection. The application of the capability, opportunity, motivation, and behavior (COM-B) model aimed to 1) explore the level of COM-B for prevention and control of COVID-19, and 2) analyze the association between factors and behaviors for prevention and control of COVID-19 among PHOs at primary care units (PCUs) of seven provinces in southern Thailand. Methods: The study design performed an analytical cross-sectional study using information from primary care units from July to September 2021. Data collection used multi-stage sampling techniques to construct the online questionnaire based on the relationship of the COM-B model. Data analysis used descriptive statistics, and Chi-squared and Fisher's exact tests to find out the association among factors. Results: The overall COM-B scores of the 203 PHOs were high, but the motivation was low. Almost all characteristics were associated with behavior. Work experience was significantly associated with capability, opportunity, and behavior ($P < 0.05$). The relationships between capability and behavior, and opportunity and motivation were statistically significant ($P < 0.05$ and $P < 0.001$ respectively). Conclusions: This is the first report applying the COM-B model to explore behavior changes relating to the COVID-19 vaccination among PHOs at PCUs. The association between factors and individual behavior of health providers can be applied to design interventions for promoting effective preventive and controlling behavior after the COVID-19 vaccination.

Title: The perceived impact of Covid-19 on periodontal practice in the United Kingdom: A questionnaire study

Journal: Journal of Dentistry

Volume: 102

Date: Nov

Short Title: The perceived impact of Covid-19 on periodontal practice in the United Kingdom: A questionnaire study

ISSN: 0300-5712

DOI: 10.1016/j.jdent.2020.103481

Article Number: 103481

Accession Number: WOS:000591836800008

Abstract: Introduction: COVID-19 has impacted dentistry in unprecedented ways. Objective: The following research aimed to investigate the impact of the COVID-19 pandemic on periodontal practice in the United Kingdom using the COM-B (Capability Opportunity Motivation-Behaviour) model as the basis for a questionnaire. Basic research design: An online survey link was sent to all members of the British Society of Periodontology and Implant Dentistry. A total of 358 responses were received and analysed.

Results: The great majority of participants thought that the pandemic had an impact on their profession, while only 4.7 % had no concerns. The main worries related to financial concerns and ability to provide appropriate levels of care. More than 80 % of respondents agreed that their establishment was compliant with infection control procedures. Some participants felt benefits mainly in terms of more time for CPD activities. It was felt that some of the changes needed will need to be sustained long-term. Conclusions: Respondents were generally worried. However, they perceived they had the physical and psychological ability to effect changes to their practice, higher than the physical and social opportunities that they were afforded. Although the COVID-19 pandemic is causing profound changes and worries for the profession of Periodontology, clinicians are clear about their capability to control the situation and feel they have the motivation to make the required changes. Clinical significance: COVID-19 has presented clinicians with novel challenges.

Investigating the professional response to change and expected impact is of interest in the current climate as we navigate the 'new normal'. Assessing the results could be useful in informing support strategies moving forward.

Title: Minimum Data Set for Families of Children With Hearing Loss: An eDelphi Study

Journal: Journal of Speech Language and Hearing Research
Volume: 65
Issue: 4
Pages: 1615-1629
Date: Apr
Short Title: Minimum Data Set for Families of Children With Hearing Loss: An eDelphi Study
ISSN: 1092-4388
DOI: 10.1044/2021_jslhr-21-00356
Accession Number: WOS:000830953900029
Abstract: Purpose: Assessing the unique needs of each family following the diagnosis of a hearing loss is central to the delivery of family-centered hearing health care. Therefore, the aim of this study was to develop a Minimum Data Set (MDS) that could be used in the design of a needs assessment tool for families of children with hearing loss transitioning to early intervention. Method: A list of potential items for the MDS was prepared. In a two-round electronic Delphi study in Australia, hearing researchers (N = 15 in Round 1; N = 9 in Round 2), clinicians, and professionals working in early intervention for children with hearing loss (N = 85) were asked to review the potential items and to rate the importance of items using a Likert scale. Results: Consensus was reached on 32 main items to be included in the MDS across six categories, including informational support (13 items), professional support (five items), peer support (one item), skills and knowledge (seven items), financial support (three items), and methods of information provision (three items). Eight optional items that could be considered for inclusion in the MDS were also identified. Conclusions: The proposed MDS could support hearing professionals in identifying families' needs in order to provide individualized information and support. Future research is needed to conduct a pilot study to evaluate the needs assessment tool in terms of usability, feasibility, and therapeutic effects.

Title: The Concussion Awareness Training Tool for Women's Support Workers Improves Knowledge of Intimate Partner Violence-Caused Brain Injury
Journal: Inquiry-the Journal of Health Care Organization Provision and Financing

Volume: 60

Date: Apr

Short Title: The Concussion Awareness Training Tool for Women's Support Workers Improves Knowledge of Intimate Partner Violence-Caused Brain Injury

ISSN: 0046-9580

DOI: 10.1177/00469580231169335

Article Number: 00469580231169335

Accession Number: WOS:000974835800001

Abstract: Women who experience physical intimate partner violence (IPV) are at high risk of suffering a brain injury (BI) due to head impacts and/or strangulation. Currently, most staff at women's shelters tend not to be aware of IPV-caused BIs. The objective of this study was to address this by developing a new online module within the Concussion Awareness Training Tool (cattonline.com) specifically focused on IPV-caused BI, and measuring its effectiveness in increasing BI awareness and knowledge among staff members at women's shelters. A mixed-methods approach was used which included (i) a survey to measure participant knowledge before and after completing the module; (ii) a 1-on-1 interview 6 months post-training to better understand participants' perceptions of what effect the training had on how they worked with women in their job; and (iii) an evaluation of the content of the module using behavior change techniques. About 81 participants recruited from staff at women's shelters completed the pre/post survey. The average BI knowledge score increased significantly from the pre-survey ($M = 8.12/12$, $SD = 1.05$) to the post-survey ($M = 9.72/12$, $SD = 1.62$), $t(80) = 9.12$, $P < .001$, $d = 1.01$). Analysis of the interviews with 9 participants highlighted 3 main themes arising from the module: knowledge, mindfulness, and advocacy. All participants felt their knowledge of IPV-caused BIs had increased and said they would recommend the training to their co-workers. Analysis of the module content revealed the most frequent behavior change techniques were related to instructions on how to perform screening and accommodation for IPV-caused BI. The results showed the module was effective in increasing knowledge of IPV-caused BIs amongst women's shelter staff as well as improving how they advocate for, and are mindful of, their clients with BIs. This online training may help improve the care women with IPV-caused BIs receive, and ultimately improve their quality of life.

Title: Using Behavior Change Theory to Understand How to Support Screening for Traumatic Brain Injuries Among Women Who Have

Experienced Intimate Partner Violence

Journal: Womens Health Reports

Volume: 2

Issue: 1

Pages: 305-315

Short Title: Using Behavior Change Theory to Understand How to Support Screening for Traumatic Brain Injuries Among Women Who Have Experienced Intimate Partner Violence

DOI: 10.1089/whr.2020.0097

Accession Number: WOS:000904639800038

Abstract: Background: Women who experience intimate partner violence (IPV) are at a high risk for traumatic brain injuries (TBIs).

Women's shelters may be an ideal location for TBI screening.

Behavior change theory can help understand factors that influence screening at women's shelters and develop interventions to promote screening. Objective: To use behavior change theory to understand the local context of women's shelters, factors influencing screening for TBIs among staff who work at women's shelters, and co-develop intervention recommendations to promote screening of TBIs at women's shelters. Methods: The research was conducted in three phases in partnership with the Kelowna Women's Shelter. In phase 1, participants (staff at women's shelters across Canada) completed an online survey that assessed their current TBI screening behaviors, knowledge of TBIs, and factors influencing screening. In phase 2, participants (staff at women's shelters in the Okanagan) completed an interview regarding the factors that influence screening for TBIs. In both phases, factors were analyzed using the Theoretical Domains Framework. In phase 3, intervention recommendations were co-developed using the Behavior Change Wheel. Results: In phase 1, findings indicate that participants (n=150) lack skills (mean=2.1, standard deviation [SD]=1.9) and knowledge (mean=2.9, SD=2.2) with regard to screening and are nervous to screen (mean=3.0, SD=2.4) for TBIs. In phase 2, 194 barriers to screening for TBI were extracted from 10 interviews with staff members. Prominent domains included knowledge (37%), beliefs about capabilities (16%), and environmental context and resources (15%). Finally, in phase 3, five intervention recommendations were co-developed for interventions aiming to promote TBI screening in women's shelters. Conclusions: This thesis was the first theory-based study to develop intervention recommendations for promoting screening of TBIs at women's shelters. The recommendations have the potential to increase TBI screening at women's shelters ultimately improving the quality of life of women who have experienced a TBI from IPV.

Abstract: Extensive research has documented the frequent gap between people's intentions to perform environmentally significant behavior and their actual behavior. Despite this, limited research has empirically unpacked the processes and conditions under which people's environmental considerations influence behavior and when they do not. The present research sought to meet this research need by investigating the influence of moral and environmental considerations on purchasing decisions related to clothing consumption. In doing so, we embedded environmental considerations within the broader concept of morality and drew upon self-control research to develop a conceptual model of moral self-control comprising moral considerations, conflict, resistance, and purchase. The conceptual model was assessed using data from a large two-week diary study (N = 594; n(obs) = 7,880) conducted in the United Kingdom. A multilevel path model at the within-person level revealed that moral considerations were associated with stronger conflict experiences, more frequent attempts to resist clothing desires, and less frequent clothing purchasing. These findings highlight the processes through which moral (and environmental) considerations exert their influence on clothing purchasing decisions, as well as help pinpoint when and why people sometimes fail to act in accordance with their moral and biospheric values.

Abstract: Limiting global warming to 2 degrees C or less compared with pre-industrial temperatures will require unprecedented rates of decarbonization globally. The scale and scope of transformational change required across sectors and actors in society raises critical questions of feasibility. Much of the literature on mitigation pathways addresses technological and economic aspects of feasibility, but overlooks the behavioral, cultural, and social factors that affect theoretical and practical mitigation pathways. We present a tripartite framework that "unpacks" the concept of mitigation pathways by distinguishing three factors that together determine actual mitigation: technical potential, initiative feasibility, and behavioral plasticity. The framework aims to integrate and streamline heterogeneous disciplinary research traditions toward a more comprehensive and transparent approach that will facilitate learning across disciplines and enable mitigation pathways to more fully reflect available knowledge. We offer three suggestions for integrating the tripartite framework into current research on climate change mitigation.

Short Title: A prospective, multisite implementation-efficacy trial of a collaborative prescriber-pharmacist model of care for Medication Assisted Treatment for Opioid Dependence: Protocol for the EPIC-MATOD study

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2021.11.007

Accession Number: WOS:000831754300021

Abstract: Background: Medication Assisted Treatment for Opioid Dependence (MATOD) is clinically effective and cost effective, yet a lack of MATOD prescribers in the community limits access to this treatment in Australia. These shortages are often greatest in regional and rural areas. Objective(s): The Enhancing Pharmacist Involvement in Care (EPIC)-MATOD study will evaluate clinical and implementation outcomes among people with opioid dependence receiving MATOD through a collaborative pharmacist-prescriber model of care across multiple sites in a regional location (encompassing a mix of metropolitan and non-metropolitan areas) of Victoria, Australia. Methods and analysis: The EPIC-MATOD study is a prospective, multisite, implementation trial of collaborative MATOD care. Pharmacists and prescribers will be recruited through the local network of opioid pharmacotherapy providers. Patients will be recruited through participating healthcare providers. After induction into the collaborative care model, patients and healthcare professionals will be followed up over 6-(patients) and 12 months (pharmacists and prescribers) in a hybrid implementation-efficacy study, with outcomes mapped to the RE-AIM framework. The primary clinical efficacy endpoint is patient retention in treatment at 26 weeks. The primary implementation outcome is treatment capacity, based on prescriber time required to provide treatment through collaborative care compared with traditional care. Secondary clinical endpoints include attendance for dosing and clinical reviews, substance use, mental and physical health and overall well-being. Implementation costs, acceptability, and provider engagement in collaborative care will be used as secondary implementation outcome indicators. Time and costs associated with collaborative care, and health service utilisation, will also be estimated. Project impact: The study will provide important information on outcomes and acceptability of collaborative care for MATOD, as well as the cost and key considerations in delivering a collaborative model of care in Australia and other countries where similar treatment barriers exist.

Title: Using the behaviour change wheel to understand and address barriers to pharmacy naloxone supply in Australia

Journal: International Journal of Drug Policy

Volume: 90

Date: Apr

Short Title: Using the behaviour change wheel to understand and address barriers to pharmacy naloxone supply in Australia

ISSN: 0955-3959

DOI: 10.1016/j.drugpo.2020.103061

Article Number: 103061

Accession Number: WOS:000695284400014

Abstract: Background: There has been low community pharmacy-based naloxone supply in Australia despite its over-the-counter status. The Behaviour Change Wheel (BCW) is a method used to understand individual and system-level barriers and facilitators to a particular behaviour to inform program implementation. The BCW is focused on three essential conditions of behaviour change (capability, opportunity, and motivation (termed the COM-B)) which we use to assess pharmacists' perceptions and experiences of naloxone provision with the aim of using informing targets for interventions to improve naloxone distribution. **Method:** Qualitative interviews with community pharmacists (n = 37) from four Australian jurisdictions explored naloxone knowledge, expectations and experiences dispensing the medicine. Audio-recorded interviews were transcribed verbatim and coded against the a priori domains in the COM-B (capability, opportunity, and motivation). Results were analysed to identify key barriers and facilitators to naloxone provision within each domain. Finally, we mapped our analysis against the intervention functions and policy-level strategies provided in the BCW to identify example intervention strategies. **Results:** Underlying all pharmacists' descriptions of naloxone were structural impediments to dispensing including poor communication regarding pharmacists' role and disrupted supply chains. Mapped across the three COM-B domains, we find two divergent groups of pharmacists. Pharmacists' capability and motivation to supply naloxone was higher amongst those who did not problematize people who inject drugs and who worked in pharmacies already supplying harm reduction services. Pharmacists were less likely to discuss capabilities and opportunities for naloxone dispensing when harm reduction was not normalised in their workplace and/or they described people who inject drugs using negative and stigmatising language. **Conclusions:** Analysis using the COM-B framework reveals key areas where implementation and policy strategies are needed to increase naloxone supply. Individual- and structural-level supports are needed to improve pharmacists' knowledge of naloxone and address other logistical and cultural barriers that limit naloxone provision in pharmacy settings.

Short Title: Routine opioid outcome monitoring in community pharmacy: Outcomes from an open-label single-arm implementation-effectiveness pilot study

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2020.02.009

Accession Number: WOS:000594634100009

Abstract: Background: In response to rising harms with prescription opioids, recent attention has focused on how to better utilise community pharmacists to monitor outcomes with opioid medicines. Objective: This pilot aimed to test the implementation of software-facilitated Routine Opioid Outcome Monitoring (ROOM). Methods: Community pharmacies in Victoria and New South Wales, Australia, were recruited to an open-label single-arm observational implementation-effectiveness pilot study. Pharmacists completed baseline and follow up interviews to measure change in knowledge and confidence following training on, and implementation of ROOM. Paired t-tests compared pre-post scores. Patients that participated were invited to complete a brief evaluation survey. Measures of feasibility and acceptability were collected. Results: Sixty-four pharmacists from 23 pharmacies were recruited and trained to conduct ROOM. Twenty pharmacies (87%) were able to implement ROOM, with four pharmacies completing the target of 20 screens. Pharmacists completed ROOM with 152 patients in total. Forty-four pharmacists provided baseline and followup data which demonstrated significant improvements in confidence identifying and responding to unmanaged pain, depression and opioid dependence. Despite increases, low to moderate confidence for these domains was reported at follow-up. Responses from pharmacists and patients indicated that implementation of ROOM was feasible and acceptable. Conclusions: Pharmacists' confidence in identifying and responding to opioid-related problems significantly increased from baseline to follow up across several domains, however scores indicated that there is still significant scope to further increase confidence in responding to opioid-related problems. ROOM is feasible and acceptable, though more extensive pharmacist training with opportunity to practice skills may assist in developing confidence and skills in this challenging clinical area.

Title: What predicts pharmacists' engagement with opioid-outcome screening? Secondary analysis from an implementation study in community pharmacy

Journal: International Journal of Clinical Pharmacy

Volume: 43

Issue: 2

Pages: 420-429

Date: Apr

Short Title: What predicts pharmacists' engagement with opioid-outcome screening? Secondary analysis from an implementation study in community pharmacy

ISSN: 2210-7703

DOI: 10.1007/s11096-020-01074-5

Accession Number: WOS:000551428300001

Abstract: Background Pharmacists have a key role to play in identifying and responding to emerging clinical problems with prescribed opioids. A pilot study in Australia examined the implementation of screening and brief intervention (Routine Opioid Outcome Monitoring [ROOM]) to identify and respond to opioid-related problems in community pharmacies. In this implementation study, the rate of screening varied considerably between pharmacies. **Objective** The aim of this study was to examine pharmacist characteristics associated with implementation of ROOM. **Setting** Community pharmacies in Victoria and New South Wales, Australia. **Methods** We implemented a validated computer-facilitated screening (ROOM), combined with brief intervention for opioid-related problems based on a widely accepted framework for monitoring outcomes. In this analysis, we examined the correlates of ROOM completion for individual pharmacists. Negative binomial regression was used to identify baseline predictors of greater screening, with the number of ROOM screens as the dependent (outcome) variable and pharmacist demographics, knowledge, confidence and comfort responding to prescription opioids problems, and attitudes towards evidence based practice examined as independent (predictor) variables. **Main outcome measure** Number of screens completed by an individual pharmacist as reported in follow-up surveys by pharmacist. **Results** Fewer years of practice was associated with a greater number of screenings conducted. On average, each additional decade of practice was associated with a 31% (95% CI 0%, 53%) reduction in the number of screenings undertaken by pharmacists. A multivariable analysis revealed that each additional decade practicing, lower knowledge of naloxone and lower confidence in identifying unmanaged pain were all independently associated with reduced engagement in screening after controlling for other variables. **Conclusion** Findings from this pilot study identified potential barriers to implementing opioid outcome monitoring. Further studies could test different groups of community pharmacists' experience of different barriers when implementing

monitoring outcomes with prescribed opioids, to inform future implementation and clinical practice.

Article Number: jrm00338

Accession Number: WOS:000877164400001

Abstract: Objective: Comprehensive intervention models for prevention of chronification of low back pain, in which the early identification of holistic risk factors is considered are needed. The aim of this study is to design a tailored biopsychosocial intervention for patients with low back pain to prevent pain chronicity. Design: A multidisciplinary empirical approach. Methods: A multidisciplinary team designed a biopsychosocial intervention following an application from the Medical Research Council's complex intervention framework. The methods used included problem identification, identification of the evidence, theory, and needs, examination of the current context and modelling of the theory. Biomechanical, psychological, social and environmental, and lifestyle and personal risk factors were taken into account. Results: The intervention process was introduced in a logic model. The model presents all the required resources, their activities and outputs, as well as the outcomes and impacts of the intervention. The intervention was tailored according to the underlying risk factors for pain chronification in patients with low back pain. Conclusion: A comprehensive tailored intervention may decrease the risk of pain chronicity. Further studies are needed to obtain information on the feasibility, effectiveness and cost-effectiveness of such interventions.

Article Number: e0251963

Accession Number: WOS:000664632800018

Abstract: Background The success of vaccination efforts to curb the COVID-19 pandemic will require broad public uptake of immunization and highlights the importance of understanding factors associated with willingness to receive a vaccine. Methods U.S. adults aged 65 and older enrolled in the Heartline(TM) clinical study were invited to complete a COVID-19 vaccine assessment through the Heartline(TM) mobile application between November 6-20, 2020. Factors associated with willingness to receive a COVID-19 vaccine were evaluated using an ordered logistic regression as well as a Random Forest classification algorithm. Results Among 9,106 study participants, 81.3% (n = 7402) responded and had available demographic data. The majority (91.3%) reported a willingness to be vaccinated. Factors most strongly associated with vaccine willingness were beliefs about the safety and efficacy of COVID-19 vaccines and vaccines in general. Women and Black or African American respondents reported lower willingness to vaccinate. Among those less willing to get vaccinated, 66.2% said that they would talk with their health provider before making a decision. During the study, positive results from the first COVID-19 vaccine outcome study were released; vaccine willingness increased after this report. Conclusions Even among older adults at high-risk for COVID-19 complications who are participating in a longitudinal clinical study, 1 in 11 reported lack of willingness to receive COVID-19 vaccine in November 2020. Variability in vaccine willingness by gender, race, education, and income suggests the potential for uneven vaccine uptake. Education by health providers directed toward assuaging concerns about vaccine safety and efficacy can help improve vaccine acceptance among those less willing. Trial registration Clinicaltrials.gov NCT04276441.

Article Number: 53

Accession Number: WOS:000353380100001

Abstract: Background: Implementation science has progressed towards increased use of theoretical approaches to provide better understanding and explanation of how and why implementation succeeds or fails. The aim of this article is to propose a taxonomy that distinguishes between different categories of theories, models and frameworks in implementation science, to facilitate appropriate selection and application of relevant approaches in implementation research and practice and to foster cross-disciplinary dialogue among implementation researchers. Discussion: Theoretical approaches used in implementation science have three overarching aims: describing and/or guiding the process of translating research into practice (process models); understanding and/or explaining what influences implementation outcomes (determinant frameworks, classic theories, implementation theories); and evaluating implementation (evaluation frameworks). Summary: This article proposes five categories of theoretical approaches to achieve three overarching aims. These categories are not always recognized as separate types of approaches in the literature. While there is overlap between some of the theories, models and frameworks, awareness of the differences is important to facilitate the selection of relevant approaches. Most determinant frameworks provide limited "how-to" support for carrying out implementation endeavours since the determinants usually are too generic to provide sufficient detail for guiding an implementation process. And while the relevance of addressing barriers and enablers to translating research into practice is mentioned in many process models, these models do not identify or systematically structure specific determinants associated with implementation success. Furthermore, process models recognize a temporal sequence of implementation endeavours, whereas determinant frameworks do not explicitly take a process perspective of implementation.

Abstract: Gamification is an efficient design strategy to enhance user experiences. 'Design' is based on the actual needs, 'Game' creates virtual experiences, 'Gamification' is a program that takes the real needs as the goal and the game system as the framework. The program builds a real and virtual mixed product service system. This paper presents a user experience driven three-level design method on gamification system, which corresponds user experiences in three levels of nature, process, and interface. In this paper, some examples are presented to verify the applicability of the design method on gamification system. It is foreseeable that gamification will be an important means of creating the full user experience combined the virtual and real world.

DOI: 10.1093/ageing/afac251

Article Number: afac251

Accession Number: WOS:000903919600008

Abstract: Objective this study sought to systematically review and synthesize qualitative data to explore older adult exergame experiences and perceptions. Methods a comprehensive search was conducted in seven databases from the earliest available date to May 2022. All qualitative and mixed-method studies available in English and explored exergame experiences in older adults were included. Tools from the Joanna Briggs Institute were used for data extraction and synthesis. Data were extracted using the Capability, Opportunity and Motivation Model of Behaviour (COM-B model) as a guide, and a pragmatic meta-aggregative approach was applied to synthesize the findings. Results this systematic review identified 128 findings and aggregated 9 categories from the 10 qualitative research articles included, and three synthesized findings were: older adult capability, opportunities in the exergaming program and motivation in the exergaming program. Capability consisted of attitude toward exergames, age- or health-related impairments and exergame knowledge and skills. Opportunities included older adult-friendly exergame design and social influence. Motivation included self-efficacy, support, instruction and feedback, health benefits, as well as unpleasant exergaming experiences. Conclusions it is crucial to tailor the exergaming program to suit the older population. We identified barriers and facilitators of implementing exergaming in older adults and found most barriers are surmountable. The results of the current systematic review could provide evidence for the design and implementation of exergaming programs among older adults. The ConQual score of the synthesized findings was assessed as low. Dependability and credibility should be accounted for in future studies to increase confidence.

Short Title: Barriers and facilitators to physical activity participation in patients with head and neck cancer: a scoping

review

ISSN: 0941-4355

DOI: 10.1007/s00520-022-06812-1

Accession Number: WOS:000742788100002

Abstract: Background Patients with head and neck cancer (HNC) usually experienced disfigurement, dysfunction, and psychosocial distress, leading to a decline in their quality of life. Physical activity (PA) is recommended for such patients. Despite the proven benefits of participating in PA, the compliance of patients with HNC is still poor. Hence, the factors influencing PA participation and adherence in patients with HNC need to be explored. Objectives This study aimed to (1) identify barriers and enablers of PA in adult patients living with HNC and (2) map barriers and facilitators to the Capability-Opportunity-Motivation-Behavior (COM-B) model. Eligibility criteria Types of studies: Studies with qualitative, quantitative, and mixed designs were included in this review. Types of participants: The current review takes into account patients with HNC aged 18 years or above. Types of interventions: This review considered all studies focusing on full-body PA. Types of outcomes: This scoping review focused on studies examining health behavior, patients' compliance, and facilitators and/or barriers to PA engagement. Five databases (Ovid Medline, Ovid Embase, CINAHL, Cochrane Library, and PsycINFO) were searched following the methodology for scoping reviews from inception to July 2021. Data extraction The extracted data included author(s)/year of publication, country, main purpose of the study, sample size/disease site and stage, methodology and methods, type of treatment, and main findings/barriers, or facilitators. Results A total of 22 studies were finally selected. The top three barriers were physical-related issues, time pressures, and low motivation or interest. Most facilitators included perceived psychological, health, and social benefits and preference for the model of PA. The most frequent COM-B model components were physical capability, automatic motivation, and physical opportunity. Conclusions Patients with HNC have unique facilitators and barriers to participating in PA. Interventions must leverage facilitators and limit barriers to exercise so as to increase compliance with exercise. Future studies should test the effectiveness of behavioral change measures based on the factors influencing the COM-B model.

Title: Office workers' beliefs about reducing sitting time at work: a belief elicitation study

Journal: Health Psychology and Behavioral Medicine

Volume: 6

Issue: 1

Pages: 15–29

Short Title: Office workers' beliefs about reducing sitting time at work: a belief elicitation study

ISSN: 2164–2850

DOI: 10.1080/21642850.2018.1428103

Accession Number: WOS:000472538400002

Abstract: Objectives: Prolonged sitting has adverse health consequences, yet office workers can spend over 10 hours sitting each day. The Theory of Planned Behaviour may offer a useful perspective for understanding and enhancing psychological determinants of sitting at work. The aim of this belief elicitation study was to identify office workers' most salient beliefs relating to achieving the recently published Public Health England recommendation of accumulating at least two hours per day of standing and light activity at work. Methods: Full-time office-based workers (n = 105) responded to our invitation on Twitter to complete an on-line questionnaire. Participants responded to six open-ended questions about their behavioural (i.e. advantages/disadvantages), normative (i.e. who would approve/disapprove), and control (i.e. easy/difficult) beliefs relating to the target behaviour, and the data were content analysed to identify the most salient themes. Results: The most salient advantage of the behaviour was better health (n = 243), and most salient disadvantage was decreased work productivity (n = 64). Participants believed that people in work with a remit for health (n = 34) were likely to approve of the behaviour, but that managers (n = 68) would be likely to disapprove. It was believed that a better physical environment (n = 75) would make it easier, and work demands (n = 102) would make it difficult to execute the behaviour. Conclusions: Although participants recognised many benefits of engaging in the behaviour, there was consistent evidence that participants believed the behaviour may have implications for working effectively, and would be influenced by the physical environment and work culture. Interventions should target these salient beliefs.

Title: Primary-Care Prescribers' Perspectives on Deprescribing Opioids and Benzodiazepines in Older Adults

Journal: Drugs & Aging

Volume: 39

Issue: 9

Pages: 739–748

Date: Sep

Short Title: Primary-Care Prescribers' Perspectives on Deprescribing Opioids and Benzodiazepines in Older Adults

ISSN: 1170-229X

DOI: 10.1007/s40266-022-00967-6

Accession Number: WOS:000831002400001

Abstract: Purpose Opioids and benzodiazepines (BZDs) are frequently implicated as contributing to falls in older adults. Deprescribing of these medications continues to be challenging. This study evaluated primary-care prescribers' confidence in and perceptions of deprescribing opioids and BZDs for older adults. **Methods** For this study, we conducted a quantitative analysis of survey data combined with an analysis of qualitative data from a focus group. A survey evaluating prescriber confidence in deprescribing opioids and BZDs was distributed to providers at 15 primary-care clinics in North Carolina between March-December 2020. Average confidence (scale 0-100) for deprescribing opioids, deprescribing BZDs, and deprescribing under impeding circumstances were reported. A virtual focus group was conducted in March 2020 to identify specific barriers and facilitators to deprescribing opioids and BZDs. Audio recordings and transcripts were analyzed using inductive coding. **Results** We evaluated 61 survey responses (69.3% response rate). Respondents were predominantly physicians (54.8%), but also included nurse practitioners (24.6%) and physician assistants (19.4%). Average overall confidence in deprescribing was comparable for opioids (64.5) and BZDs (65.9), but was lower for deprescribing under impeding circumstances (53.7). In the focus group, prescribers noted they met more resistance when deprescribing BZDs and that issues such as lack of time, availability of mental health resources, and patients seeing multiple prescribers were barriers to deprescribing. **Conclusion** Findings from quantitative and qualitative analyses identified that prescribers were moderately confident in their ability to deprescribe both opioids and BZDs in older adults, but less confident under potentially impeding circumstances. Future studies are needed to evaluate policies and interventions to overcome barriers to deprescribing opioids and BZDs in primary care. **Notes:** Niznik, Joshua D. Ferreri, Stefanie P. DOI: 10.1080/21645515.2022.2162771

Accession Number: WOS:000907843000001

Abstract: This study aimed to explore the contextual factors that may be associated with missed opportunities for vaccination (MOV) from the perspectives of healthcare providers and caregivers attending primary healthcare facilities in the Cape Town Metro Health District, South Africa. The ultimate goal of the assessment was to help inform the design and implementation of a contextually appropriate quality improvement programme targeted at reducing MOV in primary healthcare settings. We used a theory-informed exploratory qualitative research design involving focus group discussions with caregivers of children aged 0-23 months; and in-depth interviews of facility staff. A thematic template analysis approach, integrating the theoretical domains framework (TDF) and the capability, opportunity and motivation model of behavior (COM-B) was used to code and analyze the data. Three focus group sessions were conducted, each consisting of 5-8 caregivers and five in-depth interviews involving facility staff. Capability factors comprised caregivers' knowledge, attitude and behavior toward children's immunization. Opportunity factors included the organization of immunization services, long waiting time, vaccine stock out, staff shortage and health workers' attitude, knowledge and capability to assess children's immunization status and needs. Motivation factors included optimism and beliefs about immunization, fear of vaccine-preventable diseases and immunization safety concerns. This study identified important caregiver-, provider- and health system-related factors, which influence immunization outcomes; offering useful contextual insights for informing quality improvement strategies for reducing MOV at primary healthcare level.

Accession Number: WOS:000839086200013

Abstract: Objectives Systems approaches aim to change the environments in which people live, through cross-sectoral working, by harnessing the complexity of the problem. This paper sought to identify: (1) the strategies which support the implementation of We Can Move (WCM), (2) the barriers to implementation, (3) key contextual factors that influence implementation and (4) impacts associated with WCM. Design A multi-methods evaluation of WCM was completed between April 2019 and April 2021. Ripple Effects Mapping (REM) and semi-structured interviews were used. Framework and content analysis were systematically applied to the dataset. Setting WCM—a physical activity orientated systems approach being implemented in Gloucestershire, England. Participants 31 stakeholder interviews and 25 stakeholders involved in 15 REM workshops. Results A white-water rafting analogy was developed to present the main findings. The successful implementation of WCM required a facilitative, well-connected and knowledgeable guide (ie, the lead organisation), a crew (ie, wider stakeholders) who's vision and agenda aligned with WCM's purpose, and a flexible delivery approach that could respond to ever-changing nature of the river (ie, local and national circumstances). The context surrounding WCM further strengthened and hampered its implementation. Barriers included evaluative difficulties, a difference in stakeholder and organisational perspectives, misaligned expectations and understandings of WCM, and COVID-19 implications (COVID-19 also presented as a facilitative factor). WCM was said to strengthen cohesion and collaboration between partners, benefit other agendas and policies (eg, mental health, town planning, inequality), and improve physical activity opportunities and environments.

Conclusions This paper is one of the first to evaluate a systems approach to increasing physical activity. We highlight key strategies and contextual factors that influenced the implementation of WCM and demonstrate some of the wider benefits from such approaches. Further research and methodologies are required to build the evidence base surrounding systems approaches in Public Health.

Title: Barrier profiles in workplace health promotion in Germany

Journal: Health Promotion International

Volume: 38

Issue: 1

Date: Feb

Short Title: Barrier profiles in workplace health promotion in Germany

ISSN: 0957-4824

DOI: 10.1093/heapro/daac125

Article Number: daac125

Accession Number: WOS:000910890600003

Abstract: Lay Summary Workplace health promotion (WHP) is often faced with low-participation rates despite high relevance. This limits the potential for creating positive effects for the organization and its staff. Therefore, we investigated the barriers perceived by employees themselves using a representative sample (regarding age, gender and education) in Germany. Data were collected using a quantitative online questionnaire and then analyzed regarding underlying patterns. We found that there are different barrier types, and their importance differs depending on demographic criteria of the participants and the organizations they work for. These results can help organizations to reduce participation barriers to WHP for their staff. Workplace health promotion (WHP) is often faced with low-participation rates despite high relevance. This limits the potential for creating positive effects for the organization and its staff. Barriers to participation are analyzed based on the employee's perspective regarding underlying patterns to develop suggestions for improving offer design. A quantitative online questionnaire study was done in Germany (N= 690). The sample is representative regarding age, gender and education. Data were analyzed using factor analysis and non-parametric tests (e.g. Mann-Whitney-U, Kruskal-Wallis). Offer design, information and social aspects are the major barrier dimensions. Offer design barriers are more relevant for females, employees in larger organizations and those in lower occupational roles, plus individuals planning to take up WHP participation. Social aspects are less important for employees with higher age. Regular participants have lower barriers scores, indicating the importance of reducing WHP participation barriers. Depending on the specific target group, hindrance perception intensity varies. This study offers specific suggestions on how to better design WHP programs.

Accession Number: WOS:000821126100001

Abstract: Background: Performance-oriented financing of healthcare aims at demand-based and efficient resource allocation. Often, clinical pathways (CPs) are introduced in this context. Purpose: For CP success (a) the degree of utilization of and divergence, (b) cost effects and (c) health professionals' acceptance rate of and satisfaction are relevant. There are gaps in research regarding these issues in general, and more specifically in the German speaking part of Europe. Methodology/Approach: Employing a two-stage mixed-methods pilot study, we studied (a) and (b) quantitatively in Germany, Austria, and Switzerland, and (c) qualitatively in Germany and Austria. Results: Many hospitals already implemented CPs, but the utilization varies. They are expected to yield middle-range savings, but intangible benefits are more important. In general, employees are in favor of CPs, but several conditions need to be met, e.g. adaptability to local requirements. Conclusion: Linking the results to the Consolidated Framework for Implementation Research showed many criteria are covered, which might lead to the positive evaluations, but also highlights the complexity of the intervention. Practice Implication: As enhanced acceptance rates are expected to lead to higher benefits and vice versa, management team should safeguard employee participation and perceived benefits in all phases of the CP cycle.

Accession Number: WOS:000796264200067

Abstract: Objectives The overall purpose of this research programme is to develop and test the feasibility of a complex intervention for knee pain delivered by a nurse, and comprising both non-pharmacological and pharmacological interventions. In this first phase, we examined the acceptability of the non-pharmacological component of the intervention; issues faced in delivery, and resolved possible challenges to delivery. Methods Eighteen adults with chronic knee pain were recruited from the community. The intervention comprised holistic assessment, education, exercise, weight-loss advice (where appropriate) and advice on adjunctive treatments such as hot/cold treatments, footwear modification and walking aids. After nurse training, the intervention was delivered in four sessions spread over five weeks. Participants had one to one semi-structured interview at the end of the intervention. The nurse was interviewed after the last visit of the last participant. These were audio recorded and transcribed verbatim. Themes were identified by one author through framework analysis of the transcripts, and cross-checked by another. Results Most participants found the advice from the nurse easy to follow and were satisfied with the package, though some felt that too much information was provided too soon. The intervention changed their perception of managing knee pain, learning that it can be improved with self-management. However, participants thought that the most challenging part of the intervention was fitting the exercise regime into their daily routine. The nurse found discussion of goal setting to be challenging. Conclusion The nurse-led package of care is acceptable within a research setting. The results are promising and will be applied in a feasibility randomised-controlled trial.

Short Title: The Influence of Adolescent Sport Participation on Body

Mass Index Tracking and the Association between Body Mass Index and Self-Esteem over a Three-Year Period

DOI: 10.3390/ijerph192315579

Article Number: 15579

Accession Number: WOS:000897278700001

Abstract: This study aimed to (1) investigate gender-specific characteristics associated with low sport participation among UK adolescents, and (2) assess gender-specific BMI tracking, and gender-specific associations between BMI and self-esteem based on different levels of adolescent sport participation. Participants were 9046 (4523 female) UK adolescents. At 11- and 14 years self-esteem was self-reported and BMI was calculated from objectively measured height and weight. At 11- years sport participation was parent-reported. Gender-specific sport participation quartile cut-off values categorised boys and girls separately into four graded groups. Gender-specific chi(2) and independent samples t tests assessed differences in measured variables between the lowest (Q1) and highest (Q4) sport participation quartiles. Adjusted linear regression analyses examined BMI tracking and associations between BMI and self-esteem scores. Gender-specific analyses were conducted separately for sport participation quartiles. Compared to Q4 boys and girls, Q1 boys and girls were more likely to be non-White, low family income, have overweight/obesity at 11 years and report lower self-esteem at 11 years and 14 years. BMI at 11 years was positively associated with BMI at 14 years for boys and girls across sport participation quartiles. BMI at 11 years was inversely associated with self-esteem scores at 11 years for Q1 and Q2 boys, and Q1 and Q4 girls. BMI at 11 years was inversely associated with self-esteem scores at 14 years for Q1, Q3 and Q4 boys, and Q1, Q2, Q3 and Q4 girls. Gender and sport participation influence BMI tracking and the BMI and self-esteem association among adolescents.

Title: An implementation study of electronic assessment of patient-reported outcomes in inpatient radiation oncology

Journal: Journal of Patient-Reported Outcomes

Volume: 6

Issue: 1

Date: Jul

Short Title: An implementation study of electronic assessment of patient-reported outcomes in inpatient radiation oncology

DOI: 10.1186/s41687-022-00478-3

Article Number: 77

Accession Number: WOS:000827741300001

Abstract: Purpose Despite evidence for clinical benefits,

recommendations in guidelines, and options for electronic data collection, routine assessment of patient-reported outcomes (PROs) is mostly not implemented in clinical practice. This study aimed to plan, conduct and evaluate the implementation of electronic PRO (e-PRO) assessment in the clinical routine of an inpatient radiation oncology clinic. Methods The guideline- and evidence-based, stepwise approach of this single-center implementation study comprised preparatory analyses of current practice, selection of assessment instruments and times, development of staff training, and evidence-based recommendations regarding the use of the e-PRO assessment, as well as on-site support of the implementation. Process evaluation focused on potential clinical benefit (number of documented symptoms and supportive measures), feasibility and acceptance (patient contacts resulting in completion/non-completion of the e-PRO assessment, reasons for non-completion, preconditions, facilitators and barriers of implementation), and required resources (duration of patient contacts to explain/support the completion). Results Selection of instruments and assessment times resulted in initial assessment at admission (EORTC QLQ-C30, QSR 10), daily symptom monitoring (EORTC single items), and assessment at discharge (EORTC QLQ-C30). Recommendations for PRO-based clinical action and self-management advice for patients concerning nine core symptoms were developed. Staff training comprised group and face-to-face meetings and an additional e-learning course was developed. Analyses of clinical records showed that e-PRO assessment identified more symptoms followed by a higher number of supportive measures compared to records of patients without e-PRO assessment. Analysis of n = 1597 patient contacts resulted in n = 1355 (84.9%) completed e-PROs (initial assessment: n = 355, monitoring: n = 967, final assessment: n = 44) and n = 242 (15.2%) non-completions. Instructions or support to complete e-PROs took on average 5.5 +/- 5.3 min per patient contact. The most challenging issue was the integration of the results in clinical practice. Conclusion E-PRO assessment in oncologic inpatient settings is acceptable for patients and can support symptom identification and the initiation of supportive measures. The challenge of making the "data actionable" within the clinical workflow and motivating clinical staff to use the results became evident. Plain English summary Cancer patients' perceptions regarding their symptoms and functioning are important as they can differ from a professional assessment. Patients' perceptions and self-assessment can be collected via electronic devices. Thus, the clinical staff can see a graphic overview of individual disease-related burden. Despite studies indicating the benefit of this assessment for care and symptom management, it is not integrated into routine care so far. The aim of our study was, to plan, conduct and evaluate the implementation of electronic patient-reported assessment in a radio-oncology inpatient clinic under "real-life" clinical conditions instead of study conditions. Patients could complete an electronic assessment at the beginning/end and during their treatment. Results indicate that electronic self-assessment can identify more symptoms than the assessment of physicians and nurses. Patients completing a self-assessment are more likely to receive supportive measures. The majority of 80-90% of patients were willing to complete a self-assessment. On average 5-6 min were

needed to explain or support the completion. While the intervention was feasible and acceptable for patients, motivating clinical staff using its results was most challenging. The importance of technical support became evident.

Title: Protocol for the 'Virtual Traveller' cluster-randomised controlled trial: a behaviour change intervention to increase physical activity in primary-school Maths and English lessons

Journal: Bmj Open

Volume: 6

Issue: 6

Short Title: Protocol for the "Virtual Traveller" cluster-randomised controlled trial: a behaviour change intervention to increase physical activity in primary-school Maths and English lessons
ISSN: 2044-6055

DOI: 10.1136/bmjopen-2016-011982

Article Number: e011982

Accession Number: WOS:000380237100167

Abstract: Introduction Physical activity (PA) has been shown to be an important factor for health and educational outcomes in children. However, a large proportion of children's school day is spent in sedentary lesson-time. There is emerging evidence about the effectiveness of physically active lessons: integrating physical movements and educational content in the classroom. Virtual Traveller' is a novel 6-week intervention of 10-min sessions performed 3 days per week, using classroom interactive whiteboards to integrate movement into primary-school Maths and English teaching. The primary aim of this project is to evaluate the effect of the Virtual Traveller intervention on children's PA, on-task behaviour and student engagement. **Methods and analysis** This study will be a cluster-randomised controlled trial with a waiting-list control group. Ten year 4 (aged 8-9 years) classes across 10 primary schools will be randomised by class to either the 6-week Virtual Traveller intervention or the waiting-list control group. Data will be collected 5 times: at baseline, at weeks 2 and 4 of the intervention, and 1 week and 3 months post-intervention. At baseline, anthropometric measures, 4-day objective PA monitoring (including 2 weekend days; Actigraph accelerometer), PA and on-task behaviour observations and student engagement questionnaires will be performed. All but anthropometric measures will be repeated at all other data collection points. Changes in overall PA levels and levels during different time-periods (eg, lesson-time) will be examined. Changes in on-task behaviour and student engagement between intervention groups will also be examined. Multilevel regression modelling will be used to analyse the data. Process evaluation will be carried out during the intervention period. **Ethics and dissemination** The results of this study will be disseminated through peer-review publications and conference presentations. Ethical approval was obtained through the University College London Research Ethics Committee (reference number: 3500-004).

Abstract: Introduction. Activities promoting research reproducibility and transparency are crucial for generating trustworthy evidence. Evaluation of smoking interventions is one area where vested interests may motivate reduced reproducibility and transparency. Aims. Assess markers of transparency and reproducibility in smoking behaviour change intervention evaluation reports. Methods. One hundred evaluation reports of smoking behaviour change intervention randomised controlled trials published in 2018–2019 were identified. Reproducibility markers of pre-registration; protocol sharing; data, material, and analysis script sharing; replication of a previous study; and open access publication were coded in identified reports. Transparency markers of funding and conflict of interest declarations were also coded. Coding was performed by two researchers, with inter-rater reliability calculated using Krippendorff's alpha. Results. Seventy-one percent of reports were open access, and 73% were pre-registered. However, there are only 13% provided accessible materials, 7% accessible data, and 1% accessible analysis scripts. No reports were replication studies. Ninety-four percent of reports provided a funding source statement, and eighty-eight percent of reports provided a conflict of interest statement. Conclusions. Open data, materials, analysis, and replications are rare in smoking behaviour change interventions, whereas funding source and conflict of interest declarations are common. Future smoking research should be more reproducible to enable knowledge accumulation. This study was pre-registered: .

Accession Number: WOS:000799923300001

Abstract: Objectives Concerns on the lack of reproducibility and transparency in science have led to a range of research practice reforms, broadly referred to as 'Open Science'. The extent that physical activity interventions are embedding Open Science practices is currently unknown. In this study, we randomly sampled 100 reports of recent physical activity randomised controlled trial behaviour change interventions to estimate the prevalence of Open Science practices. **Methods** One hundred reports of randomised controlled trial physical activity behaviour change interventions published between 2018 and 2021 were identified, as used within the Human Behaviour-Change Project. Open Science practices were coded in identified reports, including: study pre-registration, protocol sharing, data, materials and analysis scripts sharing, replication of a previous study, open access publication, funding sources and conflict of interest statements. Coding was performed by two independent researchers, with inter-rater reliability calculated using Krippendorff's alpha. **Results** 78 of the 100 reports provided details of study pre-registration and 41% provided evidence of a published protocol. 4% provided accessible open data, 8% provided open materials and 1% provided open analysis scripts. 73% of reports were published as open access and no studies were described as replication attempts. 93% of reports declared their sources of funding and 88% provided conflicts of interest statements. A Krippendorff's alpha of 0.73 was obtained across all coding. **Conclusion** Open data, materials, analysis and replication attempts are currently rare in physical activity behaviour change intervention reports, whereas funding source and conflict of interest declarations are common. Future physical activity research should increase the reproducibility of their methods and results by incorporating more Open Science practices.

Article Number: 98

Accession Number: WOS:000406862800001

Abstract: Background: Engaging stakeholders from varied organizational levels is essential to successful healthcare quality improvement. However, engagement has been hard to achieve and to measure across diverse stakeholders. Further, current implementation science models provide little clarity about what engagement means, despite its importance. The aim of this study was to understand how stakeholders of healthcare improvement initiatives defined engagement. Methods: Participants (n = 86) in this qualitative thematic study were purposively sampled for individual interviews. Participants included leaders, core members, frontline clinicians, support personnel, and other stakeholders of Strategic Clinical Networks in Alberta Health Services, a Canadian provincial health system with over 108,000 employees. We used an iterative thematic approach to analyze participants' responses to the question, "How do you define engagement?" Results: Regardless of their organizational role, participants defined engagement through three interrelated themes. First, engagement was active participation from willing and committed stakeholders, with levels that ranged from information sharing to full decision-making. Second, engagement centered on a shared decision-making process about meaningful change for everyone "around the table," those who are most impacted. Third, engagement was two-way interactions that began early in the change process, where exchanges were respectful and all stakeholders felt heard and understood. Conclusions: This study highlights the commonalities of how stakeholders in a large healthcare system defined engagement—a shared understanding and terminology—to guide and improve stakeholder engagement. Overall, engagement was an active and committed decision-making about a meaningful problem through respectful interactions and dialog where everyone's voice is considered. Our results may be used in conjunction with current implementation models to provide clarity about what engagement means and how to engage various stakeholders.

Short Title: Development of a Smoke-Free Home Intervention for Families of Babies Admitted to Neonatal Intensive Care

DOI: 10.3390/ijerph19063670

Article Number: 3670

Accession Number: WOS:000775285000001

Abstract: Neonatal intensive care units (NICUs) have a disproportionately higher number of parents who smoke tobacco compared to the general population. A baby's NICU admission offers a unique time to prompt behaviour change, and to emphasise the dangerous health risks of environmental tobacco smoke exposure to vulnerable infants. We sought to explore the views of mothers, fathers, wider family members, and healthcare professionals to develop an intervention to promote smoke-free homes, delivered on NICU. This article reports findings of a qualitative interview and focus group study with parents whose infants were in NICU (n = 42) and NICU healthcare professionals (n = 23). Thematic analysis was conducted to deductively explore aspects of intervention development including initiation, timing, components and delivery. Analysis of inductively occurring themes was also undertaken. Findings demonstrated that both parents and healthcare professionals supported the need for intervention. They felt it should be positioned around the promotion of smoke-free homes, but to achieve that end goal might incorporate direct cessation support during the NICU stay, support to stay smoke free (relapse prevention), and support and guidance for discussing smoking with family and household visitors. Qualitative analysis mapped well to an intervention based around the '3As' approach (ask, advise, act). This informed a logic model and intervention pathway.

Article Number: e064585
Accession Number: WOS:000918750500002
Abstract: Introduction Attendees of emergency departments (EDs) have a higher than expected prevalence of smoking. ED attendance may be a good opportunity to prompt positive behaviour change, even for smokers not currently motivated to quit. This study aims to determine whether an opportunist smoking cessation intervention delivered in the ED can help daily smokers attending the ED quit smoking and is cost-effective. Methods and analysis A two-arm pragmatic, multicentred, parallel-group, individually randomised, controlled superiority trial with an internal pilot, economic evaluation and mixed methods process evaluation. The trial will compare ED-based brief smoking cessation advice, including provision of an e-cigarette and referral to local stop smoking services (intervention) with the provision of contact details for local stop smoking services (control). Target sample size is 972, recruiting across 6 National Health Service EDs in England and Scotland. Outcomes will be collected at 1, 3 and 6 months. The primary outcome at 6 months is carbon monoxide verified continuous smoking abstinence. Ethics and dissemination The trial was approved by the South Central-Oxford B Research Committee (21/SC/0288). Dissemination will include the publication of outcomes, and the process and economic evaluations in peer-reviewed journals. The findings will also be appropriately disseminated to relevant practice, policy and patient representative groups.

Short Title: Exploring young adult perspectives on the use of gamification and social media in a smartphone platform for improving vegetable intake

ISSN: 0195–6663

DOI: 10.1016/j.appet.2017.10.016

Accession Number: WOS:000416616400066

Abstract: Young adults are the poorest consumers of vegetables. Social media and smartphones are frequently used by this demographic and could serve as an engaging medium for nutrition promotion. Five focus groups were conducted to capture participants' perceptions of a theory-based gamified self-monitoring app for improving vegetable intake of young adults. Ranking activities were used to gather feedback on preferences for social media posts. Data arising from group discussion were analysed using NVivo software using a deductive approach to group common ideas into themes. Thirty two participants (14 males) attended (mean age 23.1 (SD 2.7) years). Qualitative analyses of open discussion revealed two major themes regarding preferred features for a smartphone app; (1) the use of visual guides for estimating quantities of vegetables and tracking progress, and (2) a simple interface. Gamification strategies such as earning badges were viewed more positively than the use of a self-reward framework. Social media posts which presented food pictures and recipes were ranked most motivating, while awareness raising posts received lower scores. Participants indicated a preference for viewing but reluctance to post information onto social media. "Just in time" situational cues were ranked highly and the use of an "authoritative" tone was preferred and associated with credibility. Young adults also ranked messages containing "Gen Y" language highly, with a preference for those which were personally relevant. The proposed use of social media and mobile-gaming was seen as an acceptable approach for improving vegetable intake. Materials should be visually appealing, simply designed, credible, and personally relevant to appeal to this population. This feedback may inform future mobile-phone based interventions targeting improved nutrition in young adults. (C) 2017 Elsevier Ltd. All rights reserved.

Abstract: An important purpose of science is building and advancing general theories from empirical data. This process is complicated by the immense volume of empirical data and scientific theories in some fields. Particularly, the systematic linking of empirical data with theoretical constructs is currently lacking. Within this article, we propose a prototypical solution (i.e., a metamodel and graph database) for consolidating scientific knowledge by linking theoretical constructs with empirical data. We conducted a case study within the field of health behavior change where the system is used to record three scientific theories and three empirical studies as well as their mutual links. Finally, we demonstrate how the system can be queried to accumulate knowledge.

Short Title: Views from Multidisciplinary Oncology Clinicians on Strengthening Cancer Care Delivery Systems in Tanzania

ISSN: 1083-7159

DOI: 10.1002/onco.13834

Accession Number: WOS:000661566300001

Abstract: Background In response to the increasing burden of cancer in Tanzania, the Ministry of Health, Community Development, Gender, Elderly and Children launched National Cancer Treatment Guidelines (TNCTG) in February 2020. The guidelines aimed to improve and

standardize oncology care in the country. At Ocean Road Cancer Institute (ORCI), we developed a theory-informed implementation strategy to promote guideline-concordant care. As part of the situation analysis for implementation strategy development, we conducted focus group discussions to evaluate clinical systems and contextual factors that influence guideline-based practice prior to the launch of the TNCTG. Materials and Methods In June 2019, three focus group discussions were conducted with a total of 21 oncology clinicians at ORCI, stratified by profession. A discussion guide was used to stimulate dialogue about facilitators and barriers to delivery of guideline-concordant care. Discussions were audio recorded, transcribed, translated, and analyzed using thematic framework analysis. Results Participants identified factors both within the inner context of ORCI clinical systems and outside of ORCI. Themes within the clinical systems included capacity and infrastructure, information technology, communication, efficiency, and quality of services provided. Contextual factors external to ORCI included interinstitutional coordination, oncology capacity in peripheral hospitals, public awareness and beliefs, and financial barriers. Participants provided pragmatic suggestions for strengthening cancer care delivery in Tanzania. Conclusion Our results highlight several barriers and facilitators within and outside of the clinical systems at ORCI that may affect uptake of the TNCTG. Our findings were used to inform a broader guideline implementation strategy, in an effort to improve uptake of the TNCTGs at ORCI. Implications for Practice This study provides an assessment of cancer care delivery systems in a low resource setting from the unique perspectives of local multidisciplinary oncology clinicians. Situational analysis of contextual factors that are likely to influence guideline implementation outcomes is the first step of developing an implementation strategy for cancer treatment guidelines. Many of the barriers identified in this study represent actionable targets that will inform the next phases of our implementation strategy for guideline-concordant cancer care in Tanzania and comparable settings.

Abstract: School-wide positive behavior support (SWPBIS) is a well-evaluated school approach to promoting a positive school climate and decreasing problem behaviors. Initial implementation is one of the most critical stages of program implementation. In this qualitative study, the initial implementation of SWPBIS in Swedish schools was studied using an implementation model of behavior change as guidance for interviews and analyses. The study makes significant contributions to previous research as little is known of the implementation of SWPBIS in Swedish context. Focus-group interviews were conducted with 59 professionals on implementation teams from nine schools. Themes were extracted according to implementation team members' perceptions and descriptions of how the initial implementation was carried out. The results of this study revealed relevant themes within the three domains of Capability, Opportunity, and Motivation. Core features were found under the themes of knowledge and experience of similar evidence-based programs, process or result orientation, time, manual content, organizational prerequisites, team functioning, implementation leadership, program as a unifying factor, program aligning with staff beliefs, plausible expectations, and emotional reinforcement. Results are discussed in terms of how they can be used in continuing to develop the Swedish model of SWPBIS. Implications regarding implementation in Swedish schools are discussed, as is the applicability of the model of behavior change for studying implementation in schools.

Abstract: A staggering number of individuals live with cognitive decline. Primary care providers are ideally situated to detect the

first signs of cognitive decline, but many persons remain undiagnosed. This limits their access to appropriate care. Unfortunately, the timely diagnosis of mild cognitive impairment or dementia in primary care is difficult to achieve. There is a great need for interventions to address this problem. This article applies an implementation science framework, the Behavioral Change Wheel, to evaluate the factors that influence detection of cognitive impairment in primary care and proposes candidate interventions for future study.

Short Title: Let's talk about health: shoppers' discourse regarding health while food shopping

ISSN: 1368-9800

DOI: 10.1017/s1368980014001116

Accession Number: WOS:000351243900007

Abstract: Objective: The present study aimed to examine the role of health in consumers' food purchasing decisions through investigating the nature of people's discourse regarding health while conducting their food shopping. Design: The study employed the think-aloud technique as part of an accompanied shop. All mentions of health and terms relating to health were identified from the data set.

Inductive thematic analysis was conducted to examine how health was talked about in relation to people's food choice decisions. Setting: Supermarkets in Dublin, Republic of Ireland and Belfast, Northern Ireland. Subjects: Participants (n 50) were aged over 18 years and represented the main household shopper. Results: Responsibility for others and the perceived need to illicit strict control to avoid 'unhealthy' food selections played a dominant role in how health was talked about during the accompanied shop. Consequently healthy shopping was viewed as difficult and effort was required to make the healthy choice, with shoppers relating to product-based inferences to support their decisions. Conclusions: This qualitative exploration has provided evidence of a number of factors influencing the consideration of health during consumers' food shopping. These results highlight opportunities for stakeholders such as public health bodies and the food industry to explore further ways to help enable consumers make healthy food choices.

DOI: 10.1186/s12889-015-2532-5

Article Number: 1219

Accession Number: WOS:000366550100002

Abstract: Background: High levels of sedentary behaviour (i.e., sitting) are a risk factor for poor health. With high levels of sitting widespread in desk-based office workers, office workplaces are an appropriate setting for interventions aimed at reducing sedentary behaviour. This paper describes the development processes and proposed intervention procedures of Stand More AT (SMaRT) Work, a multi-component randomised control (RCT) trial which aims to reduce occupational sitting time in desk-based office workers within the National Health Service (NHS). Methods/Design: SMaRT Work consists of 2 phases: 1) intervention development: The development of the SMaRT Work intervention takes a community-based participatory research approach using the Behaviour Change Wheel. Focus groups will collect detailed information to gain a better understanding of the most appropriate strategies, to sit alongside the provision of height-adjustable workstations, at the environmental, organisational and individual level that support less occupational sitting. 2) intervention delivery and evaluation: The 12 month cluster RCT aims to reduce workplace sitting in the University Hospitals of Leicester NHS Trust. Desk-based office workers (n = 238) will be randomised to control or intervention clusters, with the intervention group receiving height-adjustable workstations and supporting techniques based on the feedback received from the development phase. Data will be collected at four time points; baseline, 3, 6 and 12 months. The primary outcome is a reduction in sitting time, measured by the

activPAL (TM) micro at 12 months. Secondary outcomes include objectively measured physical activity and a variety of work-related health and psycho-social measures. A process evaluation will also take place. Discussion: This study will be the first long-term, evidence-based, multi-component cluster RCT aimed at reducing occupational sitting within the NHS. This study will help form a better understanding and knowledge base of facilitators and barriers to creating a healthier work environment and contribute to health and wellbeing policy.

Title: Interactive Mobile Phone HIV Adherence Support for Men Who Have Sex With Men in the Philippines Connect for Life Study: Mixed Methods Approach to Intervention Development and Pilot Testing

Journal: Jmir Formative Research

Volume: 6

Issue: 2

Date: Feb

Short Title: Interactive Mobile Phone HIV Adherence Support for Men Who Have Sex With Men in the Philippines Connect for Life Study: Mixed Methods Approach to Intervention Development and Pilot Testing

DOI: 10.2196/30811

Article Number: e30811

Accession Number: WOS:000854070800011

Abstract: Background: The HIV epidemic in the Philippines is one of the fastest growing epidemics globally, and infections among men who have sex with men are rising at an alarming rate. The World Health Organization recommends the use of mobile health (mHealth) technologies to engage patients in care and ensure high levels of adherence to antiretroviral therapy (ART). Existing mHealth interventions can be adapted and tailored to the context and population served. Objective: This study aims to create a locally tailored intervention using a mobile phone platform to support treatment adherence for HIV patients on ART in the Philippines. Methods: A mixed methods approach guided by the Behavior Change Wheel framework was used to adapt an existing mHealth adherence

support platform for the local setting and target population. A literature review, retrospective clinical record review, and focus group discussions with patients were conducted to understand the drivers of ART adherence and tailor the intervention accordingly. The resulting intervention was pilot-tested for 8 weeks, followed by focus group discussions with patients who received the intervention to assess the acceptability of the design. Results: Key issues contributing to nonadherence included side effects, lack of behavioral skills for pill taking, social support, mental health, and substance use. Patients identified mHealth as an acceptable mode of intervention delivery and wanted mHealth services to be highly personalizable. The study team, clinicians, and software developers integrated these findings into the intervention, which included a menu of services as follows: pill reminders, health tips, adherence feedback, appointment reminders, and symptom reporting. During the pilot phase, technical issues in the interactive voice response system (IVRS) were identified and addressed. Patients who participated in the pilot phase expressed a preference for SMS text messaging over the IVRS. Patients responded positively to the appointment reminders and health tips, whereas patient feedback on daily and weekly pill reminders and adherence feedback was mixed. Conclusions: The mobile phone-based SMS text messaging and IVRS intervention was acceptable to men who have sex with men in Manila, the Philippines, and qualitative analysis suggested that the intervention helped promote ART adherence and appointment attendance.

Volume: 28

Issue: 3

Pages: 339-345

Date: Jun

Short Title: A mixed-methods study of the causes and impact of poor teamwork between junior doctors and nurses

ISSN: 1353-4505

DOI: 10.1093/intqhc/mzw036

Accession Number: WOS:000380250300013

Abstract: Objectives: This study aimed to collect and analyse examples of poor teamwork between junior doctors and nurses;

identify the teamwork failures contributing to poor team function; and ascertain if particular teamwork failures are associated with higher levels of risk to patients. Design: Critical Incident Technique interviews were carried out with junior doctors and nurses. Setting: Two teaching hospitals in the Republic of Ireland. Participants: Junior doctors (n = 28) and nurses (n = 8) provided descriptions of scenarios of poor teamwork. The interviews were coded against a theoretical framework of healthcare team function by three psychologists and were also rated for risk to patients by four doctors and three nurses. Results: A total of 33 of the scenarios met the inclusion criteria for analysis. A total of 63.6% (21/33) of the scenarios were attributed to 'poor quality of collaboration', 42.4% (14/33) to 'poor leadership' and 48.5% (16/33) to a 'lack of coordination'. A total of 16 scenarios were classified as high risk and 17 scenarios were classified as medium risk. Significantly more of the high-risk scenarios were associated with a 'lack of a shared mental model' (62.5%, 10/16) and 'poor communication' (50.0%, 8/16) than the medium-risk scenarios (17.6%, 3/17 and 11.8%, 2/17, respectively). Conclusion: Poor teamwork between junior doctors and nurses is common and places patients at considerable risk. Addressing this problem requires a well-designed complex intervention to develop the team skills of doctors and nurses and foster a clinical environment in which teamwork is supported. ISSN: 0197-5897

DOI: 10.1057/s41271-016-0061-9

Accession Number: WOS:000402299700004

Abstract: Drawing on the long tradition of evidence-based medicine that aims to improve the efficiency and effectiveness of clinical practice, the field of public health has sought to apply

'hierarchies of evidence' to appraise and synthesise public health research. Various critiques of this approach led to the development of synthesis methods that include broader evidence typologies and more 'fit for purpose' privileging of methodological designs. While such adaptations offer great utility for evidence-informed public health policy and practice, this paper offers an alternative perspective on the synthesis of evidence that necessitates a yet more egalitarian approach. Dynamic simulation modelling is increasingly recognised as a valuable evidence synthesis tool to inform public health policy and programme planning for complex problems. The development of simulation models draws on and privileges a wide range of evidence typologies, thus challenging the traditional use of 'hierarchies of evidence' to support decisions on complex dynamic problems.

Short Title: 'They only smoke in the house when I'm not in': understanding the limited effectiveness of a smoke-free homes intervention

ISSN: 1741-3842

DOI: 10.1093/pubmed/fdaa042

Accession Number: WOS:000728251900085

Abstract: Background Children's second-hand smoke (SHS) exposure in the home is highest in socio-economically disadvantaged areas. Personalized household air-quality measurements can promote changes in smoking that reduce SHS exposure. The 'First Steps 2 Smoke-free' (FS2SF) intervention is the first to trial this approach delivered as part of health professionals' routine work. This paper reports the findings of qualitative interviews with participants that explored their experiences of the intervention and why outcomes varied. Methods 120 women were recruited from the NHS First Steps Programme, which supports disadvantaged mothers. They received either personalized feedback on their home air quality and advice on reducing SHS or standard SHS advice. Qualitative interviews with 15 mothers were analyzed thematically using the Capability,

Opportunity, Motivation, Behaviour (COM-B) model. Results The intervention increased women's capability to change home-smoking behaviour, through increasing awareness and salience of SHS risks to their children, and motivation to act. However, taking effective action was constrained by their limited social and environmental opportunities, including others' smoking in the home. Conclusions The FS2SF intervention was ineffective as it was unable to fully address the precarious, complex life circumstances that make creating a smoke-free home particularly difficult for women experiencing intersecting dimensions of disadvantage.

Short Title: What Helps and What Hinders the Creation of a Smoke-free Home: A Qualitative Study of Fathers in Scotland

ISSN: 1462-2203

DOI: 10.1093/ntr/ntab228

Accession Number: WOS:000762440400011

Abstract: Introduction Few studies have explored fathers' views and experiences of creating a smoke-free home, with interventions largely targeting mothers. This study aimed to identify barriers and facilitators to fathers creating a smoke-free home, to inform future intervention development. Methods Eighteen fathers who were smokers and lived in Scotland were recruited from Dads' community groups, Early Years Centres and through social media advertising. Semi-structured interviews explored their views and experiences of creating a smoke-free home. A theory-informed thematic analysis using the COM-B model highlighted ways in which capability, opportunity, and motivations shaped fathers' home smoking behaviors. Results Several fathers understood the health risks of second-hand smoke exposure through public health messaging associated with recent smoke-free legislation prohibiting smoking in cars carrying children. Limited understanding of effective exposure reduction strategies and personal mental health challenges reduced some fathers' ability to create a smoke-free home. Fathers were keen to maintain their smoke-free home rules, and their motivations for this largely centered on their perceived role as protector of their children, and their desire to be a good role model. Conclusions

Fathers' abilities to create a smoke-free home are shaped by a range of capabilities, opportunities, and motivations, some of which relate to their role as a father. Establishing a fuller understanding of the contextual and gender-specific factors that shape fathers' views on smoking in the home will facilitate the development of interventions and initiatives that fathers can identify and engage with, for the broader benefit of families and to improve gender equity and health. Implications Our findings can inform future development of father-centered and household-level smoke-free home interventions. They identify fathers' views and experiences and help reframe smoking in the home as a gendered family-wide issue, which is important in building consensus on how best to support parents to create a smoke-free home. Our findings highlight the need for additional research to develop understanding of the ways in which gender-related aspects of family structures, heterosexual relationships, and child living arrangements influence home smoking rules and how to tailor interventions accordingly.

Accession Number: WOS:000828326000013

Abstract: Objectives Managing multiple medicines can be challenging for patients with multimorbidity, who are at high risk of adverse outcomes, for example, hospitalisation. Patient-held medication lists (PHMLs) can contribute to patient safety and potentially reduce medication errors. The aims of this study are to investigate attitudes towards and use of PHMLs among healthcare professionals (HCPs), patients and carers. Design Qualitative study based on 39 semistructured telephone interviews. Setting Primary and secondary care settings in Ireland. Participants Twenty-one HCPs and 18 people

taking medicines and caregivers. Methods Telephone interviews were conducted with HCPs, people taking multiple medicines (5+ medicines) and carers of people taking medicines who were purposively sampled via social media, patient groups and research collaborators. Interviews were transcribed and thematically analysed based on the Framework approach, with the Consolidated Framework for Implementation Research and Theoretical Domains Framework. Results Three core themes emerged: (1) attitudes to PHML, (2) function and preferred features of PHML and (3) barriers and facilitators to future use of PHML. All participating (patients/carers and HCP) groups considered PHML beneficial for patients and HCPs (eg, empowering for patients and improved adherence). While PHML were used in a variety of situations such as emergencies, concerns about their accuracy were shared across all groups. HCPs and patients differed on the level of detail that should be included in PHML. HCPs' time constraints, patients' multiple medicines and cognitive impairments were reported barriers. Key facilitators included access to digital/compact lists and promotion of lists by appropriate HCPs. Conclusions Our findings provide insight into the factors that influence use of PHML. Lists were used in a variety of settings, but there were concerns about their accuracy. A range of list formats and encouragement from key HCPs could increase the use of PHML. Short Title: Advancing understanding of influences on cervical screening (non)-participation among younger and older women: A qualitative study using the theoretical domains framework and the COM-B model

ISSN: 1369-6513

DOI: 10.1111/hex.13346

Accession Number: WOS:000692019800001

Abstract: Background Effective screening can prevent cervical cancer, but many women choose not to attend their screening tests. Objective This study aimed to investigate behavioural influences on cervical screening participation using the Theoretical Domains Framework (TDF) and COM-B models of behaviour change. Design A

qualitative study and semistructured phone interviews were conducted with women invited for routine screening tests within the national cervical screening programme in Ireland. Setting and Participants Forty-eight women aged 25–65 years were recruited from the national screening register. Results Seven core themes were identified that mapped to three COM–B components and 11 TDF domains: (1) knowledge of cervical cancer and screening, (2) coping with smear tests, (3) competing motivational processes—automatic and reflective, (4) cognitive resources, (5) role of social support, (6) environmental influences and (7) perceptual and practical influences. A range of knowledge about screening, perceived risk of cervical cancer and human papillomavirus infection was evident. Factors that influenced screening behaviours may be hierarchical—some were assigned greater importance than others. Positive screening behaviours were linked to autonomous motivation. Deficits in physical and psychological capability (inadequate coping skills) were barriers to screening, while physical and social opportunity (e.g. healthcare professional 'champions') could facilitate participation. Older women raised age-related issues (e.g. screening no longer necessary) and had more negative attitudes to screening, while younger women identified practical barriers. Conclusions This study provides insight into screening participation and will aid development of theoretically informed interventions to increase uptake. Patient or Public Contribution Women invited for screening tests through the national screening programme were interviewed. A Public & Patient Involvement (PPI) Panel, established to provide input into all CERVIVA research projects, advised the research team on recruitment materials and were given the opportunity to review and comment on the interview topic guide. This panel is made up of six women with various cervical screening histories and experiences.

Title: Retention in RCTs of physical rehabilitation for adults with frailty: a systematic review and meta-analysis

Journal: Trials

Volume: 23

Issue: 1

Date: Mar

Short Title: Retention in RCTs of physical rehabilitation for adults with frailty: a systematic review and meta-analysis

DOI: 10.1186/s13063-022-06172-5

Article Number: 235

Accession Number: WOS:000773953100007

Abstract: Background Physical rehabilitation (PR) interventions can improve physical function for adults with frailty; however, participant retention rates in randomized controlled trials (RCTs) are unknown. Objective is to summarize participant retention rates in RCTs of PR for adults with frailty. Design is a systematic review and meta-analysis (DOI:10.17605/OSF.IO/G6XR2). Participants are adults ≥ 18 years with frailty. Setting consists of inpatient, outpatient and community-based interventions. Intervention includes any PR intervention. Methods We searched 7 electronic databases from inception to April 15, 2020 for published RCTs. Our primary outcome was participant retention rate to primary outcome measurement. Secondary outcomes included retention by study group, participant retention to intervention completion, reported reasons for attrition and reported strategies for maximizing retention. We completed screening, data extraction and risk of bias (ROB) assessments independently and in duplicate. We conducted a meta-analysis, calculating retention rates and 95% confidence intervals (CIs) using fixed or random-effects models, as appropriate. Results We included 21 RCTs, enrolling 1685 adults with frailty (median age 82.5 years (79.0, 82.2), 59.8% female (57.5, 69.8)). Twenty RCTs reported retention data, of which 90.0% (n = 18) had high ROB. The pooled participant retention rate to primary outcome measurement was 85.0% [95%CI (80.0, 90.0), I² = 83.9%, p < 0.05]. There were no differences by group for retention to the primary outcome [intervention 87.0% (83.0, 91.0), p < 0.05, comparator 85.0% (79.0, 90.0), p < 0.05] or in retention to intervention completion [83.0% (95.0% CI (78.0-87.0), p < 0.05]. Of the 18 studies reporting 24 reasons for attrition, 51.3% were categorized as potentially modifiable by the research team (e.g. low motivation). Only 20.0% (n = 4) of studies reported strategies for maximizing retention. Conclusions In this review of 21 RCTs of PR, we identified acceptable rates of retention for adults with frailty. High retention in PR interventions appears to be feasible in this population; however, our results are limited by a high ROB and heterogeneity.

ISSN: 0742-3071

DOI: 10.1111/dme.13276

Accession Number: WOS:000401334700004

Abstract: Background Many young adults with Type 1 diabetes experience poor outcomes. The aim of this systematic review was to synthesize the evidence regarding the effectiveness of interventions aimed at improving clinical, behavioural or psychosocial outcomes for young adults with Type 1 diabetes. Methods Electronic databases were searched. Any intervention studies related to education, support, behaviour change or health service organizational change for young adults aged between 15-30 years with Type 1 diabetes were included. A narrative synthesis of all studies was undertaken due to the large degree of heterogeneity between studies. Results Eighteen studies (of a possible 1700) were selected and categorized: Health Services Delivery (n = 4), Group Education and Peer Support (n = 6), Digital Platforms (n = 4) and Diabetes Devices (n = 4). Study designs included one randomized controlled trial, three retrospective studies, seven feasibility/acceptability studies and eight studies with a pre/post design. Continuity, support, education and tailoring of interventions to young adults were the most common themes across studies. HbA(1c) was the most frequently measured outcome, but only 5 of 12 studies that measured it showed a significant improvement. Conclusion Based on the heterogeneity among the studies, the effectiveness of interventions on clinical, behavioural and psychosocial outcomes among young adults is inconclusive. This review has highlighted a lack of high-quality, well-designed interventions, aimed at improving health outcomes for young adults with Type 1 diabetes.

Title: Exploring the Usability of a Mobile App for Adolescent Obesity Management

Journal: Jmir Mhealth and Uhealth

Volume: 2

Issue: 2

Date: Apr-Jun

Short Title: Exploring the Usability of a Mobile App for Adolescent Obesity Management

ISSN: 2291-5222

DOI: 10.2196/mhealth.3262

Article Number: e29

Accession Number: WOS:000209895000006

Abstract: Background: Obesity is a global epidemic. Behavioral change approaches towards improving nutrition, increasing physical activity level, improving sleep, and reducing sitting time are recommended as best practices in adolescent obesity management. However, access to evidence-based treatment is limited and portable technologies such as mobile apps may provide a useful platform to deliver such lifestyle interventions. No evidence-based validated app exists for obesity intervention; therefore, a novel mobile app (Reactivate) was developed for use in the Temple Street W82G0 Healthy Lifestyles Program (W82G0). **Objective:** This study aimed to test the usability (technical effectiveness, efficiency, and user satisfaction) of the Reactivate mobile app in obese adolescents. **Methods:** Ten adolescents (7 males and 3 females, aged 12-17 years) who had been treated for obesity (> 98th percentile for body mass index) at the Temple Street Children's University Hospital were recruited. Participants were given 8 tasks to complete in order to test the technical effectiveness of the app. A research assistant timed the user while completing each task in order to test the relative user efficiency of the app (time-on-task). The tasks fell into 5 categories and required the user to enter personal settings, find and answer surveys, create a message, use the goal setting feature, and enter details regarding their weight and height. In exploration of user satisfaction, each participant completed the standardized software usability measurement inventory (SUMI), which measures 5 aspects of user satisfaction: efficiency, effect, helpfulness, controllability, and learnability. Descriptive statistics were used to explore the mean relative user efficiency and SUMI scores. **Results:** Mean age was 14.26 (SD 1.58) years. All adolescents completed each of the tasks successfully. The mean relative user efficiency scores were two to three times that of an expert user. Users responded that they would use Reactivate to monitor their growth over time, for motivation, and for goal setting. All users described Reactivate as an important mobile app. **Conclusions:** Our study describes the usability of a mobile app used in adolescent obesity management. Adolescents found Reactivate easy to use and their SUMI results indicated that the app scored high on user satisfaction. Usability testing is an important step towards refining the development of the Reactivate app, which can be used in the treatment of obesity. The study on the clinical efficacy of the Reactivate app is currently underway.

Short Title: Exploring Successful Breastfeeding Behaviors Among Women Who Have High Body Mass Indices

ISSN: 0890-3344

DOI: 10.1177/08903344221102839

Article Number: 08903344221102839

Accession Number: WOS:000813558300001

Abstract: Background: Women with high body mass indices are at risk of lower breastfeeding rates but the drivers of successful breastfeeding in this population are unclear. Research Aim: We aimed to (a) explore the barriers and enablers to breastfeeding among women with high body mass indices and (b) map specific behaviors suitable for intervention across the antenatal to postpartum periods. Methods: This was a prospective, cross-sectional qualitative study. We conducted semi-structured interviews with women with high body mass indices who successfully breastfed for 6 months or more (n =20), partners (n = 22), and healthcare professionals (n =19) in Ireland during 2018. Interviews were audio recorded, and transcribed verbatim. Data were inductively coded using reflexive thematic analysis and deductively mapped within the Capability, Opportunity, Motivation-Behavior model. Results: The three themes developed were knowledge, support, and self-efficacy. Knowledge supported a participant's psychological and physical capability to engage in breastfeeding. Support was related to the social and physical opportunity to enable performance of breastfeeding behaviors. Self-efficacy influenced reflective and automatic motivation to perform breastfeeding behaviors. A multifactorial intervention design is needed to support successful breastfeeding. Conclusion: The barriers and enablers identified for participants with high body mass indices were similar to those for the broader population; however, the physicality and associated social bias of high body mass indices mean that additional support is warranted. Antenatal and postpartum breastfeeding services need a multifaceted, inclusive, and high-quality program to provide the necessary support to women with higher body mass indices.

Short Title: Women's engagement with diabetes prevention activities and the influence of contact by the Australian national gestational diabetes register

ISSN: 2047-2897

Accession Number: WOS:000657090200003

Abstract: Gestational diabetes increases a woman's risk of developing type 2 diabetes. In 2011, Australia started the first National Gestational Diabetes Register (NGDR). The register aims to improve risk awareness, promote diabetes prevention, and encourage regular diabetes screening. This study aimed to identify postnatal diabetes prevention activity and the association of NGDR awareness with that activity in a nationally representative sample of Australian women after a pregnancy with gestational diabetes. An anonymous, cross-sectional, online survey of women previously diagnosed with gestational diabetes and aged 18 years or over was run from June to November 2014. Of 8860 women invited from a stratified NGDR sample, 966 participated (response rate 13%). Postnatal screening rate was 73%. Only 47% of respondents reported receiving NGDR information postnatally. Log-binomial regression demonstrated an association with women reporting receiving NGDR information and being at intermediate risk of developing type 2 diabetes (relative ratio [RR] 1.307, 95% CI 1.030, 1.660) and at higher disadvantage (RR 1.501, 95% CI 1.080, 2.080). Postnatal screening rates, total diabetes risk perception and lifestyle risk factors were not significantly different between those recalling or not recalling receiving NGDR information. The reach and impact of NGDR information alone are limited. Women's engagement with the NGDR was not associated with better lifestyle, greater postnatal screening or higher risk perception. System-level integration is needed for improved NGDR functioning and further improvements should yield enhanced diabetes prevention efforts when primary care ties are strengthened. Title: Written information for patients (or parents of child patients) to reduce the use of antibiotics for acute upper respiratory tract infections in primary care

Journal: Cochrane Database of Systematic Reviews

Issue: 11

Short Title: Written information for patients (or parents of child patients) to reduce the use of antibiotics for acute upper respiratory tract infections in primary care

ISSN: 1469-493X

DOI: 10.1002/14651858.CD011360.pub2

Article Number: Cd011360

Accession Number: WOS:000389600300026

Abstract: Background Acute upper respiratory tract infections (URTIs) are frequently managed in primary care settings. Although many are viral, and there is an increasing problem with antibiotic resistance, antibiotics continue to be prescribed for URTIs. Written patient information may be a simple way to reduce antibiotic use for acute URTIs. Objectives To assess if written information for patients (or parents of child patients) reduces the use of antibiotics for acute URTIs in primary care. Search methods We searched CENTRAL, MEDLINE, Embase, CINAHL, LILACS, Web of Science, clinical trials.gov, and the World Health Organization (WHO) trials registry up to July 2016 without language or publication restrictions. Selection criteria We included randomised controlled trials (RCTs) involving patients (or parents of child patients) with acute URTIs, that compared written patient information delivered immediately before or during prescribing, with no information. RCTs needed to have measured our primary outcome (antibiotic use) to be included. Data collection and analysis Two review authors screened studies, extracted data, and assessed study quality. We could not meta-analyse included studies due to significant methodological and statistical heterogeneity; we summarised the data narratively. Main results Two RCTs met our inclusion criteria, involving a total of 827 participants. Both studies only recruited children with acute URTIs (adults were not involved in either study): 558 children from 61 general practices in England and Wales; and 269 primary care doctors who provided data on 33,792 patient-doctor consultations in Kentucky, USA. The UK study had a high risk of bias due to lack of blinding and the US cluster-randomised study had a high risk of bias because the methods to allocate participants to treatment groups was not clear, and there was evidence of baseline imbalance. In both studies, clinicians provided written information to parents of child patients during primary care consultations: one trained general practitioners (GPs) to discuss an eight-page booklet with parents; the other conducted a factorial trial with two comparison groups (written information compared to usual care and written information

plus prescribing feedback to clinicians compared to prescribing feedback alone). Doctors in the written information arms received 25 copies of two-page government-sponsored pamphlets to distribute to parents. Compared to usual care, we found moderate quality evidence (one study) that written information significantly reduced the number of antibiotics used by patients (RR 0.53, 95% CI 0.35 to 0.80; absolute risk reduction (ARR) 20% (22% versus 42%)) and had no significant effect on reconsultation rates (RR 0.79, 95% CI 0.47 to 1.32), or parent satisfaction with consultation (RR 0.95, 95% CI 0.87 to 1.03). Low quality evidence (two studies) demonstrated that written information also reduced antibiotics prescribed by clinicians (RR 0.47, 95% CI 0.28 to 0.78; ARR 21% (20% versus 41%); and RR 0.84, 95% CI 0.81 to 0.86; 9% ARR (45% versus 54%)). Neither study measured resolution of symptoms, patient knowledge about antibiotics for acute URTIs, or complications for this comparison. Compared to prescribing feedback, we found low quality evidence that written information plus prescribing feedback significantly increased the number of antibiotics prescribed by clinicians (RR 1.13, 95% CI 1.09 to 1.17; absolute risk increase 6% (50% versus 44%)). Neither study measured reconsultation rate, resolution of symptoms, patient knowledge about antibiotics for acute URTIs, patient satisfaction with consultation or complications for this comparison. Authors' conclusions Compared to usual care, moderate quality evidence from one study showed that trained GPs providing written information to parents of children with acute URTIs in primary care can reduce the number of antibiotics used by patients without any negative impact on reconsultation rates or parental satisfaction with consultation. Low quality evidence from two studies shows that, compared to usual care, GPs prescribe fewer antibiotics for acute URTIs but prescribe more antibiotics when written information is provided alongside prescribing feedback (compared to prescribing feedback alone). There was no evidence addressing resolution of patients' symptoms, patient knowledge about antibiotics for acute URTIs, or frequency of complications. To fill evidence gaps, future studies should consider testing written information on antibiotic use for adults with acute URTIs in high and low-income settings provided without clinician training and presented in different formats (such as electronic). Future study designs should endeavour to ensure blinded outcome assessors. Study aims should include measurement of the effect of written information on the number of antibiotics used by patients and prescribed by clinicians, patient satisfaction, reconsultation, patients' knowledge about antibiotics, resolution of symptoms, and complications.

Abstract: Background: Delirium is commonly detected in older people after hip fracture. Delirium is considered to be a multifactorial disorder that is often seen post-operatively (incidence ranging from 35% to 65%). Hospitals in Australia are required to meet eight standards including the comprehensive care standard to be able to maintain their accreditation. The standard includes actions related to falls, pressure injuries, nutrition, mental health, cognitive impairment and end-of-life care. Delirium prevention was identified as an area for improvement in our Orthopaedic unit in a Level 1 University Trauma Centre in Australia. This implementation research project aimed to understand the efficacy of a delirium prevention intervention within an existing orthopaedic speciality care system. Objective: Implementation of the tailored intervention will increase adherence to National Safety and Quality Health Service Standards, thereby reducing rate of delirium. Methods: In this study, we used an interrupted time series design to examine changes in practice over time in people admitted to hospital with a hip fracture. Clinical staff caring for patients with hip fracture in an acute care setting in Adelaide, South Australia, participated in the project. In brief, intervention included education, environmental restructuring, change champions, infographics and audit feedback reports. The primary outcome of interest was rate of delirium. The secondary outcome was compliance with the use of delirium 4AT screening tool, duration of delirium and hospital length of stay. Results: The rate of change per month in patients with delirium decreased significantly by 19.2%. There was no significant change observed in trend for duration of delirium and length of hospital stay between pre-intervention and post-intervention phases. A significant increase in the use of screening tool was observed from 4.7% in the pre-intervention phase to 33.6% in the post-intervention phase. Conclusion: Translation of evidence-based intervention model incorporating well-considered implementation strategies had a mixed impact on decreasing the rate of delirium. The scheduled hospital accreditation enhanced the use of validated screening tool to recognize delirium. This project highlights the importance of aligning implementation goals with the wider goals of the

organization as well as making clinicians accountable by consistent auditing.

Short Title: Using implementation mapping to develop strategies for
preventing non-communicable diseases in Japanese small- and medium-
sized enterprises

DOI: 10.3389/fpubh.2022.873769

Article Number: 873769

Accession Number: WOS:000872959200001

Abstract: Introduction Workplace programs to prevent non-communicable
diseases (NCDs) in the workplace can help prevent the incidence of
chronic diseases among employees, provide health benefits, and
reduce the risk of financial loss. Nevertheless, these programs are
not fully implemented, particularly in small- and medium-sized
enterprises (SMEs). The purpose of this study was to develop
implementation strategies for health promotion activities to prevent
NCDs in Japanese SMEs using Implementation Mapping (IM) to present
the process in a systematic, transparent, and replicable manner.

Methods Qualitative methods using interviews and focus group
discussions with 15 SMEs and 20 public health nurses were conducted
in a previous study. This study applied the Consolidated Framework
for Implementation Research and IM to analyze this dataset to
develop implementation strategies suitable for SMEs in Japan.

Results In task 2 of the IM, we identified performance objectives,
determinants, and change objectives for each implementation stage:
adoption, implementation, and maintenance; to identify the required
actors and actions necessary to enhance implementation
effectiveness. Twenty-two performance objectives were identified in
each implementation stage. In task 3 of the IM, the planning group
matched behavioral change methods (e.g., modeling and setting of
graded tasks, framing, self-re-evaluation, and environmental re-
evaluation) with determinants to address the performance objectives.
We used a consolidated framework for implementation research to
select the optimal behavioral change technique for performance
objectives and determinants and designed a practical application.

The planning team agreed on the inclusion of sixteen strategies from the final strategies list compiled and presented to it for consensus, for the overall implementation plan design.

This paper provides the implementation strategies for NCDs prevention for SMEs in Japan following an IM protocol. Although the identified implementation strategies might not be generalizable to all SMEs planning implementation of health promotion activities, because they were tailored to contextual factors identified in a formative research. However, identified performance objectives and implementation strategies can help direct the next steps in launching preventive programs against NCDs in SMEs.

Title: The smoke-free home study: study protocol for a cluster randomized controlled trial of a smoke-free home intervention in permanent supportive housing

Journal: BMC Public Health

Volume: 22

Issue: 1

Date: Nov

Short Title: The smoke-free home study: study protocol for a cluster randomized controlled trial of a smoke-free home intervention in permanent supportive housing

DOI: 10.1186/s12889-022-14423-y

Article Number: 2076

Accession Number: WOS:000883402200005

Abstract: Background Formerly chronically homeless adults who live in permanent supportive housing (PSH) have high prevalence of smoking. It is uncommon to find smoke-free policies in PSH because of the concern that such policies contradict PSH's harm reduction framework and could increase homelessness should residents lose their housing because of the policy. However, in the absence of such policies, non-smoking PSH residents face the harmful effects of secondhand smoke exposure while residents who smoke see increased risks from high rates of smoking throughout their residence. Our pilot work highlighted the feasibility and acceptability of an intervention designed to promote voluntary adoption of a smoke-free home. Here we report a protocol for a cluster randomized controlled trial of the smoke-free home intervention for formerly chronically homeless residents in PSH. Methods The smoke-free home intervention provides face-to-face counseling and instruction to PSH residents on how to adopt a smoke-free home and offers training for PSH staff on how to refer residents to tobacco cessation services. We will

randomize 20 PSH sites in the San Francisco Bay Area to either the intervention or wait-list control arms. We will enroll 400 PSH residents who smoke cigarettes in their housing unit and 120 PSH staff who work at the sites. At baseline, three- and six-months follow-up, we will ask residents to report their tobacco use and cessation behaviors and adoption of smoke-free homes. We will ask staff to answer questions on their knowledge, attitudes, practices, and barriers related to supporting residents' smoking cessation. The primary outcome for PSH residents is adoption of smoke-free homes for 90 days or more at six-months follow-up, and the secondary outcome is point prevalence tobacco abstinence. The primary outcome for PSH staff is change in Smoking Knowledge Attitudes Practices survey score. Discussion Voluntary adoption of smoke-free homes is a promising approach for reducing exposure to secondhand smoke and reducing tobacco use among a population facing high rates of tobacco-related disease, and is aligned with PSH's harm reduction framework. Findings from this study have the potential to inform adoption of tobacco control policies among vulnerable populations most at risk for smoking-related harms.

Title: Definition and improvement of the concept and tools of a psychosocial intervention program for parents in pediatric oncology: a mixed-methods feasibility study conducted with parents and healthcare professionals

Journal: Pilot and Feasibility Studies

Volume: 5

Issue: 1

Date: Feb

Short Title: Definition and improvement of the concept and tools of a psychosocial intervention program for parents in pediatric oncology: a mixed-methods feasibility study conducted with parents and healthcare professionals

DOI: 10.1186/s40814-019-0407-8

Article Number: 20

Accession Number: WOS:000704684500001

Abstract: Background Studies have shown that supporting parents in pediatric oncology reduces family distress following a cancer diagnosis. Manualized programs for parents have therefore been developed to reduce family distress. However, these programs have limitations that need to be improved, such as better defining programs' procedures, developing interventions focusing on parents' conjugal relationship, conducting rigorous evaluations of implementation, and proposing adaptations to various cultural

dimensions. According to the Obesity-Related Behavioral Intervention Trials (ORBIT) model for the development of behavioral intervention, we improved these limitations and developed TAKING BACK CONTROL TOGETHER, a six in-person intervention sessions to support parents of children with cancer by taking the active components of two programs: Bright IDEAS and SCCIP. Referring to the redesign phase of the ORBIT model, this study aims to refine the definition of this program's design by interviewing parents and healthcare professionals. Methods In order to refine the program, we used a sequential mixed-methods study. Parents and healthcare professionals first completed questionnaires assessing the program, and then discussed its limitations, benefits, and areas for improvement in group and/or individual interviews. We performed a descriptive thematic content analysis of the qualitative data from the open-ended questions (questionnaires and interviews) with NVivo 11 to categorize recommendations for the program refinement. Results The results showed that components seemed pertinent to final users. The main areas needing improvement were the level of complexity and understandability of the parent manual, the possibility to choose the place and time of the intervention, and the lack of ethnic/cultural diversity. Changes to the program were made accordingly. Conclusions It is necessary to include end-users when developing complex intervention programs designed for vulnerable populations and sensitive clinical contexts. Following the present refinement, we now have a treatment package, which is safe and acceptable for the target population and has a better chance of yielding a clinically significant benefit for users in a future pilot study. Short Title: What preventive care do sedated children with caries referred to specialist services need?
ISSN: 0007-0610
DOI: 10.1038/sj.bdj.2016.951
Accession Number: WOS:000394356200019
Abstract: Introduction Few studies have assessed the preventive needs of children treated under conscious sedation or their parents'/guardians' views regarding oral health education. Aim To

report on the profile of children who required treatment under conscious sedation. Also to obtain the views of the parents or guardians of these children on their experiences of oral health preventive services and the support they would like in order to improve their child's oral health. Method A researcher-administered questionnaire was used to collect quantitative and qualitative responses from a consecutive sample of 123 parents/guardians during their child's sedation appointment at King's College Hospital. Results Caries was the main reason for the child's sedation treatment and 77.2% of them were high caries risk. Parents reported that their general dentist had given advice about sugar (80%) and tooth-brushing (74%), but few had prescribed fluoride varnish (15%), fissure sealants (12%) or a fluoride rinse (36%). Parents felt challenged by the ready availability of sugar, and others suggested difficulty in maintaining healthy oral habits in complex families. Overall, the majority of parents thought leaflets, health professionals' advice, and Internet websites could be informative, and they requested school- and hospital-based prevention programmes. Discussion The majority of children had high caries risk. They had received advice but not professional preventive treatment such as fluoride varnish and fissure sealants. Their parents requested preventive education using new technologies and media and better access through school-based and hospital prevention programmes. Notes: Ogretme, M. Sipahi AbualSaoud, D. Article Number: 1865

Accession Number: WOS:000864632000002

Abstract: Introduction Diarrhea is a leading cause of child morbidity and mortality worldwide and is linked to early childhood stunting. Food contamination from improper preparation and hygiene practices is an important transmission pathway for exposure to enteric pathogens. Understanding the barriers and facilitators to

hygienic food preparation can inform interventions to improve food hygiene. We explored food preparation and hygiene determinants including food-related handwashing habits, meal preparation, cooking practices, and food storage among caregivers of children under age two in Western Kenya. Methods We used the Capabilities, Opportunities, and Motivations model for Behavior Change (COM-B) framework in tool development and analysis. We conducted 24 focus group discussions with mothers (N = 12), fathers (N = 6), and grandmothers (N = 6); 29 key informant interviews with community stakeholders including implementing partners and religious and community leaders; and 24 household observations. We mapped the qualitative and observational data onto the COM-B framework to understand caregivers' facilitators and barriers to food preparation and hygiene practices. Results Facilitators and barriers to food hygiene and preparation practices were found across the COM-B domains. Caregivers had the capability to wash their hands at critical times; wash, cook, and cover food; and clean and dry utensils. Barriers to food hygiene and preparation practices included lack of psychological capability, for instance, caregivers' lack of knowledge of critical times for handwashing, lack of perceived importance of washing some foods before eating, and not knowing the risks of storing food for more than four hours without refrigerating and reheating. Other barriers were opportunity-related, including lack of resources (soap, water, firewood) and an enabling environment (monetary decision-making power, social support). Competing priorities, socio-cultural norms, religion, and time constraints due to work hindered the practice of optimal food hygiene and preparation behaviors. Conclusion Food hygiene is an underexplored, but potentially critical, behavior to mitigate fecal pathogen exposure for young children. Our study revealed several knowledge and opportunity barriers that could be integrated into interventions to enhance food hygiene.

Title: Front-Line Hospice Staff Perceptions of Barriers and Opportunities to Discussing Advance Care Planning With Hospice Patients and Their Families

Journal: Journal of the American Medical Directors Association

Volume: 23

Issue: 7

Pages: 1205-+

Date: Jul

Short Title: Front-Line Hospice Staff Perceptions of Barriers and Opportunities to Discussing Advance Care Planning With Hospice Patients and Their Families

ISSN: 1525-8610

DOI: 10.1016/j.jamda.2021.07.014

Accession Number: WOS:000840266400022

Abstract: Objectives: To understand the facilitators and barriers to hospice staff engagement of patients and surrogates in advance care planning (ACP) conversations. Design: Qualitative study conducted with purposive sampling and semistructured interviews using ATLAS.ti software to assist with template analysis. Settings and

Participants: Participants included 51 hospice professionals (31 clinicians, 13 leaders, and 7 quality improvement administrators) from 4 geographically distinct nonprofit US hospices serving more than 2700 people. Measures: Interview domains were derived from the implementation science framework of Capability, Opportunity, Motivation, and Behavior (COM-B), with additional questions soliciting recommendations for behavior change. Differences in themes were reconciled by consensus. The facilitator, barrier, and recommendation themes were organized within the COM-B framework.

Results: Capability was facilitated by interdisciplinary teamwork and specified clinical staff roles and inhibited by lack of self-perceived skill in engaging in ACP conversations. Opportunities for ACP occurred during admission to hospice, acute changes, or deterioration in patient condition. Opportunity-related environmental barriers included time constraints such as short patient stay in hospice and workload expectations that prevented clinicians from spending more time with patients and families. Motivation to discuss ACP was facilitated by the employee's goal of providing personalized, patient-centered care. Implicit assumptions about patient's and familie's preferences reduced staff's motivation to engage in ACP. Hospice staff made recommendations to improve ACP discussions, including training and modeling practice sessions, earlier introduction of ACP concepts by clinicians in prehospice settings, and increasing workforce diversity to reflect the patient populations the organizations want to reach and cultural competency.

Conclusions and Implications: Even hospice staff can be uncomfortable discussing death and dying. Yet staff were able to identify what worked well. Solutions to increase behavior of ACP engagement included staff training and modeling practice sessions, introducing ACP prior to hospice, and increasing workforce diversity to improve cultural competency. Title: Smoking, attitudes to smoking and provision of smoking cessation advice in two teaching hospitals in Ireland: do smoke-free policies matter?

Journal: Health Psychology and Behavioral Medicine

Volume: 3

Issue: 1

Pages: 142-153

Short Title: Smoking, attitudes to smoking and provision of smoking cessation advice in two teaching hospitals in Ireland: do smoke-free policies matter?

ISSN: 2164-2850

DOI: 10.1080/21642850.2015.1026347

Accession Number: WOS:000409568800014

Abstract: Brief cessation advice from health-care professionals in the hospital setting significantly increases the likelihood of patients quitting smoking, yet patients are not routinely provided with this advice. Smoke-free hospital policies aim to protect individuals from the adverse effects of smoking; however, it is unclear if such policies encourage systematic delivery of cessation advice by health-care professionals. The study's aim was to determine the prevalence of smoking and cessation advice received by in-patients in two teaching hospitals in Ireland which have implemented smoke-free hospital policies, and to examine patient attitudes towards smoking cessation. Change in smoking prevalence and delivery of smoking cessation advice prior to and post-policy implementation was also examined in one hospital. This study surveyed 466 in-patients across 2 hospital sites, over a 3-week and 5week period, respectively. Data were also compared to a survey completed prior to the implementation of the smoke-free policy in one of the hospital sites. Smoking prevalence was 17% in Beaumont Hospital and 28% in Connolly Hospital. Overall, nicotine dependence was low (Mean Fagerstrm Test for Nicotine Dependence = 4.21, +/- 2.9). Overall, 62% of smokers did not receive smoking cessation advice from a health professional, although 55% indicated a willingness to engage with this type of service. The before-and-after analysis of Beaumont Hospital showed a reduction in smoking prevalence (17% vs 21%) amongst hospital in-patients, and a 6% increase in reported cessation advice provided following the introduction of the hospital smoke-free policy. Smoke-free hospital policies play a role in decreasing the prevalence of in-patient smokers, but further intervention is needed to increase rates of cessation advice provided. Positive attitudes to smoking cessation, coupled with low average nicotine dependence, suggest that lowintensity interventions would be beneficial for most smokers. A systematic focus on provision of brief smoking cessation advice is needed in hospitals.

Short Title: Workplace Intervention for Reducing Sitting Time in Sedentary Workers: Protocol for a Pilot Study Using the Behavior Change Wheel

DOI: 10.3389/fpubh.2022.832374

Article Number: 832374

Accession Number: WOS:000787739100001

Abstract: The workplace is a major contributor to excessive sitting in office workers. There are a wide array of adverse effects of high volumes of sitting time, including an increased risk of type 2 diabetes and depression. Active workstations can be used in effective interventions to decrease workplace sitting. However, there are a lack of interventions that have been developed using a systematic process that is informed by participant needs and a framework for identifying the most appropriate content for the intervention. Applying these methods could increase adherence and potential effectiveness of the intervention. Therefore, the purpose of this pilot study is to examine the feasibility, acceptability, and efficacy of a tailored workplace intervention to reduce and break up sitting in office workers that has been developed using the Behavior Change Wheel and the APEASE (Acceptability, Practicability, Effectiveness/cost-effectiveness, Affordability, Safety/side-effects, Equity) criteria. This article reports the protocol for this study that is currently ongoing. Participants will be cluster-randomized (by offices) to control and intervention groups. The evaluation of the intervention includes determining feasibility by assessing participant recruitment, retention and data completion rates. Adherence to the intervention will be assessed based on daily sitting and standing time relative to guidelines provided to participants as part of the intervention. Outcome measures also include productivity measured using Ecological Momentary Assessment, absenteeism, presenteeism, cardiometabolic risk markers, and wellbeing. The findings of this study will inform the effective design and implementation of interventions for reducing and breaking up sitting in office workers.

Article Number: e051983

Accession Number: WOS:000692198100012

Abstract: Objectives This study assessed antimicrobial stewardship (AMS) and infection prevention (IP) interventions targeting healthcare-associated *Clostridioides difficile* and carbapenem-resistant *Klebsiella pneumoniae* (CRKP) infections, their key outcomes and the application of behaviour change principles in these interventions. Design This scoping review was conducted in accordance with Preferred Reporting Items for Systematic Reviews and Meta-analysis Extension for Scoping Reviews (PRISMA-ScR) guidelines while focusing on acute healthcare settings in both low-to-middle income and high-income countries. Data sources The databases searched were MEDLINE, PubMed, Web of Science and CINAHL between 22 April 2020 and 30 September 2020. Eligibility The review included peer-reviewed articles published in English language between 2010 and 2019. Studies that focussed on IP and/or AMS interventions primarily targeting *C. difficile* or CRKP were included. Studies that assessed effectiveness of diagnostic devices or treatment options were excluded from this review. Data extraction and synthesis An abstraction sheet calibrated for this study was used to extract data on the main study characteristics including the population, intervention and outcomes of interest (antimicrobial use, compliance with IP interventions and risk for *C. difficile* and CRKP). A narrative synthesis of the results is provided. Results The review included 34 studies. Analysis indicates that interventions targeting *C. difficile* and CRKP include Education, Surveillance/Screening, Consultations, Audits, Policies and Protocols, Environmental measures, Bundles, Isolation as well as Notifications or alerts (represented using the ESCAPE-BIN acronym). The identified outcomes include antimicrobial use, resistance rates, risk reduction, adherence to contact precautions, hospital stay and time savings. AMS and IP interventions tend to be more adhoc with limited application of behaviour change principles. Conclusion This scoping review identified the AMS and IP interventions targeting *C. difficile* and CRKP in healthcare settings and described their key outcomes. The application of behaviour change principles in AMS and IP interventions appears to be limited.

Title: Barriers and facilitators of implementing proactive
deprescribing within primary care: a systematic review

Journal: International Journal of Pharmacy Practice

Volume: 31

Issue: 2

Pages: 126-152

Date: Apr

Short Title: Barriers and facilitators of implementing proactive
deprescribing within primary care: a systematic review

ISSN: 0961-7671

DOI: 10.1093/ijpp/riad001

Accession Number: WOS:000941921700001

Abstract: Objective Proactive deprescribing – identifying and discontinuing medicines where harms outweigh benefits – can minimise problematic polypharmacy, but has yet to be implemented into routine practice. Normalisation process theory (NPT) can provide a theory-informed understanding of the evidence base on what impedes or facilitates the normalisation of routine and safe deprescribing in primary care. This study systematically reviews the literature to identify barriers and facilitators to implementing routine safe deprescribing in primary care and their effect on normalisation potential using NPT. PubMed, MEDLINE, Embase, Web of Science, International Pharmaceutical Abstracts, CINAHL, PsycINFO and The Cochrane Library were searched (1996-2022). Studies of any design investigating the implementation of deprescribing in primary care were included. The Mixed Methods Appraisal Tool and the Quality Improvement Minimum Quality Criteria Set were used to appraise quality. Barriers and facilitators from included studies were extracted and mapped to the constructs of NPT. Key findings A total of 12,027 articles were identified, 56 articles included. In total, 178 barriers and 178 facilitators were extracted and condensed into 14 barriers and 16 facilitators. Common barriers were negative deprescribing perceptions and suboptimal deprescribing environments, while common facilitators were structured education and training on proactive deprescribing and utilising patient-centred approaches. Very few barriers and facilitators were associated with reflexive monitoring, highlighting a paucity of evidence on how deprescribing interventions are appraised. Through NPT, multiple barriers and facilitators were identified that impede or facilitate the implementation and normalisation of deprescribing in primary care. However, more research is needed into the appraisal of deprescribing post-implementation.

Short Title: Adverse Events and Their Contributors Among Older Adults During Skilled Nursing Stays for Rehabilitation: A Scoping Review

ISSN: 1179-271X

DOI: 10.2147/prom.S336784

Accession Number: WOS:000719456400001

Abstract: Purpose: To identify factors that contribute to adverse events among older adults during short stays at skilled nursing facilities (SNFs) for rehabilitation (ie, up to 100 resident days). Adults aged 65 years and older are at serious risk for adverse events throughout their continuum of care. Over 33% of older adults admitted to SNFs experienced an adverse event (eg, falls) within the first 35 days of their stay. Design: A scoping review. Setting and Participants: Older adults admitted for short stays in SNFs. Methods: Eligibility criteria were peer-reviewed original articles published between 1 January 2015 and 30 May 2021, written in English, and containing any of the following key terms and synonyms: "skilled nursing facilities", "adverse events", and "older adults". These terms were searched in PubMed, MEDLINE, CINAHL, EBSCOHost, and the ProQuest Nursing and Allied Health Database. We summarized the findings using the Joanna Briggs Institute and PRISMA-ScR reporting guidelines. We also used the Capability-Opportunity-Motivation-Behavior (COM-B) model of health behavioral change as a framework to guide the content, thematic, and descriptive analyses of the results. Results: Eleven articles were included in this scoping review. Intrinsic and extrinsic contributors to adverse events (ie, falls, medication errors, pressure ulcers, and acute infections) varied for each COM-B domain. The most frequently mentioned capacity-related intrinsic contributors to adverse events were frailty and reduced muscle strength due to advancing age. Inappropriate medication usage and polypharmacy were the most common capacity-related extrinsic factors. Opportunity-related extrinsic factors contributing to adverse events included environmental hazards, poor communication among SNF staff, lack of individualized resident safety plans, and overall poor care quality owing to racial bias and organizational and administrative issues. Conclusion: These findings shed light on areas that warrant further research and may aid in developing interventional strategies for adverse events during short SNF stays.

Title: Towards sustainable energy culture in the industrial sector: introducing an interdisciplinary method for understanding energy culture in business industries

Journal: Energy Sustainability and Society

Volume: 11

Issue: 1

Date: Aug

Short Title: Towards sustainable energy culture in the industrial sector: introducing an interdisciplinary method for understanding energy culture in business industries

ISSN: 2192-0567

DOI: 10.1186/s13705-021-00303-7

Article Number: 28

Accession Number: WOS:000686678300001

Abstract: Background There have been numerous research papers focusing on improving energy consumption and energy behaviour in domestic and residential contexts. However, workplaces and especially industry settings have gained less attention in scientific literature, even though the industry sector is one of the largest energy consumers in the world. This article introduces a methodological framework that utilizes the energy culture concept, to support understanding the factors that influence energy culture at business industry companies. Methods Building on the concept of energy culture, we introduce an interdisciplinary method, which assesses organizations' energy culture from different perspectives and recognizes the possibilities for sustainability transitions. To validate this method, the developed energy culture survey has been verified by 27 expert participants from different industry-related companies located in Finland, Italy, Switzerland, Germany France, and Austria. Results Our analysis highlights the need to consider diverse, interdisciplinary aspects to create a successful method for enhancing energy culture in the industrial sector. This will take into consideration human aspects, related to cognitive norms, beliefs, and aspirations, as well as to human interaction with the material world. Conclusions Industrial energy cultures context differs from domestic and residential contexts, and the knowledge from one context cannot be transferred to another context as such. Based on investigated studies undertaken for residential, office, and other sectors and the lessons learned, we developed a systematic method for energy culture understanding in industries. Energy managers may use it, as well as other individuals involved in energy culture issues in the industrial business sector, to evaluate the state of energy culture and engage employees towards new energy-related practices.

Title: Turkish community pharmacists' behavioral determinants in provision of pharmaceutical care to elderly patients

Journal: International Journal of Clinical Pharmacy

Volume: 43

Issue: 4

Pages: 1024-1035

Date: Aug

Short Title: Turkish community pharmacists' behavioral determinants in provision of pharmaceutical care to elderly patients

ISSN: 2210-7703

DOI: 10.1007/s11096-020-01211-0

Accession Number: WOS:000605876400004

Abstract: Background It is crucial to develop and implement community pharmacist-led pharmaceutical care services in primary care that could prevent and detect potentially inappropriate prescribing and promote medication adherence in older patients. Objective The aim of this study was to determine community pharmacists' perceived barriers and facilitators face during the provision of pharmaceutical care to older patients by using a theoretical domains framework. Method A cross-sectional online survey was conducted among community pharmacists in Turkey. A Turkish version of the 50-item Determinants of Implementation Behavior Questionnaire was developed to evaluate behavioral determinants of community pharmacists on delivering pharmaceutical care to older patients. Main outcome measures The behavioral determinants of community pharmacists. Results A total of 354 community pharmacists answered the questionnaire. The mean age was 43.2 (standard deviation = 11.1), and 227 (64%) of the pharmacists were female. Community pharmacists' positive opinions on pharmaceutical care service outcomes in older patients and feedback were regarded as facilitators. Community pharmacists' motivational level and emotions were additional determinant facilitators in delivering pharmaceutical care to older patients. Their negative opinions on the impact and action of pharmaceutical care in older patients were regarded as barriers. Conclusion In primary health care, a theory-based e-distant training program for community pharmacists and the guidelines for standard pharmaceutical care services led by community pharmacists could be designed by addressing barriers related to the impact and action of pharmaceutical care in older patients.

DOI: 10.1016/j.japh.2021.06.009

Accession Number: WOS:000717904400015

Abstract: Objective: This study aimed to evaluate the impact of theory-based, structured, standardized pharmaceutical care services led by community pharmacists (CPs) on patient-related outcomes in older Turkish adults. Practice description: This prospective, quasi-experimental pilot study was conducted at the national level at community pharmacies in Turkey. After virtual training of CPs, pharmaceutical care services including medicine bag check-up, medication review, patient medicine card, patient education, and counseling services (including motivational interviewing) were delivered to promote medication adherence in older adults. Practice innovation: Theory-based, structured, standardized pharmaceutical care services addressing medication adherence problems in older Turkish adults with noncommunicable diseases. Evaluation Methods: Descriptive data (including demographic and clinical data, medication-related problems by using the DOCUMENT classification, potential inappropriate prescribing by using the Ghent Older People's Prescriptions Community Pharmacy Screening- (GheOP(3)S) tool, and pharmacy service satisfaction) were presented. Pre- and post-evaluation were compared by using the Wilcoxon test (for continuous variables) and McNemar's or McNemar-Bowker chi-square test (for categorical variables). Results: One hundred and thirty-eight medication-related problems were identified among 52 older adults. The medication adherence rate was significantly increased from 51.9% to 75%, and the mean of total quality of life (QoL) score rose significantly from 51.7 to 53.4 ($P < 0.05$). There was a statistically significant change in the median of necessity-concern differential (baseline: 7 [2.2-10.0] vs. final: 8.0 [5-11]; $P < 0.05$). At baseline, all patients had at least 1 potential inappropriate prescribing according to the GheOP(3)S tool, and the rate was 73.1% at the final assessment. Conclusion: Community pharmacist-led pharmaceutical care services significantly improved patient-related outcomes (such as medication adherence, beliefs about medication, and QoL) in older adults with noncommunicable diseases. No statistically significant change was detected in their

lifestyle behaviors (such as physical activity and diet program) or health awareness. (C) 2021 American Pharmacists Association (R). Published by Elsevier Inc. All rights reserved.

Title: Beyond the 'teachable moment' - A conceptual analysis of women's perinatal behaviour change

Journal: Women and Birth

Volume: 29

Issue: 3

Pages: E67-E71

Date: Jun

Short Title: Beyond the 'teachable moment' - A conceptual analysis of women's perinatal behaviour change

ISSN: 1871-5192

DOI: 10.1016/j.wombi.2015.11.005

Accession Number: WOS:000377990700006

Abstract: Background: Midwives are increasingly expected to promote healthy behaviour to women and pregnancy is often regarded as a 'teachable moment' for health behaviour change. This view focuses on motivational aspects, when a richer analysis of behaviour change may be achieved by viewing the perinatal period through the lens of the Capability-Opportunity-Motivation Behaviour framework. This framework proposes that behaviour has three necessary determinants: capability, opportunity, and motivation. Aim: To outline a broader analysis of perinatal behaviour change than is afforded by the existing conceptualisation of the 'teachable moment' by using the Capability-Opportunity-Motivation Behaviour framework. Findings: Research suggests that the perinatal period can be viewed as a time in which capability, opportunity or motivation naturally change such that unhealthy behaviours are disrupted, and healthy behaviours may be adopted. Moving away from a sole focus on motivation, an analysis utilising the Capability-Opportunity-Motivation Behaviour framework suggests that changes in capability and opportunity may also offer opportune points for intervention, and that lack of capability or opportunity may act as barriers to behaviour change that might be expected based solely on changes in motivation. Moreover, the period spanning pregnancy and the postpartum could be seen as a series of opportune intervention moments, that is, personally meaningful episodes initiated by changes in capability, opportunity or motivation. Discussion: This analysis offers new avenues for research and practice, including identifying discrete events that may trigger shifts in capability, opportunity or motivation, and

whether and how interventions might promote initiation and maintenance of perinatal health behaviours. (C) 2015 Australian College of Midwives. Published by Elsevier Ltd. All rights reserved.

Abstract: IntroductionThe frequency of intravenous thrombolysis (IVT) in acute ischemic stroke (AIS) is lower than it should be in several regions of the world. It is unclear what interventions can

produce significant improvements in IVT utilization. We aimed to investigate the temporal trends in IVT in AIS and identify changes in time that could be associated with specific interventions. Methods We included patients with AIS who were admitted from January 1998 to December 2019 in our institution. To analyze trends in utilization and time points in which they changed, we performed a Joinpoint regression analysis. Interventions were assigned to a specific category according to the Behavior Change Wheel framework intervention function criteria. Results A total of 3,361 patients with AIS were admitted, among which 538 (16%) received IVT. There were 245 (45.5%) women, and the mean age and median National Institutes of Health Stroke Scale (NIHSS) scores were 68.5 (17.2) years and 8 (interquartile range, 4–15), respectively. Thrombolysis use significantly increased by an average annual 7.6% (95% CI, 5.1–10.2), with one Joinpoint in 2007. The annual percent changes were .45% from 1998 to 2007 and 9.57% from 2007 to 2019, concurring with the stroke code organization, the definition of door-to-needle times as an institutional performance measure quality indicator, and the extension of the therapeutic window. Conclusions The IVT rates consistently increased due to a continuous process of protocol changes and multiple interventions. The implementation of a complex multidisciplinary intervention such as the stroke code, as well as the definition of a hospital quality control metric, were associated with a significant change in this trend.

Short Title: Regulation crash-test: applying serious games to policy design

DOI: 10.1080/25741292.2018.1504372

Accession Number: WOS:000667238000004

Abstract: Successful policy solutions rely on policy addressees responding in certain ways. Policy designers need an analytical method that allows them to anticipate impact of a new intervention, while taking into account bounded rationality of policy actors and sociopolitical complexity. The article proposes using serious games at the stage of policy formulation to test the architecture of a new regulation in a safe environment. It provides a blueprint for using games in policy design, consisting of conceptual framework, design procedure, and techniques for strengthening game validity. The

application is illustrated with an example of a draft regulation on rural transport in Poland. The case study points out three advantages of game method: (1) revealing mechanisms triggered by the architecture of regulation, meaning actors' initial assumptions, decisions, and feedback loops created by actors' responses, (2) demonstrating the consequences of mechanisms over time, that in real life would occur with a long delay, and (3) creating a risk-free environment where policy actors can verify their assumptions and experiment with ways of interpreting and responding to new regulation. The article concludes that serious games are a promising method for anticipating impact of complex policy regulation.

Accession Number: WOS:000703825500001

Abstract: Objective:Tackling modifiable risk factors such as physical inactivity currently represents the only way to reduce the increasing prevalence of dementia worldwide. This study aimed to investigate attitudes to increasing physical activity to reduce risk of dementia in people over 50. Methods Attitudes to increasing physical activity to reduce risk of dementia were assessed in a national online survey promoted via online forums and public adverts. The Motivation to Change Behaviour for Dementia Risk Reduction (MOCHAD-10) scale examined motivation for lifestyle change. Multivariable logistic regression was used to identify the predictors of willingness and motivation to increase physical activity. Results Data from 3,948 individuals showed most people were moderately/very physically active (80%). People more likely to be physically active had better health and education, were older, male, and had a partner. People willing to increase physical activity (73%) were more likely to be younger, non-White,

underweight, had better health and lifestyles, and had experience caring for someone with dementia. People with higher levels of motivation to change lifestyle (MOCHAD-10 subscales) were more likely to be female, younger, in poorer physical/mental health, had lower perceived mental activity, and were a carer for someone with dementia. Conclusion Men and those with better health status were more physically active. Those who exercised less and those who were more motivated to increase physical activity were not necessarily able to be physically active. Multisectoral public health strategies should seek to use the high motivation levels among this group to mitigate the barriers related to physical activity for dementia risk reduction.

Short Title: What works to promote research-policy engagement?

ISSN: 1744-2648

DOI: 10.1332/174426421x16420918447616

Accession Number: WOS:000893378400001

Abstract: Background: To improve the use of evidence in policy and practice, many organisations and individuals seek to promote research-policy engagement activities, but little is known about what works. Aims and objectives: We sought (a) to identify existing research-policy engagement activities, and (b) evidence on impacts of these activities on research and decision making. Methods: We conducted systematic desk-based searches for organisations active in this area (such as funders, practice organisations, and universities) and reviewed websites, strategy documents, published evaluations and relevant research. We used a stakeholder roundtable, and follow-up survey and interviews, with a subset of the sample to check the quality and robustness of our approach. Findings: We identified 1923 initiatives in 513 organisations world-wide. However, we found only 57 organisations had publicly-available evaluations, and only 6% (141/2321) of initiatives were evaluated. Most activities aim to improve research dissemination or create

relationships. Existing evaluations offer an often rich and nuanced picture of evidence use in particular settings (such as local government), sectors (such as policing), or by particular providers (such as learned societies), but are extremely scarce. Discussion and conclusions: Funders, research-and decision-making organisations have contributed to a huge expansion in research-policy engagement initiatives. Unfortunately, these initiatives tend not to draw on existing evidence and theory, and are mostly unevaluated. The rudderless mass of activity therefore fails to provide useful lessons for those wishing to improve evidence use, leading to wasted time and resources. Future initiatives should draw on existing evidence about what works, seek to contribute to this evidence base, and respond to a more realistic picture of the decision-making context.

Short Title: Elena plus Care for COVID-19, a Pandemic Lifestyle Care

Intervention: Intervention Design and Study Protocol

DOI: 10.3389/fpubh.2021.625640

Article Number: 625640

Accession Number: WOS:000717951000001

Abstract: Background: The current COVID-19 coronavirus pandemic is an emergency on a global scale, with huge swathes of the population required to remain indoors for prolonged periods to tackle the virus. In this new context, individuals' health-promoting routines are under greater strain, contributing to poorer mental and physical health. Additionally, individuals are required to keep up to date with latest health guidelines about the virus, which may be confusing in an age of social-media disinformation and shifting

guidelines. To tackle these factors, we developed Elena+, a smartphone-based and conversational agent (CA) delivered pandemic lifestyle care intervention. Methods: Elena+ utilizes varied intervention components to deliver a psychoeducation-focused coaching program on the topics of: COVID-19 information, physical activity, mental health (anxiety, loneliness, mental resources), sleep and diet and nutrition. Over 43 subtopics, a CA guides individuals through content and tracks progress over time, such as changes in health outcome assessments per topic, alongside user-set behavioral intentions and user-reported actual behaviors. Ratings of the usage experience, social demographics and the user profile are also captured. Elena+ is available for public download on iOS and Android devices in English, European Spanish and Latin American Spanish with future languages and launch countries planned, and no limits on planned recruitment. Panel data methods will be used to track user progress over time in subsequent analyses. The Elena+ intervention is open-source under the Apache 2 license (MobileCoach software) and the Creative Commons 4.0 license CC BY-NC-SA (intervention logic and content), allowing future collaborations; such as cultural adaptations, integration of new sensor-related features or the development of new topics. Discussion: Digital health applications offer a low-cost and scalable route to meet challenges to public health. As Elena+ was developed by an international and interdisciplinary team in a short time frame to meet the COVID-19 pandemic, empirical data are required to discern how effective such solutions can be in meeting real world, emergent health crises. Additionally, clustering Elena+ users based on characteristics and usage behaviors could help public health practitioners understand how population-level digital health interventions can reach at-risk and sub-populations.

Short Title: Who eats wild meat? Profiling consumers in Ho Chi Minh City, Vietnam

DOI: 10.1002/pan3.10208

Accession Number: WOS:000641639600001

Abstract: 1. Overexploitation for consumption of meat from wild animals in urban centres currently threatens numerous species across the globe. Indiscriminate offtake to satisfy demand for wild meat affects a range of wildlife of conservation concern in Vietnam. It is essential to understand the consumption of wild meat in Vietnam in order to ensure it is not detrimental to wild species. 2. We apply the principles of target audience segmentation to a sample of 384 respondents who had consumed wild meat in the previous year in Ho Chi Minh City, Vietnam. We carried out a cluster analysis to divide wild meat consumers into subgroups considering demographic, behavioural and psychographic variables. 3. We found three consumer groups: Classic Consumers (older, less educated), Up-and-coming Professionals (younger, wealthier, more educated) and Students. Compared to Students, Classic Consumers and Up-and-coming Professionals were significantly more likely to have paid for their meal at wild meat restaurants and to have ordered a combination of wild meat and other types of food rather than other types of food only. 4. Classic Consumers match previous characterisations of wild meat consumers, but the other two groups should also be considered in demand reduction campaigns. As Students appear to have limited influence on restaurant/food choices in certain social contexts and less propensity to eat wild meat, Up-and-coming Professionals may be an important target group. 5. A wide variety of species are consumed in wild meat restaurants. Some, such as pangolins, are of conservation concern and were consumed by 5% of our respondents. This is potentially an unsustainable level of consumption. 6. Our study showcases an audience segmentation approach to understanding wildlife consumers and provides insights for behavioural interventions and further research to curtail demand for wild meat in Ho Chi Minh City, Vietnam where it is of conservation concern.

Short Title: Music festival drug checking: evaluation of an Australian pilot program
DOI: 10.1186/s12954-022-00708-3
Article Number: 127
Accession Number: WOS:000886129400002
Abstract: Background This paper explores the feasibility of delivering a music festival-based drug checking service in Australia, evaluating service design and stakeholder acceptability. Methods Questionnaire and interview data were collected from adult service users and key stakeholders. A mixed methods approach was used to analyse the data on implementation, impact and acceptability. Results The trial service tested 170 substances with more than 230 patrons (including individuals who attended in groups). Adult service users had an average age of 21 years. Voluntary participation in the evaluation resulted in 158 participants completing the pre-service questionnaire, most of whom also completed the post-service (147 participants). Eleven in-depth qualitative interviews were conducted with patrons in the weeks following the drug checking. Concordance between what the patron expected the drug to be and drug checking results occurred in 88 per cent (n = 139) of the sample. Evaluation results show that the experience of testing and the accompanying harm reduction brief interventions positively impacted on patrons' self-reported drug harm reduction knowledge, trust of health providers and stated drug use intentions. The service was received positively by service users. Conclusion This is the first independent evaluation of a pilot drug checking service in Australia. Consideration of operational feasibility and self-reported behavioural change suggests that the program was successful, although communication about the interpretation of drug checking results could be improved. Future studies should develop strategies for follow-up and consider the applicability of behavioural change theory.

Accession Number: WOS:000625537700001

Abstract: Language focused on individual dietary behaviors, or alternatively, lifestyle choices or decisions, suggests that what people eat and drink is primarily a choice that comes down to free will. Referring to and intervening upon food consumption as though it were a freely chosen behavior has an inherently logical appeal due to its simplicity and easily defined targets of intervention. However, despite decades of behavioral interventions, population-level patterns of food consumption remain suboptimal. This debate paper interrogates the manner in which language frames how problems related to poor diet quality are understood and addressed within society. We argue that referring to food consumption as a behavior conveys the idea that it is primarily a freely chosen act that can be ameliorated through imploring and educating individuals to make better selections. Leveraging practice theory, we subsequently propose that using the alternative language of eating practices and patterns better conveys the socially situated nature of food consumption. This language may therefore point to novel avenues for intervention beyond educating and motivating individuals to eat more healthfully, to instead focus on creating supportive contexts that enable sustained positive dietary change. Clearly, shifting discourse will not on its own transform the science and practice of nutrition. Nevertheless, the seeds of change may lie in aligning our terminology, and thus, our framing, with desired solutions.

Abstract: Understanding uptake of complex interventions is an increasingly prominent area of research. The interplay of macro (such as changing health policy), meso (re-organisation of professional work) and micro (rationalisation of clinical care) factors upon uptake of complex interventions has rarely been explored. This study focuses on how English General Practitioners and practice nurses make sense of a complex intervention for the management of osteoarthritis, using the macro meso micro contextual approach and Normalisation Process Theory (NPT), specifically the construct of coherence. It is embedded in a cluster RCT comprising four control practices and four intervention practices. In order to study sense-making by professionals introduction and planning meetings (N = 14) between researchers and the practices were observed. Three group interviews were carried out with 10 GPs and 5 practice nurses after they had received training in the intervention. Transcripts were thematically analysed before comparison with NPT constructs. We found that: first, most GPs and all nurses distinguished the intervention from current ways of working. Second, from the introduction meeting to the completion of the training the purpose of the intervention increased in clarity. Third, GPs varied in their understanding of their remit, while the practice nurses felt that the intervention builds on their holistic care approach. Fourth, the intervention was valued by practice nurses as it strengthened their expert status. GPs saw its value as work substitution, but felt that a positive conceptualisation of OA enhanced the consultation. When introducing new interventions in healthcare settings the interaction between macro, meso and micro factors, as well as the means of engaging new clinical practices and their sense-making by clinicians needs to be considered. Abstract: Children with intellectual disability experience significant challenges in accessing and receiving high-quality healthcare leading to poorer health outcomes and negative patient experiences. Families of these children often report a need for healthcare staff to better understand, communicate, and collaborate for better care while staff acknowledge a lack of training. To address this, we utilised an action research framework with a pre- and post- survey to evaluate an integrated continuing professional development and quality improvement program combining strategies from education, behavioural psychology and quality improvement that was delivered in two departments within a tertiary children's Hospital in Metropolitan Sydney in 2019-2020. Parents reported noticeable changes in the clinical practice of staff, and staff acknowledged and attributed their shift in behaviour to raising awareness and discussions around necessary adaptations. The program demonstrates a novel method for knowledge translation to practice and systems improvements.

Short Title: Social Norms Support the Protein Transition: The Relevance of Social Norms to Explain Increased Acceptance of Alternative Protein Burgers over 5 Years

DOI: 10.3390/foods11213413

Article Number: 3413

Accession Number: WOS:000881101500001

Abstract: Developing alternative protein products—based on protein sources other than regular meat—is a possible pathway to counter environmental and health burdens. However, alternative proteins are not always accepted by consumers, and more research is needed to support a shift to more alternative proteins. Prior studies have mainly focused on individual drivers and perceptions; although we expect that social norms—the perceptions of the opinions of relevant others—are highly relevant in accepting alternative proteins. Online surveys were conducted among 2461 respondents in 2015 and 2000 respondents in 2019 (cross-sectional datasets); a subsample (n = 500) responded to both surveys (longitudinal dataset). We add to the literature by (1) demonstrating the added explanatory value of social norms beyond a range of individual drivers; (2) showing that this finding holds over time, and (3) comparing the impact of social norms across different dietary consumer groups. Meat lovers and flexitarians are more prone to follow social norms whereas meat abstainers are more prone to follow their individual attitudes and values. This study highlights the relevance of investigations beyond personal variables such as personal norms and attitudes and underscores the relevance of considering the social aspects of accepting alternative proteins.

Short Title: Positive emotions explain increased intention to consume five types of alternative proteins

ISSN: 0950-3293

DOI: 10.1016/j.foodqual.2021.104446

Article Number: 104446

Accession Number: WOS:000715118000015

Abstract: Transitions in consumer diets towards a more 'meat-less' diet are stated to result in various health and environmental benefits. Consumption of alternative proteins provides one of the alternatives towards more meat-less diets. Alternative proteins receive a lot of attention, however it is unclear whether consumer acceptance is changing over time. Moreover, changing consumers' dietary habits is harsh. The current study explores with a longitudinally study whether trends are visible in consumer acceptance of alternative proteins, and which drivers are relevant to understand acceptance of alternative proteins over time. An online survey was conducted in the Netherlands resulting in two types of samples: a longitudinal sample (500 respondents) that answered the same survey in 2015 and 2019, and cross-sectional samples that answered the survey in 2015 (2,461 respondents) or in 2019 (2,000 respondents). The survey addressed a range of possible drivers, including personal norms, food innovation traits (i.e. food neophobia and domain-specific innovativeness), food-choice motives and positive and negative emotions. Respondents were randomly divided into five groups and presented with specific questions on: fish, seaweed, insects, legumes and cultured meat. The results reveal an increase in the intention to consume seaweed, legumes, and cultured meat over time, though self-reported consumption remains stable indicating an intention-behaviour gap. Positive emotions appear to be the most relevant driver for intention (beyond all other included variables), and intentions in turn are the most relevant driver of consumption. Thus indicating the relevance of positive emotions as joy, content and pride. Implicating that interventions, promotions and communications should not only focus on cognitive added values as environmental impact though also include affective communication messages, e.g., consumption of alternative proteins feels good.

Short Title: A trial of a six-month sugar-sweetened beverage intervention in secondary schools from a socio-economically disadvantaged region in Australia

ISSN: 1326-0200

DOI: 10.1111/1753-6405.13159

Accession Number: WOS:000717035800001

Abstract: Objective: This study assessed the effectiveness of a school-based intervention in reducing adolescents' sugar-sweetened beverage (SSB) consumption and percentage of energy from SSBs. Secondary outcomes were SSB consumption within school, average daily energy intake, and body mass index z-scores. Methods: Six secondary schools located in New South Wales, Australia were recruited to participate in a six-month pilot randomised controlled trial (1:1). The intervention included components targeting the school nutrition environment, curricula and community. Outcomes were collected via online surveys, observations, anthropometric measurements and project records. Between-group differences were assessed via linear mixed models. Results: At the six-month intervention endpoint (n=862) there were no statistically significant differences between students in intervention or control schools for mean daily intake of SSBs (8.55mL; CI -26.77, 43.87; p=0.63), percentage daily energy from SSBs (0.12% kJ; CI -0.55, 0.80; p=0.72), or for secondary outcomes. Acceptability of the school-based strategies were high, however intervention fidelity varied across schools. Conclusion: While acceptable, improving fidelity of implementation and increasing the duration or intensity of the intervention may be required to reduce SSB intake. Implications for public health: Engaging parents and education stakeholders in the development phase to co-design interventions may prove beneficial in improving intervention fidelity and enhance behavioural outcomes.

Article Number: 23312165221130584

Accession Number: WOS:000878304800001

Abstract: There has been an increasing number of qualitative studies exploring the experiences and perceptions of adult hearing aid owners throughout their hearing aid journey. As these studies and reported experiences vary greatly, a systematic review was conducted to identify and synthesize the key concepts in adult hearing aid owners' experiences during and after fitting. A systematic search of three electronic databases was conducted, yielding 443 results. Articles were evaluated for inclusion based on pre-determined eligibility criteria, including conventional, smartphone-connected, and direct-to-consumer hearing devices. Twenty-five studies met the inclusion criteria. The quality of the included articles was evaluated using the Rating of Qualitative Research scale. Guidelines of the Preferred Reporting Items for Systematic Reviews and Meta-analyses (PRISMA) and the Synthesis Without Meta-Analysis (SWiM) were followed. A narrative synthesis was conducted, and studies were grouped into three main domains, namely experiences of owners related to a) hearing aid adoption and fitting (n = 3), b) hearing aid use (n = 20), and c) hearing aid sub-optimal use (n = 25). Hearing aid owners mainly reported on how their attitude towards hearing aids affected experiences during the fitting stage. Improved psychosocial functioning was the most prevalent perceived benefit of hearing aid use. Owners described sub-optimal use in terms of hearing device-related and non-device-related concepts. The COM-B (capability, opportunity, motivation-behavior) model is used to discuss specific service-delivery, hearing-device, and hearing-aid-owner related concepts and clinical implications, including behavior change techniques to enhance understanding of the concepts that hearing aid owners perceive as essential to improve hearing aid experiences.

DOI: 10.7196/SAMJ.2019.v109i2.13429

Accession Number: WOS:000457578200013

Abstract: Background. South Africa did not meet its Millennium Development Goals with regard to the reduction in maternal and under-5 mortality. Furthermore, many birthing women do not receive intrapartum care with empathy and endure disrespectful and abusive care. Objectives. To implement a multicomponent, context-specific intervention package to change the complex interplay between preventable maternal and perinatal mortality and morbidity and poor clinical governance and supervision in midwife-led labour units. Methods. A mixed-methods intervention study was conducted in Tshwane District, South Africa, in 10 midwife-led obstetric units (MOUs), from which a purposive sample consisting of five units was selected for the intervention. The intervention took place in three phases: (i) baseline measurement; (ii) implementation of the so-called 'CLEVER' intervention package in the five intervention units, based on the results of the first phase; and (iii) a review of health systems improvements and perinatal outcomes. The intervention had three pillars: (i) feedback of the baseline measurement to the intervention units to raise awareness and solicit participation; (ii) health systems strengthening; and (iii) intensive weekly engagement for 3 months, with further monthly support afterwards. Observation of barriers during baseline activities contributed to the health systems strengthening and improvement strategies during implementation. Results. Perinatal outcome indicators for the year before the intervention were compared with data for the year in which the intervention took place and the year after the intervention. Significant declines were observed in in-facility fresh stillbirths, meconium aspiration and birth asphyxia in the intervention MOUs from 2015 to 2017. The control group showed some decline during the period owing to support from district clinical specialist team members. Conclusions. CLEVER as a context-specific, multicomponent, clinically focused intervention package may have contributed to improved perinatal morbidity and mortality rates in MOUs.

Short Title: A study protocol for improving the delivery of acute kidney replacement therapy (KRT) to critically ill patients in Alberta – DIALYZING WISELY

DOI: 10.1186/s12882-022-02990-6

Article Number: 369

Accession Number: WOS:000884738400004

Abstract: Background: Acute kidney replacement therapy (KRT) is delivered to acutely ill patients to support organ function and life in the Intensive Care Unit (ICU). Implementing standardized acute KRT pathways can ensure its safe and effective management. At present, there is no standardized approach to the management of acute KRT in Alberta ICUs. Methods: Dialyzing Wisely is a registry embedded, stepped-wedge, interrupted time-series evaluation of the implementation of a standardized, stakeholder-informed, and evidence-based acute KRT pathway into Alberta ICUs. The acute KRT pathway will consist of two distinct phases. First, we will implement routine monitoring of evidence-informed key performance indicators (KPIs) of acute KRT. Second, we will provide prescriber and program reports for acute KRT initiation patterns. After the implementation of both phases of the pathway, we will evaluate acute KRT performance quarterly and implement a customized suite of interventions aimed at improving performance. We will compare this with baseline and evaluate iterative post implementation effects of the care pathway. Discussion: Dialyzing Wisely will implement, monitor, and report a suite of KPIs of acute KRT, coupled with a care pathway that will transform the quality of acute KRT across ICUs in Alberta. This program will provide a framework for scaling evidence-informed approaches to monitoring and management of acute KRT in other jurisdictions. We anticipate improvements in acute KRT performance, decreased healthcare system costs and improved patient quality of life by decreasing patient dependence on maintenance dialysis.

Short Title: Requirements for a Dashboard to Support Quality Improvement Teams in Pain Management

DOI: 10.3389/fdata.2021.654914

Article Number: 654914

Accession Number: WOS:000659107700001

Abstract: Pain management is often considered lower priority than many other aspects of health management in hospitals. However, there is potential for Quality Improvement (QI) teams to improve pain management by visualising and exploring pain data sets. Although dashboards are already used by QI teams in hospitals, there is limited evidence of teams accessing visualisations to support their decision making. This study aims to identify the needs of the QI team in a UK Critical Care Unit (CCU) and develop dashboards that visualise longitudinal data on the efficacy of patient pain management to assist the team in making informed decisions to improve pain management within the CCU. This research is based on an analysis of transcripts of interviews with healthcare professionals with a variety of roles in the CCU and their evaluation of probes. We identified two key uses of pain data: direct patient care (focusing on individual patient data) and QI (aggregating data across the CCU and over time); in this paper, we focus on the QI role. We have identified how CCU staff currently interpret information and determine what supplementary information can better inform their decision making and support sensemaking. From these, a set of data visualisations has been proposed, for integration with the hospital electronic health record. These visualisations are being iteratively refined in collaboration with CCU staff and technical staff responsible for maintaining the electronic health record. The paper presents user requirements for QI in pain management and a set of visualisations, including the design rationale behind the various methods proposed for visualising and exploring pain data using dashboards.

Short Title: Determinants of lifejacket use among boaters on Lake Albert, Uganda: a qualitative study

ISSN: 1353-8047

DOI: 10.1136/injuryprev-2021-044483

Accession Number: WOS:000747343100001

Abstract: Background Drowning is a major cause of unintentional injury death worldwide. The toll is greatest in low and middle-income countries. Over 95% of people who drowned while boating in Uganda were not wearing a lifejacket. We explored the determinants of lifejacket use among boaters on Lake Albert, Uganda. Methods We conducted a qualitative enquiry with a hermeneutic phenomenological undertone leaning on relativism ontology and emic subjectivism epistemology. Focus group discussions (FGDs) and in-depth interviews (IDIs) were held with boaters in 10 landing sites. We explored experiences and perspectives on lifejacket use. We used thematic analysis technique to analyse data and report results according to the Consolidated Criteria for Reporting Qualitative Research. Results We recruited 88 boaters in 10 FGDs and 11 to take part in the IDIs. We identified three themes: motivators and opportunities for lifejacket use, barriers and threats to lifejacket use, and strategies to improve lifejacket use. Many boaters attributed their lifejacket use to prior experience or witness of a drowning. Perceived high costs of lifejackets, limited knowledge, reluctance to use lifejackets because of distrust in their effectiveness, and the belief that it is women who should wear lifejackets were among the barriers and threats. Participants mentioned the need for mandatory enforcement together with community sensitisations as strategies to improve lifejacket use. Conclusion Determinants of lifejacket use among boaters include experience or witness of drowning, limited knowledge about lifejackets and distrust in the effectiveness of the available lifejackets. Mandatory lifejacket wearing alongside educational interventions might improve lifejacket use.

Short Title: Lifejacket wear and the associated factors among boaters involved in occupational boating activities on Lake Albert, Uganda: a cross-sectional survey

ISSN: 1353-8047

DOI: 10.1136/injuryprev-2022-044608

Accession Number: WOS:000804155000001

Abstract: Background Drowning death rates in lakeside fishing communities in Uganda are the highest recorded globally. Over 95% of people who drowned from a boating activity in Uganda were not wearing a lifejacket. This study describes the prevalence of lifejacket wear and associated factors among boaters involved in occupational boating activities on Lake Albert, Uganda. Methods We conducted a cross-sectional survey, grounded on etic epistemology and a positivist ontological paradigm. We interviewed 1343 boaters across 18 landing sites on Lake Albert, Uganda. Lifejacket wear was assessed through observation as boaters disembarked from their boats and self-reported wear for those who 'always wore a life jacket while on the lake'. We used a mixed-effects multilevel Poisson regression, with landing site-specific random intercepts to elicit associations with lifejacket wear. We report adjusted prevalence ratios (PRs) at 95% confidence intervals. Results The majority of respondents were male, 99.6% (1338/1343), and the largest proportion, 38.4% (516/1343) was aged 20-29 years. Observed lifejacket wear was 0.7% (10/1343). However, self-reported wear was 31.9% (428/1343). Tertiary-level education (adjusted PR 1.57, 95% CI 1.29- 1.91), boat occupancy of at least four people (adjusted PR 2.12, 95% CI 1.28 - 3.52), big boat size (adjusted PR 1.55, 95% CI 1.13 - 2.12) and attending a lifejacket-use training session (adjusted PR 1.25, 95% CI 1.01 - 1.56) were associated with higher prevalence of self-reported lifejacket wear. Self-reported wear was lower among the 30-39 year-olds compared to those who were aged less than 20 years (adjusted PR 0.66, 95% CI 0.45 - 0.99). Conclusion Lifejacket wear was low. Training on lifejacket use may improve wear among boaters involved in occupational boating activities on Lake Albert.

Title: The feasibility and acceptability of a home-based, virtual exercise intervention for older patients with hepatocellular

carcinoma: protocol for a non-randomised feasibility study (TELEX-Liver Cancer)

Journal: Pilot and Feasibility Studies

Volume: 8

Issue: 1

Date: May

Short Title: The feasibility and acceptability of a home-based, virtual exercise intervention for older patients with hepatocellular carcinoma: protocol for a non-randomised feasibility study (TELEX-Liver Cancer)

DOI: 10.1186/s40814-022-01069-1

Article Number: 113

Accession Number: WOS:000800759400003

Abstract: Background: The number of incident cases and deaths from primary liver cancer, predominantly hepatocellular carcinoma (HCC), has increased markedly in the last two decades. HCC is generally diagnosed at an advanced stage, and most new cases are in people aged over 70 years with age-related comorbidities. Treatment options are often limited, with most patients receiving palliative treatment or supportive care only. As a consequence, maintaining quality of life (QoL) through symptom management is critically important and is a core objective of clinical care. Strong evidence supports the efficacy of supervised exercise training for addressing certain cancer-related symptoms, including QoL, physical function, and fatigue. However, there are many barriers to implementing supervised exercise programmes within cancer care pathways, including economic pressures on healthcare systems and personal barriers for patients. Recent advances in technology allow patients to exercise at home under the 'virtual' supervision of an exercise professional through videoconferencing software (termed 'telehealth exercise'). Despite its potential, there are uncertainties relating to the feasibility, acceptability, and safety of telehealth exercise in people living with HCC. Methods: This is a protocol for a prospective, single-centre, single-arm, pretest-posttest feasibility trial. We aim to recruit 20 patients aged 60 years or older who have received treatment for HCC and are undergoing routine clinical monitoring. Patients will be invited to take part in two online, home-based, group exercise sessions per week for 10 consecutive weeks. The 'virtual' exercise sessions will be delivered in real time by an exercise professional through videoconferencing software. Each session will comprise 30 min of aerobic and resistance exercise performed at a moderate intensity, as guided by the 10-point Borg rating of perceived exertion scale. Feasibility outcomes include recruitment, retention, adherence, intervention fidelity, and safety. Acceptability of the intervention will be assessed using a mixed-methods approach via monthly online surveys and an exit telephone interview. Physical function, accelerometry-measured physical activity, mid-upper arm circumference, and patient-reported outcome measures (PROMS) will be assessed before and after the intervention to determine the feasibility of assessing outcome measures. Physical function outcomes include the short physical performance battery and Liver Frailty Index. PROMS include the Functional Assessment of Cancer Therapy-Hepatobiliary questionnaire, Functional Assessment of Chronic Illness Therapy-Fatigue

questionnaire, Activities-specific Balance Confidence scale, Hospital Anxiety and Depression Scale, and the Godin Leisure-Time Exercise Questionnaire. Discussion: This mixed-methods study will address uncertainties relating to the feasibility and acceptability of delivering live, online, home-based, group exercise sessions to patients with HCC. The findings will inform whether any modifications are required to refine and optimise the intervention, and the assessment of outcome measures will provide information on the likely size and variability of intervention effects.

Collectively, the data generated will inform the design of a subsequent, adequately powered, randomised controlled trial to evaluate the efficacy of the telehealth exercise intervention.

Title: iPhone ECG screening by practice nurses and receptionists for atrial fibrillation in general practice: the GP-SEARCH qualitative pilot study

Journal: Australian Family Physician

Volume: 43

Issue: 5

Pages: 315-319

Date: May

Short Title: iPhone ECG screening by practice nurses and receptionists for atrial fibrillation in general practice: the GP-SEARCH qualitative pilot study

ISSN: 0300-8495

Accession Number: WOS:000343947900021

Abstract: Background Atrial fibrillation (AF) is often asymptomatic and substantially increases stroke risk. A single-lead iPhone electrocardiograph (iECG) with a validated AF algorithm could make systematic AF screening feasible in general practice. Methods A qualitative screening pilot study was conducted in three practices. Receptionists and practice nurses screened patients aged ≥ 65 years using an iECG (transmitted to a secure website) and general practitioner (GP) review was then provided during the patient's consultation. Fourteen semi-structured interviews with GPs, nurses, receptionists and patients were audio-recorded, transcribed and analysed thematically. Results Eighty-eight patients (51% male; mean age 74.8 \pm 8.8 years) were screened: 17 patients (19%) were in AF (all previously diagnosed). The iECG was well accepted by GPs, nurses and patients. Receptionists were reluctant, whereas nurses were confident in using the device, explaining and providing screening. Discussion AF screening in general practice is feasible. A promising model is likely to be one delivered by a practice nurse,

but depends on relevant contextual factors for each practice.

Short Title: Evaluating the clinical and cost effectiveness of a behaviour change intervention for lowering cardiovascular disease risk for people with severe mental illnesses in primary care (PRIMROSE study): study protocol for a cluster randomised controlled trial

DOI: 10.1186/s13063-016-1176-9

Article Number: 80

Accession Number: WOS:000369941300001

Abstract: Background: People with severe mental illnesses die up to 20 years earlier than the general population, with cardiovascular disease being the leading cause of death. National guidelines recommend that the physical care of people with severe mental illnesses should be the responsibility of primary care; however, little is known about effective interventions to lower cardiovascular disease risk in this population and setting. Following extensive peer review, funding was secured from the United Kingdom National Institute for Health Research (NIHR) to deliver the proposed study. The aim of the trial is to test the effectiveness of a behavioural intervention to lower cardiovascular disease risk in people with severe mental illnesses in United Kingdom General Practices. Methods/Design: The study is a cluster randomised controlled trial in 70 GP practices for people with severe mental illnesses, aged 30 to 75 years old, with elevated cardiovascular disease risk factors. The trial will compare the effectiveness of a behavioural intervention designed to lower cardiovascular disease risk and delivered by a practice nurse or healthcare assistant, with

standard care offered in General Practice. A total of 350 people will be recruited and followed up at 6 and 12 months. The primary outcome is total cholesterol level at the 12-month follow-up and secondary outcomes include blood pressure, body mass index, waist circumference, smoking status, quality of life, adherence to treatments and services and behavioural measures for diet, physical activity and alcohol use. An economic evaluation will be carried out to determine the cost effectiveness of the intervention compared with standard care. Discussion: The results of this pragmatic trial will provide evidence on the clinical and cost effectiveness of the intervention on lowering total cholesterol and addressing multiple cardiovascular disease risk factors in people with severe mental illnesses in GP Practices.

Abstract: Behavioural change techniques are currently used by many global organisations and public institutions. The amassing evidence base is used to answer practical and scientific questions regarding what cognitive, affective, and environment factors lead to successful behavioural change in the laboratory and in the field. In

this piece we show that there is also value to examining interventions that inadvertently fail in achieving their desired behavioural change (e.g., backfiring effects). We identify the underlying causal pathways that characterise different types of failure, and show how a taxonomy of causal interactions that result in failure exposes new insights that can advance theory and practice.

Abstract: Behavioral change techniques may show positive changes to sustainable consumption, but as with many other domains, how they interact with other typical regulatory measures is unknown. To address the empirical lacuna, the present study uses a discrete-choice set-up to simulate a lunchtime canteen in order to investigate the effects of choice preserving and choice incentivizing interventions on meal choices. Carbon tax (Experiment 1, Experiment 2) alone, behavioral interventions (Experiment 1) alone, as well in combination (Experiment 1, Experiment 2) shifted choices to a less degree than in combination. The most compelling positive behavioral change was found when introducing a redistributive pricing system that combines carbon tax and subsidies (Experiment 2), in combination with choice preserving instruments (Experiment 2, Experiment 3).

Short Title: A realist systematic review of evidence from low- and middle-income countries of interventions to improve immunization data use

DOI: 10.1186/s12913-021-06633-8

Article Number: 672

Accession Number: WOS:000674482600006

Abstract: Background The use of routine immunization data by health care professionals in low- and middle-income countries remains an underutilized resource in decision-making. Despite the significant resources invested in developing national health information systems, systematic reviews of the effectiveness of data use interventions are lacking. Applying a realist review methodology, this study synthesized evidence of effective interventions for improving data use in decision-making. **Methods** We searched PubMed, POPLINE, Centre for Agriculture and Biosciences International Global Health, and African Journals Online for published literature. Grey literature was obtained from conference, implementer, and technical agency websites and requested from implementing organizations. Articles were included if they reported on an intervention designed to improve routine data use or reported outcomes related to data use, and targeted health care professionals as the principal data users. We developed a theory of change a priori for how we expect data use interventions to influence data use. Evidence was then synthesized according to data use intervention type and level of the health system targeted by the intervention. **Results** The searches yielded 549 articles, of which 102 met our inclusion criteria, including 49 from peer-reviewed journals and 53 from grey literature. A total of 66 articles reported on immunization data use interventions and 36 articles reported on data use interventions for other health sectors. We categorized 68 articles as research evidence and 34 articles as promising strategies. We identified ten primary intervention categories, including electronic immunization registries, which were the most reported intervention type (n = 14). Among the research evidence from the immunization sector, 32 articles reported intermediate outcomes related to data quality and availability, data analysis, synthesis, interpretation, and review. Seventeen articles reported data-informed decision-making as an intervention outcome, which could be explained by the lack of consensus around how to define and measure data use. **Conclusions** Few immunization data use interventions have been rigorously studied or evaluated. The review highlights gaps in the evidence base, which future research and better measures for assessing data use should attempt to address.

Title: 'Nurses' self-management support to hospitalised patients: A scoping review

Journal: Journal of Clinical Nursing

Volume: 32

Issue: 9-10

Pages: 2270-2281

Date: May

Short Title: 'Nurses' self-management support to hospitalised patients: A scoping review

ISSN: 0962-1067

DOI: 10.1111/jocn.16242

Accession Number: WOS:000750675600001

Abstract: Aims and Objectives: To review the current literature to map and explore the interventions that have been considered or used by nurses to support adult patients' self-management during hospitalisation. Background: Nurses can play an important role in supporting patients' self-management. Currently, however, it is unclear how nurses perform this task during a patient's stay in hospital. Traditionally, nurses take the primary role in managing patients' care during hospitalisation. Ideally, patients should have the opportunity to continue applying strategies to manage their health conditions as much as possible while in the hospital. This can increase patients' self-efficacy and decrease unnecessary readmissions. Design: Scoping review informed by the Joanna Briggs Institute methodology. Methods: A database search was undertaken using Pubmed, CINAHL, Psycinfo, Cochrane, Embase and grey literature sources. Data from the included studies were mapped and summarised in a narrative summary. To synthesise the information that was given about each intervention, we conducted a qualitative inductive content analysis. Results are reported in accordance with the guidelines for reporting Items for systematic review and meta-analyses extension for scoping review (PRISMA-ScR) (Supplementary File 1). Results: 83 documents were included in this review. Based on the information about the interventions, three themes were identified: 'self-management support activities', 'focus of self-management support' and the 'intervention procedure'. Five self-management support activities can be distinguished: 'giving education', 'counselling and coaching', 'enhancing responsibility', 'engaging family-caregivers' and 'supporting transition from hospital to home'. The interventions focused on improving disease-related knowledge and on strengthening several self-management skills. Information about the procedure, development and the theoretical underpinning of the intervention was often limited. Conclusions: Most activities within the nursing interventions to support adult patients' self-management during hospitalisation are the part of regular nursing care. However, the transfer of responsibility for care task to the patient is relatively new. Further research could focus on developing interventions addressing all aspects of self-management and that are embedded in the patient's care pathway across settings.

Abstract: Four focus group interviews were held with nurses, recruited from eight wards of two general hospitals, to explore nurses' perceptions of self-management and self-management support of older patients during hospitalization. A thematic analyze of the interview transcripts was conducted. Regarding nurses understanding of self-management two perceptions emerged namely 'being self-reliant' and 'being in control'. In terms of their understanding self-management support three perceptions emerged: encouraging patients to perform activities of daily living (ADL); stimulating patient participation; and increasing patients' awareness. We also found seven themes relating to nurses' beliefs regarding older patients' self-management and self-management support during hospitalization. Results indicate that nurses have a limited understanding of self-management and do not fully understand what is expected from them with regards to inpatients' self management. It is feasible to argue that addressing nurses' beliefs can influence nurses intention and behavior regarding supporting older inpatients' self-management. (c) 2020 Elsevier Inc. All rights reserved.

Pages: 6776-6784

Date: Nov

Short Title: Catch-up immunisation for migrant children in Melbourne: A qualitative study with providers to determine key challenges

ISSN: 0264-410X

DOI: 10.1016/j.vaccine.2022.08.063

Accession Number: WOS:000920915000001

Abstract: Background: Current models of immunisation service delivery in Australia are not meeting the needs of migrant children, who experience a higher burden of vaccine preventable disease and lower immunisation rates compared to non-migrant children.

Understanding the experiences of immunisation providers is critical for designing effective and tailored interventions to improve this service. This study aimed to identify the facilitators and barriers to providers delivering a comprehensive catch-up immunisation service to migrant children in Melbourne, Australia. Methods: Semi-structured interviews with council and general practice immunisation providers were conducted. Recorded interviews were transcribed and coded inductively using thematic analysis. Identified themes were then deductively categorised according to the Capability, Opportunity and Motivation of Behaviour (COM-B) model. Results:

Twenty-four providers (five practice nurses, six general practitioners, six council nurses and seven council administration officers) were interviewed between March and June 2021. Fourteen themes were identified that contributed to the delivery of an effective catch-up immunisation service. Capability themes included training, experience and skills to perform the service and communicate with families. Opportunity themes incorporated time, workplace norms, traits of migrant families, costs, systems and resources. Themes related to motivation were provider responsibility, beliefs about migrant health, and immunisation prioritisation. Conclusions: Key barriers for providers to deliver a comprehensive catch-up immunisation service were related to opportunity. Developing an online tool to support catch-up schedule development and reporting, and funding provider time to calculate the schedule are primary actions that could overcome opportunity barriers. Capability and motivation barriers for general practitioners included limited time, skills, and motivation compared to nurses. These barriers may be overcome with improvements to training that focus on upskilling nurses to deliver the catch-up service. Service delivery challenges are multifactorial, requiring a range of strategies to optimise this service and increase immunisation coverage in migrant children. (c) 2022 Published by

Short Title: Needs of Direct Support Professionals to Support People
With Intellectual Disabilities in Leading a Healthy Lifestyle

ISSN: 1741-1122

DOI: 10.1111/jppi.12383

Accession Number: WOS:000668062600001

Abstract: Background For a healthy lifestyle, people with moderate, severe, and profound intellectual disabilities living in residential facilities and/or participating in day activity centers are dependent on their direct support professionals. However, it is unclear what knowledge and skills these direct support professionals require to support these individuals in living a healthy lifestyle. Therefore, the aim of this study was to identify the needs of direct support professionals for supporting these people with moderate to profound intellectual disabilities to achieve and maintain a healthy lifestyle. Method Direct support professionals (n = 28) were interviewed with the use of a semi-structured protocol based on the theoretical domains framework. The interviews were analyzed with a theory-driven content analysis. Results The most frequently mentioned needs referred to the following domains of the theoretical domains framework: environmental context and resources (n = 27), social/professional role and identity (n = 25), social influence (n = 25), skills (n = 24), and knowledge (n = 23). Conclusion To support people with moderate to profound intellectual disabilities in leading a healthy lifestyle, direct support professionals (DSPs) primarily needed support related to the domain environmental context and resources. Within this domain available time, dealing with different seasons, and a healthy lifestyle policy in the organization need attention. Development of interventions targeting these DSPs needs is required.

Abstract: Individuals with intellectual disability (ID) need support
from direct support professionals (DSPs) to engage in a healthy
lifestyle. However, literature shows DSPs feel insufficiently
equipped to support a healthy lifestyle. Therefore, the aim of this
study is to develop a theory-based program for DSPs to support
physical activity and healthy nutrition for people with moderate to
profound levels of ID, and to design its evaluation. The
Intervention Mapping Protocol (IM) was followed to develop a theory-
based program for DSPs. The program evaluation consists of process
and feasibility 8 evaluations. This study provided a theory-based
program consisting of a training and education section with online
and face-to-face components to support DSPs in promoting health for
people with ID.

DOI: 10.1002/vetr.1681

Article Number: e1681

Accession Number: WOS:000791026300001

Abstract: Background: This study explored dog owners' concerns and experiences related to accessing veterinary healthcare during the COVID-19 pandemic. Methods: Data were obtained through two cross-sectional owner-completed surveys conducted in May (first nationwide lockdown) and October 2020 and owner-completed diaries (April–November 2020). Diaries and relevant open-ended survey questions were analysed qualitatively to identify themes. Survey responses concerning veterinary healthcare access were summarised and compared using chi-square tests. Results: During the initial months of the pandemic, veterinary healthcare availability worried 32.4% (n = 1431/4922) of respondents. However, between 23 March and 4 November 2020, 99.5% (n = 1794/1843) of those needing to contact a veterinarian managed to do so. Delays/cancellations of procedures affected 28.0% (n = 82/293) of dogs that owners planned to neuter and 34.2% (n = 460/1346) of dogs that owners intended to vaccinate. Qualitative themes included COVID-19 safety precautions, availability of veterinary healthcare and the veterinarian–client relationship. Conclusion: Veterinary healthcare availability concerned many owners during the COVID-19 pandemic. Access to veterinary healthcare for emergencies remained largely available, but prophylactic treatments were delayed for some dogs.

Short Title: Co-design of an oral health intervention (HABIT) delivered by health visitors for parents of children aged 9–12 months

DOI: 10.1186/s12889-022-14174-w

Article Number: 1818

Accession Number: WOS:000857835500003

Abstract: Background Dental caries (tooth decay) in children is a national public health problem with impacts on the child, their family and wider society. Toothbrushing should commence from the eruption of the first primary tooth. Health visitors are a key provider of advice for parents in infancy and are ideally placed to support families to adopt optimal oral health habits. HABILIT is a co-designed complex behaviour change intervention to support health visitors' oral health conversations with parents during the 9-12-month universal developmental home visit. Methods A seven stage co-design process was undertaken: (1) Preparatory meetings with healthcare professionals and collation of examples of good practice, (2) Co-design workshops with parents and health visitors, (3) Resource development and expert/peer review, (4) Development of an intervention protocol for health visitors, (5) Early-phase testing of the resources to explore acceptability, feasibility, impact and mechanism of action, (6) Engagement with wider stakeholders and refinement of the HABILIT intervention for wider use, (7) Verification, Review and Reflection of Resources. Results Following preparatory meetings with stakeholders, interviews and co-design workshops with parents and health visitors, topic areas and messages were developed covering six key themes. The topic areas provided a structure for the oral health conversation and supportive resources in paper-based and digital formats. A five-step protocol was developed with health visitors to guide the oral health conversation during the 9-12 month visit. Following training of health visitors, an early-phase feasibility study was undertaken with preliminary results presented at a dissemination event where feedback for further refinement of the resources and training was gathered. The findings, feedback and verification have led to further refinements to optimise quality, accessibility, fidelity and behaviour change theory. Conclusion The co-design methods ensured the oral health conversation and supporting resources used during the 9-12 month visit incorporated the opinions of families and Health Visitors as well as other key stakeholders throughout the development process. This paper provides key learning and a framework that can be applied to other healthcare settings. The structured pragmatic approach ensured that the intervention was evidence-based, acceptable and feasible for the required context.

Short Title: Strategies to implement evidence into practice to
improve palliative care: recommendations of a nominal group approach
with expert opinion leaders
ISSN: 1472–684X
DOI: 10.1186/s12904–015–0044–9
Article Number: 47
Accession Number: WOS:000361936000001
Abstract: Background: In the past decades, many new insights and
best practices in palliative care, a relatively new field in health
care, have been published. However, this knowledge is often not
implemented. The aim of this study therefore was to identify
strategies to implement improvement activities identified in a
research project within daily palliative care practice. Methods: A
nominal group technique was used with members of the IMPACT
consortium, being international researchers and clinicians in cancer
care, dementia care and palliative care. Participants identified and
prioritized implementation strategies. Data was analyzed
qualitatively using inductive coding. Results: Twenty international
clinicians and researchers participated in one of two parallel

nominal group sessions. The recommended strategies to implement results from a research project were grouped in five common themes: 1. Dissemination of results e.g. by publishing results tailored to relevant audiences, 2. Identification and dissemination of unique selling points, 3. education e.g. by developing e-learning tools and integrating scientific evidence into core curricula, 4. Stimulation of participation of stakeholders, and 5. consideration of consequences e.g. rewarding services for their implementation successes but not services that fail to implement quality improvement activities. Discussion: The added value of this nominal group study lies in the prioritisation by the experts of strategies to influence the implementation of quality improvement activities in palliative care. Efforts to ensure future use of scientific findings should be built into research projects in order to prevent waste of resources.

Title: New Home, New You: A retrospective mixed-methods evaluation of a health-related behavioural intervention programme supporting social housing tenants

Journal: Health Expectations

Volume: 26

Issue: 2

Pages: 752-764

Date: Apr

Short Title: New Home, New You: A retrospective mixed-methods evaluation of a health-related behavioural intervention programme supporting social housing tenants

ISSN: 1369-6513

DOI: 10.1111/hex.13700

Accession Number: WOS:000911504400001

Abstract: Background Social housing tenants are at greater risk of engaging in unhealthy behaviours than the general population. Housing association employees are in an ideal position to contribute positively to their tenants' health. 'New Home, New You' (NHNY) is a joint venture between a social housing association, a city council and a community healthcare provider in the South West of England. It was designed with the aim of improving the health and well-being of social housing tenants. Objectives The aim of this retrospective

evaluation was to establish whether social housing tenants were benefiting from this health-related behavioural intervention in terms of their mental well-being and health-related behaviours.

MethodsThis was a mixed-methods evaluation. The outcome evaluation was a secondary analysis of quantitative data collected during the NHNY project. The process of delivering and receiving the intervention was evaluated using qualitative, semi-structured interviews with housing officers and tenants who had participated in the programme. The development of the intervention was evaluated through a focus group and additional semistructured interviews with key stakeholders. Quantitative data were analysed using the Statistical Package for the Social Sciences. Qualitative interviews were analysed using thematic analysis.

ResultsSix key stakeholders and a total of seven housing officers from several teams and seven tenants were interviewed. Of the 1016 tenants who were invited to participate in NHNY, 226 enrolled in the programme. For participating tenants, the scope for health-related behaviour change was greatest in relation to eating and smoking. Small positive statistically significant changes in mental health were found between the 6- and 12-month mean score and between the baseline and the 12-month score.

ConclusionsThe findings indicate that NHNY may have been beneficial for some participating tenants. Housing officers can have a significant role in promoting health messages and embedding behaviour change among their tenants. Although the programme was implemented as a service improvement rather than a controlled trial and focused on a particular intervention and geographical area, other housing associations may find this evaluation useful for considering whether to adopt some of the principles applied in NHNY in other settings.

Patient or Public ContributionA social housing tenant representative provided input on the methodology and methods used to evaluate NHNY, as well as the information sheet.

Abstract: Despite the high prevalence of self-harm among young

people, as well as their extensive use of mobile apps for seeking support with their mental healthcare, it is unclear whether the design of mobile apps aimed at targeting self-harm is underpinned by behavior change techniques (BCTs). To systematically analyze and identify (a) what BCTs and (b) what theories are present in self-harm apps for young people in an attempt to understand their active components. Systematic searches in Apple store, followed by thorough screening, were conducted to identify free mobile apps targeting self-harm in young people. Five apps met the inclusion criteria and were used by trained researchers, who coded identified features against the BCT Taxonomy V1. Despite the majority of apps being underpinned by principles of Dialectical Behavior Therapy (DBT), no other information is available about specific theories underpinning these apps. Nineteen of the 93 BCTs were identified across the five apps. The most frequently used BCT was "Distraction" (54.2%), offering ideas for activities to distract users from self-harming. Other techniques that were used often were "Social Support (unspecified)" (27.0%) and "Behavior Substitution" (10.6%). This study provides the first analysis of BCTs present in mental health apps which are designed to target the reduction of self-harm in young people. Future research is needed to evaluate the effectiveness of the apps, as well as assess the effectiveness of the BCTs present.

Title: Factors predicting gains in moderate-to-vigorous physical activity in prostate cancer survivors on androgen deprivation therapy

Journal: Supportive Care in Cancer

Volume: 30

Issue: 11

Pages: 9011-9018

Date: Nov

Short Title: Factors predicting gains in moderate-to-vigorous physical activity in prostate cancer survivors on androgen deprivation therapy

ISSN: 0941-4355

DOI: 10.1007/s00520-022-07300-2

Accession Number: WOS:000838489900001

Abstract: Background Whether individual, environmental, and psychosocial factors predict changes in moderate-to-vigorous physical activity (MVPA) is poorly addressed in prostate cancer (PC) survivors undergoing androgen deprivation therapy (ADT). Purpose

This secondary analysis of a randomized controlled trial examined changes in MVPA following a supervised personal training (PT), supervised group-based (GROUP) program, or a home-based, smartphone-assisted exercise (HOME) intervention in PC survivors on ADT and explored individual, environmental, and psychosocial predictors of MVPA. Methods PC survivors on ADT underwent aerobic and resistance training for 6 months via PT, GROUP, or HOME. MVPA was captured via accelerometers and the Godin Leisure-Time Exercise Questionnaire. Changes in MVPA between groups were assessed using linear regression. The following predictors of MVPA were examined using Spearman correlations: the Neighborhood Environment Walkability Scale (NEWS); the Planning, Attitudes, and Behaviours (PAB) scale; the Relatedness to Others in Physical Activity Scale (ROPAS); and individual factors at baseline. Results Participants (n = 37) were 69.4 +/- 6.5 years old and 78.4% were on ADT for >= 3 months. Changes in accelerometry-based bouts and MVPA as well as self-reported MVPA did not differ between groups at 6 months. The Aesthetics domain of the NEWS questionnaire at baseline was the strongest predictor of positive MVPA changes (r = .66). Attitude (r = .64), planning (r = .57), and motivation (r = .50) at baseline were also predictive of engaging in higher MVPA throughout the intervention. Conclusion Changes in objective MVPA were modest. Additional emphasis on specific psychosocial and individual factors is important to inform theory-based interventions that can foster PA behavior change in PC survivors on ADT.

Abstract: Human energy behavior in buildings has been identified as one of the main opportunities with high energy saving potential for both residential and tertiary buildings. Even though a lot of research has been invested in the last decade on this domain, there are still certain aspects that remain controversial and unidentified, especially in terms of socio-economic characteristics. To address this challenge, a new survey is proposed, publicly available through Zenodo, that covers a variety of different aspects that include both technical and socio-cultural traits aiming to fully depict the factors/drivers that affect occupant energy-related behavior at tertiary buildings and correlate them with 15 known strategies of persuasion to motivate people to behave pro-environmentally. The survey was deployed in four EU countries, six different cities and seven buildings, resulting in a total of 330 responses. Among different results, the descriptive analyses show that even though 40% of the total sample was still hesitating to behave pro-environmentally at their workplace, over 90% of all respondents had a positive attitude towards it. Finally, the prescriptive analysis revealed that only five socio-economic factors actually show dependencies on persuasive principles, with the most promising one being the willingness of employees to join a pro-environmental campaign in the work center. Besides, it was found that Praising people for behaving energy efficiently showed correlation with more than one factor which is in line with the literature.

Title: Making Every Contact Count and Healthy Conversation Skills as very brief or brief behaviour change interventions: a scoping review

Journal: Journal of Public Health-Heidelberg

Date: 2021 Oct

Short Title: Making Every Contact Count and Healthy Conversation Skills as very brief or brief behaviour change interventions: a scoping review

ISSN: 2198-1833

DOI: 10.1007/s10389-021-01653-4

Accession Number: WOS:000707523200001

Abstract: Aim To identify and map the available evidence regarding the implementation of Making Every Contact Count and/or Healthy Conversation Skills for both staff delivering and service users receiving the brief or very brief intervention/s. Methods A scoping review approach was used to rapidly map and provide an overview of the relevant literature, identify gaps in knowledge, and inform further, related research. Articles investigating experiences, perceptions and impact of Making Every Contact Count and/or Healthy Conversation Skills were included. Quantitative, qualitative, and mixed methods studies were eligible for inclusion, as were reviews and reports. Results Twenty-two articles were included in total. Healthy Conversation Skills training was found to be acceptable, and had a positive impact on staff confidence and competence in supporting behaviour change, across studies. Some positive effects of intervention exposure on the sedentary behaviour and dietary quality of service users were evidenced. Changes in confidence following Making Every Contact Count training were varied, as was perceived acceptability of the intervention for staff. Two studies highlighted positive impacts of the intervention on service user health; however, statistical significance was not reported. The perceived barriers and facilitators of implementation for both interventions mapped mostly to 'Environmental Context and Resources' on the Theoretical Domains Framework. Conclusion Healthy Conversation Skills is an acceptable and effective behaviour change intervention that could provide a consistent approach to Making Every Contact Count training and evaluation. Further research is warranted to evaluate this approach for more staff and service user groups.

Title: Using theories and frameworks to understand how to reduce low-value healthcare: a scoping review

Journal: Implementation Science

Volume: 17

Issue: 1

Date: Jan

Short Title: Using theories and frameworks to understand how to reduce low-value healthcare: a scoping review

ISSN: 1748-5908

DOI: 10.1186/s13012-021-01177-1

Article Number: 6

Accession Number: WOS:000744978700001

Abstract: Background There is recognition that the overuse of procedures, testing, and medications constitutes low-value care which strains the healthcare system and, in some circumstances, can cause unnecessary stress and harm for patients. Initiatives across dozens of countries have raised awareness about the harms of low-value care but have had mixed success and the levels of reductions realized have been modest. Similar to the complex drivers of implementation processes, there is a limited understanding of the individual and social behavioral aspects of de-implementation. While researchers have begun to use theory to elucidate the dynamics of de-implementation, the research remains largely atheoretical. The use of theory supports the understanding of how and why interventions succeed or fail and what key factors predict success. The purpose of this scoping review was to identify and characterize the use of theoretical approaches used to understand and/or explain what influences efforts to reduce low-value care. **Methods** We conducted a review of MEDLINE, EMBASE, CINAHL, and Scopus databases from inception to June 2021. Building on previous research, 43 key terms were used to search the literature. The database searches identified 1998 unique articles for which titles and abstracts were screened for inclusion; 232 items were selected for full-text review. **Results** Forty-eight studies met the inclusion criteria. Over half of the included articles were published in the last 2 years. The Theoretical Domains Framework (TDF) was the most commonly used determinant framework (n = 22). Of studies that used classic theories, the majority used the Theory of Planned Behavior (n = 6). For implementation theories, Normalization Process Theory and COM-B were used (n = 7). Theories or frameworks were used primarily to identify determinants (n = 37) and inform data analysis (n = 31). Eleven types of low-value care were examined in the included studies, with prescribing practices (e.g., overuse, polypharmacy, and appropriate prescribing) targeted most frequently. **Conclusions** This scoping review provides a rigorous, comprehensive, and extensive synthesis of theoretical approaches used to understand and/or explain what factors influence efforts to reduce low-value care. The results of this review can provide direction and insight for future primary research to support de-implementation and the reduction of low-value care.

DOI: 10.1371/journal.pone.0271454

Article Number: e0271454

Accession Number: WOS:000911392100160

Abstract: Surgical specialties account for a high proportion of antimicrobial use in hospitals, and misuse has been widely reported resulting in unnecessary patient harm and antimicrobial resistance. We aimed to synthesize qualitative studies on surgical antimicrobial prescribing behavior, in hospital settings, to explain how and why contextual factors act and interact to influence practice. Stakeholder engagement was integrated throughout to ensure consideration of varying interpretive repertoires and that the findings were clinically meaningful. The meta-ethnography followed the seven phases outlined by Noblit and Hare. Eight databases were systematically searched without date restrictions. Supplementary searches were performed including forwards and backwards citation chasing and contacting first authors of included papers to highlight further work. Following screening, 14 papers were included in the meta-ethnography. Repeated reading of this work enabled identification of 48 concepts and subsequently eight overarching concepts: hierarchy; fear drives action; deprioritized; convention trumps evidence; complex judgments; discontinuity of care; team dynamics; and practice environment. The overarching concepts interacted to varying degrees but there was no consensus among stakeholders regarding an order of importance. Further abstraction of the overarching concepts led to the development of a conceptual model and a line-of-argument synthesis, which posits that social and structural mediators influence individual complex antimicrobial judgements and currently skew practice towards increased and unnecessary antimicrobial use. Crucially, our model provides insights into how we might 'tip the balance' towards more evidence-based antimicrobial use. Currently, healthcare workers deploy antimicrobials across the surgical pathway as a safety net to allay fears, reduce uncertainty and risk, and to mitigate against personal blame. Our synthesis indicates that prescribing is unlikely to change until the social and structural mediators driving practice are addressed. Furthermore, it suggests that research specifically exploring the context for effective and sustainable quality improvement stewardship initiatives in surgery is now urgent.

Pages: 431-440

Date: Aug

Short Title: The determinants of antimicrobial prescribing among hospital doctors in England: a framework to inform tailored stewardship interventions

ISSN: 0306-5251

DOI: 10.1111/bcp.12953

Accession Number: WOS:000382509500011

Abstract: AIM Little is known about the determinants of antimicrobial prescribing behaviour (APB), how they vary between hospital prescribers or the mechanism by which interventions are effective. Yet, interventions based on a sound theoretical understanding of APB are more likely to be successful in changing outcomes. This study sought to quantify the potential determinants of APB among hospital doctors in south-west England. METHODS This multicentre, quantitative study employed a closed answer questionnaire to garner hospital doctors' views on factors influencing their APB. Underlying constructs within the data were identified using exploratory factor analysis and subsequent pairwise comparisons assessed for variance between groups of prescribers. RESULTS The questionnaire was completed by 301 doctors across four centres (response rate \geq 74%) and three key factors were identified: autonomy, guidelines adherence and antibiotic awareness. The internal consistency for the questionnaire scale and for each factor subscale was good ($\alpha \geq 0.7$). Subgroup analysis identified significant differences between groups of prescribers: autonomy scores increased with grade until at the specialist trainee level ($P \leq 0.009$), foundation doctors scored higher for guidelines adherence than consultants ($P = 0.004$) and specialist trainees ($P = 0.003$) and United Kingdom trained doctors scored higher than those trained abroad for antibiotic awareness ($P < 0.0005$). Scores did not vary significantly between doctors from different centres. CONCLUSION Autonomy, guidelines adherence and antibiotic awareness were identified as important factors relevant to APB, which vary with experience and training. A theoretical framework is offered to facilitate development of more effective, tailored interventions to

change APBs.

ISSN: 1869-6716

DOI: 10.1093/tbm/ibac121

Accession Number: WOS:000968629700001

Abstract: Psychosocial distress screening, mandated by the American College Surgeons' Commission on Cancer, continues to be implemented across cancer centers nationwide. Although measuring distress is critical to identifying patients who may benefit from additional support, several studies suggest that distress screening may not actually increase patients' utilization of psychosocial services. While various investigators have identified barriers that may impede effective implementation of distress screening, we posit that patients' intrinsic motivation, which we term patients' willingness, may be the biggest predictor for whether cancer patients choose to engage with psychosocial services. In this commentary, we define patient willingness towards psychosocial services as a novel construct, distinct from the intention toward a certain behavior described across pre-existing models of health behavior change. Further, we offer a critical perspective of models of intervention design that focus on acceptability and feasibility as preliminary outcomes thought to encompass the willingness construct described herein. Finally, we summarize several health service models that successfully integrate psychosocial services alongside routine oncology care. Overall, we present an innovative model that acknowledges barriers and facilitators and underscores the critical role of willingness in health behavior change. Consideration of patients' willingness toward psychosocial care will move the field of psychosocial oncology forward in clinical practice, policy initiatives, and study design.

Short Title: "I have travelled along on my own"-Experiences of seeking help for serious non-COVID health problems during the COVID-19 pandemic: A qualitative study

ISSN: 1359-107X

DOI: 10.1111/bjhp.12615

Accession Number: WOS:000830871200001

Abstract: Objectives During COVID-19 the UK general population has been given strong messages to stay at home. Concurrently unprecedented changes occurred in healthcare access with moves to remote/triage systems. Data have shown that the number of people accessing healthcare services decreased and there are significant concerns that the pandemic has negatively affected help-seeking for serious conditions, with potentially increased morbidity and mortality. An understanding of help-seeking is urgently needed to inform public campaigns. We aimed to develop an in-depth, theory-based understanding of how, when and why people sought help for potentially serious symptoms (e.g., related to major cardiovascular events or cancer diagnoses) during the pandemic, and what influenced their decisions. Design Qualitative semi-structured interviews. Methods We interviewed 25 adults recruited through a targeted social media campaign. Interviews were conducted via telephone or online platform. Our topic guide was informed by the Model of Pathways to Treatment and the Capability-Opportunity-Motivation-Behaviour model. Results The analysis identified four main themes: Delay in recognition, Holding on to concerns, Weighing it up and Long-term impacts. Multiple societal and environmental factors influenced participants' help-seeking and motivation, capability and opportunity to seek help, with long-term impacts on well-being and future help-seeking. Conclusions There is a need for clear guidance about pathways to raise concerns about symptoms and gain advice while usual healthcare contacts are paused or stopped.

Recommendations for future interventions to support help-seeking during pandemics include clearer messaging, co-produced with end-users, on when, where and how to seek help.

Short Title: Media multitasking and cognitive control: A systematic review of interventions
ISSN: 0747-5632
DOI: 10.1016/j.chb.2018.11.031
Accession Number: WOS:000457504100032
Abstract: Extending from the increasing prevalence of media in personal, social, and work environments, research has indicated that media multitasking (i.e., engaging in more than one media or non-media activity simultaneously) is associated with changes in cognitive control and failures of everyday executive functioning. While more research is required to elucidate these associations, the emergent trend, while small, suggests a negative relationship between high levels of media multitasking and aspects of cognitive control. In response, researchers have called for studies investigating the remedial efficacy of interventions targeting the effects of media multitasking on executive functioning. To provide a foundation for such research this systematic review integrates current findings concerning such interventions. Four databases (Web of Science, Scopus, Academic Search Premier, and PsycINFO) were searched to identify relevant studies, producing 2792 results. 15 studies met the eligibility criteria. At the time of review current interventions fall into three categories: awareness, restriction, and mindfulness. While some interventions have been effective at changing behaviour or cognitive outcomes, no single category contains interventions which, categorically, produced improvements in attention-related performance. Extending from this synthesis key research gaps are identified, with suggestions for future research proposed.

DOI: 10.1007/s00134-017-4685-4

Accession Number: WOS:000397314800006

Abstract: Purpose: To identify, evaluate and synthesise studies examining the barriers and enablers for survivors of critical illness to participate in physical activity in the ICU and post-ICU settings from the perspective of patients, caregivers and healthcare providers. Methods: Systematic review of articles using five electronic databases: MEDLINE, CINAHL, EMBASE, Cochrane Library, Scopus. Quantitative and qualitative studies that were published in English in a peer-reviewed journal and assessed barriers or enablers for survivors of critical illness to perform physical activity were included. Prospero ID: CRD42016035454. Results: Eighty-nine papers were included. Five major themes and 28 sub-themes were identified, encompassing: (1) patient physical and psychological capability to perform physical activity, including delirium, sedation, illness severity, comorbidities, weakness, anxiety, confidence and motivation; (2) safety influences, including physiological stability and concern for lines, e.g. risk of dislodgement; (3) culture and team influences, including leadership, interprofessional communication, administrative buy-in, clinician expertise and knowledge; (4) motivation and beliefs regarding the benefits/risks; and (5) environmental influences, including funding, access to rehabilitation programs, staffing and equipment. Conclusions: The main barriers identified were patient physical and psychological capability to perform physical activity, safety concerns, lack of leadership and ICU culture of mobility, lack of interprofessional communication, expertise and knowledge, and lack of staffing/equipment and funding to provide rehabilitation programs. Barriers and enablers are multidimensional and span diverse factors. The majority of these barriers are modifiable and can be targeted in future clinical practice.

Short Title: What factors affect implementation of early rehabilitation into intensive care unit practice? A qualitative study with clinicians

ISSN: 0883-9441

DOI: 10.1016/j.jcsrc.2016.11.005

Accession Number: WOS:000401100300025

Abstract: Purpose: To identify the barriers and enablers that influence clinicians' implementation of early rehabilitation in critical care. Materials and methods: Qualitative study involving 26 multidisciplinary participants who were recruited using purposive sampling. Four focus groups were conducted using semistructured questions to explore attitudes, beliefs, and experiences. Data were transcribed verbatim and thematic analysis was performed. Results: Six themes emerged, as follows: (1) the clinicians' expectations and knowledge (including rationale for rehabilitation, perceived benefits, and experience), (2) the evidence for and application of rehabilitation (including beliefs regarding when to intervene), (3) patient factors (including prognosis, sedation, delirium, cooperation, motivation, goals, and family), (4) safety considerations (including physiological stability and presence of devices or lines), (5) environmental influences (staffing, resources, equipment, time, and competing priorities), and (6) culture and teamwork. Key strategies identified to facilitate rehabilitation included addressing educational needs for all multidisciplinary team members, supporting junior nursing staff, and potential expansion of physiotherapy staffing hours to closer align with the 24-hour patient care model. Conclusions: Key barriers to implementation of early rehabilitation in critical care are diverse and include both clinician- and health care system-related factors. Research targeted at bridging this evidence-practice gap is required to improve provision of rehabilitation. (C) 2016 Elsevier Inc. All rights reserved.

Title: Improved confidence in performing nutrition and physical
activity behaviours mediates behavioural change in young adults:
Mediation results of a randomised controlled mHealth intervention

Journal: Appetite

Volume: 108

Pages: 425-433

Date: Jan

Short Title: Improved confidence in performing nutrition and
physical activity behaviours mediates behavioural change in young
adults: Mediation results of a randomised controlled mHealth
intervention

ISSN: 0195-6663

DOI: 10.1016/j.appet.2016.11.005

Accession Number: WOS:000390622000050

Abstract: Background: The burden of weight gain disproportionately
affects young adults. Understanding the underlying behavioural
mechanisms of change in mHealth nutrition and physical activity
interventions designed for young adults is important for enhancing
and translating effective interventions. Purpose: First, we
hypothesised that knowledge, self-efficacy and stage-of-change for
nutrition and physical activity behaviours would improve, and
second, that self-efficacy changes in nutrition and physical
activity behaviours mediate the behaviour changes observed in an
mHealth RCT for prevention of weight gain. Methods: Young adults,
aged 18-35 years at risk of weight gain (n = 250) were randomly
assigned to an mHealth-program, TXT2BFiT, consisting of a three-
month intensive phase and six-month maintenance phase or to a
control group. Self-reported online surveys at baseline, three- and
nine-months assessed nutrition and physical activity behaviours,
knowledge, self-efficacy and stage-of-change. The mediating effect
of self-efficacy was assessed in multiple PROCESS macro-models for
three- and nine-month nutrition and physical activity behaviour
change. Results: Young adults randomised to the intervention
increased and maintained knowledge of fruit requirements (P = 0.029)
compared to controls. Intervention participants' fruit and takeaway
behaviours improved to meet recommendations at nine months, with a
greater proportion progressing to action or maintenance stage-of-
change (P < 0.001 and P = 0.012 respectively) compared to controls.
Intervention participants' vegetable and physical activity
behaviours did not meet recommendations, thereby halting progress to
action or maintenance stage-of-change. Indirect effects of improved

nutrition and physical activity behaviours at three- and nine-months in the intervention group were explained by changes in self-efficacy, accounting for 8%–37% of the total effect. Conclusions: This provides insights into how the mHealth intervention achieved part of its effects and the importance of improving self-efficacy to facilitate improved eating and physical activity behaviours in young adults. Abstract: INTRODUCTION New packaging of tobacco products, with plain packaging and new enlarged health warnings, was made compulsory in France in 2017. This study aims to measure the impact of new packaging on smokers' embarrassment and their motivation to quit smoking. METHODS Data from Sante publique France 2016, 2017 and 2018 Health Barometer surveys were used. These randomized surveys were conducted by telephone with samples of 15216 (2016), 25319 (2017), and 9074 (2018) people aged 18–75 years. The association between smokers' embarrassment and the influence of new packaging on motivation to quit smoking was studied using multivariate logistic regressions. RESULTS After the introduction of new plain packaging, the proportion of smokers who felt embarrassed taking out their pack of cigarettes in plain sight because of its appearance doubled in 2017 (11.9%, 95% CI: 10.2–13.9 vs 5.9%, 95% CI: 4.4–7.8 in 2016, $p < 0.001$) and continued to increase in 2018 (15.5%, 95% CI: 13.7–17.5, $p < 0.01$). In 2018, women were more embarrassed than men (OR=2.0; 95% CI: 1.5–2.6, $p < 0.001$). In 2018, 26.8% (95% CI: 24.6–29.1) of smokers said the appearance of a pack of cigarettes motivated them to quit, and 22.5% (95% CI: 18.3–27.2) ex-smokers cited it as having motivated them to quit. Smokers who were embarrassed by displaying their pack were more likely to be motivated to quit because of the pack's appearance. People with

higher incomes were less likely to report motivation to quit due to the pack than people with the lowest income (OR=0.5; 95% CI: 0.3–0.7, $p<0.001$). CONCLUSIONS In the French context, the new plain packaging of tobacco products probably had an impact on smokers' perception of tobacco by increasing the embarrassment they felt when they took out their pack of cigarettes in plain sight. It also influenced the motivation to quit smoking, and more generally, it could contribute to the denormalization of tobacco.

Short Title: Firearm injury—a preventable public health issue

ISSN: 2468–2667

Accession Number: WOS:000928270600014

Abstract: Firearm-related injury is a leading cause of death disproportionately affecting adolescents and young adults across the world, especially in the Americas. Little progress has been made over the past four decades, as inaction and the adoption of ineffective or unevidenced interventions have become commonplace. The COVID-19 pandemic reconfigured health systems towards prevention and harm reduction, sharpened public attention to the burden of preventable deaths, and inspired a fresh ambition of eliminating avertable deaths. In this Viewpoint, we argue that preventing firearm injury should garner bolder action in post-pandemic public health and we present a case for reducing the global burden of firearm injury supported by evidence and international examples. Crucially, we aim to guide policy making in directions that end the cycle of grief, anger, activism, deflection, and inaction and create more peaceful and fairer societies.

Short Title: Impact of COVID-19 on digital practice in UK paediatric speech and language therapy and implications for the future: A national survey

ISSN: 1368-2822

DOI: 10.1111/1460-6984.12750

Accession Number: WOS:000835828100001

Abstract: Background The COVID-19 pandemic and subsequent measures to reduce transmission risk has led to unprecedented digital transformation across health, education and social care services. This includes UK paediatric speech and language therapy (SLT), which sits at the crossroads of these services. Given the rapid onset of this pandemic-induced digital transition, there is now a need to capture, reflect and learn from the SLT profession so that benefits can be sustained, and barriers addressed. Aims To survey the impact of COVID-19 remote working on UK paediatric SLTs' digital views and experiences using the Capability, Opportunity, Motivation and Behaviour (COM-B) model. Methods & Procedures An online survey was conducted from May to October 2020. Respondents were asked to rate their use of technology in service delivery before and during the pandemic, to select factors facilitating digital practice, and to provide open-response aspirations for the future role of technology in paediatric SLT which were analysed thematically using the COM-B behaviour change model. Outcomes & Results A total of 424 UK paediatric SLTs responded to the survey. Findings indicate a marked increase in clinicians' perception of their frequency, convenience and confidence with digital practice during COVID-19 compared with before the pandemic. Respondents identified that specialist training (27%), funding for workplace devices (22%) and supportive leadership (19%) were most likely to facilitate sustained digital practice. Clinicians hoped for a blended approach going forward with technology enhancing existing best practice. Further prominent themes included digital accessibility for all and maintaining the increased opportunity for multidisciplinary working that videoconferencing has afforded. More service-specific aspirations were bespoke technological solutions as well as parents/carers being able to engage remotely with school-based provisions. Conclusions & Implications During COVID-19, paediatric SLTs' recognition and acceptance of how technology can augment practice has accelerated, with particular value being placed on inclusivity, choice, training, resources, leadership and indication of effectiveness. These are important considerations to help guide the profession towards the long-term digital enhancement of SLT services. WHAT THIS PAPER ADDS What is already known on the subject The COVID-19 pandemic led to an unprecedented interest in the use of technology across SLT practice. Studies are emerging nationally and internationally to identify the digital priorities of the SLT workforce, the areas of digital SLT provision that are thriving or lacking, and the evidence to guide clinical practice and service development. What this study adds to existing knowledge This is the first UK-wide COVID-19 survey solely

focusing on the digital practice of paediatric SLTs. The findings provide critical insights into SLT perception of how practice has been impacted in the early stages of the COVID-19 pandemic, including digital trends that are service, condition and demographic specific. Tools and channels required to support sustained beneficial change are also discussed. What are the potential or actual clinical implications of this work? This paper demonstrates the potential for digital solutions to enhance SLT practice, as long as implementation is guided by clinicians' experiences and perspectives. The findings lay groundwork for service development work, such as the creation of training packages, updating of clinical guidelines and care pathways, and development of processes to ensure equitable allocation of evidence-based resources.

Title: Using Participatory Design to Engage Physicians in the Development of a Provider-Level Performance Dashboard and Feedback System

Journal: Joint Commission Journal on Quality and Patient Safety

Volume: 48

Issue: 3

Pages: 165-172

Date: Mar

Short Title: Using Participatory Design to Engage Physicians in the Development of a Provider-Level Performance Dashboard and Feedback System

ISSN: 1553-7250

DOI: 10.1016/j.jcjq.2021.10.003

Accession Number: WOS:000763291600006

Abstract: Problem Definition: Performance feedback, in which clinicians are given data on select metrics, is widely used in the context of quality improvement. However, there is a lack of practical guidance describing the process of developing performance feedback systems. Initial Approach: This study took place at the University of California, San Francisco (UCSF) with hospitalist physicians. Participatory design methodology was used to develop a performance dashboard and feedback system. Twenty hospitalist physicians participated in a series of six design sessions and two surveys. Each design session and survey systematically addressed key components of the feedback system, including design, metric selection, data delivery, and incentives. The Capability Opportunity Motivation and Behavior (COM-B) model was then used to identify behavior change interventions to facilitate engagement with the dashboard during a pilot implementation. Key Insights, Lessons

Learned: In regard to performance improvement, physicians preferred collaboration over competition and internal motivation over external incentives. Physicians preferred that the dashboard be used as a tool to aid in clinical practice improvement and not punitively by leadership. Metrics that were clinical or patient-centered were perceived as more meaningful and more likely to motivate behavior change. Next Steps: The performance dashboard has been introduced to the entire hospitalist group, and evaluation of implementation continues by monitoring engagement and physician attitudes. This will be followed by targeted feedback interventions to attempt to improve performance.

Accession Number: WOS:000826026400001

Abstract: Healthcare professional (HCP) behaviours are actions performed by individuals and teams for varying and often complex patient needs. However, gaps exist between evidence-informed care behaviours and the care provided. Implementation science seeks to develop generalizable principles and approaches to investigate and address care gaps, supporting HCP behaviour change while building a cumulative science. We highlight theory-informed approaches for defining HCP behaviour and investigating the prevalence of evidence-based care and known correlates and interventions to change professional practice. Behavioural sciences can be applied to develop implementation strategies to support HCP behaviour change and provide valid, reliable tools to evaluate these strategies. There are thousands of different behaviours performed by different HCPs across many contexts, requiring different implementation approaches. HCP behaviours can include activities related to promoting health and preventing illness, assessing and diagnosing illnesses, providing treatments, managing health conditions,

managing the healthcare system and building therapeutic alliances. The key challenge is optimising behaviour change interventions that address barriers to and enablers of recommended practice. HCP behaviours may be determined by, but not limited to, Knowledge, Social influences, Intention, Emotions and Goals. Understanding HCP behaviour change is a critical to ensuring advances in health psychology are applied to maximize population health.

Short Title: Evaluation of an injury prevention programme (Prep-to-Play) in women and girls playing Australian Football: design of a pragmatic, type III, hybrid implementation-effectiveness, stepped-wedge, cluster randomised controlled trial

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-062483

Article Number: e062483

Accession Number: WOS:000854148700001

Abstract: Introduction Due to the increase in participation and risk of anterior cruciate ligament (ACL) injuries and concussion in women's Australian Football, an injury prevention programme (Prep-to-Play) was codesigned with consumers (eg, coaches, players) and stakeholders (eg, the Australian Football League). The impact of supported and unsupported interventions on the use of Prep-to-Play (primary aim) and injury rates (secondary aim) will be evaluated in women and girls playing community Australian Football. Methods and analysis This stepped-wedge, cluster randomised controlled trial will include >= 140 teams from U16, U18 or senior women's

competitions. All 10 geographically separated clusters (each containing ≥ 14 teams) will start in the control (unsupported) phase and be randomised to one of five dates (or 'wedges') during the 2021 or 2022 season to sequentially transition to the intervention (supported Prep-to-Play), until all teams receive the intervention. Prep-to-Play includes four elements: a neuromuscular training warm-up, contact-focussed football skills (eg, tackling), strength exercises and education (eg, technique cues). When transitioning to supported interventions, study physiotherapists will deliver a workshop to coaches and player leaders on how to use Prep-to-Play, attend team training at least two times and provide ongoing support. In the unsupported phase, team will continue usual routines and may freely access available Prep-to-Play resources online (eg, posters and videos about the four elements), but without additional face-to-face support. Outcomes will be evaluated throughout the 2021 and 2022 seasons (similar to 14 weeks per season). Primary outcome: use of Prep-to-Play will be reported via a team designate (weekly) and an independent observer (five visits over the two seasons) and defined as the team completing 75% of the programme, two-thirds (67%) of the time. Secondary outcomes: injuries will be reported by the team sports trainer and/or players. Injury definition: any injury occurring during a football match or training that results in: (1) being unable to return to the field of play for that match or (2) missing \geq one match. Outcomes in the supported and unsupported phases will be compared using a generalised linear mixed model adjusting for clustering and time. Due to the type III hybrid implementation-effectiveness design, the study is powered to detect a improvement in use of Prep-to-Play and a reduction in ACL injuries. Ethics and dissemination La Trobe University Ethics Committee (HREC 20488) approved. Coaches provided informed consent to receive the supported intervention and players provided consent to be contacted if they sustained a head or knee injury. Results will be disseminated through partner organisations, peer-reviewed publications and scientific conferences.

Short Title: "I Smoked That Cigarette, and It Calmed Me Down": A Qualitative Analysis of Intrapersonal, Social, and Environmental Factors Influencing Decisions to Smoke Among Youth Experiencing Homelessness

ISSN: 1462-2203

DOI: 10.1093/ntr/ntab196

Accession Number: WOS:000753113600014

Abstract: Introduction Approximately 70% of youth experiencing homelessness smoke cigarettes; many try to quit and are interested in formal smoking cessation programs. The purpose of this study was to describe the intrapersonal, social, and environmental contexts associated with the most recent smoking experience among youth experiencing homelessness and (2) identify differences in contextual factors by age and willingness to quit. Methods Thirty-six youth experiencing homelessness aged 14-24 years and who reported current smoking were recruited from a drop-in center in a Midwestern city. Semi-structured in-person interviews were analyzed to understand smoking behaviors. Results Two-thirds of participants reported stress and nicotine dependence as primary reasons for smoking, and older youth (aged 18-24 years) reported smoking to de-escalate negative emotions associated with stressful events. For 25% of participants, and especially older youth, smoking was described as part of a routine. Over 80% of participants smoked outside at the homeless drop-in center or the places they lived. Social prompts from drop-in center peers regularly preempted smoking. Younger youth (aged 14-17 years) reported smoking socially while older youth were more likely to smoke alone. Conclusions For youth experiencing homelessness, smoking is integrated into daily life and is often used to manage stress associated with homelessness and engage socially with homeless peers. Multicomponent interventions to reduce structural stressors specific to homelessness, change social smoking norms (environmental and social context), and address stress management and nicotine dependence (intrapersonal context) are needed to support smoking cessation among youth experiencing homelessness. Implications Youth experiencing homelessness overwhelmingly described how daily stressors associated with homelessness and nicotine dependence preceded recent smoking. Older

youth (aged 18–24 years) also reported smoking as "routine", which likely underscores nicotine dependence in this group. Younger youth (aged 14–17 years) described social smoking. Researchers must develop optimized multilevel interventions to support youth experiencing homelessness who want to quit smoking. Interventions directly targeting social determinants of stress (e.g., poverty, housing instability, food insecurity) and linkages to supportive services are needed. Complementary strategies to address stress coping and nicotine dependence (intrapersonal context) and social smoking norms (social and environmental context) are also necessitated.

Title: Psychosocial factors influencing smoking relapse among youth experiencing homelessness: A qualitative study

Journal: Plos One

Volume: 17

Issue: 7

Date: Jul

Short Title: Psychosocial factors influencing smoking relapse among youth experiencing homelessness: A qualitative study

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0270665

Accession Number: WOS:000860587700004

Abstract: ObjectivesIn the United States, up to 70% of youth experiencing homelessness smoke cigarettes. Many are interested in quitting; however, little is known about psychosocial factors influencing smoking relapse in this population. This study, part of a larger project to develop an optimized smoking cessation intervention for youth experiencing homelessness, aimed to describe how psychosocial factors influence smoking relapse in this group. MethodsThis study describes the smoking relapse experiences of 26 youth tobacco users, aged 14–24 years, who were recruited from a homeless drop-in center in Ohio. We conducted semi-structured interviews to understand how stress, opportunity, and coping contribute to smoking relapse. ResultsFive themes emerged from the data: (1) smoking as a lapse in emotional self-regulation in response to stress; (2) smoking as active emotional self-regulation in response to stress; (3) social opportunities facilitate smoking in the context of emotion-focused stress coping; (4) problem-focused stress coping; and (5) opportunity facilitates smoking relapse.

Conclusions Stress was a primary driver of smoking relapse among youth experiencing homelessness, yet social and environmental opportunities to smoke also precipitated relapse. Interventions to improve abstinence among this population should target foundational stressors, coping skills, social supports, and nicotine dependence.

Title: The role of athlete support personnel in preventing doping: a qualitative study of a rugby union academy

Journal: Qualitative Research in Sport Exercise and Health

Volume: 15

Issue: 1

Pages: 70-88

Date: Jan

Short Title: The role of athlete support personnel in preventing doping: a qualitative study of a rugby union academy

ISSN: 2159-676X

DOI: 10.1080/2159676x.2022.2086166

Accession Number: WOS:000814123900001

Abstract: Global anti-doping policy indicates that athlete support personnel (ASP, e.g. doctors, nutritionists) can play an important role in fostering supportive environments that protect against intentional and inadvertent doping. Yet, research into ASP anti-doping roles is limited and no study has examined how (if at all) different members of ASP work together. Therefore, this study investigated anti-doping roles of ASP in a single sports club environment via semi-structured interviews. Through inductive reflexive thematic analysis, three overarching themes were constructed: 1) Everyone has responsibility for anti-doping, but most of the work rests unevenly on a few shoulders, 2) Education is fundamental to doping prevention, and 3) (Preventing doping) It's all about the way we work with players and each other. As the first study of its kind, the findings indicated that actions taken to prevent doping varied across ASP working together in the same environment. The nutritionist and medical staff were most active in anti-doping efforts and least active were strength and conditioning coaches. Factors underpinning anti-doping roles were individuals' relevant expertise/training and overall job responsibilities (e.g. supplements, medications) related to risk of doping. Staff also connected their doping prevention efforts to the club's person-centred philosophy, which prioritised 'individualisation' and supportive relationships. While the data indicates potential for anti-doping responsibilities to be shared amongst ASP who work well together and trust one another, it revealed that reliance on one or

two ASP in any environment might allow other ASP to neglect their opportunity to have a positive influence on players' doping-related decisions.

Article Number: e068164

Accession Number: WOS:000891257700003

Abstract: ObjectivesTo determine the feasibility of a patient-education booklet to support patients with low back pain (LBP) to reduce paracetamol intake. DesignSingle group, repeated measures feasibility study. SettingCommunity. ParticipantsAdults experiencing LBP of any kind and self-reporting consumption of paracetamol for LBP weekly for at least 1 month were invited to participate.

InterventionParticipants received a patient-education booklet 1 week after the baseline measures were collected. The intervention was designed to change beliefs, increase knowledge and self-efficacy to deprescribe paracetamol for their LBP and create discussion with a health professional through the mechanisms of motivation, capacity and opportunity. Primary outcome measuresFeasibility of recruitment procedures, data collection and acceptability of the intervention.

Secondary outcome measuresChanges in motivation, self-efficacy, opportunity to deprescribe paracetamol for their LBP, paracetamol usage and LBP clinical outcomes at baseline, 1-week and 1-month follow-up. ResultsA total of 24 participants were recruited into the study within the timeframe of 3 months from study advertisement and all completed the study follow-up. There were no missing data for any outcome measure across all follow-up points, 22 (91.6%) participants were willing to participate in a future randomised control trial (RCT) and over 60% of participants responded positively to questions regarding acceptability of the patient-educational booklet. Overall, at the 1-month follow-up,

approximately two thirds (15/24) of participants had an increase in motivation and self-efficacy scores and had discussed or intended to discuss their paracetamol use for LBP with a health professional. Conclusions The results of this study demonstrate that the patient-education booklet is feasible to implement, and both the intervention and study design were well-received by participants. This study supports the undertaking an RCT to assess the effects of the patient-education booklet on deprescribing paracetamol in people with LBP.

DOI: 10.1186/1748-5908-9-38

Article Number: 38

Accession Number: WOS:000335605500001

Abstract: Background: Stroke is a leading cause of death and disability internationally. One of the three effective interventions in the acute phase of stroke care is thrombolytic therapy with tissue plasminogen activator (tPA), if given within 4.5 hours of onset to appropriate cases of ischaemic stroke. Objectives: To test the effectiveness of a multi-component multidisciplinary collaborative approach compared to usual care as a strategy for increasing thrombolysis rates for all stroke patients at intervention hospitals, while maintaining accepted benchmarks for low rates of intracranial haemorrhage and high rates of functional outcomes for both groups at three months. Methods and design: A cluster randomised controlled trial of 20 hospitals across 3 Australian states with 2 groups: multi-component multidisciplinary collaborative intervention as the experimental group and usual care

as the control group. The intervention is based on behavioural theory and analysis of the steps, roles and barriers relating to rapid assessment for thrombolysis eligibility; it involves a comprehensive range of strategies addressing individual-level and system-level change at each site. The primary outcome is the difference in tPA rates between the two groups post-intervention. The secondary outcome is the proportion of tPA treated patients in both groups with good functional outcomes (modified Rankin Score (mRS <2) and the proportion with intracranial haemorrhage (mRS >= 2), compared to international benchmarks. Discussion: TIPS will trial a comprehensive, multi-component and multidisciplinary collaborative approach to improving thrombolysis rates at multiple sites. The trial has the potential to identify methods for optimal care which can be implemented for stroke patients during the acute phase. Study findings will include barriers and solutions to effective thrombolysis implementation and trial outcomes will be published whether significant or not.

Short Title: How can we improve stroke thrombolysis rates? A review of health system factors and approaches associated with thrombolysis administration rates in acute stroke care

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0414-6

Article Number: 51

Accession Number: WOS:000374524200001

Abstract: Background: Thrombolysis using intravenous (IV) tissue plasminogen activator (tPA) is one of few evidence-based acute stroke treatments, yet achieving high rates of IV tPA delivery has been problematic. The 4.5-h treatment window, the complexity of determining eligibility criteria and the availability of expertise and required resources may impact on treatment rates, with barriers encountered at the levels of the individual clinician, the social context and the health system itself. The review aimed to describe health system factors associated with higher rates of IV tPA administration for ischemic stroke and to identify whether system-focussed interventions increased tPA rates for ischemic stroke. Methods: Published original English-language research from four electronic databases spanning 1997–2014 was examined. Observational studies of the association between health system factors and tPA rates were described separately from studies of system-focussed intervention strategies aiming to increase tPA rates. Where study outcomes were sufficiently similar, a pooled meta-analysis of outcomes was conducted. Results: Forty-one articles met the inclusion criteria: 7 were methodologically rigorous interventions that met the Cochrane Collaboration Evidence for Practice and Organization of Care (EPOC) study design guidelines and 34 described observed associations between health system factors and rates of IV tPA. System-related factors generally associated with higher IV tPA rates were as follows: urban location, centralised or hub and spoke models, treatment by a neurologist/ stroke nurse, in a neurology department/stroke unit or teaching hospital, being admitted by ambulance or mobile team and stroke-specific protocols. Results of the intervention studies suggest that telemedicine approaches did not consistently increase IV tPA rates. Quality improvement strategies appear able to provide modest increases in stroke thrombolysis (pooled odds ratio = 2.1, p = 0.05). Conclusions: In order to improve IV tPA rates in acute stroke care, specific health system factors need to be targeted. Multi-component quality improvement approaches can improve IV tPA rates for stroke, although more thoughtfully designed and well-reported trials are required to safely increase rates of IV tPA to eligible stroke patients. Date: Jul

Short Title: Pharmacogenomic testing: perception of clinical utility, enablers and barriers to adoption in Australian hospitals

ISSN: 1444-0903

DOI: 10.1111/imj.15719

Accession Number: WOS:000778060300001

Abstract: Background Despite healthcare professionals (HCP) endorsing the clinical utility of pharmacogenomics testing, use in clinical practice is limited. Aims To assess HCP' perceptions of pharmacogenomic testing and identify barriers to implementation. Methods HCP involved in prescribing decisions at three hospitals in Sydney, Australia, were invited to participate. The online survey assessed perceptions of pharmacogenomic testing, including: (i) demographic and practice variables; (ii) use, knowledge and confidence; (iii) perceived benefits; (iv) barriers to implementation; and (v) operational and/or system changes and personnel required to implement on site. Results HCP were predominantly medical practitioners (75/107) and pharmacists (25/107). HCP perceived pharmacogenomic testing was beneficial to identify reasons for drug intolerance (85/95) and risk of side-effects (86/95). Although testing was considered relevant to their practice (79/100), few HCP (23/100) reported past or intended future use (26/100). Few HCP reported confidence in their ability to identify indications for pharmacogenomic testing (14/107), order tests (19/106) and communicate results with patients (16/107). Lack of clinical practice guidelines (62/79) and knowledge (54/77) were identified as major barriers to implementation of pharmacogenomics. Comprehensive reimbursement for testing and clinical practice guidelines, alongside models-of-care involving multidisciplinary teams and local clinical champions were suggested as strategies to facilitate implementation of pharmacogenomic testing into practice. Conclusions Pharmacogenomic testing was considered important to guide drug selection and dosing decisions. However, limited knowledge, low confidence and an absence of guidelines impede the use of pharmacogenomic testing. Establishment of local resources including multidisciplinary models-of-care was suggested to facilitate implementation of pharmacogenomics.

Short Title: Leveraging Faith Communities to Prevent Violence against Women: Lessons from the Implementation and Delivery of the Motivating Action through Empowerment (MATE) Program
DOI: 10.3390/ijerph192315833
Article Number: 15833
Accession Number: WOS:000897380900001
Abstract: Gender-based violence is a human rights and public health issue, disproportionately affecting women. The Motivating Action Through Empowerment (MATE) bystander program aims to address violence against women by shifting focus from perpetrators and victims of violence to community responsibility for not accepting attitudes and behaviors that support or allow the violence to occur. Traditionally bystander programs have been delivered through institutions, most notably college campuses in the United States. The translation of bystander programs to community settings is not widely reported. This research aimed to understand whether a violence prevention program could be effectively delivered in a faith community setting; specifically, it focuses on the implementation of MATE in a Christian church network in the Gold Coast region of Queensland, Australia. Semi-structured interviews were conducted with ten church-based trainers in the MATE pilot program. Theoretically informed analysis using the COM-B behavior model identified that environmental factors had a large bearing on opportunities to deliver MATE workshops. This research identified six key lessons for MATE and other programs wishing to leverage faith communities: (1) Provide religious context; (2) Accommodate diversity; (3) Build faith leader capacity; (4) Employ social marketing; (5) Undertake co-design; (6) Actively administer, measure and monitor.

Title: Bleeding Management Practices of Australian Cardiac Surgeons, Anesthesiologists and Perfusionists: A Cross-Sectional National

Survey Incorporating the Theoretical Domains Framework (TDF) and COM-B Model

Journal: Journal of Multidisciplinary Healthcare

Volume: 13

Pages: 27-41

Short Title: Bleeding Management Practices of Australian Cardiac Surgeons, Anesthesiologists and Perfusionists: A Cross-Sectional National Survey Incorporating the Theoretical Domains Framework (TDF) and COM-B Model

ISSN: 1178-2390

DOI: 10.2147/jmdh.S232888

Accession Number: WOS:000511097900001

Abstract: Purpose: Excessive bleeding is an acknowledged consequence of cardiac surgery, occurring in up to 10% of adult patients. This clinically important complication leads to poorer patient outcomes. Clinical practice guidelines are available to support best practice however variability in bleeding management practice and related adverse outcomes still exist. This study had two objectives: 1) to gain insight into current bleeding management practice for adult cardiac surgery in Australia and how that compared to guidelines and literature; and 2) to understand perceived difficulties clinicians face implementing improvements in bleeding management. Methods: A national cross-sectional questionnaire survey was utilized.

Perspectives were sought from cardiac surgeons, cardiac anesthesiologists and perfusionists. Thirty-nine closed-ended questions focused on routine bleeding management practices to address pre and intra-operative care. One open-ended question was asked; "What would assist you to improve bleeding management with cardiac surgery patients?" Quantitative data were analysed with SPSS. Qualitative data were categorized into the domains of the Theoretical Domains Framework; the domains were then mapped to the COM-B model. Results: Survey responses from 159 Anesthesiologists, 39 cardiac surgeons and 86 perfusionists were included (response rate 37%). Four of the recommendations queried in this survey were reported as routinely adhered to < 50% of the time, 9 queried recommendations were adhered to 51-75% of the time and 4 recommendations were routinely followed >76% of the time.

Conclusion: There is a wide variation in peri-operative bleeding management practice among cardiac anaesthesiologists, surgeons and perfusionists in Australian cardiac surgery units. Conceptualizing factors believed necessary to improve practice with the TDF and COM-B model found that bleeding management could be improved with a standardized approach including; point of care diagnostic assays, a bleeding management algorithm, access to concentrated coagulation factors, cardiac surgery specific bleeding management education, multidisciplinary team agreement and support, and an overarching national approach.

DOI: 10.1186/s12913-021-06269-8

Article Number: 550

Accession Number: WOS:000660892900001

Abstract: Background Bleeding during cardiac surgery is a common complication that often requires the transfusion of blood products. The combination of bleeding and blood product transfusion incrementally increases adverse outcomes including infection and mortality. Following bleeding management guideline recommendations could assist with minimising risk but adherence is not high, and the cause for lack of adherence is not well understood. This study aimed to identify barriers and facilitators to practicing and implementing evidenced-based intra-operative, bleeding management in Australian cardiac surgery units. **Methods** We used a qualitative descriptive design to conduct semi-structured interviews with Australian cardiac surgeons, anaesthetists and perfusionists. The Theoretical Domains Framework (TDF) was utilised to guide interviews and thematically analyse the data. Categorized data were then linked with the three key domains of the COM-B model (capability, opportunity, motivation – behaviour) to explore and understand behaviour. **Results** Seventeen interviews were completed. Nine of the 14 TDF domains emerged as significant. Analysis revealed key themes to improving capability included, standardisation, monitoring, auditing and feedback of data and cross discipline training. Opportunity for change was improved with interpersonal and interdepartmental collaboration through shared goals, and more efficient and supportive processes allowing clinicians to navigate unfamiliar business and financial models of health care. Results suggest as individuals, clinicians had the motivation to make change and healthcare organisations have an obligation and a responsibility to partner with clinicians to support change and improve goal directed best practice. **Conclusion** Using a theory-based approach it was possible to identify factors which may be positively or negatively influence clinicians ability to implement best practice bleeding management in Australian cardiac surgical units.

Title: A feasibility randomised controlled trial of a Fibromyalgia
Self-management Programme for adults in a community setting with a
nested qualitative study (FALCON)

Journal: BMC Musculoskeletal Disorders

Volume: 23

Issue: 1

Date: Jul

Short Title: A feasibility randomised controlled trial of a
Fibromyalgia Self-management Programme for adults in a community
setting with a nested qualitative study (FALCON)

DOI: 10.1186/s12891-022-05529-w

Article Number: 656

Accession Number: WOS:000824891700002

Abstract: Background Fibromyalgia is a condition associated with
widespread musculoskeletal pain, fatigue and sleep problems.
Fibromyalgia treatment guidelines recommend non-pharmacological
interventions and the development of self-management skills. An
example of a programme that fits these guidelines is the
Fibromyalgia Self-management Programme (FSMP) which consists of one
2.5-hour weekly session over six successive weeks and includes
education about fibromyalgia, goal setting, pacing, sleep hygiene
and nutritional advice. The FSMP is currently provided in a
secondary care hospital setting and co-delivered by a
multidisciplinary team. Delivery in a primary care setting has the
potential to improve the accessibility of the programme to people
with fibromyalgia. Therefore, this feasibility study aimed to
determine the practicality and acceptability of conducting a future
definitive randomised controlled trial of the FSMP in a community
setting. Method An exploratory, parallel-arm, one-to-one, randomised
controlled trial. Participants were recruited from general practices
across South West England, and the FSMP was co-delivered by
physiotherapists and occupational therapists across two community
sites. To determine the outcome measures for a future definitive
trial several were tested. The Revised Fibromyalgia Impact
Questionnaire, Arthritis Self-Efficacy Scale-8, Chalder Fatigue
Scale, Short form 36, 5-Level EQ-5D version and Jenkins Sleep Scale
were collected at baseline, 6 weeks and 6 months. Semi-structured
interviews were conducted with patient participants, occupational
therapists and physiotherapists to explore the acceptability and
feasibility of delivering the FSMP in a community setting. Results A
total of 74 participants were randomised to the FSMP intervention (n
= 38) or control arm (n = 36). Attrition from the trial was 42%

(31/74) at 6 months. A large proportion of those randomised to the intervention arm (34%, 13/38) failed to attend any sessions with six of the 13 withdrawing before the intervention commenced. The proportion of missing values was small for each of the outcome measures. Three overarching themes were derived from the interview data; (1) barriers and facilitators to attending the FSMP; (2) FSMP content, delivery and supporting documentation; and (3) trial processes. Conclusion It is feasible to recruit people with fibromyalgia from Primary Care to participate in a randomised controlled trial testing the FSMP in a community setting. However, improvement in trial attrition and engagement with the intervention is needed.

Date: May

Short Title: Sunproofed study protocol: A mixed-methods scoping study of sun safety policies in primary schools in Wales

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0268141

Article Number: e0268141

Accession Number: WOS:000818854500047

Abstract: Background Skin cancer, including melanoma and non-melanoma (keratinocyte), is increasing in incidence in the UK. Accounting for half of all cancers in England and Wales, the disease significantly impacts overstretched dermatology services. Research suggests that 86% of melanoma is preventable with modified sun exposure. Educating children about sun safety in schools can help prevent skin cancer and is recommended by major health organisations. In England, teaching sun safety in primary schools is compulsory, while in Wales this is left to school discretion. Aims Understand how primary schools in Wales are responding to growing skin cancer rates and explore the effectiveness of sun safety policies in schools on knowledge and behaviour. Methods Sunproofed is a mixed-methods scoping study comprising 5 work packages (WP) using survey and routine electronic health record (EHR) data supplemented by qualitative case studies. Objective(s) are to: WP1: Discover if primary schools in Wales have sun safety policies;

policy characteristics; determine factors that may influence their presence and identify areas where schools need support. WP2: Determine what EHR data is available regarding the incidence of sunburn in primary school children and the feasibility of using this data to evaluate the impact of sun safety policies. WP3: Understand the impact of sun safety policies on sun-safe knowledge and behaviour amongst children, parents, teachers, and school management; identify barriers and facilitators to schools implementing sun safety policies. WP4: Co-produce guidance regarding sun safety policies and best methods for implementation in schools. WP5: Disseminate guidance and findings widely to ensure impact and uptake. Discussion Skin cancer rates are increasing in the UK, straining limited resources. Sunproofed has the potential to inform the development of future prevention activities, both in Wales and beyond. This could reduce the number of skin cancer cases in the future and keep people healthier for longer.

Short Title: The role of behaviour-change theory in sleep interventions with emerging adults (aged 18-29 years): a systematic review and meta-analysis

ISSN: 0962-1105

DOI: 10.1111/jsr.13877

Accession Number: WOS:000950400900001

Abstract: Previous systematic reviews and meta-analysis of sleep interventions with young adults have not reached consensus on what contributes to their efficacy. Behaviour-change theories may influence the efficacy of interventions; hence, the aim of this research was to investigate the role of such theories in sleep interventions with this population. Six electronic databases and reference lists were searched (April-May 2021) for published sleep behaviour-change interventions with emerging adults (aged 18-29 years) that used control groups. A selection of 20 studies fulfilled the inclusion criteria, but only six were based on behaviour-change theories. Meta-analysis was run with eight studies, as the others had a high risk of bias or did not present the necessary data to calculate Hedges' g. The estimation of a random effects model for

the studies showed a small effect in the sleep quality of the participants in the experimental group ($g = -0.26$; 95% confidence interval -0.42 to -0.09), with low levels of heterogeneity ($I^2 = 21\%$), and a small 95% prediction interval (-0.59 to 0.08). Although we could not examine theory or any other moderators of the effect, a qualitative analysis of the behaviour-change techniques present in the interventions leads us to hypothesise that there is not a direct link between behaviour-change techniques and the success of the intervention. Other characteristics of the interventions may be linked to their variable levels of efficacy and should be investigated in the future, as for now there are no answers as to what the key is for successful sleep interventions.

DOI: 10.1186/s13012-016-0481-8

Article Number: 116

Accession Number: WOS:000381665500001

Abstract: Background: Type 2 diabetes (T2DM) affects 113.9 million people in China, the largest number of any country in the world (JAMA 310: 948-59, 2013). T2DM prevalence has risen dramatically from around 1 % in the 1980s to now over 10 % and is expected to continue rising. Despite the growing disease burden, few people with T2DM are achieving adequate management targets to prevent complications. Health system infrastructure in China is struggling to meet these gaps in care, and innovative, cost-effective and affordable solutions are needed. One promising strategy that may be particularly relevant to the Chinese context is improving support for lay family members to care for their relatives with T2DM.

Methods: We hypothesise that an interactive mobile health management system can support lay family health promoters (FHP) and healthcare staff to improve clinical outcomes for family members with T2DM through medical assessment, regular monitoring, lifestyle advice and the prescribing of guidelines recommended medications. This intervention will be implemented as a cluster randomised controlled trial involving 80 communities (40 communities in Beijing and 40

rural villages in Hebei province) and 2000 people with T2DM. Outcome analyses will be conducted blinded to intervention allocation. The primary outcome is the proportion of patients achieving ≥ 2 "ABC" goals (HbA1c $<7.0\%$, blood pressure (BP) $<140/80$ mmHg and LDL cholesterol <100 mg/dl or 2.6 mmol/L) at the end of follow-up (Diabetes Care 36(Supplement 1): S11-S66, 2013). Secondary outcomes include the proportion of patients achieving individual ABC targets; mean changes in HbA1c, BP, LDL, renal function (serum creatinine and urinary albumin), body mass index, quality of life (QOL, EQ-5D), and healthcare utilisation from baseline; and cost-effectiveness/utility of intervention. Trial outcomes will be accompanied by detailed process and economic evaluations. Discussion: The Chinese government has prioritised prevention and treatment of diabetes as 1 of 11 National Basic Public Health Services. Despite great promise for mHealth interventions to improve access to effective health care, there remains uncertainty about how this can be successfully achieved. The findings are likely to inform policy on a scalable strategy to overcome sub-optimal access to effective health care in China.

Abstract: Background: The Global Alliance for Chronic Diseases

comprises the majority of the world's public research funding agencies. It is focussed on implementation research to tackle the burden of chronic diseases in low- and middle-income countries and amongst vulnerable populations in high-income countries. In its inaugural research call, 15 projects were funded, focussing on lowering blood pressure-related disease burden. In this study, we describe a reflexive mapping exercise to identify the behaviour change strategies undertaken in each of these projects. Methods: Using the Behaviour Change Wheel framework, each team rated the capability, opportunity and motivation of the various actors who were integral to each project (e.g. community members, non-physician health workers and doctors in projects focussed on service delivery). Teams then mapped the interventions they were implementing and determined the principal policy categories in which those interventions were operating. Guidance was provided on the use of Behaviour Change Wheel to support consistency in responses across teams. Ratings were iteratively discussed and refined at several group meetings. Results: There was marked variation in the perceived capabilities, opportunities and motivation of the various actors who were being targeted for behaviour change strategies. Despite this variation, there was a high degree of synergy in interventions functions with most teams utilising complex interventions involving education, training, enablement, environmental restructuring and persuasion oriented strategies. Similar policy categories were also targeted across teams particularly in the areas of guidelines, communication/marketing and service provision with few teams focussing on fiscal measures, regulation and legislation. Conclusions: The large variation in preparedness to change behaviour amongst the principal actors across these projects suggests that the interventions themselves will be variably taken up, despite the similarity in approaches taken. The findings highlight the importance of contextual factors in driving success and failure of research programmes. Forthcoming outcome and process evaluations from each project will build on this exploratory work and provide a greater understanding of factors that might influence scale-up of intervention strategies.

DOI: 10.1186/s40814-021-00812-4

Article Number: 71

Accession Number: WOS:000704712800002

Abstract: Background: Discharge teaching by nurses during hospitalization is essential to provide multimorbid inpatients with the knowledge and skills to self-manage their health conditions. However, available disease-specific teaching guidelines do not address the cumulative complexity of multiple chronic diseases that occur with greater frequency in older adults. Therefore, there is a need for a discharge teaching intervention which uses concepts that specifically address the needs of these patients, such as considering their level of activation (i.e. knowledge, skills and confidence to self-manage their health) and the burden of multimorbid disease. The objectives of this pragmatic study will be to (1) test the feasibility of implementing a nursing discharge teaching intervention and (2) conduct a preliminary test of this novel discharge teaching intervention with adult inpatients age 50 or greater who have multiple comorbid conditions. Methods: This study uses a two-group pre-posttest design. Participants are drawn from medical units in three hospitals in the French-speaking part of Switzerland. The implementation of the intervention will be facilitated by implementation strategies from the Theoretical Domains Framework and the Behavior Change Wheel and will target change in nurses' teaching behaviours. Implementation outcomes will include measures of feasibility of the implementation strategies and the intervention process. Participants in the intervention group will receive tailored discharge teaching by trained teaching nurses. Patient outcomes will inform the preliminary testing of the intervention and will be measured with validated questionnaires assessing patients' activation level, health confidence, perceived readiness for discharge, experience with the discharge process and rate of and time to readmission. Discussion: The study takes a pragmatic approach to examining the feasibility of implementing the discharge teaching intervention to contribute to the knowledge development within the context of the real-world practice setting. Results will provide the foundation for clinical trials to build evidence for widespread adoption of this intervention.

Short Title: Physical activity promotion in rural health care settings: A rapid realist review

DOI: 10.1016/j.pmedr.2022.101905

Article Number: 101905

Accession Number: WOS:000888513300008

Abstract: Physical activity promotion in health care settings is poorly understood and has limited uptake among health care providers. The environmental and health care context of rural communities is unique from urban areas and may interact to influence intervention delivery and success. The aim of this rapid realist review was to synthesize knowledge related to the promotion of physical activity in rural health and social care settings. We searched Medline EBSCO, CINAHL, PsychINFO, and SPORTDiscus for relevant publications. We included qualitative or quantitative studies reporting on an intervention to promote physical activity in rural health (e.g., primary or community care) or social (e.g., elder support services) care settings. Studies without a rural focus or well-defined physical activity/exercise component were excluded. Populations of interest included adults and children in the general population or clinical sub-population. Intervention mechanisms from included studies were mapped to the Behaviour Change Wheel (capability, opportunity, motivation (COM-B)). Twenty studies were included in our review. Most interventions focused on older adults or people with chronic disease risk factors. The most successful intervention strategies leading to increased physical activity behaviour included wearable activity trackers, and check-ins or reminders from trusted sources. Interventions with mechanisms categorized as physical opportunity, automatic motivation, and psychological capability were more likely to be successful than other factors of the COM-B model. Successful intervention activities included a method for tracking progress, providing counselling, and follow-up reminders to prompt behaviour change. Cultivation of necessary community partnerships and adaptations for implementation of interventions in rural communities were not clearly described and may support successful outcomes in future studies.

Title: Nurses' clinical practices reducing the impact of HIV-related stigmatisation in non-HIV-specialised healthcare settings: a protocol for a realist synthesis

Journal: Bmj Open

Volume: 12

Issue: 11

Date: Nov

Short Title: Nurses' clinical practices reducing the impact of HIV-related stigmatisation in non-HIV-specialised healthcare settings: a protocol for a realist synthesis

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-062569

Article Number: e062569

Accession Number: WOS:000886687900012

Abstract: Introduction Despite tremendous progress in care, people living with HIV (PLHIV) continue to experience HIV-related stigmatisation by nurses in non-HIV-specialised healthcare settings. This has consequences for the health of PLHIV and the spread of the virus. In the province of Quebec (Canada), only four interventions aimed at reducing the impact of HIV-related stigmatisation by nurses have been implemented since the beginning of the HIV pandemic. While mentoring and persuasion could be promising strategies, expression of fears of HIV could have deleterious effects on nurses' attitudes towards PLHIV. In literature reviews on stigma reduction interventions, the contextual elements in which these interventions have been implemented is not considered. In order to develop new interventions, we need to understand how the mechanisms (M) by which interventions (I) interact with contexts (C) produce their outcomes (O). Methods and analysis Realist synthesis (RS) was selected to formulate a programme theory that will rely on CIMO configuration to describe (1) nursing practices that may influence stigmatisation experiences by PLHIV in non-HIV-specialised healthcare settings, and (2) interventions that may promote the adoption of such practices by nurses. The RS will draw on the steps recommended by Pawson: clarify the scope of the review; search for evidence; appraise primary studies and extract data; synthesise evidence and draw conclusions. To allow an acute interpretation of the disparities between HIV-related stigmatisation experiences depending on people's serological status, an initial version of the programme theory will be formulated from data gathered from scientific and grey literature, and then consolidated through realist interviews with various stakeholders (PLHIV, nurses, community workers and researchers). Ethics and dissemination Ethical approval for realist interviews will be sought following the initial programme theory design. We intend to share the final programme theory with intervention developers via scientific publications and

recommendations to community organisations that counter HIV-related stigmatisation.

Title: Novel behaviour change frameworks for digital health interventions: A critical review

Journal: Journal of Health Psychology

Date: 2023 Apr

Short Title: Novel behaviour change frameworks for digital health interventions: A critical review

ISSN: 1359-1053

DOI: 10.1177/13591053231164499

Accession Number: WOS:000970760500001

Abstract: Digital health interventions – interventions delivered over digital media to support the health of users – are becoming increasingly prevalent. Utilising an intervention development framework can increase the efficacy of digital interventions for health-related behaviours. This critical review aims to outline and review novel behaviour change frameworks that guide digital health intervention development. Our comprehensive search for preprints and publications used PubMed, PsycINFO, Scopus, Web of Science and the Open Science Framework repository. Articles were included if they: (1) were peer-reviewed; (2) proposed a behaviour change framework to guide digital health intervention development; (3) were written in English; (4) were published between 1/1/19 and 1/8/2021; and (5) were applicable to chronic diseases. Intervention development frameworks considered the user, intervention elements and theoretical foundations. However, the timing and policy of interventions are not consistently addressed across frameworks. Researchers should deeply consider the digital applicability of behaviour change frameworks to improve intervention success.

PATIENT PERSPECTIVES OF A CONSUMER HEALTH INFORMATION TECHNOLOGY
APPLICATION

ISSN: 1049-510X

DOI: 10.18865/ed.29.S2.393

Accession Number: WOS:000471257000014

Abstract: Objective: We describe the implementation, clinical outcomes and participant perspectives for e-Healthystrides(C). Setting: Three independent ambulatory clinics and an historic African American (AA) church. Participants: Adults with diagnosed diabetes mellitus type 2. Interventions: e-Healthystrides(C) health coach facilitated intervention Primary outcome: Acquisition of three new self-management behaviors. Secondary outcomes: Blood pressure, blood glucose, A1c, attrition rate and participant perspectives of e-Healthystrides(C). Methods: A convergent parallel mixed method design was used in both pilot studies. Results: Two hundred and sixty-four participants, aged similar to 62 +/- 16 years, enrolled. Attrition at 52 weeks varied 50%-90% by site. Low engagement users were defined mainly by anxiety with putting health information online. The primary outcome was achieved in 36% of our participants, with the top 3 self-management behaviors acquired being: reducing risk (24.5%); healthy eating (23.7%); and monitoring (16.4%). Problem solving had the lowest rate of achievement (.91%). Blood pressure improved significantly at all sites at 12 weeks and at clinics A,B,C at 52 weeks. Blood glucose improved at 12 weeks: clinic A (P=.0001), B (P=.003), C (P=.001) and D (P=.03); but, at 52 weeks, only clinics A (P =<.0001) and B (P= .0001). Participants felt empowered by features of e-Healthystrides(C). Engagement with health coaches and peers was highly valued. Conclusions: e-Healthystrides(C) is effective for self-management behavior change. Participants showed the best success with healthy coping, healthy eating, and monitoring behaviors. They felt empowered by access to health information and valued interaction with coaches and peers. Our findings support strong relational/social network strategy with a role for coaches as guides (apomediaries) who facilitate skill acquisition using technology.

ISSN: 1930-7381

DOI: 10.1002/oby.23165

Accession Number: WOS:000696505600001

Abstract: Objective The aim of this study was to examine the effectiveness of a school-based gamification strategy to prevent childhood obesity. Methods Schools were randomized in Santiago, Chile, between March and May 2018 to control or to receive a nutrition and physical activity intervention using a gamification strategy (i.e., the use of points, levels, and rewards) to achieve healthy challenges. The intervention was delivered for 7 months and participants were assessed at 4 and 7 months. Primary outcomes were mean difference in BMI z score and waist circumference (WC) between trial arms at 7 months. Secondary outcomes were mean difference in BMI and systolic and diastolic blood pressure between trial arms at 7 months. Results A total of 24 schools (5 controls) and 2,197 students (653 controls) were analyzed. Mean BMI z score was lower in the intervention arm compared with control (adjusted mean difference -0.133 , 95% CI: -0.25 to -0.01), whereas no evidence of reduction in WC was found. Mean BMI and systolic blood pressure were lower in the intervention arm compared with control. No evidence of reduction in diastolic blood pressure was found. Conclusions The multicomponent intervention was effective in preventing obesity but not in reducing WC. Gamification is a potentially powerful tool to increase the effectiveness of school-based interventions to prevent obesity.

Title: A mixed-methods feasibility case series of a job retention vocational rehabilitation intervention for people with multiple sclerosis

Journal: Disability and Rehabilitation

Date: 2023 Feb

Short Title: A mixed-methods feasibility case series of a job retention vocational rehabilitation intervention for people with multiple sclerosis

ISSN: 0963-8288

DOI: 10.1080/09638288.2023.2181411

Accession Number: WOS:000941556800001

Abstract: Purpose To ascertain the feasibility and acceptability of delivering a job retention vocational rehabilitation intervention [MSVR] for people with multiple sclerosis (pwMS) in a community setting. Secondary objectives included determining whether MSVR was associated with changes in quality of life, fatigue, mood, cognition, workplace accommodations, work instability, work self-efficacy, and goal attainment. Methods Single-centre mixed-methods feasibility case series. Results 15 pwMS and three employers received 8.36 (SD = 4.48) and 1.94 (SD = 0.38) hours of MSVR respectively over three months. The intervention predominantly addressed managing cognition, fatigue, and negotiating reasonable accommodations. Four healthcare professionals were recruited to clarify clinical information. The intervention was feasible to deliver, and there was a significant positive impact on goal attainment immediately following MSVR ($t(14) = 7.44, p = .0001, d = 1.9$), and at months 3 ($t(13) = 4.81, p = .0001, d = 1.28$), 6 ($t(11) = 4.45, p = .001, d = 1.28$), and 12 ($t(9) = 5.15, p = .001, d = -2.56$). There was no impact on quality of life, fatigue, mood, cognition, workplace accommodations, work instability, and work self-efficacy. In post-intervention interviews, participants reported that MSVR was acceptable. Four themes were derived regarding the context, employer engagement, empowerment through knowledge, and intervention components and attributes. Conclusion It was feasible and acceptable to deliver MSVR. Participants better understood their MS, became more confident managing problems at work and attained their work-related goals.

Title: Parents' perspectives on smartphone acquisition amongst 9-to

12-year-old children in the UK – a behaviour change approach
Journal: Journal of Family Studies
Date: 2023 May
Short Title: Parents' perspectives on smartphone acquisition amongst 9-to 12-year-old children in the UK – a behaviour change approach
ISSN: 1322-9400
DOI: 10.1080/13229400.2023.2207563
Accession Number: WOS:000980902100001
Abstract: Smartphone ownership has increased rapidly over the past decade, including amongst children and young people. Evidence is mixed in terms of the impact of smartphones on this population; with a number of benefits cited as well as a large number of risks. Given the pace of change in this area, research is sparse, including research to understand the influences on when children and young people acquire a smartphone. This is important because parents report struggling with deciding when to give their child a smartphone. This qualitative study applies the Behaviour Change Wheel to in-depth interviews, with a diverse sample of 11 parents, to report the barriers and enablers to parents giving children their first smartphone between the ages of 9 and 12 years old. Enablers include aspects of the physical and social environment, such as children starting to walk to school or preparing to move to secondary school, as well as the influence of other parents and children. Parents' skills are a barrier whilst their beliefs about the consequences of their child owning a smartphone are a mix of barriers and enablers. Recommendations for interventions include age restrictions, regulations, parental training, education and guidance to support parental decision-making.

Accession Number: WOS:000829743000001
Abstract: Globally, 2.8 billion people cook with biomass fuels, resulting in devastating health and environmental consequences. Efforts to transition households to cooking with clean fuels are hampered by 'fuel stacking', the reliance on multiple fuels and

stoves. Consequently, there have been few interventions that have realized the full potential of clean cooking. Here we conduct a structured literature review (N = 100) to identify drivers of fuel stacking and specify them according to a psychological model of behaviour, the Capability–Opportunity–Motivation (COM–B) model. We create a taxonomy of stacking and find that the Physical Opportunity domain accounted for 82% of drivers. Our results have important implications for intervention design as they suggest improving opportunity is the most effective pathway to adoption of cleaner fuels. The findings are used to derive recommendations about how policymakers and practitioners can proactively address drivers of stacking to foster adoption of clean cooking stoves and fuels. Realizing the full potential of clean cooking transitions requires an understanding of fuel stacking in which multiple fuels and stoves are used. Towards this end, Perros et al. analyse the literature on clean cooking interventions through a behavioural model and identify underlying drivers of stacking.

Article Number: e0259949

Accession Number: WOS:000755305800071

Abstract: Background Improving adherence to self-protective behaviours is a public health priority. We aimed to assess the potential effectiveness and ease of use of an online version of the Risk Acceptance Ladder (RAL) in promoting help-seeking for cigarette smoking, excessive alcohol consumption, insufficient physical activity, or low fruit and vegetable consumption. Methods 843 UK adults were recruited, of whom 602 engaged in at least one risky behaviour. Those with no immediate plans to change (n = 171) completed a behaviour specific RAL. Participants were randomised to one of two conditions; a short message congruent (on-target, n = 73) or incongruent (off-target, n = 98) with their RAL response. Performance of the RAL was assessed by participants' ability to select an applicable RAL item and reported ease of use of the RAL. Effectiveness was assessed by whether or not participants clicked a

link to receive information about changing their target behaviour. Results Two thirds (68.9%, 95% CI = 61.8%–75.3%) of participants were able to select an applicable RAL item that corresponded to what they believed would need to change in order to alter their target behaviour, with 64.9% (95% CI = 57.5%–71.7%) reporting that it was easy to select one option. Compared with the off-target group, participants allocated to the on-target group had greater odds of clicking on the link to receive information (31.5% vs 19.4%; OR = 2.07, 95% CI = 1.01–4.26). Conclusion The Risk Acceptance Ladder may have utility as a tool for tailoring messages to prompt initial steps to engaging in self-protective behaviours.

Title: Pragmatic nihilism: how a Theory of Nothing can help health psychology progress

Journal: Health Psychology Review

Volume: 11

Issue: 2

Pages: 103–121

Short Title: Pragmatic nihilism: how a Theory of Nothing can help health psychology progress

ISSN: 1743–7199

DOI: 10.1080/17437199.2017.1284015

Accession Number: WOS:000400284600001

Abstract: Health psychology developed a plethora of theories to explain and change a wide variety of behaviours. Several attempts have been undertaken to build integrative theories, some even striving for a Theory of Everything. We argue against these efforts, arguing that instead a 'pragmatic nihilism' perspective may be more fruitful to understand and change health behaviours. The first tenet of pragmatic nihilism is that psychological variables are usefully considered as metaphors rather than referring to entities that exist in the mind. As a consequence, the second tenet emphasizes theories' definitions and guidelines for the operationalisation of those variables. The third tenet of pragmatic nihilism is that each operationalisation represents an intersection of a variety of dimensions, such as behavioural specificity and duration, and most importantly, psychological aggregation level. Any operationalisation thus represents a number of choices regarding these dimensions. Pragmatic nihilism has two implications. First, it provides a foundation that enables integrating theories in a more flexible and accurate manner than made possible by integrative theories. Second, it emphasizes the importance of operationalisations, underlining the importance of investing in the careful development of measurement

instruments, thorough reporting of measurement instruments' specifics and performance, and full disclosure of the instruments themselves.

ISSN: 1613-0863

DOI: 10.1055/s-0043-107606

Accession Number: WOS:000406459500005

Abstract: Lack of physical activity is a widespread risk factor for chronic diseases and physical activity as well as exercise are effective therapeutic interventions with regard to a multitude of existing conditions. Nevertheless, physical inactivity is highly prevalent in the German population. Thus physical activity promotion is needed and is indeed effective in various forms (approaches targeting individuals and policy and environmental approaches). For example, national recommendations for physical activity and physical activity promotion (NEBB) have existed in Germany since September 2016. NEBB provides information concerning the amount of physical activity that persons of different population groups (e.g. children, adolescents and adults) should perform as well as the various interventions of physical activity promotion based on scientific evidence. For the future dissemination of the NEBB, it is therefore necessary to have knowledge about the relevant players contributing directly or indirectly to physical activity promotion. Project SAMBA was initiated with the objective of enabling this systematic overview. In the study, a multi-stage procedure is being used. On the one hand it comprises qualitative expert interviews, subsequent network visualization as well as analysis for network formation and on the other hand, a questionnaire survey of relevant and potential players in physical activity promotion.

Title: From expected to actual barriers and facilitators when
implementing a new screening tool: A qualitative study applying the
Theoretical Domains Framework

Journal: Journal of Clinical Nursing

Date: 2022 Jun

Short Title: From expected to actual barriers and facilitators when
implementing a new screening tool: A qualitative study applying the
Theoretical Domains Framework

ISSN: 0962-1067

DOI: 10.1111/jocn.16410

Accession Number: WOS:000814870600001

Abstract: Aim and objectives To identify determinants for using a new screening tool to identify older patients eligible for targeted nurse-led intervention, as perceived by healthcare professionals implementing the tool, and to examine how these perceptions changed over time. Design A cross-sectoral longitudinal qualitative study based on semi-structured interviews with healthcare professionals in a Danish hospital and two collaborating municipalities. Methods In three focus groups, seven single interviews and a workshop, we examined the healthcare professionals' perceptions of and attitudes towards the new screening tool before, during and after the implementation. The Theoretical Domains Framework was used to identify the healthcare professionals' perception of barriers and facilitators, followed by content analysis. The results were further discussed using the COM-B system as an analytic framework. This qualitative study is reported according to the Consolidated Criteria for Reporting Qualitative Studies (COREQ) checklist. Results 'Professional role', 'Goals' and 'Environmental context' were the domains most talked about by the healthcare professionals across the three time points. The content analysis identified four determinants for using the new screening tool: Making time for the project, External motivation and management, Expectations and reality, and Professional identity. The healthcare professionals' perception of the determinants changed during the implementation, influencing their behaviour and, consequently, the implementation's sustainability. Conclusion Perception of barriers and facilitators to the interventions were time- and context-sensitive. Beliefs and motivational factors changed during the project, which points out the importance of following implementation processes systematically to understand the outcome of an intervention. Relevance for clinical practice Perceptions and attitudes towards a new initiative may change over time, emphasising the importance of following barriers and facilitators during the implementation of an intervention and working with an implementation plan that can be adapted along the

way.

Title: Mental health promotion in youth sporting clubs: predictors of stakeholder participation

Journal: BMC Public Health

Volume: 23

Issue: 1

Date: Mar

Short Title: Mental health promotion in youth sporting clubs: predictors of stakeholder participation

DOI: 10.1186/s12889-023-15377-5

Article Number: 481

Accession Number: WOS:000949858500010

Abstract: Background Young people are disproportionately affected by poor mental health. Youth sport settings hold immense potential to improve the mental health outcomes of this demographic. Efforts to leverage youth sport settings to promote mental health are limited by the lack of knowledge pertaining to engagement with mental health interventions in these settings. Therefore, this study aimed to examine the willingness of youth sporting club stakeholders (e.g., sportspersons, coaches, support staff, parents/guardians) to engage in mental health initiatives conducted by sporting clubs and ascertain possible determinants of engagement. **Methods** This study used an observational cross-sectional design. Participants completed an online survey assessing likelihood of supporting a mental health campaign, mental health literacy (help-seeking, inclusive attitudes), and perceived club support. Perceptions pertaining to the importance of youth mental health and sporting clubs supporting youth mental health were also assessed. **Results** The survey was completed by 275 stakeholders of youth sporting clubs in Australia (M-age = 40.2 +/- 15.8 years, 60.3% female). The findings indicated that stakeholders were willing to participate in mental health initiatives in youth sport clubs. A linear regression analysis indicated that the significant predictors of stakeholders supporting such initiatives were older age (> 25-50 and > 50 years; beta = 0.15, p = .033, beta = 0.19, p = .005, respectively), along with perceived importance of youth mental health (beta = 0.24, p = .003) and sporting clubs supporting youth mental health (beta = 0.22, p = .004). **Conclusion** Youth sport settings have the capacity to improve the provision of mental health support among young people. There is a need for tailored approaches to enhance the engagement with, and

effectiveness of, mental health resources in sport contexts.

Short Title: Impact of a novel online learning module on specialist palliative care nurses' pain assessment competencies and patients' reports of pain: Results from a quasi-experimental pilot study

ISSN: 0269-2163

DOI: 10.1177/0269216314527780

Accession Number: WOS:000337258800008

Abstract: Background: Pain is a complex multidimensional phenomenon moderated by consumer, provider and health system factors. Effective pain management cuts across professional boundaries, with failure to screen and assess contributing to the burden of unrelieved pain.

Aim: To test the impact of an online pain assessment learning module on specialist palliative care nurses' pain assessment competencies, and to determine whether this education impacted positively on palliative care patients' reported pain ratings. Design: A quasi-experimental pain assessment education pilot study utilising 'Qstream (c)', an online methodology to deliver II case-based pain assessment learning scenarios, developed by an interdisciplinary expert panel and delivered to participants' work emails over a 28-day period in mid-2012. The 'Self-Perceived Pain Assessment Competencies' survey and chart audit data, including patient-reported pain intensity ratings, were collected pre-intervention (T1) and post-intervention (T2) and analysed using inferential statistics to determine key outcomes. Setting/participants: Nurses working at two Australian inpatient specialist palliative care services in 2012. Results: The results reported conform to the Strengthening the Reporting of Observational Studies in Epidemiology (STROBE) Guidelines. Participants who completed the education intervention (n = 34) increased their pain assessment knowledge, assessment tool knowledge and confidence to undertake a pain assessment (p < 0.001). Participants were more likely to document

pain intensity scores in patients' medical records than non-participants (95% confidence interval = 7.3%-22.7%, $p = 0.021$). There was also a significant reduction in the mean patient-reported pain ratings between the admission and audit date at post-test of 1.5 (95% confidence interval = 0.7-2.3) units in pain score. Conclusion: This pilot confers confidence of the education interventions capacity to improve specialist palliative care nurses' pain assessment practices and to reduce patient-rated pain intensity scores.

Short Title: Can A Complex Online Intervention Improve Cancer Nurses' Pain Screening and Assessment Practices? Results from a Multicenter, Pre-post Test Pilot Study

ISSN: 1524-9042

DOI: 10.1016/j.pmn.2017.01.003

Accession Number: WOS:000398646400048

Abstract: Unrelieved cancer pain has an adverse impact on quality of life. While routine screening and assessment forms the basis of effective cancer pain management, it is often poorly done, thus contributing to the burden of unrelieved cancer pain. The aim of this study was to test the impact of an online, complex, evidence-based educational intervention on cancer nurses' pain assessment capabilities and adherence to cancer pain screening and assessment guidelines. Specialist inpatient cancer nurses in five Australian acute care settings participated in an intervention combining an online spaced learning cancer pain assessment module with audit and feedback of pain assessment practices. Participants' self-perceived pain assessment competencies were measured at three time points. Prospective, consecutive chart audits were undertaken to appraise nurses' adherence with pain screening and assessment guidelines. The differences in documented pre-post pain assessment practices were

benchmarked and fed back to all sites post intervention. Data were analyzed using inferential statistics. Participants who completed the intervention (n = 44) increased their pain assessment knowledge, assessment tool knowledge, and confidence undertaking a pain assessment (p < .001). The positive changes in nurses' pain assessment capabilities translated into a significant increasing linear trend in the proportion of documented pain assessments in patients' charts at the three time points (chi(2) trend = 18.28, df = 1, p < .001). There is evidence that learning content delivered using a spaced learning format, augmented with pain assessment audit and feedback data, improves inpatient cancer nurses' self perceived pain screening and assessment capabilities and strengthens cancer pain guideline adherence. (C) 2017 by the American Society for Pain Management Nursing.

Short Title: Engaging and supporting women with chronic kidney disease with pre-conception decision-making (including their experiences during COVID 19): A mixed-methods study protocol

ISSN: 0309-2402

DOI: 10.1111/jan.14803

Accession Number: WOS:000624558900001

Abstract: Aim To report a protocol for a qualitative study to better understand the key factors that influence decision making about pregnancy from women's perspectives and to use these data to develop a theoretical model for shared decision-making tools for the multiple stakeholders. Design Mixed-method design using online surveys (with validated components) and purposively sampled follow-up semi structured interviews. Methods Funded from September 2020 for 12 months. Online surveys of adult women (aged 18-50) identified via all Wales kidney database (n >= 500), additional recruitment through multidisciplinary healthcare professionals, relevant third

sector organizations and social media. Follow-up in-depth qualitative interviews with n = 30 women. Linear regression models to identify associations between shared decision-making preferences and clinical and psychosocial variables. Qualitative interviews will use a visual timeline task to empower women in taking control over their narratives. Qualitative data will be fully transcribed and analysed thematically, based around a chronological and theoretical (theoretical domains framework) structure that maps out key challenges and opportunities for improved decision support in the care pathway. Visual timelines will be used during stakeholder consultation activities, to enable us to co-create a map of current support, gaps in provision, and opportunities for interventions. Quantitative data will be analysed descriptively to characterize our cohort. We will assemble a multidisciplinary shared decision-making intervention development group and provide ongoing stakeholder consultation activities with patient and public representatives. Discussion Outcomes will support new learning into; the ways women's knowledge of kidney disease may affect family planning and pregnancy, their needs in terms of psychological and social support, and how they weigh up the pros and cons of starting a family. Impact Evidence will inform the design of new shared decision-making tools to better support women with the complex and often emotional decisions about having children while living with kidney disease. Short Title: Cohort profile: The UK COVID-19 Public Experiences (COPE) prospective longitudinal mixed-methods study of health and well-being during the SARSCoV2 coronavirus pandemic

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0258484

Article Number: e0258484

Accession Number: WOS:000732519500050

Abstract: Public perceptions of pandemic viral threats and government policies can influence adherence to containment, delay, and mitigation policies such as physical distancing, hygienic practices, use of physical barriers, uptake of testing, contact tracing, and vaccination programs. The UK COVID-19 Public Experiences (COPE) study aims to identify determinants of health behaviour using the Capability, Opportunity, Motivation (COM-B) model using a longitudinal mixed-methods approach. Here, we provide a detailed description of the demographic and self-reported health characteristics of the COPE cohort at baseline assessment, an overview of data collected, and plans for follow-up of the cohort. The COPE baseline survey was completed by 11,113 UK adult residents (18+ years of age). Baseline data collection started on the 13(th) of March 2020 (10-days before the introduction of the first national COVID-19 lockdown in the UK) and finished on the 13(th) of April 2020. Participants were recruited via the HealthWise Wales (HWW) research registry and through social media snowballing and advertising (Facebook((R)), Twitter((R)), Instagram((R))). Participants were predominantly female (69%), over 50 years of age (68%), identified as white (98%), and were living with their partner (68%). A large proportion (67%) had a college/university level education, and half reported a pre-existing health condition (50%). Initial follow-up plans for the cohort included in-depth surveys at 3-months and 12-months after the first UK national lockdown to assess short and medium-term effects of the pandemic on health behaviour and subjective health and well-being. Additional consent will be sought from participants at follow-up for data linkage and surveys at 18 and 24-months after the initial UK national lockdown. A large non-random sample was recruited to the COPE cohort during the early stages of the COVID-19 pandemic, which will enable longitudinal analysis of the determinants of health behaviour and changes in subjective health and well-being over the course of the pandemic.

Article Number: 105726

Accession Number: WOS:000707764100008

Abstract: Pledges are a popular strategy to encourage meat reduction, though experimental studies of their efficacy are lacking. Three-hundred and twenty-five participants from three different countries (UK, Germany, Australia) were randomly assigned to pledge 28 days meat-free or not, and their behavior was tracked via smartphones. Participants answered daily surveys regarding their eating behavior, meat cravings, and shared photos of their meals. Baseline data was collected prior to the pledge, after the 28 days, and one-month post-intervention. Participants assigned to the pledge condition ate less meat across the 28 days, compared to control participants. Meat reductions, observed at outset, did not endure one-month post-intervention. Overall, German participants ate the least amount of meat, and showed the sharpest decrease in consumption when pledging. Meat cravings tended to increase among pledgers, relative to control participants. Pledgers who reported high starting intentions and conflict about meat tended to eat less meat and reported fewer cravings. All participants reported reduced meat-eating justifications one-month post-intervention. These findings provide experimental evidence that pledges can encourage meat consumers to reduce their intake, though additional mechanisms are needed to sustain commitments.

Abstract: Revelateur des inegalites sociales de sante, le tabagisme en etablissement penitentiaire exige des interventions visant sa reduction d'etre adaptees aux specificites du milieu carceral. Dans le cadre de la recherche interventionnelle TABAPRI, nous avons mobilise une premiere etude sociologique afin d'apporter des connaissances sur cette problematique. Une enquete a ete realisee au sein de trois etablissements penitentiaires, precedant les phases de construction, d'implementation et d'evaluation de l'intervention. Cet article decrit d'une part la demarche methodologique et d'autre part, la contribution de la sociologie, tant dans ses apports conceptuels que methodologiques, a la construction d'une intervention. Notre travail a notamment souligne l'importance d'amenager des espaces d'echange permettant aux professionnels et aux personnes detenues de construire ensemble les modalites d'intervention qui participent a la reduction du tabagisme en detention.

Short Title: Barriers to following imaging guidelines for the treatment and management of patients with low-back pain in primary care: a qualitative assessment guided by the Theoretical Domains Framework

DOI: 10.1186/s12875-022-01751-6

Article Number: 143

Accession Number: WOS:000805770800001

Abstract: Background Low back pain (LBP) is a leading cause of disability and is among the top five reasons that patients visit their family doctors. Over-imaging for non-specific low back pain remains a problem in primary care. To inform a larger study to develop and evaluate a theory-based intervention to reduce inappropriate imaging, we completed an assessment of the barriers and facilitators to reducing unnecessary imaging for NSLBP among family doctors in Newfoundland and Labrador (NL). Methods This was an exploratory, qualitative study describing family doctors' experiences and practices related to diagnostic imaging for non-specific LBP in NL, guided by the Theoretical Domains Framework (TDF). Data were collected using in-depth, semi-structured interviews. Transcripts were analyzed deductively (assigning text to one or more domains) and inductively (generating themes at each of the domains) before the results were examined to determine which domains should be targeted to reduce imaging. Results Nine family doctors (four males; five females) working in community (n = 4) and academic (n = 5) clinics in both rural (n = 6) and urban (n = 3) settings participated in this study. We found five barriers to reducing imaging for patients with NSLBP: 1) negative consequences, 2) patient demand 3) health system organization, 4) time, and 5) access to resources. These were related to the following domains: 1) beliefs about consequences, 2) beliefs about capabilities, 3) emotion, 4) reinforcement, 5) environmental context and resources, 6) social influences, and 7) behavioural regulation. Conclusions Family physicians a) fear that if they do not image they may miss something serious, b) face significant patient demand for imaging, c) are working in a system that encourages unnecessary imaging, d) don't have enough time to counsel patients about why they don't need imaging, and e) lack access to appropriate practitioners, community programs, and treatment modalities to prescribe to their patients. These barriers were related to seven TDF domains. Successfully reducing inappropriate imaging requires a comprehensive intervention that addresses these barriers using established behaviour change techniques. These techniques should be matched directly to relevant TDF domains. The results of our study represent the important first step of this process - identifying the contextual barriers and the domains to which they are related.

Abstract: Digital behaviour change interventions, particularly those using pervasive computing technology, hold great promise in supporting users to change their behaviour. However, most interventions fail to take habitual behaviour into account, limiting their potential impact. This failure is partly driven by a plethora of overlapping behaviour change theories and related strategies that do not consider the role of habits. We critically review the main theories and models used in the research to analyse their application to designing effective habitual behaviour change interventions. We highlight the potential for Dual Process Theory, modern habit theory, and Goal Setting Theory, which together model how users form and break habits, to drive effective digital interventions. We synthesise these theories into an explanatory framework, the Habit Alteration Model, and use it to outline the state of the art. We identify the opportunities and challenges of habit-focused interventions.

ISSN: 1526-8004
DOI: 10.1055/s-0041-1735456
Accession Number: WOS:000688208900002
Abstract: This article aimed to identify the behavior change

techniques (BCTs) based on facilitators and barriers to lifestyle management in women with polycystic ovary syndrome (PCOS) according to the behavior change wheel (BCW). This qualitative study design using inductive thematic analysis following semistructured interviews (n =20) identified barriers and enablers to lifestyle management. These were then mapped to Capability, Opportunity, Motivation-Behavioral Model (COM-B) constructs and the corresponding Theoretical Domains Framework (TDF) domains. This study included women with PCOS residing in Australia. Main outcome measures include intervention functions, policy categories, and BCTs described in the BCW. Twenty-three BCTs were recognized to influence behavior change in women with PCOS. Factors were categorized into the subcomponents of the COM-B: psychological capability (e.g., lack of credible information), physical capability (e.g., managing multiple health conditions), physical opportunity (e.g., limited access to resources), social opportunity (e.g., adequate social support), reflective motivation (e.g., positive health expectancies following behavior change), and automatic motivation (e.g., emotional eating). Future research should use this work to guide PCOS lifestyle intervention development and then test intervention effectiveness through an experimental phase to provide empirical evidence for wider use and implementation of tailored, theory-informed PCOS lifestyle programs as part of evidence-based PCOS management.

Article Number: 19
Accession Number: WOS:000357305900001
Abstract: Background: Long-term sedative use is prevalent and associated with significant morbidity, including adverse events such as falls, cognitive impairment, and sedation. The development of dependence can pose significant challenges when discontinuation is attempted as withdrawal symptoms often develop. We conducted a scoping review to map and characterize the literature and determine opportunities for future research regarding deprescribing strategies for long-term benzodiazepine and Z-drug (zopiclone, zolpidem, and zaleplon) use in community-dwelling adults. Methods: We searched PubMed, Cochrane Central Register of Controlled Trials, EMBASE, PsycINFO, CINAHL, TRIP, and JBI Ovid databases and conducted a grey literature search. Articles discussing methods for deprescribing benzodiazepines or Z-drugs in community-dwelling adults were selected. Results: Following removal of duplicates, 2797 articles were reviewed for eligibility. Of these, 367 were retrieved for full-text assessment and 139 were subsequently included for review. Seventy-four (53 %) articles were original research, predominantly randomized controlled trials (n = 52 [37 %]), whereas 58 (42 %) were narrative reviews and seven (5 %) were guidelines. Amongst original

studies, pharmacologic strategies were the most commonly studied intervention (n = 42 [57 %]). Additional deprescribing strategies included psychological therapies (n = 10 [14 %]), mixed interventions (n = 12 [16 %]), and others (n = 10 [14 %]). Behaviour change interventions were commonly combined and included enablement (n = 56 [76 %]), education (n = 36 [47 %]), and training (n = 29 [39 %]). Gradual dose reduction was frequently a component of studies, reviews, and guidelines, but methods varied widely. Conclusions: Approaches proposed for deprescribing benzodiazepines and Z-drugs are numerous and heterogeneous. Current research in this area using methods such as randomized trials and meta-analyses may too narrowly encompass potential strategies available to target this phenomenon. Realist synthesis methods would be well suited to understand the mechanisms by which deprescribing interventions work and why they fail.

Short Title: Co-production of two whole-school sexual health
interventions for English secondary schools: positive choices and
project respect

DOI: 10.1186/s40814-020-00752-5

Article Number: 50

Accession Number: WOS:000704715400001

Abstract: Background: Whole-school interventions represent promising approaches to promoting adolescent sexual health, but they have not been rigorously trialled in the UK and it is unclear if such interventions are feasible for delivery in English secondary schools. The importance of involving intended beneficiaries, implementers and other key stakeholders in the co-production of such complex interventions prior to costly implementation and evaluation studies is widely recognised. However, practical accounts of such processes remain scarce. We report on co-production with specialist providers, students, school staff, and other practice and policy professionals of two new whole-school sexual health interventions for implementation in English secondary schools. Methods: Formative qualitative inquiry involving 75 students aged 13-15 and 23 school

staff. A group of young people trained to advise on public health research were consulted on three occasions. Twenty-three practitioners and policy-makers shared their views at a stakeholder event. Detailed written summaries of workshops and events were prepared and key themes identified to inform the design of each intervention. Results: Data confirmed acceptability of addressing unintended teenage pregnancy, sexual health and dating and relationships violence via multi-component whole-school interventions and of curriculum delivery by teachers (providing appropriate teacher selection). The need to enable flexibility for the timetabling of lessons and mode of parent communication; ensure content reflected the reality of young people's lives; and develop prescriptive teaching materials and robust school engagement strategies to reflect shrinking capacity for schools to implement public-health interventions were also highlighted and informed intervention refinements. Our research further points to some of the challenges and tensions involved in co-production where stakeholder capacity may be limited or their input may conflict with the logic of interventions or what is practicable within the constraints of a trial. Conclusions: Multi-component, whole-school approaches to addressing sexual health that involve teacher delivered curriculum may be feasible for implementation in English secondary schools. They must be adaptable to individual school settings; involve careful teacher selection; limit additional burden on staff; and accurately reflect the realities of young people's lives. Co-production can reduce research waste and may be particularly useful for developing complex interventions, like whole-school sexual health interventions, that must be adaptable to varying institutional contexts and address needs that change rapidly. When co-producing, potential limitations in relation to the representativeness of participants, the 'depth' of engagement necessary as well as the burden on participants and how they will be recompensed must be carefully considered. Having well-defined, transparent procedures for incorporating stakeholder input from the outset are also essential. Formal feasibility testing of both co-produced interventions in English secondary schools via cluster RCT is warranted.

Short Title: Feasibility study of a Behavioural Intervention for Opioid Reduction (BIOR) for patients with chronic non-cancer pain in primary care: a protocol

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-065646

Article Number: e065646

Accession Number: WOS:000918750500020

Abstract: Introduction Around 30%–50% of adults suffer moderate to severe chronic pain not caused by cancer. Significant numbers are treated with opioids which over time may cease to be effective and produce side effects (eg, nausea, drowsiness and constipation). Stopping taking opioids abruptly can cause unpleasant withdrawal effects. Tapering in small steps is recommended, though some patients might struggle and need support, particularly if they have limited access to pain management alternatives. Awareness of the potential risks as well as benefits of tapering should be explored with patients. Methods and analysis A randomised controlled pilot feasibility study to investigate the effectiveness and feasibility of reducing high doses of opioids through a tapering protocol, education and support in primary care. Working with NHS Knowsley Place, we will identify patients taking 50 mg or above morphine equivalent dose of opioids per day to be randomly allocated to either the tapering group or tapering with support group. At an initial joint appointment with a pain consultant and General Practitioner (GP) GP tapering will be discussed and negotiated. Both groups will have their opioid reduced by 10% per week. The taper with support group will have access to additional support, including motivational counselling, realistic goal setting and a toolkit of resources to promote self-management. Some patients will successfully reduce their dose each week. For others, this may be more difficult, and the tapering reduction will be adjusted to 10% per fortnight. We assess opioid use, pain and quality of life in both groups at the start and end of the study to determine which intervention works best to support people with chronic pain who wish to stop taking opioids. Ethics and dissemination The Behavioural Intervention for Opioid Reduction feasibility study has been granted full approval by Liverpool Central Research Ethics Committee on 7 April 2022 (22/NW/0047). The current protocol version is V.1.1, date 6 July 2022. Results will be published in peer-reviewed journals and disseminated to patient stakeholders in a lay summary report available on the project website and in participating GP surgeries. Short Title: Development of a behaviour change intervention: a case study on the practical application of theory

ISSN: 1748-5908

DOI: 10.1186/1748-5908-9-42

Article Number: 42

Accession Number: WOS:000334893100001

Abstract: Background: Use of theory in implementation of complex interventions is widely recommended. A complex trial intervention, to enhance self-management support for people with osteoarthritis (OA) in primary care, needed to be implemented in the Managing Osteoarthritis in Consultations (MOSAICS) trial. One component of the trial intervention was delivery by general practitioners (GPs) of an enhanced consultation for patients with OA. The aim of our case study is to describe the systematic selection and use of theory to develop a behaviour change intervention to implement GP delivery of the enhanced consultation. Methods: The development of the behaviour change intervention was guided by four theoretical models/frameworks: i) an implementation of change model to guide overall approach, ii) the Theoretical Domains Framework (TDF) to identify relevant determinants of change, iii) a model for the selection of behaviour change techniques to address identified determinants of behaviour change, and iv) the principles of adult learning. Methods and measures to evaluate impact of the behaviour change intervention were identified. Results: The behaviour change intervention presented the GPs with a well-defined proposal for change; addressed seven of the TDF domains (e. g., knowledge, skills, motivation and goals); incorporated ten behaviour change techniques (e. g., information provision, skills rehearsal, persuasive communication); and was delivered in workshops that valued the expertise and professional values of GPs. The workshops used a mixture of interactive and didactic sessions, were facilitated by opinion leaders, and utilised 'context-bound communication skills training.' Methods and measures selected to evaluate the behaviour change intervention included: appraisal of satisfaction with workshops, GP report of intention to practise and an assessment of video-recorded consultations of GPs with patients with OA. Conclusions: A stepped approach to the development of a behaviour change intervention, with the utilisation of theoretical frameworks to identify determinants of change matched with behaviour change techniques, has enabled a systematic and theory-driven development of an intervention designed to enhance consultations by GPs for patients with OA. The success of the behaviour change intervention in practice will be evaluated in the context of the MOSAICS trial as a whole, and will inform understanding of practice level and patient outcomes in the trial.

Issue: 6
Pages: 1347-1356
Date: Jun
Short Title: Implementation of protected mealtimes in the subacute
setting: stepped wedge cluster trial protocol
ISSN: 0309-2402
DOI: 10.1111/jan.12930
Accession Number: WOS:000376007400012
Abstract: Aim. This protocol paper describes a study that aims to
determine if protected mealtimes implementation closes the energy
deficit of 1900 kJ between estimated requirements and actual energy
intake of hospitalized adults in the subacute setting. Background.
Protected mealtimes, a strategy developed to address the prevalence
of malnourished hospitalized adults, aims to minimize unavoidable
and unnecessary interruptions at mealtimes. It has been implemented
widely with limited high-quality studies as to its effect. Design. A
pragmatic stepped wedge cluster trial. Primary outcomes are daily
energy and protein intake. Methods. Funding was awarded in October
2014. In this study, protected mealtimes implementation will occur

across each cluster (ward) chosen at random. A waiver of consent has been endorsed, enabling all patients to receive the intervention. Patients excluded from outcome evaluation will be those receiving end of life care and patients who are nil by mouth. The selection of patients for outcome evaluation will also occur randomly. Sample size, randomization, statistical analysis and contamination issues consider the reporting guidelines of the CONSORT statement: extension to cluster randomized trials. Conclusions. The methods selected will ensure that the research is of high quality with conclusions useful and relevant for translation into practice settings. The study does not aim to assess whether the intervention is sustainable beyond the study period, rather it will establish whether the removal of known barriers to intervention uptake enables high fidelity with the intervention. As a result we will have a greater understanding of the nutritional consequences of protected mealtimes in subacute care.

Title: The efficacy of Protected Mealtimes in hospitalised patients: a stepped wedge cluster randomised controlled trial

Journal: BMC Medicine

Volume: 15

Date: Feb

Short Title: The efficacy of Protected Mealtimes in hospitalised patients: a stepped wedge cluster randomised controlled trial

ISSN: 1741-7015

DOI: 10.1186/s12916-017-0780-1

Article Number: 25

Accession Number: WOS:000395929900001

Abstract: Background: Protected Mealtimes is an intervention developed to address the problem of malnutrition in hospitalised patients through increasing positive interruptions (such as feeding assistance) whilst minimising unnecessary interruptions (including ward rounds and diagnostic procedures) during mealtimes. This clinical trial aimed to measure the effect of implementing Protected Mealtimes on the energy and protein intake of patients admitted to the subacute setting. Methods: A prospective, stepped wedge cluster randomised controlled trial was undertaken across three hospital sites at one health network in Melbourne, Australia. All patients, except those receiving end-of-life care or not receiving oral nutrition, admitted to these wards during the study period participated. The intervention was guided by the British Hospital Caterers Association reference policy on Protected Mealtimes and by

principles of implementation science. Primary outcome measures were daily energy and protein intake. The study was powered to determine whether the intervention closed the daily energy deficit between estimated intake and energy requirements measured as 1900 kJ/day in the pilot study for this trial. Results: There were 149 unique participants, including 38 who crossed over from the control to intervention period as the Protected Mealtimes intervention was implemented. In total, 416 observations of 24-hour food intake were obtained. Energy intake was not significantly different between the intervention ([mean +/- SD] 6479 +/- 2486 kJ/day) and control (6532 +/- 2328 kJ/day) conditions (p = 0.88). Daily protein intake was also not significantly different between the intervention (68.6 +/- 26.0 g/day) and control (67.0 +/- 25.2 g/day) conditions (p = 0.86). The differences between estimated energy/protein requirements and estimated energy/protein intakes were also limited between groups. The adjusted analysis yielded significant findings for energy deficit: (coefficient [robust 95% CI], p value) of 1405 (-2354 to -457), p = 0.004. Variability in implementation across aspects of Protected Mealtimes policy components was noted. Conclusions: The findings of this trial mirror the findings of other observational studies of Protected Mealtimes implementation where nutritional intakes were observed. Very few positive improvements to nutritional intake have been identified as a result of Protected Mealtimes implementation. Instead of this intervention, approaches with a greater level of evidence for improving nutritional outcomes, such as mealtime assistance, other food-based approaches and the use of oral nutrition support products to supplement oral diet, should be considered in the quest to reduce hospital malnutrition.

Title: The impact of COVID-19 on the eating habits of families engaged in a healthy eating pilot trial: a thematic analysis

Journal: Health Psychology and Behavioral Medicine

Volume: 10

Issue: 1

Pages: 241-261

Date: Dec

Short Title: The impact of COVID-19 on the eating habits of families engaged in a healthy eating pilot trial: a thematic analysis

ISSN: 2164-2850

DOI: 10.1080/21642850.2022.2043750

Article Number: 2043750

Accession Number: WOS:000761606500001

Abstract: Background: The eating habits of children and adults have been impacted by the COVID-19 pandemic, with evidence of increases in snacking and emotional eating, including eating to relieve boredom. We explored the experiences of families with children aged 4-8 years who had recently participated in a healthy eating pilot trial when the first national lockdown began in England. Methods: Eleven mothers were interviewed in April and May 2020. Interview questions were developed based on the COM-B model of behaviour. Four main themes were constructed using inductive thematic analysis. Results: The first theme related to an initial panic phase, in which having enough food was the primary concern. The second related to ongoing challenges during the lockdown, with sub-themes including difficulties accessing food, managing children's food requests and balancing home and work responsibilities. The perception that energy-dense foods met families' needs during this time led to increased purchasing of (and thus exposure to) energy-dense foods. In the third theme, families described a turning point, with a desire to eat a healthier diet than they had in the early stages of the lockdown. Finally, in the fourth theme, families reported a number of strategies for adapting and encouraging a balanced diet with their children. Conclusions: Our results suggest that even if parents have the capability (e.g. knowledge) and motivation to provide a healthy diet for their family, opportunity challenges (e.g. time, access to resources, environmental stressors) mean this is not always practical. Healthy eating interventions should not assume parents lack motivation and should be sensitive to the context within which parents make feeding decisions. Notes: Porter, Lucy Cox, Jennifer S. Title: Adherence of those at low risk of disease to public health measures during the COVID-19 pandemic: A qualitative study

Journal: Plos One

Volume: 17

Issue: 10

Date: Oct

Short Title: Adherence of those at low risk of disease to public health measures during the COVID-19 pandemic: A qualitative study

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0276746

Article Number: e0276746

Accession Number: WOS:000952381400001

Abstract: Public health measures (PHMs) proactively and reactively reduce the spread of disease. While these measures target individual

behaviour, they require broad adherence to be effective. Consequently, the World Health Organization issued a special appeal to young adults, a known non-adherent population, for increased adherence with COVID-19 guidelines. However, little is known about why these low-risk individuals do or do not adhere to PHMs. This study investigates why young adults in a low-risk setting adhered to PHMs implemented during the COVID-19 pandemic. A qualitative research approach was chosen to gain an in-depth understanding of participants' thoughts and experiences related to PHM adherence. Semi-structured interviews were conducted in April-May 2021 with 30 young adults living in Prince Edward Island (PEI), the province with the lowest COVID-19 case rate in Canada at that time. Thematic analysis was used to create a codebook based on the Theoretical Domains Framework, which was then inductively modified. The analysis identified eight themes that explained the adherence of young adults: (1) clear, purpose-driven adherence rationale, (2) developing trust in the local leadership, (3) adapting to novel measures, (4) manageable disruption, (5) adhering to reduce anxiety, (6) collective duty towards one's community, (7) moral culpability and (8) using caution rather than compliance. Together, these themes demonstrate that young adults adhered to PHMs because of their sense of connection to their community, public health leadership, and concerns over stigma. We further argue that clear guidelines and communication from public health officials during both periods of high and low COVID-19 cases facilitate adherence. These findings are important for mitigating future public health emergencies as they explain why young adults, an important segment of the population whose adherence is critical to the success of PHMs, follow PHMs. Further, these findings can inform public health officials and other stakeholders aiming to develop successful adherence strategies. Accession Number: WOS:000728777000002

Abstract: Sport organizations have been noted as pivotal to the success or failure of athletes, and sport environments can impact the wellbeing and development of athletes. In this study, the

authors explored stakeholders' perceptions of how high-performance sport organizations support athlete development. Semistructured interviews were conducted with 18 stakeholders from the United Kingdom's high-performance sport system and transcripts were analyzed using a semantic thematic analysis. Participants emphasized the importance of performance lifestyle advisors, sport psychologists, and financial assistance for promoting athlete development. Several stakeholders observed that despite the extensive support available to athletes, many do not engage with available support, and the prevalence of a performance narrative has led to an environment that discourages holistic development. It follows that sport organizations could develop alternative strategies for promoting athletes' access to and engagement with available supports, while funding agencies might broaden existing funding criteria to include well-being or athlete development targets.

Article Number: 102021

Accession Number: WOS:000792389400003

Abstract: Fall-related hip fracture (HF) is a frequent trauma in Scandinavia with a yearly incidence of 8,000 among >65 year-old citizens in Denmark. The rising incidence and global predictions are alarming since a HF is a major, and potentially fatal, trauma to the citizen, requiring acute surgery, a multimodal approach and post-operative crosssectoral rehabilitation. However, continuity of the rehabilitation program is frequently interrupted in the transition between sectors, compromising optimal recovery of frail citizens. Thus, there is a need to develop and implement optimized cross-sectoral rehabilitation after HF. The purpose of this explorative study was to develop, implement and evaluate an optimized cross-sectoral rehabilitation program (OCRCP) after HF surgery using validated theoretical frameworks. OCRCP was developed, implemented and evaluated in one municipality using a pragmatic user-centered

approach, quantitative and qualitative data collection and theoretical frameworks including the Behavior Change Wheel (BCW) and RE-AIM. Results of OCRP showed optimized rehabilitation based on motivated health professionals, high patient satisfaction and tendencies of improved levels of physical function. No re-referrals to rehabilitation were reported after OCRP. The BCW, RE-AIM and user-centered approach to program development, implementation and evaluation are useful to apply in program development and evaluation processes across sectors, professions, and medical specialties.

Abstract: In-work poverty (IWP), a growing problem in the United Kingdom, describes being in employment but having financial resources close to thresholds associated with poverty. IWP is associated with poorer health behaviors. We examined why people experiencing IWP may exhibit poorer health behaviors. Experiences of six individuals with whole-household IWP in North East England, were elicited using inductive reflexive thematic analysis with semi-structured interviews. Three themes were generated, showing that IWP impacted on the adoption of healthy behaviors, resulting in an obesogenic environment, particularly for single parents. IWP is a socioeconomic health disparity requiring further exploration.

Short Title: Systematic review of factors promoting behaviour change toward antibiotic use in hospitals

ISSN: 1198-743X

DOI: 10.1016/j.cmi.2022.01.005

Accession Number: WOS:000833417600003

Abstract: Background: Antimicrobial stewardship (AMS) programmes include actions to improve antibiotic use. Objectives: This study aimed to identify factors of AMS interventions associated with behaviour change toward antibiotic use in hospitals, applying behavioural sciences. Data sources: PubMed and Scopus online databases were searched. Study eligibility criteria: Studies published between January 2015 and December 2020 were included. The required study outcomes were as follows: effect of the intervention reported in terms of antibiotic consumption, antibiotic costs, appropriateness of prescription, duration of therapy, proportion of patients treated with antibiotics, or time to appropriate antibiotic therapy. Participants: Participants included health care professionals involved in antibiotic prescription and use in hospitals and patients receiving or susceptible to receiving antibiotics. Interventions: Studies investigating AMS interventions in hospitals were included. Methods: Risk of bias was determined using the integrated quality criteria for review of multiple study designs tool. A systematic review of AMS interventions was conducted using the behaviour change wheel to identify behaviour changes functions of interventions; and the action, actor, context, target, and time framework to describe how they are implemented. Relationships between intervention functions and the action, actor, context, target, and time domains were explored to deduce factors for optimal implementation. Results: Among 124 studies reporting 123 interventions, 64% were effective in reducing antibiotic use or improving the quality of antibiotic prescription. In addition, 91% of the studies had a high risk of bias. The main functions retrieved in the effective interventions were enablement, environmental restructuring, and education. The most common subcategories were audit and feedback and real-time recommendation for enablement function, as well as material resources, human resources, and new tasks for environmental restructuring function. Most AMS interventions focused on prescriptions, targeted prescribers, and were implemented by pharmacists, infectious diseases specialists, and microbiologists. Interventions focusing on specific clinical situation were effective in 70% of cases. Conclusions: Knowledge of factors associated with behaviour changes will help address local barriers and enablers before implementing interventions. Title: How the COVID-19 crisis affected the well-being of nurses working in paediatric critical care: A qualitative study

Journal: British Journal of Health Psychology

Date: 2023 Mar

Short Title: How the COVID-19 crisis affected the well-being of nurses working in paediatric critical care: A qualitative study

ISSN: 1359-107X

DOI: 10.1111/bjhp.12661

Accession Number: WOS:000983962400001

Abstract: Objectives Evidence shows paediatric critical care (PCC) nurses display high rates of burnout, moral distress, symptoms associated with post-traumatic stress disorder (PTSD) and poor well-being. The COVID-19 pandemic magnified these pressures producing extremely challenging working conditions. The objective was to understand PCC nurses' lived experience of working during COVID-19 to determine the impact it had on their well-being. Design A qualitative design was used with individual, semi-structured online interviews analysed using thematic analysis. Results Ten nurses from six PCC units in England participated. Five themes were generated: (i) Challenges of working in Personal Protective Equipment (PPE), (ii) Adapting to redeployment to adult intensive care, (iii) Changes to staff working relationships, (iv) Being unable to attain work-life balance and (v) Unprocessed traumatic experiences of working in COVID-19. It was clear COVID-19 presented novel challenges to PCC nurses' well-being. With those came enforced changes in practice; some were temporary, for example use of PPE and redeployment, but others provided insight into the prerequisites for good staff well-being, for example strong professional relationships, work-life balance and managing one's psychological health. Conclusions Findings show authentic connections between peers, verbal and non-verbal communication and a sense of belonging were crucial to nurses' well-being. A dent in PCC nurses' perceived competence significantly affected their well-being. Finally, staff need a psychologically safe space to process distress and trauma experienced during COVID-19. Future research needs to test evidence-based, theoretically-informed well-being interventions to improve and maintain PCC nurses' well-being.

Article Number: e040493

Accession Number: WOS:000604459900033

Abstract: Introduction A key priority for the UK National Health Service and patients is to ensure that medicines are used safely and effectively. However, medication changes are not always optimally communicated and implemented when patients transfer from hospital into community settings. Heart failure is a common reason for admission to hospital. Patients with heart failure have a high burden of morbidity, mortality and complex pharmacotherapeutic regimens. The Improving the Safety and Continuity Of Medicines management at Transitions of care programme comprises a cluster randomised controlled trial which will test the effectiveness of a complex behavioural intervention aimed at improving medications management at the interface between hospitals discharge and community care. We will conduct a rigorous process evaluation to inform interpretation of the trial findings, inform implementation of the intervention on a wider scale and aid dissemination of the intervention. Methods and analysis The process evaluation will be conducted in six purposively selected intervention sites (ie, hospital trusts and associated community pharmacies) using a mixed-methods design. Fidelity and barriers/enablers of implementation of the Medicines at Transitions Intervention (MaTI) will be explored using observation, interviews (20 patients, 40 healthcare professionals), surveys and routine trial data collection on adherence to MaTI. A parallel mixed analysis will be applied. Qualitative data will be thematically analysed using Framework analysis and survey data will be analysed descriptively. Data will be synthesised, triangulated and mapped to the Consolidated Framework for Implementation Research where appropriate. The process evaluation commenced on June 2018 and is due to end on February 2021. Ethics and dissemination Approved by Research Ethics Committee

and the UK Health Research Authority REC: 18/YH/0017/IRAS: 231431. Findings will be disseminated via academic and policy conferences, peer-reviewed publications and social media. Trial registration number ISRCTN66212970.

Article Number: 53

Accession Number: WOS:000704717800003

Abstract: Background There is a critical need for an intervention to improve nurses' eating and physical activity behaviours. As nurses spend a substantial proportion of their waking hours at work, concerted efforts to deliver such interventions in the workplace is growing. This study formed part of a multiphase programme of research that aimed to systematically develop an evidence-based and theory-informed workplace intervention to promote changes in eating and physical activity among nurses. Methods The intervention was developed iteratively, in line with Medical Research Council complex intervention guidelines. It involved four activities: (1) identifying the evidence base, (2) understanding the determinants of nurses' eating and physical activity behaviour change through theory-based qualitative interviews and survey, (3) identifying intervention options using the Behaviour Change Wheel, and (4) specifying intervention content and implementation options using a taxonomy of behaviour change techniques. Results Data from 13 randomised controlled trials indicated that workplace-based behaviour change interventions targeted to this population are effective in changing behaviour. The evidence base was, however, limited in quantity and quality. Nurses' beliefs about important factors determining their eating and physical activity behaviour

were identified across 16 qualitative interviews and 245 survey responses, and key determinants included environmental context and resources, behavioural regulation, emotion, beliefs about consequences, knowledge and optimism. Based on these findings, 22 behaviour change techniques suitable for targeting the identified determinants were identified and combined into a potential workplace intervention. Conclusions An evidence-based and theory-informed intervention tailored to the target population and setting has been explicitly conceptualised using a systematic approach. The proposed intervention addresses previous evidence gaps for the user population of nurses. Further to this, such an intervention, if implemented, has the potential to impact nurses' eating and physical activity behaviours and in turn, the health of nurses and the quality of healthcare delivery.

Abstract: As coronavirus disease of 2019 (COVID-19) continues to disrupt pretertiary education provision and examinations in the United Kingdom, urgent consideration must be given to how best to support the 2021-2022 cohort of incoming undergraduate students to higher education. In this paper, we draw upon the "Five Sense of Student Success" model to highlight five key evidence-based, psychology-informed considerations that higher education educators should be attentive to when preparing for the next academic year. These include the challenge in helping students to reacclimatize to academic work following a period of prolonged educational disruption, supporting students to access the "hidden curriculum" of higher education, negotiating mental health consequences of COVID-19, and remaining sensitive to inequalities of educational provision that students have experienced as a result of COVID-19. We

provide evidence-based, psychology-informed recommendations to each of these considerations.

Short Title: A qualitative study about college students' attitudes, knowledge and perceptions regarding sugar intake

ISSN: 0195-6663

DOI: 10.1016/j.appet.2020.105059

Article Number: 105059

Accession Number: WOS:000609011800009

Abstract: Excessive sugar intake has been associated with multiple health conditions (e.g., higher risk for noncommunicable diseases). Hence, health organizations have issued guidelines defining the maximum daily intake of free or added sugars. However, data from several countries suggests that these guidelines are rarely met, particularly by young adults. For example, almost half of Portuguese adolescents and young adults exceed the recommended sugar intake. In this work, we aim to further explore college students' attitudes, knowledge, and perceptions about sugar intake, as well as about sugar intake guidelines. A thematic analysis on data from five focus groups (N = 40) indicated that participants reported difficulty in the comprehension of added/free sugars definition and sugar intake recommendations. Overall, attitudes toward sugar were ambivalent. Sugar was simultaneously perceived as pleasurable and needed, but also as addictive and harmful. Although aware of the potential negative health outcomes associated with excessive sugar intake, most participants did not perceive being at risk due to their youth, exercise habits, or type of diet. The few concerns expressed were mostly associated with the negative impact of high sugar intake on body image (e.g., weight gain). The main barriers to reducing sugar intake identified were environmental (e.g., time restrictions, food available at the university). Still, participants could identify several individual strategies to effectively regulate sugar intake. By identifying knowledge gaps and sources of bias related to sugar consumption, our findings are useful to inform future interventions aiming to address the problem of high sugar intake among university students.

Pages: 738-759

Date: Mar

Short Title: Body size preferences for women and adolescent girls
living in Africa: a mixed-methods systematic review

ISSN: 1368-9800

DOI: 10.1017/s1368980021000768

Article Number: Pii s1368980021000768

Accession Number: WOS:000768559000025

Abstract: Objective: To synthesise evidence on body size preferences
for females living in Africa and the factors influencing these.

Design: Mixed-methods systematic review including searches on
Medline, CINHALL, ASSIA, Web of Science and PsycINFO (PROSPERO
CRD42015020509). A sequential-explanatory approach was used to

integrate quantitative and qualitative findings. Setting: Urban and
rural Africa. Participants: Studies of both sexes providing data on
body size preferences for adolescent girls and women aged ≥ 10

years. Results: Seventy-three articles from twenty-one countries
were included: fifty quantitative, fifteen qualitative and eight
mixed methods. Most studies reported a preference for normal or
overweight body sizes. Some studies of adolescent girls/young women
indicated a preference for underweight. Factors influencing

preferences for large(r) body sizes included: socio-demographic
(e.g. education, rural residency), health-related (e.g. current BMI,
pubertal status), psycho-social (e.g. avoiding HIV stigma) and

socio-cultural factors (e.g. spouse's preference, social standing,
cultural norms). Factors influencing preferences for slim(mer) body
sizes included: socio-demographic (e.g. higher socioeconomic status,
urban residency, younger age), health-related (e.g. health

knowledge, being nulliparous), psycho-social (e.g. appearance, body
size perception as overweight/obese) and socio-cultural factors

(e.g. peer pressure, media). Conclusions: Preference for overweight
(not obese) body sizes among some African females means that

interventions need to account for the array of factors that maintain
these preferences. The widespread preference for normal weight is
positive in public health terms, but the valorisation of underweight
in adolescent girls/young women may lead to an increase in body

dissatisfaction. Emphasis needs to be placed on education to prevent all forms of malnutrition.

Title: The effect of virtual specialist conferences between endocrinologists and general practitioners about type 2 diabetes: study protocol for a pragmatic randomized superiority trial

Journal: Trials

Volume: 23

Issue: 1

Date: Dec

Short Title: The effect of virtual specialist conferences between endocrinologists and general practitioners about type 2 diabetes: study protocol for a pragmatic randomized superiority trial

DOI: 10.1186/s13063-022-06961-y

Article Number: 1059

Accession Number: WOS:000905694500002

Abstract: Background: To support the primary care sector in delivering high-quality type 2 diabetes (T2D), literature reviews emphasize the need for implementing models of collaboration that in a simple and effective way facilitate clinical dialogue between general practitioners (GPs) and endocrinologists. The overall aim of the project is to evaluate if virtual specialist conferences between GPs and endocrinologists about patients living with T2D is clinically effective and improves diabetes competences and organization in general practice in comparison to usual practice.

Methods: A prospective, pragmatic, and superiority RCT with two parallel arms of general practices in the Municipality of Aarhus, Denmark. All general practices are invited (n = 100). The intervention runs for 12 months and consists of four virtual conferences between endocrinologists and an individual general practice. Before the first conference, an introductory webinar teaches GPs about how to use an IT-platform to identify and manage T2D patients. The main analysis (month 12) concerns the difference between the intervention and control arm. It is expected that the virtual conferences at the patient level will improve adherence to international recommendations on diabetes medication for T2D patients and improve the risk profile with a reduction in glycated haemoglobin, blood pressure, and cholesterol. The study design allows for identifying a significant difference between the

intervention (n = 15) and control group (n = 15) regarding the three primary clinical outcomes with a power of 0.8870–0.9941. At the general practice level, it is expected that general practitioners and practice staff in the intervention group will improve self-reported diabetes competence and organization. The control arm will get the intervention when the primary intervention ends (months 12–24), and the intervention arm transitions to a maintenance phase. Discussion: The potential of virtual conferences is yet to be fully tapped because of methodological limitations. Studies have also not yet systematically evaluated virtual conferences in the context of chronic care using a high-quality research design. Given the nature of this real-life intervention, general practitioners and endocrinologists cannot be blinded to their allocation to either the intervention or comparison arm.

Title: General practitioner attitudes towards systems-level opioid prescribing interventions A pooled secondary qualitative analysis

Journal: Australian Journal of General Practice

Volume: 50

Issue: 5

Pages: 309–316

Date: May

Short Title: General practitioner attitudes towards systems-level opioid prescribing interventions A pooled secondary qualitative analysis

ISSN: 2208-794X

Accession Number: WOS:000647221600013

Abstract: Background and objective Several Australian systems-level initiatives have been implemented to reduce opioid overprescribing. The aim of this study was to explore general practitioner (GP) attitudes towards these interventions. Methods This secondary qualitative analysis used pooled interview data (collected in 2018 and 2019), recoded using thematic analysis and the Capability–Opportunity–Motivation model of behaviour change (COM–B model). Participants were professionally registered GPs or general practice registrars from Victoria and New South Wales. Results Fifty-seven GPs and general practice registrars were included. Participants expressed positive attitudes towards real-time prescription monitoring and codeine up-scheduling. High-prescriber 'nudge' letters sent by the government were perceived to be overly paternalistic and as potentially threatening to the prescribing of adequate analgesia. Guidelines and education were considered useful in principle, but were not commonly used. Discussion Systems-level

interventions aimed at reducing opioid overprescribing by GPs may be more successful if they partner with GPs and consider prescriber motivation a prerequisite to capacity to change. It may be beneficial for new interventions to target motivation beyond single mechanisms.

Short Title: A multifaceted strategy using mobile technology to assist rural primary healthcare doctors and frontline health workers in cardiovascular disease risk management: protocol for the SMARTHealth India cluster randomised controlled trial

ISSN: 1748-5908

DOI: 10.1186/1748-5908-8-137

Article Number: 137

Accession Number: WOS:000327598200001

Abstract: Background: Blood Pressure related disease affected 118 million people in India in the year 2000; this figure will double by 2025. Around one in four adults in rural India have hypertension, and of those, only a minority are accessing appropriate care. Health systems in India face substantial challenges to meet these gaps in care, and innovative solutions are needed. Methods: We hypothesise that a multifaceted intervention involving capacity strengthening of primary healthcare doctors and non-physician healthcare workers through use of a mobile device-based clinical decision support system will result in improved blood pressure control for individuals at high risk of a cardiovascular disease event when compared with usual healthcare. This intervention will be implemented as a stepped wedge, cluster randomised controlled trial in 18 primary health centres and 54 villages in rural Andhra Pradesh involving adults aged ≥ 40 years at high cardiovascular disease event risk (approximately 15,000 people). Cardiovascular disease event risk will be calculated based on World Health Organisation/ International Society of Hypertension's region-specific risk charts. Cluster randomisation will occur at the level of the primary health

centres. Outcome analyses will be conducted blinded to intervention allocation. Expected outcomes: The primary study outcome is the difference in the proportion of people meeting guideline-recommended blood pressure targets in the intervention period vs. the control period. Secondary outcomes include mean reduction in blood pressure levels; change in other cardiovascular disease risk factors, including body mass index, current smoking, reported healthy eating habits, and reported physical activity levels; self-reported use of blood pressure and other cardiovascular medicines; quality of life (using the EQ-5D); and cardiovascular disease events (using hospitalisation data). Trial outcomes will be accompanied by detailed process and economic evaluations. Significance: The findings are likely to inform policy on a scalable strategy to overcome entrenched inequities in access to effective healthcare for under-served populations in low and middle income country settings. Trial registration: Clinical Trial Registry India CTRI/ 2013/ 06/ 003753.

Short Title: SMARTHealth India: Development and Field Evaluation of a Mobile Clinical Decision Support System for Cardiovascular Diseases in Rural India

ISSN: 2291-5222

DOI: 10.2196/mhealth.3568

Article Number: e54

Accession Number: WOS:000209895200019

Abstract: Background: Cardiovascular disease (CVD) is the major cause of premature death and disability in India and yet few people at risk of CVD are able to access best practice health care. Mobile

health (mHealth) is a promising solution, but very few mHealth interventions have been subjected to robust evaluation in India. Objective: The objectives were to develop a multifaceted, mobile clinical decision support system (CDSS) for CVD management and evaluate it for use by public nonphysician health care workers (NPHWs) and physicians in a rural Indian setting. Methods: Plain language clinical rules were developed based on standard guidelines and programmed into a computer tablet app. The algorithm was validated and field-tested in 11 villages in Andhra Pradesh, involving 11 NPHWs and 3 primary health center (PHC) physicians. A mixed method evaluation was conducted comprising clinical and survey data and in-depth patient and staff interviews to understand barriers and enablers to the use of the system. Then this was thematically analyzed using NVivo 10. Results: During validation of the algorithm, there was an initial agreement for 70% of the 42 calculated variables between the CDSS and SPSS software outputs. Discrepancies were identified and amendments were made until perfect agreement was achieved. During field testing, NPHWs and PHC physicians used the CDSS to screen 227 and 65 adults, respectively. The NPHWs identified 39% (88/227) of patients for referral with 78% (69/88) of these having a definite indication for blood pressure (BP)-lowering medication. However, only 35% (24/69) attended a clinic within 1 month of referral, with 42% (10/24) of these reporting continuing medications at 3-month follow-up. Physicians identified and recommended 17% (11/65) of patients for BP-lowering medications. Qualitative interviews identified 3 interrelated interview themes: (1) the CDSS had potential to change prevailing health care models, (2) task-shifting to NPHWs was the central driver of change, and (3) despite high acceptability by end users, actual transformation was substantially limited by system-level barriers such as patient access to doctors and medicines. Conclusions: A tablet-based CDSS implemented within primary health care systems has the potential to help improve CVD outcomes in India. However, system-level barriers to accessing medical care limit its full impact. These barriers need to be actively addressed for clinical innovations to be successful.

Title: A new integrated behavioural intervention for knee osteoarthritis: development and pilot study

Journal: BMC Musculoskeletal Disorders

Volume: 22

Issue: 1

Date: Jun

Short Title: A new integrated behavioural intervention for knee osteoarthritis: development and pilot study

DOI: 10.1186/s12891-021-04389-0

Article Number: 526

Accession Number: WOS:000662726000001

Abstract: Background: Exercise-based approaches have been a cornerstone of physiotherapy management of knee osteoarthritis for many years. However, clinical effects are considered small to modest and the need for continued adherence identified as a barrier to clinical efficacy. While exercise-based approaches focus on muscle strengthening, biomechanical research has identified that people with knee osteoarthritis over activate their muscles during functional tasks. Therefore, we aimed to create a new behavioural intervention, which integrated psychologically informed practice with biofeedback training to reduce muscle overactivity, and which was suitable for delivery by a physiotherapist. **Methods:** Through literature review, we created a framework linking theory from pain science with emerging biomechanical concepts related to overactivity of the knee muscles. Using recognised behaviour change theory, we then mapped a set of intervention components which were iteratively developed through ongoing testing and consultation with patients and physiotherapists. **Results:** The underlying framework incorporated ideas related to central sensitisation, motor responses to pain and also focused on the idea that increased knee muscle overactivity could result from postural compensation. Building on these ideas, we created an intervention with five components: making sense of pain, general relaxation, postural deconstruction, responding differently to pain and functional muscle retraining. The intervention incorporated a range of animated instructional videos to communicate concepts related to pain and biomechanical theory and also used EMG biofeedback to facilitate visualization of muscle patterns. User feedback was positive with patients describing the intervention as enabling them to "create a new normal" and to be "in control of their own treatment." Furthermore, large reductions in pain were observed from 11 patients who received a prototype version of the intervention. **Conclusion:** We have created a new intervention for knee osteoarthritis, designed to empower individuals with capability and motivation to change muscle activation patterns and beliefs associated with pain. We refer to this intervention as Cognitive Muscular Therapy. Preliminary feedback and clinical indications are positive, motivating future large-scale trials to understand potential efficacy. It is possible that this new approach could bring about improvements in the pain associated with knee osteoarthritis without the need for continued adherence to muscle strengthening programmes.

Article Number: 212

Accession Number: WOS:000836218800004

Abstract: Background Models, theories, and frameworks (MTFs) provide the foundation for a cumulative science of implementation, reflecting a shared, evolving understanding of various facets of implementation. One under-represented aspect in implementation MTFs is how intersecting social factors and systems of power and oppression can shape implementation. There is value in enhancing how MTFs in implementation research and practice account for these intersecting factors. Given the large number of MTFs, we sought to identify exemplar MTFs that represent key implementation phases within which to embed an intersectional perspective. Methods We used

a five-step process to prioritize MTFs for enhancement with an intersectional lens. We mapped 160 MTFs to three previously prioritized phases of the Knowledge-to-Action (KTA) framework. Next, 17 implementation researchers/practitioners, MTF experts, and intersectionality experts agreed on criteria for prioritizing MTFs within each KTA phase. The experts used a modified Delphi process to agree on an exemplar MTF for each of the three prioritized KTA framework phases. Finally, we reached consensus on the final MTFs and contacted the original MTF developers to confirm MTF versions and explore additional insights. Results We agreed on three criteria when prioritizing MTFs: acceptability (mean = 3.20, SD = 0.75), applicability (mean = 3.82, SD = 0.72), and usability (median = 4.00, mean = 3.89, SD = 0.31) of the MTF. The top-rated MTFs were the Iowa Model of Evidence-Based Practice to Promote Quality Care for the 'Identify the problem' phase (mean = 4.57, SD = 2.31), the Consolidated Framework for Implementation Research for the 'Assess barriers/facilitators to knowledge use' phase (mean = 5.79, SD = 1.12), and the Behaviour Change Wheel for the 'Select, tailor, implement interventions' phase (mean = 6.36, SD = 1.08). Conclusions Our interdisciplinary team engaged in a rigorous process to reach consensus on MTFs reflecting specific phases of the implementation process and prioritized each to serve as an exemplar in which to embed intersectional approaches. The resulting MTFs correspond with specific phases of the KTA framework, which itself may be useful for those seeking particular MTFs for particular KTA phases. This approach also provides a template for how other implementation MTFs could be similarly considered in the future.

Abstract: Socioeconomic status and health are strongly related to the ability of a person to participate in society. Acting upon activation and employment possibilities is difficult for several groups. One group described as especially hard to activate is long-term welfare recipients. In the current study, the role of an activation broker was studied as a supplementary practice to regular support practices. A qualitative research design using an analysis of the administrative logbook of the activation broker and interviews with professionals (n = 8) and long-term welfare recipients (n = 10) was carried out. To structure the retrieved data, the Activation Broker Wheel was developed. Findings Seven core behaviours were identified and categorized in three determinants; capabilities, opportunities and motivation. Contextual factors supporting the activation broker approach were selected. The activation broker approach was found to be successful in activating long-term welfare recipients. Applications The behaviours, determinants and context made visible within the Activation Broker Wheel provided insight into workable elements that may help future activation brokers to optimize their support.

Short Title: Development and Evaluation of an eLearning Training Module to Improve United Kingdom Secondary School Teachers' Knowledge and Confidence in Supporting Young People Who Self-Harm

DOI: 10.3389/feduc.2022.889659

Article Number: 889659

Accession Number: WOS:000820139700001

Abstract: BackgroundSelf-harm is a major public health concern with evidence suggesting that the rates are higher in the United Kingdom than anywhere else in Europe. Increasingly, policy highlights the role of school staff in supporting young people (YP) who are self-harming, yet research indicates that school staff often feel ill-equipped to provide support and address self-harm behaviors. Here, we assess the impact of a bespoke eLearning module for United Kingdom secondary school teachers on teacher's actual and perceived knowledge of self-harm, and their self-reported confidence in supporting and talking to YP who self-harm. MethodsTwenty-one secondary schools across the West Midlands and South East of England were invited to complete a 30-min web-based eLearning module on

self-harm in schools. Participants completed pre-and post-intervention measures. Results One-hundred and seventy-three teachers completed the eLearning, and pre-and post-measures. The eLearning significantly enhanced participants' perceived knowledge, actual knowledge, and confidence in talking to and supporting YP who self-harm. The majority of participants (90.7%) felt that eLearning was a good way to receive training. Conclusion The 30-min eLearning module was rated highly and may be an effective way to increase secondary school teachers' knowledge of self-harm, and confidence in supporting and talking to YP who self-harm.

Short Title: Barriers and facilitators of childhood flu vaccination: the views of parents in North East England

ISSN: 2198-1833

DOI: 10.1007/s10389-022-01695-2

Accession Number: WOS:000757252000001

Abstract: Aim The aim of this study was to complete a descriptive qualitative investigation of parents' perceptions of the barriers and facilitators to flu vaccination for pre-school children. Subject and method Participants were recruited through various communication channels to maximize sample variation. Invitations to participate in the study were sent to members of the Newcastle University Parent Network and to parents who had participated in previous research conducted at Newcastle University. Twelve participants (six with vaccinated children, six whose children were not vaccinated) took part in a semi-structured interview via Zoom. Transcripts were coded using Nvivo 12 and data were thematically analyzed using the COM-B model of health behavior change. Results Participants whose children were not vaccinated against flu nonetheless generally held favourable views of vaccination and reported low concern about side-effects. Barriers involved a combination of internal and external factors, mainly a lack of convenient access to vaccination opportunities and flu vaccination being a low priority for busy parents. Conclusion Our findings suggest that socioeconomic status, which is known to influence other vaccination behaviors, may

influence uptake of the flu vaccine in this population. Inconvenient vaccination opportunities and a lack of awareness of the need to vaccinate are major barriers to uptake for some parents. The finding that belief that flu vaccination is a civic responsibility is a new contribution to the literature.

Short Title: Attitudes of Australian dermatologists on the use of genetic testing: A cross-sectional survey with a focus on melanoma

DOI: 10.3389/fgene.2022.919134

Article Number: 919134

Accession Number: WOS:000892087900001

Abstract: Background: Melanoma genetic testing reportedly increases preventative behaviour without causing psychological harm. Genetic testing for familial melanoma risk is now available, yet little is known about dermatologists' perceptions regarding the utility of testing and genetic testing ordering behaviours. Objectives: To survey Australasian Dermatologists on the perceived utility of genetic testing, current use in practice, as well as their confidence and preferences for the delivery of genomics education. Methods: A 37-item survey, based on previously validated instruments, was sent to accredited members of the Australasian College of Dermatologists in March 2021. Quantitative items were analysed statistically, with one open-ended question analysed qualitatively. Results: The response rate was 56% (256/461), with 60% (153/253) of respondents between 11 and 30 years post-graduation. While 44% (112/252) of respondents agreed, or strongly agreed, that genetic testing was relevant to their practice today, relevance to future practice was reported significantly higher at 84% (212/251) ($t = -9.82$, $p < 0.001$). Ninety three percent (235/254) of respondents reported rarely or never ordering genetic testing. Dermatologists who viewed genetic testing as relevant to current practice were more likely to have discussed ($p < 0.001$) and/or offered testing ($p < 0.001$). Respondents indicated high confidence in discussing family history of melanoma, but lower confidence in ordering genetic tests and interpreting results. Eighty four percent (207/247) believed that genetic testing could negatively impact life

insurance, while only 26% (63/244) were aware of the moratorium on using genetic test results in underwriting in Australia. A minority (22%, 55/254) reported prior continuing education in genetics. Face-to-face courses were the preferred learning modality for upskilling. Conclusion: Australian Dermatologists widely recognise the relevance of genetic testing to future practice, yet few currently order genetic tests. Future educational interventions could focus on how to order appropriate genetic tests and interpret results, as well as potential implications on insurance.

Short Title: Protocol for the PLAY Study: a randomised controlled trial of an intervention to improve infant development by encouraging maternal self-efficacy using behavioural feedback

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-064976

Accession Number: WOS:000960988700031

Abstract: Introduction The early infant caregiving environment is crucial in the formation of parent-child relationships, neurobehavioural development and thus child outcomes. This protocol describes the Play Love And You (PLAY) Study, a phase 1 trial of an intervention designed to promote infant development through encouraging maternal self-efficacy using behavioural feedback, and supportive interventions. Methods and analysis 210 mother-infant pairs will be recruited at delivery from community clinics in Soweto, South Africa, and individually randomised (1:1) into two

groups. The trial will consist of a standard of care arm and an intervention arm. The intervention will start at birth and end at 12 months, and outcome assessments will be made when the infants are 0, 6 and 12 months of age. The intervention will be delivered by community health helpers using an app with resource material, telephone calls, in person visits and behavioural feedback with individualised support. Every 4 months, mothers in the intervention group will receive rapid feedback via the app and in person on their infant's movement behaviours and on their interaction styles with their infant. At recruitment, and again at 4 months, mothers will be screened for mental health risk and women who score in the high-risk category will receive an individual counselling session from a licensed psychologist, followed by referral and continued support as necessary. The primary outcome is efficacy of the intervention in improving maternal self-efficacy, and the secondary outcomes are infant development at 12 months, and feasibility and acceptability of each component of the intervention. Ethics and dissemination The PLAY Study has received ethical approval from the Human Research Ethics Committee of the University of the Witwatersrand (M220217). Participants will be provided with an information sheet and required to provide written consent prior to being enrolled. Study results will be shared via publication in peer-reviewed journals, conference presentation and media engagement.

Title: The awareness and usage of orthodontic apps and social media by orthodontists in the UK: A questionnaire-based study

Journal: Journal of Orthodontics

Volume: 50

Issue: 1

Pages: 9-17

Date: Mar

Short Title: The awareness and usage of orthodontic apps and social media by orthodontists in the UK: A questionnaire-based study

ISSN: 1465-3125

DOI: 10.1177/14653125221094334

Accession Number: WOS:000793152300001

Abstract: Objective: To assess the awareness and usage of mobile apps and social media among orthodontic clinicians to support patients with orthodontic treatment, support the professional development of orthodontists, and identify any relevant apps and social media platforms currently recommended to patients. Design: Cross-sectional questionnaire-based study. Setting: United Kingdom.

Methods: A questionnaire was developed and distributed to members of the British Orthodontic Society (BOS). To increase the response rate, the questionnaire was circulated at three time points between January and March 2020. Results: A total of 149 orthodontists responded to the questionnaire (15% response rate) with 113 orthodontists completing all questions (11.4%). Of those who answered, 81% (n = 111) had been qualified for >10 years, 35% worked in practice (n = 48), 34% worked in a hospital (n = 47) and 26% worked in both hospital and practice (n = 36). The results indicated that 20% of clinicians (n = 22) used apps to support patients and 33% (n = 37) reported using apps for professional purposes. Brush DJ appeared to be the most popular patient focused app (39%, n = 18) whereas the IOTN (17%, n = 8), Invisalign (17%, n = 8) and Dental Monitoring apps (9%, n = 4) were the most popular clinician-focused apps. With regard to social media, 53% (n = 60) of respondents reported that they used social media to communicate generic orthodontic information and promote their practice to patients. The most commonly used social media platforms were Facebook and Instagram. Of respondents, 96% expressed a willingness to recommend an evidence-based mobile app to patients if available, and 88% were willing to recommend an evidence-based social media platform. Conclusions: Orthodontic clinicians are utilising mobile apps and social media to support both patients and their own professional development. There is a willingness to increase the use of evidence-based platforms and apps to support patients.

Short Title: Writing implementation research grant proposals: ten key ingredients

ISSN: 1748-5908

DOI: 10.1186/1748-5908-7-96

Article Number: 96

Accession Number: WOS:000315962000001

Abstract: Background: All investigators seeking funding to conduct implementation research face the challenges of preparing a high-quality proposal and demonstrating their capacity to conduct the proposed study. Applicants need to demonstrate the progressive nature of their research agenda and their ability to build cumulatively upon the literature and their own preliminary studies.

Because implementation science is an emerging field involving complex and multilevel processes, many investigators may not feel equipped to write competitive proposals, and this concern is pronounced among early stage implementation researchers. Discussion: This article addresses the challenges of preparing grant applications that succeed in the emerging field of dissemination and implementation. We summarize ten ingredients that are important in implementation research grants. For each, we provide examples of how preliminary data, background literature, and narrative detail in the application can strengthen the application. Summary: Every investigator struggles with the challenge of fitting into a page-limited application the research background, methodological detail, and information that can convey the project's feasibility and likelihood of success. While no application can include a high level of detail about every ingredient, addressing the ten ingredients summarized in this article can help assure reviewers of the significance, feasibility, and impact of the proposed research. Abstract: Implementation strategies have unparalleled importance in implementation science, as they constitute the 'how to' component of changing healthcare practice. Yet, implementation researchers and other stakeholders are not able to fully utilize the findings of studies focusing on implementation strategies because they are often inconsistently labelled and poorly described, are rarely justified theoretically, lack operational definitions or manuals to guide their use, and are part of 'packaged' approaches whose specific elements are poorly understood. We address the challenges of specifying and reporting implementation strategies encountered by researchers who design, conduct, and report research on implementation strategies. Specifically, we propose guidelines for naming, defining, and operationalizing implementation strategies in terms of seven dimensions: actor, the action, action targets, temporality, dose, implementation outcomes addressed, and

theoretical justification. Ultimately, implementation strategies cannot be used in practice or tested in research without a full description of their components and how they should be used. As with all intervention research, their descriptions must be precise enough to enable measurement and 'reproducibility.' We propose these recommendations to improve the reporting of implementation strategies in research studies and to stimulate further identification of elements pertinent to implementation strategies that should be included in reporting guidelines for implementation strategies.

Short Title: Cattle farmer psychosocial profiles and their association with control strategies for bovine viral diarrhoea

ISSN: 0022-0302

DOI: 10.3168/jds.2021-21386

Accession Number: WOS:000821073000014

Abstract: Bovine viral diarrhoea (BVD) is endemic in the United Kingdom and causes major economic losses. Control is largely voluntary for individual farmers and is likely to be influenced by psychosocial factors, such as altruism, trust, and psychological proximity (feeling close) to relevant "others," such as farmers, veterinarians, the government, and their cows. These psychosocial factors (factors with both psychological and social aspects) are important determinants of how people make decisions related to their own health, many of which have not been studied in the context of infectious disease control by farmers. Farmer psychosocial profiles were investigated using multiple validated measures in an observational survey of 475 UK cattle farmers using the capability, opportunity, motivation-behavior (COMB) framework. Farmers were clustered by their BVD control practices using latent class analysis. Farmers were split into 5 BVD control behavior classes, which were tested for associations with the psychosocial and COMB factors using multinomial logistic regression, with doing nothing as the baseline class. Farmers who were controlling disease both for themselves and others were more likely to do something to control BVD (e.g., test, vaccinate). Farmers who did not trust other farmers, had high psychological capability (knowledge and understanding of how to control disease), and had high physical

opportunity (time and money to control disease) were more likely to have a closed, separate herd and test. Farmers who did not trust other farmers were also more likely to undertake many prevention strategies with an open herd. Farmers with high automatic motivation (habits and emotions) and reflective motivation (decisions and goals) were more likely to vaccinate and test, alone or in combination with other controls. Farmers with high psychological proximity (feeling of closeness) to their veterinarian were more likely to undertake many prevention strategies in an open herd. Farmers with high psychological proximity to dairy farmers and low psychological proximity to beef farmers were more likely to keep their herd closed and separate and test or vaccinate and test. Farmers who had a lot of trust in other farmers and invested in them, rather than keeping everything for themselves, were more likely to be careful introducing new stock and test. In conclusion, farmer psychosocial factors were associated with strategies for BVD control in UK cattle farmers. Psychological proximity to veterinarians was a novel factor associated with proactive BVD control and was more important than the more extensively investigated trust. These findings highlight the importance of a close veterinarian–farmer relationship and are important for promoting effective BVD control by farmers, which has implications for successful nationwide BVD control and eradication schemes.

Title: Primary care implementation study to scale up early identification and brief intervention and reduce alcohol-related negative outcomes at the community level (PINO): study protocol for a quasi-experimental 3-arm study

Journal: BMC Family Practice

Volume: 22

Issue: 1

Date: Jul

Short Title: Primary care implementation study to scale up early identification and brief intervention and reduce alcohol-related negative outcomes at the community level (PINO): study protocol for a quasi-experimental 3-arm study

DOI: 10.1186/s12875-021-01479-9

Article Number: 144

Accession Number: WOS:000671723600005

Abstract: Background Primary healthcare-based Early Identification and Brief Intervention (EIBI) for hazardous and harmful alcohol use is both a clinically relevant and cost-effective strategy to reduce heavy drinking. Unfortunately, it remains poorly implemented in daily practice. Multiple studies have shown that training and support (T&S) programs can increase the use of EIBI. Nonetheless, gains have only been modest and short-term at best. Suggestions have been made to rely more on multicomponent programs that simultaneously address several barriers to the implementation of EIBI. The PINO-project aims to evaluate the added value of such a multicomponent program to improve EIBI delivery in daily practice. **Methods/design** A quasi-experimental three-arm implementation study in Flanders (Belgium) will assess the effects of tailored T&S to General Practitioners (GPs) with or without community mobilisation on EIBI delivery in general practice. The study lasts 18 months and will take place in three comparable municipalities. In municipality 1 and 2, GPs receive a tailored T&S program. The T&S is theoretically founded and tailored to the GPs' views, needs and practice characteristics. Furthermore, community actions will be embedded within municipality 1 providing additional, contextual, support. In municipality 3, GPs are offered a minimal intervention to facilitate data collection. The primary outcome is the proportion of adult patients screened for hazardous and harmful alcohol use at the end of an 18-month implementation period. The secondary outcome is the scaling up activity at municipal level in screening rates, as assessed every 3 months, and the proportion of patients who received an additional brief intervention when necessary. Furthermore, the correlation between the opinions and needs of the GP's, their practice organisation and their EIBI performance will be explored. **Discussion** The PINO-project addresses the gap between what is theoretically possible and the current practice. This is an innovative study combining T&S at GP level with community actions. At the same time, it implements and evaluates practice T&S based on the theoretical domains framework. **Trial registration** This trial was approved by the Ethics Committee for Research of UZ/KU Leuven (reference number s63342 and G-2020-2177-R2(MAR)) and is registered on clinicaltrials.gov (NCT04398576) in May 2020.

Article Number: 1474515119885240

Accession Number: WOS:000496678700001

Abstract: Background: Self-management is crucial for blood pressure control and subsequent disease prevention. Health literacy and acceptance of illness may contribute to self-management behaviour; in addition, acceptance of illness may mediate the effects of health literacy on self-management behaviour among patients with hypertension. Objective: The aims of the research were to examine whether health literacy and acceptance of illness were associated with both pharmacological and non-pharmacological management behaviour and examine the possible mediating effects of the acceptance of illness in patients with hypertension. Methods: Hierarchical regression analysis was conducted to analyse the relationships between health literacy, acceptance of illness, pharmacological and non-pharmacological management behaviours. Mediation effects were examined by the PROCESS macro. Results: This was a cross-sectional study. A total of 478 hypertensive patients completed measures of health literacy, acceptance of illness, self-management, social support, depression, physical function and demographic and clinical characteristics. Functional, communicative, critical health literacy and acceptance of illness showed positive associations to pharmacological and non-pharmacological management behaviour. Acceptance of illness mediated the relationships between three types of health literacy, pharmacological and non-pharmacological management but the effects size and pathway differed. In detail, functional health literacy influenced pharmacological and non-pharmacological management behaviour mainly by indirect effects mediated by the acceptance of illness, but communicative and critical health literacy influenced pharmacological and non-pharmacological management behaviour mainly by direct effects. Conclusions: Acceptance of illness mediated the relationships between three types of health literacy and self-management. Health literacy and acceptance of illness should be addressed when taking measures to improve patients' self-management behaviour.

Short Title: Effectiveness of a French mass-media campaign in raising knowledge of both long-term alcohol-related harms and low-risk drinking guidelines, and in lowering alcohol consumption

ISSN: 0965-2140

DOI: 10.1111/add.16107

Accession Number: WOS:000905254800001

Abstract: Aims To evaluate the effectiveness of a French mass-media campaign in raising knowledge of both long-term alcohol-related harms (LTH) and low-risk drinking guidelines (LRDG), as well as in lowering alcohol consumption. Design An 8-month longitudinal survey from February to October 2019, with three waves of on-line data collection (T0 before the campaign, T1 just after it ended and T2 6 months after it ended). Setting France. Participants A total of 2538 adult drinkers (aged 18-75 years). Measurements The main outcomes' variables were LTH knowledge (cancer, hypertension, brain haemorrhage), LRDG knowledge (two guidelines: 'maximum of two drinks a day' and 'minimum of 2 days without alcohol per week'), intention to reduce alcohol consumption and self-declared consumption with respect to the French LRDG. At T1, exposure to the campaign was measured using self-reported campaign recall. Findings In T1, we observed significant positive interactions between exposure group based on campaign recall and survey waves on knowledge of (i) the 'maximum two drinks a day' guideline [adjusted odds ratio (aOR) = 1.32, 95% confidence interval (CI) = 1.08-1.62, P = 0.008], (ii) brain haemorrhage (aOR = 1.80, 95% CI = 1.44-2.25, P < 0.001) and (iii) hypertension (aOR = 1.41, 95% CI = 1.09-1.81, P = 0.008) risks. Campaign exposure was also associated with a significant decrease in at-risk drinking in women (aOR = 0.67, 95% CI = 0.50-0.88, P = 0.004). No significant interaction was observed at T1 for the knowledge of the 'minimum of 2 days without alcohol a week' guideline, or of cancer risk. At T2, no significant interaction was observed for the main outcomes' variables. Conclusions There appears to be an association between exposure to a 2019 French mass-media campaign to raise knowledge of long-term alcohol-related harms and low-risk drinking guidelines and reduce alcohol consumption and (i) improved knowledge of the 'maximum two drinks per day guideline', (ii) knowledge of the risks of hypertension and brain haemorrhage and (iii) a reduction in the proportion of people exceeding low-risk drinking guidelines (in the general population only). These associations were only observed over the short term and, in some cases, only for certain segments of the population.

Accession Number: WOS:000808143300001

Abstract: Objective: This study aims to understand the context of place associated with smoking in urban Hamilton parks from a Te Ao Maori perspective (the worldview of Maori, the Indigenous people of Aotearoa New Zealand). Methods: Our study approached smokefree environments in Hamilton through a Maori lens, undertaking interviews with family groups and people from organisations involved in the local Smokefree environments policy. Results: The majority of the 26 adult participants identified as Maori, with 30% being current smokers. Parks had a place in the sporting memories of participants. Smoking was merged with these memories. Important features of places that influenced smoking behaviours were raised, with signage a key talking point. Conclusions: The colonial construct of parks do not make visible Maori values and historical associations with the land, nor do they set a framework that would promote Maori ways of being and doing, including enacting smokefree spaces and places. Implications for public health: This study provides the incentive to address change in parks and reserve management that would support Maori aspirations for their health and wellbeing associated with ancestral land, and give meaning to smokefree environments.

Short Title: Online training in evidence-based medicine and research methods for GP registrars: a mixed-methods evaluation of engagement and impact

DOI: 10.1186/s12909-021-02916-0

Article Number: 492

Accession Number: WOS:000695825800002

Abstract: Background Evidence-based medicine (EBM) is a core skillset for enhancing the quality and safety of patients' care. Online EBM education could improve clinicians' skills in EBM, particularly when it is conducted during vocational training. There are limited studies on the impact of online EBM training on clinical practice among general practitioner (GP) registrars (trainees in specialist general practice). We aimed to describe and evaluate the acceptability, utility, satisfaction and applicability of the GP registrars experience with the online course. The course was developed by content-matter experts with educational designers to encompass effective teaching methods (e.g. it was interactive and used multiple teaching methods). Methods Mixed-method data collection was conducted after individual registrars' completion of the course. The course comprised six modules that aimed to increase knowledge of research methods and application of EBM skills to everyday practice. GP registrars who completed the online course during 2016-2020 were invited to complete an online survey about their experience and satisfaction with the course. Those who completed the course within the six months prior to data collection were invited to participate in semi-structured phone interviews about their experience with the course and the impact of the course on clinical practice. A thematic analysis approach was used to analyse the data from qualitative interviews. Results The data showed the registrars were generally positive towards the course and

the concept of EBM. They stated that the course improved their confidence, knowledge, and skills and consequently impacted their practice. The students perceived the course increased their understanding of EBM with a Cohen's d of 1.6. Registrars identified factors that influenced the impact of the course. Of those, some were GP-related including their perception of EBM, and being comfortable with what they already learnt; some were work-place related such as time, the influence of supervisors, access to resources; and one was related to patient preferences. Conclusions This study showed that GP registrars who attended the online course reported that it improved their knowledge, confidence, skill and practice of EBM over the period of three months. The study highlights the supervisor's role on GP registrars' ability in translating the EBM skills learnt in to practice and suggests exploring the effect of EBM training for supervisors.

Short Title: Perspectives about smoking cessation during pregnancy and beyond of Aboriginal women in Australia: A qualitative analysis using the COM-B model

ISSN: 0020-7292

DOI: 10.1002/ijgo.13854

Accession Number: WOS:000688290100001

Abstract: Objective Aboriginal and Torres Strait Islander women (hereafter Aboriginal) and their babies experience poor health outcomes for which smoking is a major risk factor. This paper explores Aboriginal women's perspectives on and experiences of smoking cessation, within and outside pregnancy, and their use of smoking cessation services using the COM-B (Capability, Opportunity, Motivation as determinants of Behaviour) model to understand Aboriginal women's capabilities, opportunities, and motivation for smoking cessation. Methods Data came from 11 focus groups conducted in regional New South Wales, Australia, with 80 women aged between 16 and 68 years. Thematic analysis was performed following the COM-B model. Results Seven themes related to capability, opportunity,

motivation, and smoking cessation behaviors were identified. The themes highlighted that agency, knowledge, and self-efficacy (as capability), a supportive social environment, and access to culturally appropriate services and resources (as opportunities), together with automatic and reflective motivations for quitting, may enable short- or long-term smoking cessation. Conclusion Smoking cessation interventions may be more effective if the dynamics of the COM-B factors are considered. Policy and practice changes for further enhancing regional Aboriginal women's psychological capability and supportive social environments, and making smoking cessation services culturally appropriate are warranted.

Title: How Are Community Health Workers Trained to Deliver Physical Activity to Adults A Scoping Review

Journal: Translational Journal of the American College of Sports Medicine

Volume: 4

Issue: 6

Pages: 34-44

Date: Mar

Short Title: How Are Community Health Workers Trained to Deliver Physical Activity to Adults A Scoping Review

DOI: 10.1249/tjx.0000000000000081

Accession Number: WOS:000755984700001

Abstract: Purpose: Community-based physical activity interventions are recommended because of increased reach and public health impact. To improve adult physical activity levels, access and availability of community-based interventions are needed, and delivery personnel must be trained to meet this need. However, there is a gap in the literature related to training and recruitment of the community health workers (CHW) who deliver these interventions to adults. The purpose of this study was to determine the characteristics of CHW who were trained to deliver in-person physical activity to adults, the structural and mechanistic components of physical activity trainings, and the effectiveness of these trainings. Methods: A scoping review of peer-reviewed literature was conducted from November 2017 to January 2018. The review was limited to CHW training on adult physical activity delivery that reported reach, effect, or outcomes of training. The search was conducted in PubMed

and EBSCOhost and included articles published from 1995 (coinciding with the release of the national physical activity guidelines) to December 2017. Results: A total of 6651 peer-reviewed studies were identified, 205 full manuscripts were evaluated, and 7 articles met inclusion criteria and were analyzed. All studies reported the initial sample size of CHW trained; however, limited information on CHW personal characteristics was provided. The majority of studies reported that trainings were in-person with an average dose of 6 h. Four studies reported on training outcomes, with methods, measures, and outcomes varying widely. Conclusions: There is inconsistent reporting on training across the literature, making comparisons between studies difficult and conclusions regarding training effectiveness difficult to discern. Further research is needed to understand for whom, under what conditions, and why physical activity trainings strategies are effective for CHW.

Title: Understanding the primary health care experiences of individuals who are homeless in non-traditional clinic settings

Journal: BMC Primary Care

Volume: 23

Issue: 1

Date: Dec

Short Title: Understanding the primary health care experiences of individuals who are homeless in non-traditional clinic settings

DOI: 10.1186/s12875-022-01932-3

Article Number: 338

Accession Number: WOS:000904096100001

Abstract: BackgroundDespite the widespread implementation of Health Care for the Homeless programs that focus on comprehensive, integrated delivery systems of health care for people experiencing homelessness, engaging and retaining people experiencing homelessness in primary care remains a challenge. Few studies have looked at the primary care delivery model in non-traditional health care settings to understand the facilitators and barriers to engagement in care. The objective of our study was to explore the clinic encounters of individuals experiencing homelessness receiving care at two different sites served under a single Health Care for the Homeless program. MethodsSemi-structured interviews were conducted with people experiencing homelessness for an explorative qualitative study. We used convenience sampling to recruit participants who were engaged in primary care at one of two sites: a shelter clinic, n=16, and a mobile clinic located in a church, n=15. We then used an iterative, thematic approach to identify emergent themes and further mapped these onto the Capability-Opportunity-

Motivation model. Results Care accessibility, quality and integration were themes that were often identified by participants as being important facilitators to care. Psychological capability and capacity became important barriers to care in instances when patients had issues with memory or difficulty with perceiving psychological safety in healthcare settings. Motivation for engaging and continuing in care often came from a team of health care providers using shared decision-making with the patient to facilitate change. Conclusion To optimize health care for people experiencing homelessness, clinical interventions should: (1) utilize shared-decision making during the visit, (2) foster a sense of trust, compassion, and acceptance, (3) emphasize continuity of care, including consistent providers and staff, and (4) integrate social services into Health Care for the Homeless sites.

Short Title: Worries, beliefs and factors influencing perinatal COVID-19 vaccination: a cross-sectional survey of preconception, pregnant and lactating individuals

DOI: 10.1186/s12889-022-14617-4

Article Number: 2418

Accession Number: WOS:000903245800002

Abstract: Background: COVID-19 vaccines are recommended for pregnant and lactating individuals, and there is substantial evidence for their safety and effectiveness. As the pandemic continues, information on worries and beliefs surrounding perinatal COVID-19 vaccination remains important to inform efforts aimed at improving vaccine uptake. Our objectives were to assess factors associated with COVID-19 vaccination among perinatal individuals; and to explore motivational factors associated with willingness to be vaccinated among unvaccinated perinatal individuals. Methods: This was a cross-sectional web-based survey of preconception, pregnant, and lactating individuals in Canada. The outcomes of interest were vaccination with at least one dose of any COVID-19 vaccine and willingness to be vaccinated among unvaccinated individuals. Sample characteristics were summarized using frequencies and percentages.

The association between eight prespecified risk factors and two outcomes (vaccination status and willingness to be vaccinated) was assessed by logistic regression. Odds ratios (OR) and 95% confidence intervals (CI) were calculated for the total sample, and across perinatal sub-groups. Results: Among 3446 survey respondents, there were 447 (13.0%) preconception, 1832 (53.2%) pregnant, and 1167 (42.4%) lactating. There were 1460 (42.4%) and 1982 (57.5%) who were vaccinated and unvaccinated, respectively. Factors positively associated with COVID-19 vaccine status were speaking to a healthcare provider about vaccination during the perinatal period (aOR:2.35, 95% CI:1.97-2.80) and believing that the COVID-19 vaccine is effective (aOR:1.91, 95% CI:1.46-2.48). Factors negatively associated with vaccine status included worries about fetal growth and development (aOR:0.55, 95% CI:0.43-0.70) and future child behavioral/neurodevelopmental problems (aOR:0.59, 95% CI:0.46-0.75). Among unvaccinated individuals specifically, characteristics positively associated with willingness to vaccinate were speaking to a healthcare provider (aOR:1.67, 95% CI:1.32-2.12) and believing the COVID-19 vaccine is effective (aOR:3.56, 95% CI:2.70-4.69). Factors negatively associated with willingness were concerns over infertility (aOR:0.66, 95% CI:0.49-0.88), fetal growth and development (aOR:0.33, 95% CI:0.24-0.46), and future child behavioral/neurodevelopmental problems (aOR:0.64, 95% CI:0.48-0.84). Conclusions: In this Canadian perinatal population, approximately 42% reported COVID-19 vaccination. Among unvaccinated individuals, willingness to receive vaccination was high (73%). Factors enhancing vaccine willingness included discussions with healthcare providers and believing the vaccine was effective. Concerns regarding vaccine safety, particularly with respect to fetal/child development, were the greatest barriers to vaccine uptake.

Short Title: Using segmented regression analysis of interrupted time series data to assess colonoscopy quality outcomes of a web-enhanced

implementation toolkit to support evidence-based practices for bowel preparation: a study protocol

ISSN: 1748-5908

DOI: 10.1186/s13012-015-0276-3

Article Number: 85

Accession Number: WOS:000356036000001

Abstract: Background: While there is convincing evidence on interventions to improve bowel preparation for patients, the evidence on how to implement these evidence-based practices (EBPs) in outpatient colonoscopy settings is less certain. The Strategies to Improve Colonoscopy (STIC) study compares the effect of two implementation strategies, physician education alone versus physician education plus an implementation toolkit for staff, on adoption of three EBPs (split-dosing of bowel preparation, low-literacy education, teach-back) to improve pre-procedure and intra-procedure quality measures. The implementation toolkit contains a staff education module, website containing tools to support staff in delivering EBPs, tailored patient education materials, and brief consultation with staff to determine how the EBPs can be integrated into the existing workflow. Given adaptations to the implementation plan and intentional flexibility in the delivery of the EBPs, we utilize a pragmatic study to balance external validity with demonstrating effectiveness of the implementation strategies.

Methods/Design: Participants will include all outpatient colonoscopy physicians, staff, and patients from a convenience sample of six endoscopy settings. Aim #1 will explore the relative effect of two strategies to implement patient-level EBPs on adoption and clinical quality outcomes. We will assess the change in level and trends of clinical quality outcomes (i.e., adequacy of bowel preparation, adenoma detection) using segmented regression analysis of interrupted time series data with two groups (intervention and delayed start). Aim #2 will examine the influence of organizational readiness to change on EBP implementation. We use a PRECIS diagram to reflect the extent to which each indicator of the study was pragmatic versus explanatory, revealing a largely pragmatic study.

Discussion: Implementation challenges have already motivated several adaptations to the original plan, reflecting the nature of implementation in real-world healthcare settings. The pragmatic study responds to the evolving needs of its healthcare partners and allows for flexibility in intervention delivery, thereby informing clinical decision-making in real-world settings. The current study will provide information about what works (intervention effectiveness), for whom it works (influence of Medicaid versus other insurance), in which contexts it works (setting characteristics that influence implementation), and how it works best (comparison of implementation strategies).

Short Title: Dissemination and implementation research for oral and craniofacial health: Background, a review of literature and future directions

ISSN: 0301-5661

DOI: 10.1111/cdoe.12841

Accession Number: WOS:000928795700001

Abstract: Oral conditions are highly prevalent globally and have profound consequence on individuals and communities. Clinical (e.g. dental treatments, behavioural counselling) and non-clinical (e.g. community-based programming, water fluoridation, oral health policy) evidence-based interventions have been identified, recommended and applied at the clinic, community and policy levels. Still, the burden of oral conditions persists, with inequitable distribution across populations. A major driver of this lack of progress is poor translation of research findings, which results in an evidence-to-practice gap. Dissemination and implementation science (DIS) has emerged to address this gap. A relatively new field, application of DIS represents an important avenue for achieving good dental, oral and craniofacial health for all. The goal of this introductory article is to provide a brief background on DIS relevant to researchers in dentistry and oral health. The problem of knowledge translation, basic concepts and terminology in DIS, and approaches to doing dissemination and implementation research—including implementation strategies, key outcomes, and implementation theories, models and frameworks—are discussed. Additionally, the article reviews literature applying DIS to dentistry and oral health. Results of published studies and their implications for the field are presented. Drawing on the literature review and contemporary thinking in DIS, current gaps, opportunities and future directions are discussed. Resources for understanding and applying DIS are provided throughout. This article serves as a primer on DIS for dental and oral health researchers of all types working across a range of contexts; it also serves as a call to action for increased application of DIS to address the burden of oral conditions globally.

Article Number: 103870

Accession Number: WOS:000642451700024

Abstract: Background: The culture of acute mental health wards is often dominated by medical models of care despite some patient dissatisfaction with care in these settings and a demand for increased access to psychosocial interventions. Research has found that psychosocial interventions can improve a number of patient and staff outcomes, however, implementation within these settings is often challenging. Objectives: The aim of this review was to provide a comprehensive synthesis of the barriers and facilitators to implementing psychosocial interventions on acute wards, in order to develop a list of recommendations for embedding psychosocial interventions within the ward culture in acute settings. Methods: Databases were systematically searched using search terms related to acute mental health wards and psychosocial intervention implementation from inception to December 2019. Thirty-nine studies (forty-three papers) that explored the implementation of psychosocial interventions on adult acute mental health wards using qualitative methods met inclusion criteria. Data relating to barriers and facilitators to implementing psychosocial interventions extracted from the results sections of the papers were synthesised using the COM-B model. Results and conclusions: We conclude that to address barriers to the implementation of psychosocial interventions, services should provide clear information to patients regarding the benefits of engagement, and additional training for staff. A shift in ward culture is required and can be achieved through the recruitment of empathic implementers, together with providing staff with protected time for delivery of psychosocial interventions with clear accountability for intervention delivery through the provision of clearly defined roles. Short Title: Determinants of health and wellbeing in refractory epilepsy and surgery: The Patient Reported, Implementation science (PRIME) model

ISSN: 1525-5050

DOI: 10.1016/j.yebeh.2018.11.027

Accession Number: WOS:000461905800013

Abstract: This paper offers a new way of understanding the course of a chronic, neurological condition through a comprehensive model of patient-reported determinants of health and wellbeing: The Patient Reported Implementation science (PRIME) model is the first model of its kind to be based on patient-driven insights for the design and implementation of initiatives that could improve tertiary, primary, and community healthcare services for patients with refractory epilepsy, and has broad implications for other disorders; PRIME focuses on: patient-reported determinants of health and wellbeing, pathways through care, gaps in treatment and other system delays, patient need and expectation, and barriers and facilitators to high-quality care provision; PRIME highlights that in the context of refractory epilepsy, patients value appropriate, clear, and speedy referrals from primary care practitioners and community neurologists to specialist healthcare professionals based in tertiary epilepsy centers. Many patients also want to share in decisions around treatment and care, and gain a greater understanding of their debilitating disease, so as to find ways to self-manage their illness more effectively and plan for the future. Here, PRIME is presented using refractory epilepsy as the exemplar case, while the model remains flexible, suitable for adaptation to other settings, patient populations, and conditions; PRIME comprises six critical levels; 1) The Individual Patient Model; 2) The Patient Relationships Model; 3) The Patient Care Pathways Model; 4) The Patient Transitions Model; 5) The Pre- and Postintervention Model; and 6) The Comprehensive Patient Model. Each level is dealt with in detail, while Levels 5 and 6 are presented in terms of where the gaps lie in our current knowledge, in particular in relation to patients' journeys through healthcare, system intersections, and individuals adaptive behavior following resective surgery, as well as others' views of the disease, such as family members. Accession Number: WOS:000917796500001

Abstract: Persistent physical symptoms (PPS) remain a challenge in the healthcare system due to time-constrained consultations, uncertainty and limited specialised care capacity. Self-help interventions may be a cost-effective way to widen the access to treatment. As a foundation for future interventions, we aimed to describe intervention components and their potential effects in self-help interventions for PPS. A systematic literature search was made in PubMed, EMBASE, PsycINFO and CENTRAL. Fifty-one randomised controlled trials were included. Interventions were coded for effect on outcomes (standardised mean difference ≥ 0.2) related to symptom burden, anxiety, depression, quality of life, healthcare utilisation and sickness absence. The Behaviour Change Technique (BCT) Taxonomy v1 was used to code intervention components. An index of potential was calculated for each BCT within an outcome category. Each BCT was assessed as 'potentially effective' or 'not effective' based on a two-sided test for binomial random variables. Sixteen BCTs showed potential effect as treatment components. These BCTs represented the themes: goals and planning, feedback and monitoring, shaping knowledge, natural consequences, comparison of behaviour, associations, repetition and substitution, regulation, antecedents and identity. The results suggest that specific BCTs should be included in new PPS self-help interventions aiming to improve the patients' physical and mental health.

Short Title: Why don't general dental practitioners test for diabetes in periodontitis patients? How infrastructure, role identity and self-efficacy can prevent effective shared care

ISSN: 0007-0610

DOI: 10.1038/s41415-022-4294-7

Accession Number: WOS:000809354100023

Abstract: Aim To explore the attitudes of general dental practitioners (GDPs) towards testing for diabetes in periodontitis patients amid recommendations from professional organisations that dentists and oral health professionals are well-positioned to support the diagnosis of diabetes in primary dental care. Method GDPs were selected based on purposeful sampling. The number of GDPs recruited was dependent on thematic saturation. Semi-structured telephone interviews were conducted with all recruited GDPs. Interviews were audio recorded and transcribed verbatim. Thematic analysis was utilised to generate initial codes and subsequent themes. Results Fifteen GDPs participated in this qualitative study. Three main interrelated themes emerged: 1) there is an inadequate infrastructure within the current NHS; 2) the difference in the definition and threshold of the social and professional roles and identities of GDPs; and 3) there is a low self-efficacy to testing due to a perceived lack of knowledge. Conclusions This qualitative study has identified the barriers to and enablers for testing for diabetes in patients with periodontitis attending general dental practices in England. The findings have the potential to influence interventions and policies going forward to improve the co-management of diabetes and periodontitis within primary healthcare.

Abstract: Despite the availability of various methods and tools to facilitate secure coding, developers continue to write code that contains common vulnerabilities. It is important to understand why technological advances do not sufficiently facilitate developers in writing secure code. To widen our understanding of developers' behaviour, we considered the complexity of the security decision space of developers using theory from cognitive and social psychology. Our interdisciplinary study reported in this article (1) draws on the psychology literature to provide conceptual underpinnings for three categories of impediments to achieving security goals, (2) reports on an in-depth meta-analysis of existing software security literature that identified a catalogue of factors that influence developers' security decisions, and (3) characterises the landscape of existing security interventions that are available to the developer during coding and identifies gaps. Collectively, these show that different forms of impediments to achieving security goals arise from different contributing factors. Interventions will be more effective where they reflect psychological factors more sensitively and marry technical sophistication, psychological frameworks, and usability. Our analysis suggests "adaptive security interventions" as a solution that responds to the changing security needs of individual developers and a present a proof-of-concept tool to substantiate our suggestion.

DOI: 10.1177/2047487312462803

Accession Number: WOS:000337571700015

Abstract: Background: Smoking is a major cardiovascular risk factor, and smoking cessation is imperative for patients hospitalized with a cardiovascular event. This study aimed to evaluate a systems-based approach to helping hospitalized smokers quit and to identify implementation barriers. Design: Prospective intervention study followed by qualitative analysis of staff interviews. Methods: The prospective intervention study assessed the effects of implementing standard operating procedures (SOPs) for the provision of counselling and pharmacotherapy to smokers admitted to cardiology wards on counselling frequency. In addition, a qualitative analysis of staff interviews was undertaken to examine determinants of physician and nurse behaviour; this sought to understand barriers in terms of motivation, capability, and/or opportunity. Results: A total of 150 smoking patients were included in the study (75 before and 75 after SOP implementation). Before the implementation of SOPs, the proportion of patients reporting to have received cessation counselling from physicians and nurses was 6.7% and 1.3%, respectively. Following SOP implementation, these proportions increased to 38.7% ($p < 0.001$) and 2.7% ($p = 0.56$), respectively. Qualitative analysis revealed that lack of motivation, e. g. role incongruence, appeared to be a major barrier. Conclusions: Introduction of a set of standard operating procedures for smoking cessation advice was effective with physicians but not nurses. Analysis of barriers to implementation highlighted lack of motivation rather than capability or opportunity as a major factor that would need to be addressed.

Abstract: Background: To improve the quality of antimicrobial stewardship (AMS) interventions the application of behavioural sciences supported by multidisciplinary collaboration has been recommended. We analysed major UK scientific research conferences to investigate AMS behaviour change intervention reporting. Methods: Leading UK 2015 scientific conference abstracts for 30 clinical specialties were identified and interrogated. All AMS and/or antimicrobial resistance(AMR) abstracts were identified using validated search criteria. Abstracts were independently reviewed by four researchers with reported behavioural interventions classified using a behaviour change taxonomy. Results: Conferences ran for 110 days with >57,000 delegates. 311/12,313(2.5%) AMS-AMR abstracts (oral and poster) were identified. 118/311(40%) were presented at the UK's infectious diseases/microbiology conference. 56/311(18%) AMS-AMR abstracts described behaviour change interventions. These were identified across 12/30(40%) conferences. The commonest abstract reporting behaviour change interventions were quality improvement projects [44/56 (79%)]. In total 71 unique behaviour change functions were identified. Policy categories; "guidelines" (16/71) and "service provision" (11/71) were the most frequently reported. Intervention functions; "education" (6/71),

"persuasion" (7/71), and "enablement" (9/71) were also common. Only infection and primary care conferences reported studies that contained multiple behaviour change interventions. The remaining 10 specialties tended to report a narrow range of interventions focusing on "guidelines" and "enablement". Conclusion: Despite the benefits of behaviour change interventions on antimicrobial prescribing, very few AMS-AMR studies reported implementing them in 2015. AMS interventions must focus on promoting behaviour change towards antimicrobial prescribing. Greater focus must be placed on non-infection specialties to engage with the issue of behaviour change towards antimicrobial use.

Abstract: Green human resource management contributes to an understanding of the role of human resource management (HRM) towards sustainability and environmental outcomes. This paper assesses employees' environmental knowledge as well as self-perceptions of ability, motivation and opportunity (AMO) to practise green behaviours by operationalising the AMO framework towards a pro-environmental agenda. The study draws on a survey sample of 394 employees from five organisations in regional Australia. Key findings show that pro-environmental AMO are positively associated with green behaviours and that these are more prevalent at home than in the workplace. Further, line managers moderate the relationship between pro-environmental AMO and green behaviour although not the relationship between environmental knowledge and green behaviour. Such benchmark measurement informs HRM policies, practices and interventions and contributes to environmental management. Key points Promoting a green culture and behaviours that eliminate or reduce harm to the environment have been shown to benefit organisations in a multitude of ways. Pro-environmental AMO predicts

green behaviours and these behaviours are more prevalent at home than in the workplace. Line managers moderate the relationship between pro-environmental AMO and green behaviour although not the relationship between environmental knowledge and green behaviour. Benchmark measurement using such an AMO tool can inform future HRM policies, practices and interventions that can contribute to environmental management.

Short Title: Chronic Conditions and Behavioural Change Approaches to Medication Adherence: Rethinking Clinical Guidance and Recommendations

ISSN: 1177-889X

DOI: 10.2147/ppa.S239916

Accession Number: WOS:000520450200001

Abstract: Patient adherence to medication is an ongoing concern for clinicians, obfuscating treatment efficacy and resulting in wastage of medicine, reduced clinical benefit, and increased mortality. Despite this, procedural guidance on how clinicians should best engage patients regarding their medicine-taking is limited in the United Kingdom. Adherence for chronic conditions is notably complex, requiring clear education, communication, and behavioural shifts to initiate and sustain daily regimens successfully. This article explores current clinician guidance on assuring patient adherence to medication within the National Health Service, comparing it to that provided for healthcare workers in the field of behavioural change. Outlining the inertia of the former and the progress of the latter, we consider what steps should be taken to address this deficit, including greater focus on patient concerns, as well as knowledge translation for healthcare professionals in future adherence research. Current United Kingdom clinical guidance for assuring patient adherence is largely outdated based on inconclusive evidence for best practice. However, efforts to encourage behavioural change in the public health setting demonstrate evidence-based success. Integrating knowledge generated around adherence behaviour and the practical application of adherence and behavioural change research, as well as funding for longer-term studies with a focus on clinical outcomes, may help to solidify the NICE guidance on adherence and

further progress the field. This would require close involvement from patient groups and networks informing ethical aspects of study design and clinical implementation.

DOI: 10.1111/obr.13228

Article Number: e13228

Accession Number: WOS:000634292600001

Abstract: Responsive infant feeding is a critical component of childhood obesity prevention. However, there is little guidance for caregivers on how to do this successfully. The first step to developing an intervention to promote responsive feeding is to systematically identify its barriers and enablers. Searches were conducted in CINAHL, Cochrane Library, Medline, Embase, PubMed, PsycINFO, Maternity, and Infant Care from inception to November 2020. All study designs were included if they reported a barrier or enabler to responsive feeding during the first 2 years of life. We used a "best fit" framework synthesis, with the Capacity, Opportunity, Motivation, and Behaviour (COM-B) model. The Mixed Method Appraisal Tool (MMAT) was used to assess study quality. Forty-three studies were included in the review. Barriers (n = 36) and enablers (n = 21) were identified across five COM-B domains: psychological capacity, physical and social opportunity, and reflective and automatic motivation. Enablers were recognition of infant feeding cues, feeding knowledge and family and friends. Caregiver attitude toward control of feeding was a barrier, together with health care professional advice about formula feeding and breastfeeding expectation. These barriers and enablers provide a comprehensive evidence base to guide intervention development to

improve responsive feeding and prevent obesity across individual and population levels.

Abstract: In addition to the importance of fostering and developing measures for better health-system resilience globally from the effects of climate change, there have been increasing calls for health professionals, as well as public health and medical education systems, to become partners in climate change mitigation efforts. Direct clinical practice considerations, however, have not been adequately fostered equitably across all regions with an often-confusing array of practice areas within planetary health and sustainable healthcare. This article calls for a more coordinated effort within clinical practice spaces given the urgency of global environmental change, while also taking lessons from Indigenous traditional knowledge systems—a viewpoint that is rarely heard from or prioritized in public health or medicine. Simpler and more coordinated messaging in efforts to improve patient and planetary health are needed. The creation of unifying terminology within planetary health-rooted clinical and public health practice has been proposed with the potential to bring forth dialogue between and within disciplinary offshoots and public health advocacy efforts, and within clinical and health-system policy spaces.

Accession Number: WOS:000705440300001

Abstract: Purpose ParticiPate CP is a participation-focused therapy intervention that is effective to increase perceived performance of physical activity (PA) participation goals in children with cerebral palsy (CP). We aimed to characterise the contents of ParticiPate CP using validated behaviour change frameworks. Materials and methods Data came from physiotherapist treatment notes and were used to specify: (1) physiotherapist-perceived barriers to behaviour change (using the International Classification of Functioning, Disability and Health Framework [ICF] and Theoretical Domains Framework), intervention content (Behaviour Change Technique Taxonomy v1), intervention functions (Behaviour Change Wheel) and mechanisms of action (Capability, Opportunity, Motivation – Behaviour model). Results Physiotherapist-perceived barriers to participation were identified in all ICF and Theoretical Domains Framework domains. ParticiPate CP consisted of 32 behaviour change techniques, delivered via six intervention functions of the Behaviour Change Wheel, especially enablement. All six possible mechanisms of action were identified according to the Capability, Opportunity, Motivation – Behaviour model. These were targeted most frequently through Theoretical Domains Framework domains social influences, environmental context and resources, intentions, skills, knowledge, and beliefs about capabilities. Conclusions The content of a PA intervention for children with CP can be specified according to behaviour change frameworks. ParticiPate CP was complex, with multiple targets, constituent behaviour change techniques and mechanisms of action.

Abstract: Antimicrobial use in agriculture has been identified as an area of focus for reducing overall antimicrobial use and improving stewardship. In this paper, we outline the design of a complex antimicrobial stewardship (AMS) intervention aimed at developing a national Veterinary Prescribing Champion programme for Welsh farm animal veterinary practices. We describe the process by which participants were encouraged to design and deliver bespoke individualised AMS activities at practice level by forging participant "champion" identities and communities of practice through participatory and educational online activities. We describe the key phases identified as important when designing this complex intervention, namely (i) involving key collaborators in government and industry to stimulate project engagement; (ii) grounding the design in the literature, the results of stakeholder engagement, expert panel input, and veterinary clinician feedback to promote contextual relevance and appropriateness; and (iii) taking a theoretical approach to implementing intervention design to foster critical psychological needs for participant motivation and scheme involvement. With recruitment of over 80% of all farm animal practices in Wales to the programme, we also describe demographic data of the participating Welsh Veterinary Prescribing Champions in order to inform recruitment and design of future AMS programmes.

Short Title: From the 'fragile rationalist' to 'collective resilience': what human psychology has taught us about the COVID-19 pandemic and what the COVID-19 pandemic has taught us about human psychology
ISSN: 1478-2715
DOI: 10.4997/jrcpe.2021.236
Accession Number: WOS:000667279600004
Abstract: A successful response to the Covid-19 pandemic is dependent on changing human behaviour to limit proximal interactions with others. Accordingly, governments have introduced severe constraints upon freedoms to move and to mix. This has been accompanied by doubts as to whether the public would abide by these constraints. Such doubts are underpinned by a psychological model of individuals as fragile rationalists who have limited cognitive capacities, who panic under pressure and turn a crisis into a tragedy. Drawing on evidence from the UK, we show that this did not occur. Rather, the pandemic has illustrated the remarkable collective resilience of individuals when brought together as a community by the common experience of crisis. This is a crucial lesson for the future, because it underpins the importance of developing leadership and policies that enhance rather than weaken such emergent social identity.

Title: Group or individual lifestyle-integrated functional exercise (LiFE)? A qualitative analysis of acceptability

Journal: BMC Geriatrics

Volume: 21

Issue: 1

Date: Feb

Short Title: Group or individual lifestyle-integrated functional exercise (LiFE)? A qualitative analysis of acceptability

DOI: 10.1186/s12877-020-01991-0

Article Number: 93

Accession Number: WOS:000616637100002

Abstract: BackgroundThe Lifestyle-integrated Functional Exercise (LiFE) program is an effective but resource-intensive fall prevention program delivered one-to-one in participants' homes. A recently developed group-based LiFE (gLiFE) could enhance large-scale implementability and decrease resource intensity. The aim of this qualitative focus group study is to compare participants' experiences regarding acceptability of gLiFE vs LiFE.MethodsPrograms were delivered in seven group sessions (gLiFE) or seven individual home visits (LiFE) within a multi-center, randomized non-inferiority trial. Four structured focus group discussions (90-100min duration; one per format and study site) on content, structure, and subjective effects of gLiFE and LiFE were conducted. Qualitative content analysis using the method of inductive category formation by Mayring was applied for data analysis. Coding was managed using NVivo.ResultsIn both formats, participants (N =30, 22 women, n(gLiFE) =15, n(LiFE) =15, mean age 78.86.6years) were positive about content, structure, and support received by trainers. Participants reflected on advantages of both formats: the social aspects of learning the program in a peer group (gLiFE), and benefits of learning the program at home (LiFE). In gLiFE, some difficulties with the implementation of activities were reported. In both formats, the majority of participants reported positive outcomes and successful implementation of new movement habits.ConclusionThis is the first study to examine participants' views on and experiences with gLiFE and LiFE, revealing strengths and limitations of both formats that can be used for program refinement. Both formats were highly acceptable to participants, suggesting that gLiFE may have similar potential to be adopted by adults aged 70years and older compared to LiFE.Trial registration ClinicalTrials.gov, NCT03462654. Registered on March 12, 2018.

Title: Facilitators and barriers to health enhancing physical activity in individuals with severe functional limitations after stroke: A qualitative study

Journal: Frontiers in Psychology

Volume: 13

Date: Oct

Short Title: Facilitators and barriers to health enhancing physical activity in individuals with severe functional limitations after stroke: A qualitative study

ISSN: 1664-1078

DOI: 10.3389/fpsyg.2022.982302

Article Number: 982302

Accession Number: WOS:000878916300001

Abstract: BackgroundPatients with chronic conditions are less physically active than the general population despite knowledge of positive effects on physical and mental health. There is a variety of reasons preventing people with disabilities from achieving levels of physical activities resulting in health benefits. However, less is known about potential facilitators and barriers for physical activity (PA) in people with severe movement impairments. The aim of this study was to identify obstacles and facilitators of PA in individuals with severe disabilities. Materials and methodsUsing a qualitative approach to explore individuals' subjective perspectives in depth, five community-dwelling adults (age 52-72, 2 female, 3 male) living with chronic mobility impairments after stroke that restrict independent PA were interviewed. A semi structured topic guide based on the theoretical domains framework was utilized. The interview data was analyzed thematically, and the theoretical domains framework constructs were mapped onto the main and sub-categories. ResultsThe six main categories of facilitators and barriers along the capability, opportunity, motivation-behavior (COM-B) framework were: (1) physical capabilities, (2) psychological capabilities, (3) motivation reflective, (4) motivation automatic, (5) opportunity physical, and (6) opportunity social. The physical capabilities to independently perform PA were variable between participants but were not necessarily perceived as a barrier. Participants were highly motivated to maintain and/or increase their abilities to master their everyday lives as independently as possible. It became clear that a lack of physical opportunities, such as having access to adequate training facilities can present a barrier. Social opportunities in the form of social support, social norms, or comparisons with others can act as both facilitators and barriers. ConclusionWhile confirming known barriers and facilitators that impact the ability of individuals with functional limitations to be active, the findings highlight the need and opportunities for comprehensive service models based on interdisciplinary collaborations.

Title: Use of the behaviour change wheel to improve everyday person-centred conversations on physical activity across healthcare

Journal: BMC Public Health

Volume: 22

Issue: 1

Date: Sep

Short Title: Use of the behaviour change wheel to improve everyday person-centred conversations on physical activity across healthcare

DOI: 10.1186/s12889-022-14178-6

Article Number: 1784

Accession Number: WOS:000855808500004

Abstract: Background An implementation gap exists between the evidence supporting physical activity in the prevention and management of long-term medical conditions and clinical practice. Person-centred conversations, i.e. focussing on the values, preferences and aspirations of each individual, are required from healthcare professionals. However, many currently lack the capability, opportunity, and motivation to have these conversations. This study uses the Behaviour Change Wheel (BCW) to inform the development of practical and educational resources to help bridge this gap. **Methods** The BCW provides a theoretical approach to enable the systematic development of behaviour change interventions. Authors followed the described eight-step process, considered results from a scoping review, consulted clinical working groups, tested and developed ideas across clinical pathways, and agreed on solutions to each stage by consensus. **Results** The behavioural diagnosis identified healthcare professionals' initiation of person-centred conversations on physical activity at all appropriate opportunities in routine medical care as a suitable primary target for interventions. Six intervention functions and five policy categories met the APEASE criteria. We mapped 17 Behavioural Change Techniques onto BCW intervention functions to define intervention strategies. **Conclusions** This study uses the BCW to outline a coherent approach for intervention development to improve healthcare professionals' frequency and quality of conversations on physical activity across clinical practice. Time-sensitive and role-specific resources might help healthcare professionals understand the focus of their intervention. Educational resources aimed at healthcare professionals and patients could have mutual benefit, should fit into existing care pathways and support professional development. A trusted information source with single-point access via the internet is likely to improve accessibility. Future evaluation of resources built and coded using this framework is required to establish the effectiveness of this approach and help improve understanding of what works to change conversations around physical activity in clinical practice.

Short Title: "The whole of humanity has lungs, doesn't it? We are not all the same sort of people": patient preferences and choices for an online, self-guided chronic breathlessness supportive intervention: SELF-BREATHE

DOI: 10.1183/23120541.00093-2022

Article Number: 00093-2022

Accession Number: WOS:000825130900003

Abstract: Introduction The burden of chronic breathlessness on individuals, family, society and health systems is significant and set to increase exponentially with an ageing population with complex multimorbidity, yet there is a lack of services. This has been further amplified by the coronavirus disease 2019 pandemic. Online breathlessness interventions have been proposed to fill this gap, but need development and evaluation based on patient preferences and choices. This study aimed to explore the preferences and choices of patients regarding the content of an online self-guided chronic breathlessness supportive intervention (SELF-BREATHE). Methods Semi-structured telephone interviews were conducted with adults living with advanced malignant and nonmalignant disease and chronic breathlessness (July to November 2020). Interviews were analysed using conventional and summative content analysis. Results 25 patients with advanced disease and chronic breathlessness (COPD n=13, lung cancer n=8, interstitial lung disease n=3, bronchiectasis n=1; 17 male; median (range) age 70 (47-86) years; median (range) Medical Research Council dyspnoea score 3 (2-5)) were interviewed. Individuals highlighted strong preferences for focused education, methods to increase self-motivation and engagement, interventions targeting breathing and physical function, software capability to personalise the content of SELF-BREATHE to make it more meaningful to the user, and aesthetically designed content using various communication methods including written, video and audio content. Furthermore, they identified the need to address motivation as a key potential determinant of the success of SELF-BREATHE. Conclusion Our findings provide an essential foundation for future digital intervention development (SELF-BREATHE) and scaled research.

Title: Determinants of consumer acceptance and use of personalized
dietary advice: A systematic review

Journal: Trends in Food Science & Technology

Volume: 131

Pages: 277-294

Date: Jan

Short Title: Determinants of consumer acceptance and use of
personalized dietary advice: A systematic review

ISSN: 0924-2244

DOI: 10.1016/j.tifs.2022.12.008

Accession Number: WOS:000917447500001

Abstract: Background: There has been growing attention towards
personalizing dietary advice to the specific lifestyle, phenotypic
and genotypic properties of consumers. Consumer acceptance and
advice adherence is critical for the success of services offering
personalized dietary advice. However, more insight is needed in the
current body of knowledge on the determinants of consumer acceptance
and use of personalized dietary advice. Scope and approach: This
literature review provides an overview of the current knowledge on
consumer accep-tance, use and effectiveness of personalized dietary
advice based on the four information flow stages in personalized
dietary advice: (1) information provision from consumer to formulate
a personalized dietary advice, (2) personalized advice generation,
(3) advice provision to the consumer, (4) advice acceptance and
adherence. Key Findings and Conclusions: Results show that the
extent to which each step in the cycle is considered in the reviewed
studies varies strongly, with most emphasis on the advice adherence,
such as changes in dietary intake. In contrast, it is less clear how
consumer data is used to generate a personalized dietary advice.
Based on the studies in our review, we identify aspects that play a
role in the consumer acceptance of personalized dietary advice and
the best design practices for creating a successful personalized
advice.

ISSN: 1532-3005

DOI: 10.1002/smi.3133

Accession Number: WOS:000759702800001

Abstract: Poor student well-being at UK universities is overstressing institutional support services, highlighting a need for effective new resources. Despite extensive literature on mental health and well-being interventions, students' engagement with support remains unexplored. The study aimed to understand students' experience of engagement with well-being support, identify their well-being needs and form concrete recommendations for future intervention design and delivery. The Person-Based Approach to intervention design was followed to centralise users' experience, in turn maximising acceptability and effectiveness of resources. An online survey (N = 52) was followed by three focus groups (N = 14). Survey data were analysed descriptively, and reflexive thematic analysis was performed on qualitative data. Mixed-methods data integration produced four key student priorities for well-being resources – ease of access, inclusive and preventative approach, sense of community and a safe space, and applying skills to real-life contexts. Five actionable guiding principles for intervention design were produced through consultation with expert stakeholders. This work helps understand why and how students engage with support at university. The resulting recommendations can inform future intervention development, leading to more acceptable, engaging and effective student well-being resources.

Title: Identifying Factors That Influence Physical Activity Promotion in Outpatient Physical Therapist Practice Using the Theoretical Domains Framework

Journal: Journal of Geriatric Physical Therapy

Volume: 45

Issue: 4

Pages: 190-196

Date: Oct-Dec

Short Title: Identifying Factors That Influence Physical Activity Promotion in Outpatient Physical Therapist Practice Using the Theoretical Domains Framework

ISSN: 1539-8412

DOI: 10.1519/jpt.0000000000000353

Accession Number: WOS:000869397900009

Abstract: Background and Purpose: Physical activity (PA) promotion is not routine practice for physical therapists. Understanding the PA promotion beliefs of physical therapists may offer targets for behavior change interventions to improve PA promotion. The purpose of this study was to explore outpatient US physical therapists' beliefs about PA promotion and determine which Theoretical Domains Framework (TDF) domains can inform implementation efforts. Methods: We used a descriptive qualitative research design. A TDF-based interview guide was developed to identify beliefs about PA promotion. Twenty-six outpatient US physical therapists (13 regular PA promoters and 13 irregular PA promoters) completed semistructured interviews. Directed content analysis identified specific beliefs by grouping similar belief statements. Specific beliefs were mapped to TDF domains. Results and Discussion: Five TDF domains were identified as likely relevant to changing physical therapists' PA promotion behaviors. Key beliefs within those domains included conflicting comments about PA guidelines being evidence based, a lack of confidence to promote PA due to perceived deficits in communication skills, and time constraints as key barriers. Beliefs about improving PA promotion included incorporating screening for baseline PA and continuing education targeting confidence and communication. Conclusions: We identified key beliefs that influence outpatient US physical therapists' PA promotion. These beliefs identify targets for behavior change interventions to improve PA promotion rates among outpatient US physical therapists including incorporating baseline screening for PA and the development of continuing education training programs.

Date: Nov

Short Title: Increasing Uptake of Depression Screening and Treatment Guidelines in Cardiac Patients: A Behavioral and Implementation Science Approach to Developing a Theory-Informed, Multilevel Implementation Strategy

ISSN: 1941-7705

DOI: 10.1161/circoutcomes.122.009338

Article Number: e009338

Accession Number: WOS:000886074100007

Abstract: Background: Depression leads to poor health outcomes in patients with coronary heart disease (CHD). Despite guidelines recommending screening and treatment of depressed patients with CHD, few patients receive optimal care. We applied behavioral and implementation science methods to (1) identify generalizable, multilevel barriers to depression screening and treatment in patients with CHD and (2) develop a theory-informed, multilevel implementation strategy for promoting guideline adoption. Methods: We conducted a narrative review of barriers to depression screening and treatment in patients with CHD (ie, medications, exercise, cardiac rehabilitation, or therapy) comprising data from 748 study participants. Informed by the behavior change wheel framework and Expert Recommendations for Implementing Change, we defined multilevel target behaviors, characterized determinants (capability, opportunity, motivation), and mapped barriers to feasible, acceptable, and equitable intervention functions and behavior change techniques to develop a multilevel implementation strategy, targeting health care systems/providers and patients. Results: We identified implementation barriers at the system/provider level (eg, Capability: knowledge; Opportunity: workflow integration; Motivation: ownership) and patient level (eg, Capability: knowledge; Opportunity: mobility; Motivation: symptom denial). Acceptable, feasible, and equitable intervention functions included education, persuasion, environmental restructuring, and enablement. Expert Recommendations for Implementing Change strategies included learning collaborative, audit, feedback, and educational materials. The final multicomponent strategy (iHeart DepCare) for promoting depression screening/treatment included problem-solving meetings with clinic staff (system); educational/motivational videos, electronic health record reminders/decisional support (provider); and a shared decision-making (electronic shared decision-making) tool with several functions for patients, for example, patient activation, patient treatment selection support. Conclusions: We applied implementation and behavioral science methods to identify implementation barriers and to develop a multilevel implementation strategy for increasing uptake of depression screening and treatment

in patients with CHD as a use case. The multilevel implementation strategy will be evaluated in a future hybrid II effectiveness-implementation trial.

Title: Rebalancing meat and legume consumption: change-inducing food choice motives and associated individual characteristics in non-vegetarian adults

Journal: International Journal of Behavioral Nutrition and Physical Activity

Volume: 19

Issue: 1

Date: Sep

Short Title: Rebalancing meat and legume consumption: change-inducing food choice motives and associated individual characteristics in non-vegetarian adults

DOI: 10.1186/s12966-022-01317-w

Article Number: 112

Accession Number: WOS:000848742200003

Abstract: Background: A shift toward more plant-based foods in diets is required to improve health and to reduce environmental impact. Little is known about food choice motives and associated characteristics of those individuals who have actually reduced their consumption of animal-based foods. The aim of this cross-sectional study was to identify change-inducing motives related to meat and legume consumptions among non-vegetarians. The association between change-inducing motives and individual characteristics was also studied. Methods: This study included 25,393 non-vegetarian participants in the French NutriNet-Sante cohort (77.4% women, mean age 55.4 +/- 13.9 y.). The motives related to the declared change in meat and legume consumptions (e.g., taste, environment, social pressure) were assessed by an online questionnaire in 2018. For each motive, respondents could be classified into three groups: no motive; motive, not change-inducing; change-inducing motive. Associations between change-inducing motives and individual characteristics were evaluated using multivariable polytomous logistic regressions. Characteristics of participants who rebalanced their meat and legume consumptions were also compared to those who reduced their meat but did not increase their legume consumption. Results: Motives most strongly declared as having induced a change in meat or legume consumptions were health and nutrition

(respectively 90.7 and 81.0% declared these motives as change-inducing for the meat reduction), physical environment (82.0% for meat reduction only) and taste preferences (77.7% for legume increase only). Other motives related to social influences, meat avoidance and meat dislike were reported by fewer individuals, but were declared as having induced changes in food consumption. Most motives that induced a meat reduction and a legume increase were more likely to be associated with specific individual characteristics, for example being a woman or highly educated for health motives. Conclusions: Besides the motives reported as important, some motives less frequently felt important were declared as having induced changes in meat or legume consumptions. Change-inducing motives were reported by specific subpopulations. Public campaigns on health and sustainability could usefully develop new tools to reach populations less willing to change.

Abstract: Purpose of review Quality and safety are important themes in acute kidney care (AKC). There have been many recent initiatives highlighting these aspects. However, for these to become part of clinical practice, a rigorous implementation science methodology must be followed. This review will present these practices and will highlight recent initiatives in acute kidney injury (AKI), kidney replacement therapy (KRT) and recovery from AKI. Recent findings The 22nd Acute Disease Quality Initiative (ADQI) focused on achieving a

framework for improving AKI care. This has led to various quality improvement (QI) initiatives that have been implemented following a robust implementation science methodology. In AKI, QI initiatives have been focused on implementing care bundles and early detection systems for patients at risk or with AKI. KRT initiatives have focused on measuring and reporting key performance indicators (KPIs), and providing targeted feedback and education to improve delivery of KRT. Finally, it has been recognized that post-AKI care is vitally important, and ongoing work has been focused on implementing pathways to ensure continuing kidney-focused care. Quality and safety continue to be important focuses in AKC. Although recent work have focused on initiatives to improve these themes, additional work is necessary to further develop these items as we strive to improve the care to patients with AKI.

Accession Number: WOS:000918236400019

Abstract: OBJECTIVES: Our aim was to compare the effect of 2 treatment models on attendance and child abstract weight status: a less intense guided self-help (GSH) program delivered in the primary care setting versus traditional family-based behavioral treatment (FBT) delivered in an academic center. METHODS: We conducted a randomized clinical trial among 164 children between 5 and 13 years old with a BMI \geq 85th percentile and their parents. The intervention group (GSH) received 14 individual sessions over 6 months, with 5.3 hours of treatment. The control group (FBT) received 20 group-based sessions over 6 months, with 20 hours of treatment. Main outcomes included proportion of sessions families attended and change in child BMI z-score (BMIz), percentage from the 95th BMI percentile, difference from the 95th BMI percentile at the end of treatment, and 6-month follow-up. RESULTS: Mean age of children was 9.6 years, BMI z-score 2.1, 49% female, and >90% Latino. The odds of attending GSH compared to FBT was 2.2 ($P < 0.01$). Those assigned to GSH had a 67% reduced risk of attrition (hazard ratio 5 0.33, 95% confidence interval 0.22-0.50, $P < .001$).

Intent-to-treat analysis showed no between-group differences in change in BMIz and percentage from the 95th BMI percentile over time. Combined, there was a significant reduction in BMIz from baseline to posttreatment (beta = -0.07 (0.01), P <.01, d: 0.60) and a slight increase from posttreatment to follow-up (beta = 0.007 (0.13), P 5.56). CONCLUSIONS: This study provides support for a novel, less intense GSH model of obesity treatment, which can be implemented in the primary care setting. Future studies should examine effective approaches to dissemination and implementation of GSH in different settings to increase access to treatment.

Short Title: Experienced Carers Helping Others (ECHO): Protocol for a Pilot Randomised Controlled Trial to Examine a Psycho-educational Intervention for Adolescents with Anorexia Nervosa and Their Carers

ISSN: 1072-4133

DOI: 10.1002/erv.2298

Accession Number: WOS:000337612200007

Abstract: Experienced Carers Helping Others (ECHO) is an intervention for carers of people with eating disorders. This paper describes the theoretical background and protocol of a pilot multicentre randomised controlled trial that will explore the use of two variants of ECHO for improving outcomes for adolescents with anorexia nervosa (AN) referred for outpatient care. Adolescent patients and their carers (typically parents and close others in a supportive role) will be recruited from 38 eating disorder outpatient services across the UK. Carers will be randomly allocated to receive ECHOc' guided self-help (in addition to treatment as usual), ECHO' self-help only (in addition to treatment as usual) or treatment as usual only. Primary outcomes are a summary measure of the Short Evaluation of Eating Disorders at 6- and 12-month follow-ups. Secondary outcomes are general psychiatric morbidity of AN patients and carer, carers' coping and behaviour, and change in healthcare use and costs at 6- and 12-month follow-ups. Therapist effects will be examined, and process evaluation of ECHOc will be

completed. The findings from this pilot trial will be used in preparation for executing a definitive trial to determine the impact of the preferred variant of ECHO to improve treatment outcomes for AN. Copyright (c) 2014 John Wiley & Sons, Ltd and Eating Disorders Association.

Abstract: The gap between the decision to engage in physical activity and subsequent behavioral enactment is considerable for many. Action control theories focus on this discordance in an attempt to improve the translation of intention into behavior. The purpose of this mini-review was to overview one of these approaches, the multi-process action control (M-PAC) framework, which has evolved from a collection of previous works. The main concepts and operational structure of M-PAC was overviewed followed by applications of the framework in physical activity, and concluded with unanswered questions, limitations, and possibilities for future research. In M-PAC, it is suggested that three layered processes (reflective, regulatory, reflexive) build upon each other from the formation of an intention to a sustained profile of physical activity action control. Intention-behavior discordance is because of strategic challenges in goal pursuit (differences in outcome vs. behavioral goals; balancing multiple behavioral goals) and automatic tendencies (approach-avoidance, conservation of energy expenditure). Regulatory processes (prospective and reactive tactics) are employed to hold the relationship between reflective processes and behavior concordant by countering these strategic challenges and automatic tendencies until the development of reflexive processes (habit, identity) begin to co-determine action control. Results from 29 observational and preliminary experimental studies generally support

the proposed M-PAC framework. Future research is needed to explore the temporal dynamic between reflexive and regulatory constructs, and implement M-PAC interventions in different forms (e.g., mobile health), and at different levels of scale (clinical, group, population).

ISSN: 0883-6612

DOI: 10.1093/abm/kaab044

Accession Number: WOS:000736061200001

Abstract: Background: Intention is theorized as the proximal determinant of behavior in many leading theories and yet intention-behavior discordance is prevalent. Purpose: To theme and appraise the variables that have been evaluated as potential moderators of the intention-physical activity (I-PA) relationship using the capability-opportunity-motivation-behavior model as an organizational frame. Methods: Literature searches were concluded in August 2020 using seven common databases. Eligible studies were selected from English language peer-reviewed journals and had to report an empirical test of moderation of I-PA with a third variable. Findings were grouped by the moderator variable for the main analysis, and population sample, study design, type of PA, and study quality were explored in subanalyses. Results: The search yielded 1,197 hits, which was reduced to 129 independent studies (138 independent samples) of primarily moderate quality after screening for eligibility criteria. Moderators of the I-PA relationship were present among select variables within sociodemographic (employment status) and personality (conscientiousness) categories. Physical capability, and social and environmental opportunity did not show evidence of interacting with I-PA relations, while psychological capability had inconclusive findings. By contrast, key factors underlying reflective (intention stability, intention commitment, low goal conflict, affective attitude, anticipated regret, perceived behavioral control/self-efficacy) and automatic (identity) motivation were moderators of I-PA relations. Findings were generally invariant to study characteristics. Conclusions: Traditional intention theories may

need to better account for key I-PA moderators. Action control theories that include these moderators may identify individuals at risk for not realizing their PA intentions.

ISSN: 1758-0846

DOI: 10.1111/aphw.12236

Accession Number: WOS:000574138400001

Abstract: Background The purpose of this study was to explore socio-ecological predictors of moderate to vigorous physical activity (MVPA) as a result of the COVID-19 pandemic restrictions. Method A representative sample of 1,055 English-speaking Canadians (18+ years) completed measures of MVPA during the COVID-19 restrictions and reflecting on MVPA prior to these restrictions, as well as demographics, COVID-19-related cognitions and behavior (i.e. perceived threat, social distancing), psychological factors (e.g. personality traits, habit, identity, strategic planning), social factors (e.g. dependent children, co-habitation), home environment affordances (exercise equipment, programming) and the neighborhood environment (e.g. access to outdoor recreation, neighborhood safety). Results Participants perceived that they had decreased weekly MVPA ($p < .01$) and the availability of home equipment and strategic planning were critical predictors ($p < .01$). Profiles by MVPA guidelines, however, showed that 58 per cent of the sample had not changed and 6 per cent had increased MVPA. Identity was the critical predictor of the different MVPA profiles, followed by habit, extraversion, availability of home equipment, and the age of the participant ($p < .01$). Conclusion Pandemic restrictions have affected the MVPA of many Canadians, and variables across the socio-ecological spectrum explain who has been able to maintain MVPA during this unprecedented time.

Short Title: Using Theory of Change to improve post-2020
conservation: A proposed framework and recommendations for use
DOI: 10.1111/csp2.301
Article Number: e301
Accession Number: WOS:000586272700001
Abstract: Contemporary conservation must address social well-being
while still protecting biodiversity. Accordingly, the objective of
the Convention on Biological Diversity's recent Zero Draft Post-2020
Global Biodiversity Framework is to sustainably meet the needs of
people while reducing biodiversity loss. However, frequent
"failures" in achieving this social-ecological balance necessitates
more holistic, systematic, and adaptive post-2020 conservation
interventions. The Theory of Change (ToC) approach provides a useful
and flexible tool to support this endeavor. However, debate persists
over its usefulness, and "best" manner of use. This paper explores
the elements of, and proposes a framework for developing robust
conservation ToC pathways. The framework emphasizes the importance
of producing a shared vision of desired results and actions, and
associated causal assumptions, among actors. Furthermore, evaluation
is considered key to informing required ongoing adaptation to better
achieve desired results. The paper also critically explores the
challenges associated with ToC, and makes recommendations for its
improved use in post-2020 conservation. In particular, we aim to
inform the implementation and mainstreaming of the Post-2020 Global
Biodiversity Framework, especially at a national- and local-level.
The framework and discussion should be relevant to a broad range of
conservation actors at various scales that must address linked
social and ecological objectives.

Accession Number: WOS:000357669300008
Abstract: Social-cognitive models such as the theory of planned behavior have demonstrated efficacy in predicting behavior, but few studies have examined the theory as a predictor of treatment adherence in chronic illness. We tested the efficacy of the theory for predicting adherence to treatment in chronic illness across multiple studies. A database search identified 27 studies, meeting inclusion criteria. Averaged intercorrelations among theory variables were computed corrected for sampling error using random-effects meta-analysis. Path-analysis using the meta-analytically derived correlations was used to test theory hypotheses and effects of moderators. The theory explained 33 and 9 % of the variance in intention and adherence behavior respectively. Theoretically consistent patterns of effects among the attitude, subjective norm, perceived behavioral control, intention and behavior constructs were found with small-to-medium effect sizes. Effect sizes were invariant across behavior and measurement type. Although results support theory predictions, effect sizes were small, particularly for the intention-behavior relationship.

DOI: 10.2196/31801

Article Number: e31801

Accession Number: WOS:000854067700009

Abstract: Background: The long-term impact and cost-effectiveness of weight management programs depend on posttreatment weight maintenance. There is growing evidence that interventions based on third-wave cognitive behavioral therapy, particularly acceptance and commitment therapy (ACT), could improve long-term weight management; however, these interventions are typically delivered face-to-face by psychologists, which limits the scalability of these types of intervention. Objective: The aim of this study is to use an evidence-, theory-, and person-based approach to develop an ACT-based intervention for weight loss maintenance that uses digital technology and nonspecialist guidance to minimize the resources needed for delivery at scale. Methods: Intervention development was guided by the Medical Research Council framework for the development of complex interventions in health care, Intervention Mapping Protocol, and a person-based approach for enhancing the acceptability and feasibility of interventions. Work was conducted in two phases: phase 1 consisted of collating and analyzing existing and new primary evidence and phase 2 consisted of theoretical modeling and intervention development. Phase 1 included a synthesis of existing evidence on weight loss maintenance from previous research, a systematic review and network meta-analysis of third-wave cognitive behavioral therapy interventions for weight management, a qualitative interview study of experiences of weight loss maintenance, and the modeling of a justifiable cost for a weight loss maintenance program. Phase 2 included the iterative development of guiding principles, a logic model, and the intervention design and content. Target user and stakeholder panels were established to inform each phase of development, and user testing of successive iterations of the prototype intervention was conducted. Results: This process resulted in a guided self-help ACT-based intervention called SWiM (Supporting Weight Management). SWiM is a 4-month program consisting of weekly web-based sessions for 13 consecutive weeks followed by a 4-week break for participants to reflect and practice their new skills and a final session at week 18. Each session consists of psychoeducational content, reflective exercises, and behavioral experiments. SWiM includes specific sessions on key determinants of weight loss maintenance, including developing skills to manage high-risk situations for lapses, creating new helpful habits, breaking old unhelpful habits, and learning to manage interpersonal relationships and their impact on weight management. A trained, nonspecialist coach provides guidance for the participants through the program with 4 scheduled 30-minute telephone calls and 3 further optional calls. Conclusions: This comprehensive approach facilitated the development of an intervention that is based on scientific theory and evidence for supporting people with weight loss maintenance and is grounded in the experiences of the target users and the context in which it is intended to be delivered. The intervention will be refined based on

the findings of a planned pilot randomized controlled trial.

Abstract: Background: Clinicians often disregard potentially
beneficial clinical decision support (CDS). Objective: In this
study, we sought to explore the psychological and behavioral
barriers to the use of a CDS tool. Methods: We conducted a
qualitative study involving emergency medicine physicians and
physician assistants. A semistructured interview guide was created
based on the Capability, Opportunity, and Motivation-Behavior model.
Interviews focused on the barriers to the use of a CDS tool built
based on Wells' criteria for pulmonary embolism to assist clinicians
in establishing pretest probability of pulmonary embolism before
imaging. Results: Interviews were conducted with 12 clinicians. Six
barriers were identified, including (1) Bayesian reasoning, (2) fear
of missing a pulmonary embolism, (3) time pressure or cognitive
load, (4) gestalt includes Wells' criteria, (5) missed risk factors,
and (6) social pressure. Conclusions: Clinicians highlighted several
important psychological and behavioral barriers to CDS use.
Addressing these barriers will be paramount in developing CDS that
can meet its potential to transform clinical care.

Short Title: Investigating psychological variables for technologies promoting physical activity

ISSN: 2055-2076

DOI: 10.1177/20552076221116559

Article Number: 20552076221116559

Accession Number: WOS:000835659600001

Abstract: Background Many technological interventions designed to promote physical activity (PA) have limited efficacy and appear to lack important factors that could increase engagement. This may be due to a discrepancy between research conducted in this space, and software designers' and developers' use of this research to inform new digital applications. Objectives This study aimed to identify (1) what are the variables that act as barriers and facilitators to PA and (2) which PA variables are currently considered in the design of technologies promoting PA including psychological, physical, and personal/contextual ones which are critical in promoting PA. We emphasize psychological variables in this work because of their sparse and often simplistic integration in digital applications for PA. Methods We conducted two systematized reviews on PA variables, using PsycInfo and Association for Computing Machinery Digital Libraries for objectives 1 and 2. Results We identified 38 PA variables (mostly psychological ones) including barriers/facilitators in the literature. 17 of those variables were considered when developing digital applications for PA. Only few studies evaluate PA levels in relation to these variables. The same barriers are reported for all weight groups, though some barriers are stronger in people with obesity. Conclusions We identify PA variables and illustrate the lack of consideration of these in the design of PA technologies. Digital applications to promote PA may have limited efficacy if they do not address variables acting as facilitators or barriers to participation in PA, and that are important to people representing a range of body weight characteristics.

Short Title: Developing consensus measures for global programs: lessons from the Global Alliance for Chronic Diseases Hypertension research program

DOI: 10.1186/s12992-017-0242-8

Article Number: 17

Accession Number: WOS:000396930400003

Abstract: Background: The imperative to improve global health has prompted transnational research partnerships to investigate common health issues on a larger scale. The Global Alliance for Chronic Diseases (GACD) is an alliance of national research funding agencies. To enhance research funded by GACD members, this study aimed to standardise data collection methods across the 15 GACD hypertension research teams and evaluate the uptake of these standardised measurements. Furthermore we describe concerns and difficulties associated with the data harmonisation process highlighted and debated during annual meetings of the GACD funded investigators. With these concerns and issues in mind, a working group comprising representatives from the 15 studies iteratively identified and proposed a set of common measures for inclusion in each of the teams' data collection plans. One year later all teams were asked which consensus measures had been implemented. Results: Important issues were identified during the data harmonisation process relating to data ownership, sharing methodologies and ethical concerns. Measures were assessed across eight domains; demographic; dietary; clinical and anthropometric; medical history; hypertension knowledge; physical activity; behavioural (smoking and alcohol); and biochemical domains. Identifying validated measures relevant across a variety of settings presented some difficulties. The resulting GACD hypertension data dictionary comprises 67 consensus measures. Of the 14 responding teams, only two teams were including more than 50 consensus variables, five teams were including between 25 and 50 consensus variables and four teams were including between 6 and 24 consensus variables, one team did not provide details of the variables collected and two teams did not include any of the consensus variables as the project had already commenced or the measures were not relevant to their study.

Conclusions: Deriving consensus measures across diverse research

projects and contexts was challenging. The major barrier to their implementation was related to the time taken to develop and present these measures. Inclusion of consensus measures into future funding announcements would facilitate researchers integrating these measures within application protocols. We suggest that adoption of consensus measures developed here, across the field of hypertension, would help advance the science in this area, allowing for more comparable data sets and generalizable inferences.

DOI: 10.1186/1748-5908-8-124

Article Number: 124

Accession Number: WOS:000327595500001

Abstract: Background: Evidence-based clinical practice guidelines may improve treatment quality, but the uptake of guideline recommendations is often incomplete and slow. Recently new low back pain guidelines are being launched in Denmark. The guidelines are considered to reduce personal and public costs. The aim of this study is to evaluate whether a complex, multifaceted implementation strategy of the low back pain guidelines will reduce secondary care referral and improve patient outcomes compared to the usual simple implementation strategy. Methods/design: In a two-armed cluster randomised trial, 100 general practices (clusters) and 2,700 patients aged 18 to 65 years from the North Denmark region will be included. Practices are randomly allocated 1:1 to a simple or a complex implementation strategy. Intervention practices will receive a complex implementation strategy, including guideline facilitator visits, stratification tools, and quality reports on low back pain treatment. Primary outcome is referral to secondary care. Secondary outcomes are pain, physical function, health-related quality of life, patient satisfaction with care and treatment outcome, employment status, and sick leave. Primary and secondary outcomes pertain to the patient level. Assessments of outcomes are blinded and follow the intention-to-treat principle. Additionally, a process assessment will evaluate the degree to which the intervention elements will be delivered as planned, as well as measure changes in beliefs and behaviours among general practitioners and patients.

Discussion: This study provides knowledge concerning the process and effect of an intervention to implement low back pain guidelines in general practice, and will provide insight on essential elements to include in future implementation strategies in general practice.

Title: A Scoping Review of International Barriers to Asthma

Medication Adherence Mapped to the Theoretical Domains Framework

Journal: Journal of Allergy and Clinical Immunology-in Practice

Volume: 9

Issue: 1

Date: Jan

Short Title: A Scoping Review of International Barriers to Asthma

Medication Adherence Mapped to the Theoretical Domains Framework

ISSN: 2213-2198

DOI: 10.1016/j.jaip.2020.08.021

Accession Number: WOS:000608162400046

Abstract: BACKGROUND: Internationally, adult asthma medication adherence rates are low. Studies characterizing variations in barriers by country are lacking. OBJECTIVE: To conduct a scoping review to characterize international variations in barriers to asthma medication adherence among adults. METHODS: MEDLINE, EMBASE, Web of Science (WOS), and CINAHL were searched from inception to February 2017. English-language studies employing qualitative methods (eg, focus groups, interviews) were selected to assess adult patient- and/or caregiver-reported barriers to asthma medication adherence. Two investigators independently identified, extracted data, and collected study characteristics, methodologic approach, and barriers. Barriers were mapped using the Theoretical Domains Framework and findings categorized according to participants' country of residence, countries' gross national income, and the presence of universal health care (World Health Organization definitions). RESULTS: Among 2942 unique abstracts, we reviewed 809 full texts. Among these, we identified 47 studies, conducted in 12 countries, meeting eligibility. Studies included a total of 2614 subjects, predominately female (67%), with the mean age of 19.1 to 70 years. Most commonly reported barriers were beliefs about consequences (eg, medications not needed for asthma control, N = 29, 61.7%) and knowledge (eg, not knowing when to take medication, N = 27, 57.4%); least common was goals (eg, asthma not a priority, N = 1, 2.1%). In 27 studies conducted in countries classified as high income (HIC) with universal health care (UHC), the most reported barrier was participants' beliefs about consequences (N = 17, 63.3%). However, environmental context and resources (N = 12, 66.7%) were more common in HIC without UHC. CONCLUSION: International adherence barriers are diverse and may vary with a country's sociopolitical context. Future adherence interventions should account for trends. Title: A Systematic Review of Patient- and Family-Level Inhaled Corticosteroid Adherence Interventions in Black/African Americans

Journal: Journal of Allergy and Clinical Immunology-in Practice

Volume: 7

Issue: 4

Pages: 1184-+

Date: Apr

Short Title: A Systematic Review of Patient- and Family-Level Inhaled Corticosteroid Adherence Interventions in Black/African Americans

ISSN: 2213-2198

DOI: 10.1016/j.jaip.2018.10.036

Accession Number: WOS:000463732500013

Abstract: BACKGROUND: Inhaled corticosteroid (ICS) adherence rates are suboptimal among adult black/African Americans. Comprehensive studies characterizing the effectiveness and the methodological approaches to the development of interventions to improve ICS adherence in adult black/African Americans have not been performed. OBJECTIVES: Conduct a systematic review of patient/family-level interventions to improve ICS adherence in adult black/African Americans. METHODS: We searched MEDLINE, EMBASE, Web of Science, and CINAHL from inception to August 2017 for English-language US studies enrolling at least 30% black/African Americans comparing patient/family-level ICS adherence interventions with any comparator. Two investigators independently selected, extracted data from, and rated risk of bias. We collected information on intervention characteristics and outcomes, and assessed whether studies were informed by behavior theory, stakeholder engagement, or both. RESULTS: Among 1661 abstracts identified, we reviewed 230 full-text articles and identified 4 randomized controlled trials (RCTs) and 1 quasi-experimental (pre-post design) study meeting criteria. Study participants (N range, 17-333) varied in mean age (22-47 years), proportion black/African Americans studied (71%-93%), and sex (69%-82% females). RCTs evaluated problem-solving classes, self-efficacy training, technology-based motivational interviewing program, and the use of patient advocates. The RCT testing self-efficacy training was the only intervention informed by both behavior theory and stakeholder engagement. All 4 RCTs compared interventions with active control and rated as medium risk of bias. No RCTs found a statistically significant improvement in adherence. CONCLUSIONS: Few studies assessing asthma adherence interventions focused on adult black/African-American populations. No RCTs demonstrated improved ICS adherence in participants. Future studies that are informed by behavior change theory and stakeholder engagement are needed. (C) 2018 American Academy of Allergy, Asthma & Immunology

Title: How do we effectively communicate air pollution to change public attitudes and behaviours? A review

Journal: Sustainability Science

Volume: 16

Issue: 6

Pages: 2027–2047

Date: Nov

Short Title: How do we effectively communicate air pollution to change public attitudes and behaviours? A review

ISSN: 1862–4065

DOI: 10.1007/s11625–021–01038–2

Accession Number: WOS:000701009200001

Abstract: Solutions that engage the public are needed to tackle air pollution. Technological approaches are insufficient to bring urban air quality to recommended target levels, and miss out on opportunities to promote health more holistically through behavioural solutions, such as active travel. Behaviour change is not straightforward, however, and is more likely to be achieved when communication campaigns are based on established theory and evidence-based practices. We systematically reviewed the academic literature on air pollution communication campaigns aimed at influencing air pollution-related behaviour. Based on these findings, we developed an evidence-based framework for stimulating behaviour change through engagement. Across the 37 studies selected for analyses, we identified 28 different behaviours assessed using a variety of designs including natural and research-manipulated experiments, cross-sectional and longitudinal surveys and focus groups. While avoidance behaviour (e.g. reducing outdoor activity) followed by contributing behaviours (e.g. reducing idling) were by far the most commonly studied, supporting behaviour (e.g. civil engagement) shows promising results, with the added benefit that supporting local and national policies may eventually lead to the removal of social and physical barriers that prevent wider behavioural changes. Providing a range of actionable information will reduce disengagement due to feelings of powerlessness. Targeted localized information will appear more immediate and engaging, and positive framing will prevent cognitive dissonance whereby people rationalize their behaviour to avoid living with feelings of unease. Communicating the co-benefits of action may persuade individuals with different drivers but as an effective solution, it remains to be explored. Generally, finding ways to connect with people's emotions, including activating social norms and identities and creating a sense of collective responsibility, provide promising yet under-explored directions. Smartphones provide unique opportunities that enable flexible and targeted engagement, but care must be taken to avoid transferring responsibility for action from national and

local authorities onto individuals. Multidisciplinary teams involving artists, members of the public, community and pressure groups, policy makers, researchers, and businesses, are needed to co-create the stories and tools that can lead to effective action to tackle air pollution through behavioural solutions.

Title: Collaborative care model for depression in rural Nepal: a mixed-methods implementation research study

Journal: Bmj Open

Volume: 11

Issue: 8

Short Title: Collaborative care model for depression in rural Nepal: a mixed-methods implementation research study

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2020-048481

Article Number: e048481

Accession Number: WOS:000685841100019

Abstract: Introduction Despite carrying a disproportionately high burden of depression, patients in low-income countries lack access to effective care. The collaborative care model (CoCM) has robust evidence for clinical effectiveness in improving mental health outcomes. However, evidence from real-world implementation of CoCM is necessary to inform its expansion in low-resource settings. Methods We conducted a 2-year mixed-methods study to assess the implementation and clinical impact of CoCM using the WHO Mental Health Gap Action Programme protocols in a primary care clinic in rural Nepal. We used the Capability Opportunity Motivation-Behaviour (COM-B) implementation research framework to adapt and study the intervention. To assess implementation factors, we qualitatively studied the impact on providers' behaviour to screen, diagnose and treat mental illness. To assess clinical impact, we followed a cohort of 201 patients with moderate to severe depression and determined the proportion of patients who had a substantial clinical response (defined as $\geq 50\%$ decrease from baseline scores of Patient Health Questionnaire (PHQ) to measure depression) by the end of the study period. Results Providers experienced improved capability (enhanced self-efficacy and knowledge), greater opportunity (via

access to counsellors, psychiatrist, medications and diagnostic tests) and increased motivation (developing positive attitudes towards people with mental illness and seeing patients improve) to provide mental healthcare. We observed substantial clinical response in 99 (49%; 95% CI: 42% to 56%) of the 201 cohort patients, with a median seven point (Q1:-9, Q3:-2) decrease in PHQ-9 scores ($p < 0.0001$). Conclusion Using the COM-B framework, we successfully adapted and implemented CoCM in rural Nepal, and found that it enhanced providers' positive perceptions of and engagement in delivering mental healthcare. We observed clinical improvement of depression comparable to controlled trials in high-resource settings. We recommend using implementation research to adapt and evaluate CoCM in other resource-constrained settings to help expand access to high-quality mental healthcare.

Short Title: Effect of a tailored sepsis treatment protocol on patient outcomes in the Tikur Anbessa Specialized Hospital, Ethiopia: results of an interrupted time series analysis

ISSN: 1748-5908

DOI: 10.1186/s13012-022-01221-8

Article Number: 45

Accession Number: WOS:000827738500001

Abstract: Background: Despite improvement, sepsis mortality rates remain high, with an estimated 11 million sepsis-related deaths globally in 2017 (Rudd et. al, Lancet 395:200-211, 2020). Low- and middle-income countries (LMICs) are estimated to account for 85% of global sepsis mortality; however, evidence for improved sepsis mortality in LMICs is lacking. We aimed to improve sepsis care and

outcomes through development and evaluation of a sepsis treatment protocol tailored to the Tikur Anbessa Specialized Hospital Emergency Department, Ethiopia, context. Methods: We employed a mixed methods design, including an interrupted times series study, pre-post knowledge testing, and process evaluation. The primary outcome was the proportion of patients receiving appropriate sepsis care (blood culture collection before antibiotics and initiation of appropriate antibiotics within 1 h of assessment). Secondary outcomes included time to antibiotic administration, 72-h sepsis mortality, and 90-day all-cause mortality. Due to poor documentation, we were unable to assess our primary outcome and time to antibiotic administration. We used segmented regression with outcomes as binomial proportions to assess the impact of the intervention on mortality. Pre-post knowledge test scores were analyzed using the Student's t-test to compare group means for percentage of scenarios with correct diagnosis. Results: A total of 113 and 300 patients were enrolled in the pre-implementation and post-implementation phases respectively. While age and gender were similar across the phases, a higher proportion (31 vs. 57%) of patients had malignancies in the post-implementation phase. We found a significant change in trend between the phases, with a trend for increasing odds of survival in the pre-implementation phase (OR 1.24, 95% CI 0.98–1.56), and a shift down, with odds of survival virtually flat (OR 0.95, 95% CI. 0.88–1.03) in the post-implementation phases for 72-h mortality, and trends for survival pre- and post-implementation are virtually flat for 90-day mortality. We found no significant difference in pre-post knowledge test scores, with interpretation limited by response rate. Implementation quality was negatively impacted by resource challenges. Conclusion: We found no improvement in sepsis outcomes, with a trend for increasing odds of survival lost post-implementation and no significant change in knowledge pre- and post-implementation. Variable availability of resources was the principal barrier to implementation.

Short Title: Bridging the gap: Evidence-based practice guidelines for sports nutritionists

ISSN: 2296-861X

DOI: 10.3389/fnut.2023.1118547

Article Number: 1118547

Accession Number: WOS:000967959200001

Abstract: Evidence-based practice is a systematic approach to decision-making developed in the 1990s to help healthcare professionals identify and use the best available evidence to guide clinical practice and patient outcomes amid a plethora of information in often challenging, time-constrained circumstances. Today's sports nutrition practitioners face similar challenges, as they must assess and judge the quality of evidence and its appropriateness to their athlete, in the often chaotic, time-pressed environment of professional sport. To this end, we present an adapted version of the evidence-based framework to support practitioners in navigating their way through the deluge of available information and guide their recommendations to athletes whilst also reflecting on their practice experience and skills as evidence-based practitioners, thus, helping to bridge the gap between science and practice in sport and exercise nutrition.

Short Title: Two-month follow-up evaluation of a cancer awareness training workshop ("Talk Cancer") on cancer awareness, beliefs and confidence of front-line public health staff and volunteers

DOI: 10.1016/j.pmedr.2018.11.017

Accession Number: WOS:000645467400018

Abstract: People working across the health service, local government, community and voluntary sectors are appropriately placed to have discussions about cancer prevention and early diagnosis with members of the public. Cancer Research UK's training workshop ("Talk Cancer") aims to increase awareness of cancer screening programmes and risk factors, promote more positive beliefs about cancer and increase confidence to discuss cancer with members of the public, among people working in these roles. This study evaluated "Talk Cancer" by surveying 178 trainees immediately before, immediately after, and two months after training in the United Kingdom. Results showed that "Talk Cancer" was effective at promoting and maintaining more positive beliefs about cancer and confidence to discuss cancer. While there was an improvement in awareness of risk factors immediately after the workshop, there was less evidence that this was maintained at two-months, but awareness was improved relative to

baseline in most cases. Increased awareness of the national bowel screening programme was maintained at two-months. While awareness that screening programmes do not exist for oral, skin and prostate cancers was not maintained, awareness was higher than baseline. The majority of trainees (86%) indicated they had applied their learning in their role and 59% reported having had more conversations about cancer prevention and early diagnosis since training. The impact of "Talk Cancer" on trainees' beliefs and confidence persists beyond the workshop, however, ongoing support is required to maintain improvements in awareness of cancer risk factors and which cancer types do not have national screening programmes.

Title: A Photography-based, Social Media Walking Intervention

Targeting Autonomous Motivations for Physical Activity:

Semistructured Interviews With Older Women

Journal: Jmir Serious Games

Volume: 10

Issue: 2

Date: Apr-Jun

Short Title: A Photography-based, Social Media Walking Intervention

Targeting Autonomous Motivations for Physical Activity:

Semistructured Interviews With Older Women

ISSN: 2291-9279

DOI: 10.2196/35511

Article Number: e35511

Accession Number: WOS:000822088800011

Abstract: Background: Older adult women are at risk for negative health outcomes that engaging in sustained physical activity can help prevent. However, promoting long-term maintenance of physical activity in this population has proven to be a challenge. Increasing autonomous motivations (ie, intrinsic, integrated, and identified regulations) for physical activity may facilitate enduring behavior change. Digitally delivered games for health that take a celebratory technology approach, that is, using technology to create new ways to experience valued behaviors and express valued beliefs, may be a useful way to target autonomous motivations for physical activity. Formative research with the target population is needed to design compelling intervention content. Objective: The objective of this study is to investigate older adult women's reactions to and thoughts about a photography-based, social media walking game targeting autonomous motivations for physical activity. Methods: During an individual semistructured interview, a moderator solicited feedback from 20 older adult women (age range 65-74 years) as part

of formative research to develop a social media game featuring weekly walking challenges. The challenges were designed to target autonomous motivations for physical activity. Interviews were audio-recorded and transcribed verbatim. Two reviewers conducted thematic content analysis on interview transcripts. Results: We identified 3 overarching themes in qualitative data analysis. These reflected the playful experiences, value, and acceptability associated with the intervention challenges. Generally, participants understood what the challenges were asking them to do, proffered appropriate example responses, and indicated that the challenges would be enjoyable. Participants reported that the intervention content afforded many and varied playful experiences (eg, competition, discovery, exploration, expression, fellowship, humor, nurture, sensation). Further, participants indicated that the intervention increased their motivation for physical activity, occasioned meaningful shifts in perspective, increased their knowledge of various topics of interest, provided an opportunity to create valued connection with others, and provided health-related benefits. Participants suggested the intervention emphasize local history, nature, and cultural events. Conclusions: The photography-based, social media walking game with relatively simple game mechanics was well received and judged to be apt to bring about a wide variety of emotive experiences. A clear, geographically specific identity emerged as a key driver of interest for intervention content. Taking a celebratory technology approach holds promise for targeting autonomous motivations for physical activity in older adult women. (JMIR Serious Games 2022;10(2):e35511) doi: 10.2196/35511

Title: Designing Digital Health Technology to Support Patients Before and After Bariatric Surgery: Qualitative Study Exploring Patient Desires, Suggestions, and Reflections to Support Lifestyle Behavior Change

Journal: Jmir Human Factors

Volume: 9

Issue: 1

Date: Jan-Mar

Short Title: Designing Digital Health Technology to Support Patients Before and After Bariatric Surgery: Qualitative Study Exploring Patient Desires, Suggestions, and Reflections to Support Lifestyle

Behavior Change

ISSN: 2292-9495

DOI: 10.2196/29782

Article Number: e29782

Accession Number: WOS:000787631400008

Abstract: Background: A patient's capability, motivation, and opportunity to change their lifestyle are determinants of successful outcomes following bariatric surgery. Lifestyle changes before and after surgery, including improved dietary intake and physical activity levels, have been associated with greater postsurgical weight loss and improved long-term health. Integrating patient-centered digital technologies within the bariatric surgical pathway could form part of an innovative strategy to promote and sustain healthier behaviors, and provide holistic patient support, to improve surgical success. Previous research focused on implementing digital technologies and measuring effectiveness in surgical cohorts. However, there is limited work concerning the desires, suggestions, and reflections of patients undergoing bariatric surgery. This qualitative investigation explores patients' perspectives on technology features that would support behavior changes during the pre- and postoperative periods, to potentially maintain long-term healthy lifestyles following surgery. Objective: This study aims to understand how digital technologies can be used to support patient care during the perioperative journey to improve weight loss outcomes and surgical success, focusing on what patients want from digital technologies, how they want to use them, and when they would be of most benefit during their surgical journey. Methods: Patients attending bariatric surgery clinics in one hospital in the North of England were invited to participate. Semistructured interviews were conducted with purposively sampled pre- and postoperative patients to discuss lifestyle changes and the use of digital technologies to complement their care. The interviews were audio recorded and transcribed verbatim. Reflexive thematic analysis enabled the development of themes from the data. Ethical approval was obtained from the National Health Service Health Research Authority. Results: A total of 20 patients were interviewed (preoperative phase: 40% (8/20); postoperative phase: 60% (12/20)). A total of 4 overarching themes were developed and related to the optimization of technology functionality. These centered on providing tailored content and support; facilitating self-monitoring and goal setting; delivering information in an accessible, trusted, and usable manner; and meeting patient information-seeking and engagement needs during the surgical pathway. Functionalities that delivered personalized feedback and postoperative follow-up were considered beneficial. Individualized goal setting functionality could support a generation of digitally engaged patients with bariatric conditions as working toward achievable targets was deemed an effective strategy for motivating behavior change. The creation of digital package of care checklists between patients and clinicians was a novel finding from this study. Conclusions: Perceptions of patients undergoing bariatric surgery validated the integration of digital technologies within the surgical pathway, offering enhanced connectedness and support. Recommendations are made relating to the design, content, and functionality of digital

interventions to best address the needs of this cohort. These findings have the potential to influence the co-design and integration of person-centered, perioperative technologies.

Title: Designing the Optimal Digital Health Intervention for Patients' Use Before and After Elective Orthopedic Surgery: Qualitative Study

Journal: Journal of Medical Internet Research

Volume: 23

Issue: 3

Date: Mar

Short Title: Designing the Optimal Digital Health Intervention for Patients' Use Before and After Elective Orthopedic Surgery: Qualitative Study

ISSN: 1438-8871

DOI: 10.2196/25885

Article Number: e25885

Accession Number: WOS:000626261100005

Abstract: Background: Health behavior changes made by patients during the perioperative period can impact the outcomes and success of elective surgeries. However, there remains a limited understanding of how best to support patients during this time, particularly through the use of digital health interventions. Recognizing and understanding the potential unmet needs of elective orthopedic surgery patients is central to motivating healthier behavior change, improving recovery, and optimizing overall surgical success in the short and long term. Objective: The aim of this study is to explore patient perspectives on technology features that would help support them to change their lifestyle behaviors during the pre- and postoperative periods, and that could potentially maintain long-term healthy lifestyles following recovery. Methods: Semistructured interviews with pre- and postoperative elective orthopedic patients were conducted between May and June 2020 using telephone and video call-based software. Patient perspectives on the use of digital technologies to complement current surgical care and support with lifestyle behavior changes were discussed. Interviews were audio recorded and transcribed verbatim. Reflexive thematic analysis enabled the development of themes from the data, with QSR NVivo software (version 12) facilitating data management. Ethical approval was obtained from the National Health Service Health Research Authority. Results: A total of 18 participants were

interviewed. Four themes were developed from the data regarding the design and functionality of digital technologies to best support the perioperative journey. These center around an intervention's ability to incorporate interactive, user-centered features; direct a descriptive and structured recovery; enable customizable, patient-controlled settings; and deliver both general and specific surgical advice in a timely manner. Interventions that are initiated preoperatively and continued postoperatively were perceived as beneficial. Interventions designed with personalized milestones were found to better guide patients through a structured recovery. Individualized tailoring of preparatory and recovery information was desired by patients with previously high levels of physical activity before surgery. The use of personalized progression-based exercises further encouraged physical recovery; game-like rewards and incentives were regarded as motivational for making and sustaining health behavior change. In-built video calling and messaging features offered connectivity with peers and clinicians for supported care delivery. Conclusions: Specific intervention design and functionality features can provide better, structured support for elective orthopedic patients across the entire surgical journey and beyond. This study provides much-needed evidence relating to the optimal design and timing of digital interventions for elective orthopedic surgical patients. Findings from this study suggest a desire for personalized perioperative care, in turn, supporting patients to make health behavior changes to optimize surgical success. These findings should be used to influence future co-design projects to enable the design and implementation of patient-focused, tailored, and targeted digital health technologies within modern health care settings.

Title: Eating attentively: a systematic review and meta-analysis of the effect of food intake memory and awareness on eating

Journal: American Journal of Clinical Nutrition

Volume: 97

Issue: 4

Pages: 728-742

Date: Apr

Short Title: Eating attentively: a systematic review and meta-analysis of the effect of food intake memory and awareness on eating

ISSN: 0002-9165

DOI: 10.3945/ajcn.112.045245

Accession Number: WOS:000316644200009

Abstract: Background: Cognitive processes such as attention and memory may influence food intake, but the degree to which they do is unclear. Objective: The objective was to examine whether such cognitive processes influence the amount of food eaten either immediately or in subsequent meals. Design: We systematically reviewed studies that examined experimentally the effect that manipulating memory, distraction, awareness, or attention has on food intake. We combined studies by using inverse variance meta-analysis, calculating the standardized mean difference (SMD) in food intake between experimental and control groups and assessing heterogeneity with the I² statistic. Results: Twenty-four studies were reviewed. Evidence indicated that eating when distracted produced a moderate increase in immediate intake (SMD: 0.39; 95% CI: 0.25, 0.53) but increased later intake to a greater extent (SMD: 0.76; 95% CI: 0.45, 1.07). The effect of distraction on immediate intake appeared to be independent of dietary restraint. Enhancing memory of food consumed reduced later intake (SMD: 0.40; 95% CI: 0.12, 0.68), but this effect may depend on the degree of the participants' tendencies toward disinhibited eating. Removing visual information about the amount of food eaten during a meal increased immediate intake (SMD: 0.48; 95% CI: 0.27, 0.68). Enhancing awareness of food being eaten may not affect immediate intake (SMD: 0.09; 95% CI: -0.42, 0.35). Conclusions: Evidence indicates that attentive eating is likely to influence food intake, and incorporation of attentive-eating principles into interventions provides a novel approach to aid weight loss and maintenance without the need for conscious calorie counting. Am J Clin Nutr 2013;97:728-42.

Short Title: Development and feasibility testing of a smart phone based attentive eating intervention

DOI: 10.1186/1471-2458-13-639

Article Number: 639

Accession Number: WOS:000322584400001

Abstract: Background: Attentive eating means eating devoid of distraction and increasing awareness and memory for food being consumed. Encouraging individuals to eat more attentively could help reduce calorie intake, as a strong evidence base suggests that memory and awareness of food being consumed substantially influence energy intake. Methods: The development and feasibility testing of a smartphone based attentive eating intervention is reported. Informed by models of behavioral change, a smartphone application was developed. Feasibility was tested in twelve overweight and obese volunteers, sampled from university staff. Participants used the application during a four week trial and semi-structured interviews were conducted to assess acceptability and to identify barriers to usage. We also recorded adherence by downloading application usage data from participants' phones at the end of the trial. Results: Adherence data indicated that participants used the application regularly. Participants also felt the application was easy to use and lost weight during the trial. Thematic analysis indicated that participants felt that the application raised their awareness of what they were eating. Analysis also indicated barriers to using a smartphone application to change dietary behavior. Conclusions: An attentive eating based intervention using smartphone technology is feasible and testing of its effectiveness for dietary change and weight loss is warranted.

Title: Strategies to improve uptake and adherence of non-pharmacologic interventions for orthostatic hypotension in older people: a qualitative study

Journal: European Geriatric Medicine

Volume: 13

Issue: 3

Pages: 685-692

Date: Jun

Short Title: Strategies to improve uptake and adherence of non-pharmacologic interventions for orthostatic hypotension in older people: a qualitative study

ISSN: 1878-7649

DOI: 10.1007/s41999-022-00632-6

Accession Number: WOS:000768658100001

Abstract: Key Summary Points Aim To identify specific behavioural change techniques to promote uptake and adherence with non-pharmacologic interventions for older adults with OH. Findings

Specific behaviour change strategies, derived from older people with orthostatic hypotension, include biofeedback, rehearsal, embedding into daily routine and patient education. Message Evidence-based behaviour change strategies may be used to improve uptake and adherence to non-drug therapies for older people with orthostatic hypotension. Purpose Non-pharmacologic therapies are a safe and effective treatment for orthostatic hypotension (OH) in older adults. However, adherence to non-drug therapies is challenging and may require specific behaviour change approaches to promote uptake and adherence. The study aim is to identify specific behavioural change techniques to promote uptake and adherence with non-pharmacologic interventions for older adults with OH. Methods Forty semi-structured, qualitative interviews were performed in 25 older adults with OH. Each participant experienced bolus-water drinking, physical counter-maneuvres and compression garments during two efficacy studies. Emergent themes were identified through framework analysis, based on The Behaviour Change Technique Taxonomy. Results Several themes to encourage uptake and adherence arose. Motivation to adhere with an intervention may be improved by demonstrating its effectiveness, either through symptom monitoring or biofeedback. Practising or rehearsing how to use an intervention may improve self-efficacy and promote habit formation. Embedding therapies into daily life so that they become second nature was felt to be a useful strategy. Educating older adults about why they are being asked to use a therapy and demonstrating how to use it is important. More specific barriers may be overcome by encouraging a personal problem-solving approach. Conclusion These specific behaviour change techniques, derived by older people with OH and based on evidence-based approaches, provide useful strategies to improve the uptake and adherence of non-drug therapies in the treatment of OH.

Accession Number: WOS:000824746200001

Abstract: Purpose Young incarcerated male offenders are at risk of poorer sexual health, adolescent parenthood and lack opportunities

for formative relationship and sexuality education (RSE) as well as positive male role models. The purpose of this paper is to report the process of co-production and feasibility testing of a novel, gender-transformative RSE programme with young male offenders to encourage positive healthy relationships, gender equality, and future positive fatherhood. Design/methodology/approach Using a rights-based participatory approach, the authors co-produced an RSE programme with young offenders and service providers at two UK prison sites using a sequential research design of: needs analysis, co-production and a feasibility pilot. Core components of the programme are grounded in evidence-based RSE, gender-transformative and behaviour change theory. Findings A needs analysis highlighted the men's interest in RSE along with the appeal of film drama and peer-group-based activities. In the co-production stage, scripts were developed with the young men to generate tailored film dramas and associated activities. This co-production led to "If I Were a Dad", an eight-week programme comprising short films and activities addressing masculinities, relationships, sexual health and future fatherhood. A feasibility pilot of the programme demonstrated acceptability and feasibility of delivery in two prison sites. The programme warrants further implementation and evaluation studies. Originality/value The contribution of this paper is the generation of an evidence-based, user-informed, gender-transformative programme designed to promote SRHR of young male offenders to foster positive sexual and reproductive health and well-being in their own lives and that of their partners and (future) children.

Abstract: Objectives Interventions designed to improve men's diet and physical activity (PA) have been recommended as methods of cancer prevention. However, little is known about specific factors that support men's adherence to these health behaviour changes, which could inform theory-led diet and PA interventions. We aimed to explore these factors in men following prostatectomy for prostate cancer (PCa). Design, setting and participants A qualitative study using semistructured interviews with men, who made changes to their diet and/or PA as part of a factorial randomised controlled trial conducted at a single hospital in South West England. Participants were 17 men aged 66 years, diagnosed with localised PCa and underwent prostatectomy. Interview transcripts underwent thematic analysis. Results Men were ambivalent about the relationship of nutrition and PA with PCa risk. They believed their diet and level of PA were reasonable before being randomised to their interventions. Men identified several barriers and facilitators to performing these new behaviours. Barriers included tolerance to dietary changes, PA limitations and external obstacles. Facilitators included partner involvement in diet, habit formation and brisk walking as an individual activity. Men discussed positive effects associated with brisk walking, such as feeling healthier, but not with nutrition interventions. Conclusions The facilitators to behaviour change suggest that adherence to trial interventions can be supported using well-established behaviour change models. Future studies may benefit from theory-based interventions to support adherence to diet and PA behaviour changes in men diagnosed with PCa.

Title: Reduction in self-monitoring of blood glucose in type 2 diabetes: an observational controlled study in east London

Journal: British Journal of General Practice

Volume: 65

Issue: 633

Pages: E256-E263

Date: Apr

Short Title: Reduction in self-monitoring of blood glucose in type 2 diabetes: an observational controlled study in east London

ISSN: 0960-1643

DOI: 10.3399/bjgp15X684421

Accession Number: WOS:000356965100011

Abstract: Background Self-monitoring of blood glucose (SMBG) confers no benefit for many people with type 2 diabetes not being treated with insulin. It accounts for 21% of diabetes prescribing costs. Aim To improve care quality at reduced cost for type 2 diabetes by reducing unnecessary SMBG. Design and setting Non-randomised, observational controlled study in two intervention clinical commissioning groups (CCGs) and one control CCG in east London. Method In total, 19 602 people with type 2 diabetes not being treated with insulin were recruited from two intervention CCGs; 16 033 were recruited from a control CCG. The intervention (from 2010 to 2013) comprised implementation of a locally developed guideline, including IT support and peer feedback of performance. Data on practice prescribing SMBG testing strips were gathered using GP electronic health records. Information on costs were obtained via the ePACT electronic database. Results Over 4 years, in all non-insulin type 2 diabetes treatment groups, use of SMBG was reduced in the two intervention CCGs from 42.8% to 16.5%, and in the control CCG from 56.4% to 47.2%. In people on metformin alone or no treatment, intervention CCGs reduced SMBG use from 29.6% to 6.0%, and in the control CCG use dropped from 47.1% to 38.7% ($P < 0.001$). From 2009 to 2012 the total cost of all SMBG prescribing (type 1 and type 2 diabetes, including users of insulin) was reduced by 4.9% (62 pound 476) in the two intervention CCGs and increased in the control CCG by 5.0% (42 pound 607); in England, the total cost increased by 13.5% (19.4 pound million). In total, 20% (3865 of 19 602) fewer patients used SMBG in the intervention CCGs. Conclusion This low-cost programme demonstrated a major reduction in unnecessary prescribing of SMBG, along with cost savings. If replicated nationally, this would avoid unnecessary testing in 340 000 people and prescribing costs that total 21.8 pound million.

Short Title: Exploring Barriers and Facilitators to Physical Activity during the COVID-19 Pandemic: A Qualitative Study

DOI: 10.3390/ijerph19159169

Article Number: 9169

Accession Number: WOS:000840161400001

Abstract: Quantitative data show that physical activity (PA) reduced during the COVID-19 pandemic, with differential impacts across demographic groups. Qualitative research is limited; thus, this study aimed to understand barriers and facilitators to PA during the pandemic, focusing on groups more likely to have been affected by restrictions, and to map these onto the capability, opportunity, motivation model of behaviour (COM-B). One-to-one interviews were conducted with younger (aged 18-24) and older adults (aged 70+), those with long-term physical or mental health conditions, and parents of young children. Themes were identified using reflexive thematic analysis and were mapped onto COM-B domains. A total of 116 participants contributed (aged 18-93, 61% female, 71% White British). Key themes were the importance of the outdoor environment, impact of COVID-19 restrictions, fear of contracting COVID-19, and level of engagement with home exercise. Caring responsibilities and conflicting priorities were a barrier. PA as a method of socialising, establishing new routines, and the importance of PA for protecting mental health were motivators. Most themes mapped onto the physical opportunity (environmental factors) and reflective motivation (evaluations/plans) COM-B domains. Future interventions should target these domains during pandemics (e.g., adapting PA guidance depending on location and giving education on the health benefits of PA).

ISSN: 1743-7199

DOI: 10.1080/17437199.2021.1938632

Accession Number: WOS:000667998600001

Abstract: Pregnancy is an opportune time for women to make healthy changes to their lifestyle, however, many women struggle to do so. Multiple reasons have been posited as to why this may be. This review aimed to synthesise this literature by identifying factors

that influence women's health behaviour during pregnancy, specifically in relation to dietary behaviour, physical activity, smoking, and alcohol use. Bibliographic databases (MEDLINE, PsycINFO, CINAHL-P, MIDIRS) were systematically searched to retrieve studies reporting qualitative data regarding women's experiences or perceptions of pregnancy-related behaviour change relating to the four key behaviours. Based on the eligibility criteria, 30,852 records were identified and 92 studies were included. Study quality was assessed using the CASP tool and data were thematically synthesised. Three overarching themes were generated from the data. These were (1) A time to think about 'me', (2) Adopting the 'good mother' role, and (3) Beyond mother and baby. These findings provide an improved understanding of the various internal and external factors influencing women's health behaviour during the antenatal period. This knowledge provides the foundations from which future pregnancy-specific theories of behaviour change can be developed and highlights the importance of taking a holistic approach to maternal behaviour change in clinical practice.

Accession Number: WOS:000736491000001

Abstract: Objectives: Theoretical models have informed the understanding of pregnancy as a 'teachable moment' for health behaviour change. However, these models have not been developed specifically for, nor widely tested, in this population. Currently, no pregnancy-specific model of behaviour change exists, which is important given it is a unique yet common health event. This study aimed to assess the extent to which factors influencing antenatal behaviour change are accounted for by the COM-B model and Teachable Moments (TM) model and to identify which model is best used to understand behaviour change during pregnancy. Design: Theoretical

mapping exercise. Methods: A deductive approach was adopted; nine sub-themes identified in a previous thematic synthesis of 92 studies were mapped to the constructs of the TM and COM-B models. The subthemes reflected factors influencing antenatal health behaviour. Findings: All sub-themes mapped to the COM-B model constructs, whereas the TM model failed to incorporate three sub-themes. Missed factors were non-psychological, including practical and environmental factors, social influences, and physical pregnancy symptoms. In contrast to the COM-B model, the TM model provided an enhanced conceptual understanding of pregnancy as a teachable moment for behaviour change, however, neither model accounted for the changeable salience of influencing factors throughout the pregnancy experience. Conclusions: The TM and COM-B models are both limited when applied within the context of pregnancy. Nevertheless, both models offer valuable insight that should be drawn upon when developing a pregnancy-specific model of behaviour change. Notes: Rockliffe, Lauren Peters, Sarah Heazell, Alexander E. DOI: 10.1111/bjhp.12590

Accession Number: WOS:000769988100001

Abstract: Objectives Pregnancy has been described as a 'teachable moment' for behaviour change, which presents an important opportunity for health promotion within antenatal care settings. However, no pregnancy-specific model has been developed or tested in the context of health behaviour change during pregnancy. This study aimed to investigate and compare the utility of the Capability-Opportunity-Motivation Behaviour (COM-B) and Teachable Moments (TM) models, to explain health behaviour change during pregnancy, within the context of eating behaviour. Design Longitudinal cohort study. Methods Five hundred and sixteen women completed a survey at between 12-16 weeks gestation (T1). Follow-up data were collected at 20-24

weeks (T2), 36–40 weeks (T3), and 6–12 weeks postnatally (T4). The primary outcome was eating behaviour. To assess the utility of the COM-B model, perceived capability, opportunity, and motivation to eat healthily were measured. To assess the utility of the TM model, risk perceptions, self-image, and affective response were measured. Results Overall, the COM-B model explained 18.4% of the variance in eating behaviour, whilst the TM model explained 9%. Both models explained the most variance in eating behaviour at T1 and T3, compared with T2 and T4. Small changes were observed in eating behaviour and the model constructs over the time period studied, although these were not clinically meaningful. Conclusions Neither the COM-B nor TM model provide a satisfactory explanation of eating behaviour during pregnancy, however the findings suggest that certain stages of pregnancy may create more salient opportunities for behaviour change. The findings also support claims that motivation may not play a key role in directing eating behaviour during pregnancy. Further research is needed to explore the role of timing in antenatal behaviour change. The development of a pregnancy-specific model is necessary to optimise understanding of pregnancy as a teachable moment for behaviour change.

Short Title: A qualitative exploration of influences on eating behaviour throughout pregnancy

DOI: 10.1186/s12884-022-05135-7

Article Number: 939

Accession Number: WOS:000899627800004

Abstract: Background: Pregnancy is often conceptualised as a 'teachable moment' for health behaviour change. However, it is likely that different stages of pregnancy, and individual antenatal events, provide multiple distinct teachable moments to prompt behaviour change. Whilst previous quantitative research supports this argument, it is unable to provide a full understanding of the nuanced factors influencing eating behaviour. The aim of this study was to explore influences on women's eating behaviour throughout pregnancy. Methods: In-depth interviews were conducted online with 25 women who were less than six-months postpartum. Interviews were

audio-recorded and transcribed verbatim. Data were analysed thematically. Results: Five themes were generated from the data that capture influences on women's eating behaviour throughout pregnancy: 'The preconceptual self', 'A desire for good health', 'Retaining control', 'Relaxing into pregnancy', and 'The lived environment'. Conclusion: Mid-pregnancy may provide a more salient opportunity for eating behaviour change than other stages of pregnancy. Individual antenatal events, such as the glucose test, can also prompt change. In clinical practice, it will be important to consider the changing barriers and facilitators operating throughout pregnancy, and to match health advice to stages of pregnancy, where possible. Existing models of teachable moments may be improved by considering the dynamic nature of pregnancy, along with the influence of the lived environment, pregnancy symptoms, and past behaviour. These findings provide an enhanced understanding of the diverse influences on women's eating behaviour throughout pregnancy and provide a direction for how to adapt existing theories to the context of pregnancy.

Short Title: Can a simple plan change a complex behavior?

Implementation intentions in the context of water drinking

ISSN: 0195-6663

DOI: 10.1016/j.appet.2023.106459

Article Number: 106459

Accession Number: WOS:000925664400001

Abstract: Underhydration has significant adverse physical and mental health effects, yet many people drink too little water.

Implementation intentions have been found to effectively promote many health behaviors, but little is known about the processes underlying their effects in naturalistic settings, and whether they could improve water drinking. This mixed-methods study assessed the impact and potential underlying processes of using implementation intentions to increase self-reported water intake over a five-day follow-up. Ninety-five participants (Mage = 39, SD = 12) received an educational quiz to increase their water drinking motivation before being randomly assigned to the control or intervention group. Participants also completed a qualitative survey that assessed the processes underlying their attempts to increase water intake.

Quantitative results suggested that most participants increased their average daily water intake regardless of group. Qualitative results indicated that implementation intention participants struggled with remembering and the perceived effort of preparation and drinking behaviors, which reduced the effect of planning on behavior. This study provides essential theoretical and methodological considerations for researchers studying implementation intentions, as the effects and mechanisms of implementation intentions in real-life situations may be more complex than previously assumed. For example, the results suggest that implementation intentions did not automatize remembering and performing the behavior in ways the current literature theorizes. Other kinds of interventions may be needed to improve the complex daily-life behaviour of water drinking.

Short Title: Understanding the implementation strategy of a secondary care tobacco addiction treatment pathway (the CURE project) in England: a strategic behavioural analysis

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2021-054739

Article Number: e054739

Accession Number: WOS:000811702800022

Abstract: Objectives The Conversation, Understand, Replace, Experts and evidence-based treatment (CURE) project implemented an evidence-based intervention that offers a combination of pharmacotherapy and behavioural support to tobacco-dependent inpatients. Understanding key characteristics of CURE's implementation strategy, and identifying areas for improvement, is important to support the roll-out of nationwide tobacco dependence services. This study aimed to (1) specify key characteristics of CURE's exiting implementation strategy and (2) develop theoretical-informed and stakeholder-informed recommendations to optimise wider roll-out. Design and methods Data were collected via document review and secondary analysis of interviews with 10 healthcare professionals of a UK hospital. Intervention content was specified through behaviour change techniques (BCTs) and intervention functions within the Behaviour Change Wheel. A logic model was developed to specify

CURE's implementation strategy and its mechanisms of impact. We explored the extent to which BCTs and intervention functions addressed the key theoretical domains influencing implementation using prespecified matrices. The development of recommendations was conducted over a two-round Delphi exercise. Results We identified six key theoretical domains of influences: 'environmental context and resources', 'goals', 'social professional role and identity', 'social influences', 'reinforcement' and 'skills'. The behavioural analysis identified 26 BCTs, 4 intervention functions and 4 policy categories present within the implementation strategy. The implementation strategy included half the relevant intervention functions and BCTs to target theoretical domains influencing CURE implementation, with many BCTs focusing on shaping knowledge. Recommendations to optimise content were developed following stakeholder engagement. Conclusions CURE offers a strong foundation from which a tobacco dependence treatment model can be developed in England. The exiting strategy could be strengthened via the inclusion of more theoretically congruent BCTs, particularly relating to 'environmental context and resources'. The recommendations provide routes to optimisation that are both theoretically grounded and stakeholder informed. Future research should assess the feasibility/acceptability of these recommendations in the wider secondary-care context.

Abstract: Consumer IoT devices may suffer malware attacks, and be

recruited into botnets or worse. There is evidence that generic advice to device owners to address IoT malware can be successful, but this does not account for emerging forms of persistent IoT malware. Less is known about persistent malware, which resides on persistent storage, requiring targeted manual effort to remove it. This paper presents a field study on the removal of persistent IoT malware by consumers. We partnered with an ISP to contrast remediation times of 760 customers across three malware categories: Windows malware, non-persistent IoT malware, and persistent IoT malware. We also contacted ISP customers identified as having persistent IoT malware on their network-attached storage devices, specifically QSnatch. We found that persistent IoT malware exhibits a mean infection duration many times higher than Windows or Mirai malware; QSnatch has a survival probability of 30% after 180 days, whereby most if not all other observed malware types have been removed. For interviewed device users, QSnatch infections lasted longer, so are apparently more difficult to get rid of, yet participants did not report experiencing difficulty in following notification instructions. We see two factors driving this paradoxical finding: First, most users reported having high technical competency. Also, we found evidence of planning behavior for these tasks and the need for multiple notifications. Our findings demonstrate the critical nature of interventions from outside for persistent malware, since automatic scan of an AV tool or a power cycle, like we are used to for Windows malware and Mirai infections, will not solve persistent IoT malware infections. DOI: 10.1111/jan.12613

Accession Number: WOS:000356624700003

Abstract: AimTo synthesize evidence from systematic reviews on the management of urinary incontinence and promotion of continence using conservative/behavioural approaches in older people in care homes to inform clinical practice, guidelines and research.

BackgroundIncontinence is highly prevalent in older people in care

home populations. Design Systematic review of systematic reviews with narrative synthesis. Data sources Electronic searches of published systematic reviews in English using MEDLINE and CINAHL with no date restrictions up to September 2013. Searches supplemented by hand searching and electronic searching of Cochrane Library and PROSPERO. Review methods PRISMA statement was followed, as were established methods for systematic review of systematic reviews. Results Five systematic reviews of high quality were included, three specific to intervention studies and two reviewed descriptive studies. Urinary incontinence was the primary outcome in three reviews with factors associated with the management of urinary incontinence the primary outcome for the other reviews. Conclusion Toileting programmes, in particular prompted voiding, with use of incontinence pads are the main conservative behavioural approach for the management of incontinence and promotion of continence in this population with evidence of effectiveness in the short term. Evidence from associated factors; exercise, mobility, comorbidities, hydration, skin care, staff perspectives, policies and older people's experiences and preference are limited. The majority of evidence of effectiveness are from studies from one country which may or may not be transferable to other care home populations. Future international studies are warranted of complex combined interventions using mixed methods to provide evidence of effectiveness, context of implementation and economic evaluation.

Article Number: e048959

Accession Number: WOS:000727532600016

Abstract: Introduction Th last two decades have seen a twofold increase in colorectal cancer (CRC) incidence among individuals under the recommended screening age of 50 years. Although the origin

of this early-onset CRC (EOCRC) spike remains unknown, prior studies have reported that EOCRC harbours a distinct molecular and clinical phenotype in younger individuals. The sharp increase in EOCRC incidence rates may be attributable to a complex interplay of factors, including race; lifestyle; and ecological, sociodemographic and geographical factors. However, more research that address psychosocial experiences and accounts for lifestyle-related behaviours before, during and after an EOCRC diagnosis are warranted. This study aims to develop and pilot test a theorydriven, community-based intervention to increase awareness of EOCRC, reduce its associated risk factors and improve early detection among adults aged 18-49 years. Methods and analysis Guided by the Behaviour Change Wheel, we will use a multistage mixed-methods study design. We will pilot a sequential mixed-methods intervention study as follows: (1) First, we will analyse linked quantitative data from the Utah Cancer Registry and National Cancer Institute Surveillance, Epidemiology and End Results registry, linked to state-wide demographic and vital records in the Utah Population Database to identify EOCRC hotspots in Utah by examining the EOCRC incidence and survival variance explained by personal and county-level factors. (2) Next, we will conduct one-on-one interviews with 20 EOCRC survivors residing in EOCRC hotspots to ascertain psychosocial and lifestyle challenges that accompany an EOCRC diagnosis. (3) Finally, we will consider existing evidence-based approaches, our integrated results (quantitative +qualitative) and community action board input to design a community-based intervention to increase EOCRC awareness that can feasibly be delivered by means of outdoor mass media, and via social media. We will pilot the multicomponent media campaign with a quasiexperimental design among 17 EOCRC hotspot residents and 17 EOCRC 'coldspot' residents. Ethics and dissemination Ethics approval was obtained from the University of Utah Institutional Review Board (IRB_00138357). Signed informed consent will be obtained from all participants prior to any data collection. Study results will be disseminated through CRC community blogs, targeted infographics, conference presentations at national and international professional conferences and publications in peer-reviewed journals. Final intervention-specific data will be available on reasonable request from the corresponding author.

DOI: 10.1111/bjhp.12663
Accession Number: WOS:000971918200001
Abstract: Purpose: Recommendations for exclusive breastfeeding are
not often adhered to despite the robust evidence of its benefits.
This systematic review aims to collate evidence on the attitudes
mothers and health care providers have towards breastfeeding
interventions to understand what aspects best contribute to
acceptability and feasibility. Methods: This review further
investigates the value of identifiable behaviour change techniques

(BCTs) to uncover which components of an intervention are perceived to be most useful and acceptable. The main biomedical databases were searched, and 17 (n = 17) studies met the inclusion criteria. Results: A total of nine BCTs were identified within the interventions. The thematic analysis produced four main domains: usefulness, accessibility, value and sustainability. Women discussed the importance of the support they received in these interventions and demonstrated a positive view towards three BCTs: 'social support (unspecified)', 'instruction on how to perform behaviour' and 'demonstration of behaviour'. Additionally, women highlighted the benefit of personal, non-clinical and flexible emotional and practical support from peers, lactation consultants and support groups. Health care providers echoed these opinions and specifically highlighted the usefulness of interventions that allowed for continuity of care and more personal breastfeeding support. Conclusions: These findings suggest that ongoing practical as well as emotional support is crucial for standard in-hospital support to succeed at increasing breastfeeding rates. Future research would need to better understand the nuances of the interventions among women and providers to enhance their implementation.

Accession Number: WOS:000384319900008

Abstract: Objective: Effective hearing loss rehabilitation support options are available. Yet, people often experience delays in receiving rehabilitation support. This study aimed to document support-seeking experiences among a sample of UK adults with hearing loss, and views towards potential strategies to increase rehabilitation support uptake. People with hearing loss were interviewed about their experiences of seeking support, and responses to hypothetical intervention strategies, including public awareness campaigns, a training programme for health professionals, and a national hearing screening programme. Design: Semi-structured qualitative interview design with thematic analysis. Study sample:

Twenty-two people with hearing loss, aged 66–88. Results: Three themes, representing barriers to receiving rehabilitation support and potential areas for intervention, were identified: making the journey from realization to readiness, combatting social stigma, and accessing appropriate services. Barriers to receiving support mostly focused on appraisal of hearing loss symptoms. Interventions enabling symptom appraisal, such as routine screening, or demonstrating how to raise the topic effectively with a loved one, were welcomed. Conclusions: Interventions to facilitate realization of hearing loss should be prioritized. Raising awareness of the symptoms and prevalence of hearing loss may help people to identify hearing problems and reduce stigma, in turn increasing hearing loss acceptance.

Accession Number: WOS:000586449200001

Abstract: Self-administered eHealth interventions provide a potential low-cost solution for reducing diabetes risk. The aim of this pilot randomised controlled trial (RCT) was to evaluate the feasibility, including recruitment, retention, preliminary efficacy (primary outcome) and acceptability (secondary outcome) of the "Body Balance Beyond" eHealth intervention in women with previous gestational diabetes mellitus (GDM). Women with overweight/obesity who had recent GDM (previous 24 months) were randomised into one of three groups: 1) high personalisation (access to "Body Balance Beyond" website, individual telehealth coaching via video call by a dietitian and exercise physiologist, and text message support); 2) low personalisation (website only); or 3) waitlist control. To evaluate preliminary efficacy, weight (kg), glycosylated hemoglobin, type A1C (HbA1c), cholesterol (total, low-density lipoprotein (LDL) and high-density lipoprotein (HDL)), diet quality and moderate-

vigorous physical activity were analysed at baseline and at 3 and 6 months using generalised linear mixed models. To investigate acceptability, process evaluation was conducted at 3 and 6 months. Of the 327 potential participants screened, 42 women (mean age 33.5 +/- 4.0 years and BMI 32.4 +/- 4.3 kg/m²) were randomised, with 30 (71%) completing the study. Retention at 6 months was 80%, 54% and 79% for high personalisation, low personalisation and waitlist control, respectively (reasons: personal/work commitments, n = 4; started weight-loss diet, n = 1; pregnant, n = 1; resources not useful, n = 1; and not contactable, n = 5). No significant group-by-time interactions were observed for preliminary efficacy outcomes, with the exception of HDL cholesterol, where a difference favoured the low personalisation group relative to the control (p = 0.028). The majority (91%) of women accessed the website in the first 3 months and 57% from 4-6 months. The website provided useful information for 95% and 92% of women at 3 and 6 months, respectively, although only a third of women found it motivating (30% and 25% at 3 and 6 months, respectively). Most women agreed that the telehealth coaching increased their confidence for improving diet (85%) and physical activity (92%) behaviours, although fewer women regarded the text messages as positive (22% and 31% for improving diet and physical activity, respectively). The majority of women (82% at 3 months and 87% at 6 months) in the high personalisation group would recommend the program to other women with GDM. Recruiting and retaining women with a recent diagnosis of GDM is challenging. The "Body Balance Beyond" website combined with telehealth coaching via video call is largely acceptable and useful for women with recent GDM. Further analysis of the effect on diabetes risk reduction in a larger study is needed.

Short Title: Knowledge Translation Research to Promote Behavior Changes in Rehabilitation: Use of Theoretical Frameworks and Tailored Interventions: A Scoping Review

ISSN: 0003-9993

DOI: 10.1016/j.apmr.2021.01.076

Accession Number: WOS:000823864200013

Abstract: Objective: To describe knowledge translation (KT) research as a means of changing practice behaviors in rehabilitation. We specifically aimed to explore how theories, models, and frameworks (TMFs) are used to guide KT, guide methods to tailor KT interventions, and evaluate outcomes. We hypothesized these methods would have increased over the past 10 years. Data Sources: We identified articles through searches conducted using databases Cumulative Index to Nursing and Allied Health, MEDLINE, PubMed, Academic Search Premier, and previous reviews from January 2000 to April 2020. Search terms included physical therapy, occupational therapy, speech-language pathology, knowledge translation, and knowledge-to-action (KTA). Study Selection: Two authors interpedently screened titles, abstracts, and full-text articles. Studies were included if behavior change of rehabilitation practitioners was measured. Systematic reviews, protocols, and capacity-building interventions were excluded. Data Extraction: Three authors extracted information on study design, theoretical frameworks, intervention strategies, and outcome evaluation. Data Synthesis: Fifty-six studies were included in the review. Sixteen (29%) reported the use of a theoretical framework to guide the KT process. Since 2013, the KTA framework was used 35% of the time. Twenty-two studies (39%) reported barrier assessments to tailor interventions, and 82% were published after 2013. However, barrier assessment in the local context was only conducted 64% of the time. Outcomes of tailored interventions were most frequently measured using chart audits (50%) and questionnaires (41%). Further, the link between KT theory, specific barriers, and selection of intervention strategies was not consistently described. Conclusions: Over the past 7 years, there has been an increase in the use of KT TMFs and tailored interventions. Recommendations for future research include the use of TMFs to guide local barrier assessment, KT strategy selection, intervention development, and overall KT process and mapping barriers to selected intervention strategies. Short Title: The AERO study: A feasibility randomised controlled trial of individually tailored exercise adherence strategies based on a brief behavioural assessment for older people with musculoskeletal conditions

ISSN: 0031-9406

DOI: 10.1016/j.physio.2022.08.006

Accession Number: WOS:000927378600001

Abstract: Introduction Exercise is a widely used treatment modality for older people with musculoskeletal conditions. The effectiveness of exercise programmes is limited by adherence. The aims of this study were to examine the acceptability and feasibility of the AERO intervention in facilitating exercise adherence in older people with musculoskeletal conditions, and to inform the design of a future randomised controlled trial. Methods A two arm feasibility randomised controlled trial with an embedded qualitative study conducted at one orthopaedic hospital in the South of England. Older adults referred to physiotherapy with musculoskeletal conditions were randomised to receive either usual care consisting of standard physiotherapy only, or the AERO intervention, consisting of usual care with the addition of tailored exercise adherence approaches based on a brief behavioural assessment. Feasibility outcomes included recruitment, randomisation, retention, acceptability, and fidelity to trial protocol. Secondary outcomes included exercise adherence, physical activity, and behavioural regulation. Results 48 participants were recruited to the study with 27 randomised to usual care and 21 to AERO and usual care. On the basis of recruitment, retention, the acceptability to participants and physiotherapists and fidelity, the AERO intervention was determined to be feasible. Conclusion The AERO intervention in which participants received tailored adherence strategies based on a behavioural assessment plus standard physiotherapy is feasible and acceptable. It is now ready to be tested in an adequately powered randomised controlled trial.

Short Title: Factors associated with older persons' perceptions of dignity and well-being over a three-year period. A retrospective national study in residential care facilities

DOI: 10.1186/s12877-022-03205-1

Article Number: 515

Accession Number: WOS:000815083800002

Abstract: Background Dignity and well-being are central concepts in the care of older people, 65 years and older, worldwide. The person-centred practice framework identifies dignity and well-being as person-centred outcomes. Older persons living in residential care facilities, residents, have described that they sometimes lack a sense of dignity and well-being, and there is a need to understand which modifiable factors to target to improve this. The aim of this study was to examine the associations between perceptions of dignity and well-being and the independent variables of the attitudes of staff, the indoor-outdoor-mealtime environments, and individual factors for residents over a three-year period. **Methods** A national retrospective longitudinal mixed cohort study was conducted in all residential care facilities within 290 municipalities in Sweden. All residents aged 65 years and older in 2016, 2017 and 2018 were invited to respond to a survey; including questions regarding self-rated health and mobility, the attitudes of staff, the indoor-outdoor-mealtime environments, safety, and social activities. Data regarding age, sex and diagnosed dementia/prescribed medication for dementia were collected from two national databases. Descriptive statistics and ordinal logistic regression models were used to analyse the data. **Results** A total of 13 763 (2016), 13 251 (2017) and 12 620 (2018) residents answered the survey. Most of them (69%) were women and the median age was 88 years. The odds for satisfaction with dignity did not differ over the three-year period, but the odds for satisfaction with well-being decreased over time. Residents who rated their health as good, who were not diagnosed with dementia/had no prescribed medication for dementia, who had not experienced disrespectful attitudes of staff and who found the indoor-outdoor-mealtime environments to be pleasant had higher odds of being satisfied with aspects of dignity and well-being over the three-year period. **Conclusions** The person-centred practice framework, which targets the attitudes of staff and the care environment, can be used as a theoretical framework when designing improvement strategies to promote dignity and well-being. Registered nurses, due to their core competencies, focusing on person-centred care and quality improvement work, should be given an active role as facilitators in such improvement strategies.

Title: Use of Intervention Mapping for Occupational Risk Prevention and Health Promotion: A Systematic Review of Literature

Journal: International Journal of Environmental Research and Public Health

Volume: 18

Issue: 4

Date: Feb

Short Title: Use of Intervention Mapping for Occupational Risk Prevention and Health Promotion: A Systematic Review of Literature

DOI: 10.3390/ijerph18041775

Article Number: 1775

Accession Number: WOS:000623569400001

Abstract: Aim: Intervention mapping (IM) is a method to systematically design interventions that is applied regularly within the public health domain. This study investigates whether IM is effectively used within the occupational safety and health domain as well. Specifically, this study explores the relation between the fidelity regarding the use of the IM protocol for intervention development, the implementation process and the effectiveness of the occupational risk prevention and health promotion interventions.

Methods: A systematic review was conducted including articles on development, implementation, and effects of occupational risk prevention and health promotion interventions that were developed according to the IM-protocol. By means of a checklist, two authors reviewed the articles and rated them on several indicators regarding the fidelity of the IM-protocol, the implementation process, and the intervention effect. Results: A literature search resulted in a total of 12 interventions as described in 38 articles. The fidelity to the IM-protocol was relatively low for participation throughout the development process and implementation planning. No relationship was found between fidelity of the IM-protocol and the intervention effect. A theory-based approach (as one of the core elements of IM) appears to be positively related to a successful implementation process. Conclusion: Results of the review suggest that organizing a participative approach and implementation planning is difficult in practice. In addition, results imply that conducting matrices of change objectives as part of the intervention development, although challenging and time-consuming, may ultimately pay off, resulting in a tailored intervention that matches the target group.

Short Title: Insights into parents' and teachers' support for policies promoting increased plant-based eating in schools

ISSN: 0195-6663

DOI: 10.1016/j.appet.2023.106511

Article Number: 106511

Accession Number: WOS:000954829600001

Abstract: Global environmental and public health challenges related to current food systems call for large-scale shifts towards increasingly plant-based diets, especially in Western meat-centric societies. School meal systems can play a role in these changes due to their widespread prevalence and multi-sectoral impact. However, there is a lack of evidence about how adults involved in the school meals system perceive school-based pro-environmental food policies, which limits the ability to align those policies with the needs and expectations of the school community. This study aimed to address this knowledge gap by exploring parents' (n = 104) and teachers' (n = 252) support for policies to promote increased plant-based eating in public schools in a highly meat-centric EU country (Portugal). Overall, teachers seemed to be slightly more supportive of such policies and displayed more favorable (injunctive and dynamic) norms toward plant-based eating, more negative appraisals of meals with meat (i.e., perceived healthiness, naturalness, and sustainability), and lower attachment to meat consumption. Furthermore, injunctive norms in favor of plant-based meals were linked with higher support for measures promoting plant-based meals in schools, in both samples (parents, teachers). Lower meat attachment and favorable perceived meal attributes (e.g., perceptions about plant-based and fish meals) were associated with teachers' support for measures promoting plant-based meals in schools. These findings suggest that future efforts and research with parents and teachers to enable less meat-centric and more flexitarian food practices in schools should consider social and motivation variables relevant to plant-forward transitions.

Title: Efficacy of a theory-driven program to implement alcohol

screening and brief interventions in primary health-care: a cluster randomized controlled trial

Journal: Addiction

Volume: 117

Issue: 6

Pages: 1609–1621

Date: Jun

Short Title: Efficacy of a theory-driven program to implement alcohol screening and brief interventions in primary health-care: a cluster randomized controlled trial

ISSN: 0965-2140

DOI: 10.1111/add.15782

Accession Number: WOS:000744747600001

Abstract: Background and Aims Screening and brief interventions (SBI) in primary health-care practices (PHCP) are effective in reducing reported alcohol consumption, but have not been routinely implemented. Most programs seeking to improve implementation rates have lacked a theoretical rationale. This study aimed to test whether a theory-based intervention for PHCPs could significantly increase alcohol SBI delivery. Design Two-arm, cluster-randomized controlled, parallel, 12-month follow-up, trial. Setting PHCPs in Portugal. Participants Staff from 12 PHCPs (n = 222, 81.1% women): nurses (35.6%), general practitioners (28.8%), receptionists (26.1%) and family medicine residents (9.5%); patients screened for alcohol use: intervention n = 8062; controls n = 58. Intervention and Comparator PHCPs were randomized to receive a training and support program (n = 6; 110 participants) tailored to the barriers and facilitators for implementing alcohol SBIs following the principles of the Behavior Change Wheel/Theoretical Domains Framework approach, or to a waiting-list control (n = 6; 112 participants). Training was delivered over the first 12 weeks of the trial. Measurements The primary outcome was the proportion of eligible patients screened (unit of analysis: patient list). Secondary outcomes included the brief intervention (BI) rate per screen-positive patient and the population-based BI rate (unit of analysis: patient list), and changes in health providers' perceptions of barriers to implementation and alcohol-related knowledge (unit of analysis: health provider). Findings The implementation program had a significant effect on the screening activity in the intervention practices compared with control practices at the 12-month follow-up (21.7% vs. 0.16%, intention-to-treat analysis, p = 0.003). Although no significant difference was found on the BI rate per screen-positive patient (intervention 85.7% vs. control 63.6%, p = 0.55, Bayes factor = 0.28), the intervention was effective in increasing the population-based BI rate (intervention 0.69% vs. control 0.02%, p = 0.006). Health providers in the intervention arm reported fewer barriers to SBI implementation and higher levels of alcohol-related knowledge at 12-month follow-up than those in control practices. Conclusion A theory-based implementation program, which included training and support activities, significantly increased alcohol screening and population-based brief intervention rates in primary care.

Short Title: Relationships between nutritional knowledge, obesity,
and sleep disorder severity

ISSN: 0962-1105

DOI: 10.1111/jsr.12378

Accession Number: WOS:000383451800013

Abstract: Obstructive sleep apnea affects 20% of the adult population. Weight control is considered the best non-medical means of managing the condition, therefore improving nutritional knowledge in individuals may be an appropriate strategy. This study aimed to describe the relationship between nutritional knowledge and: (i) sleep disorder severity; (ii) body mass index; and (iii) demographic characteristics in persons suspected of obstructive sleep apnea. Nutrition knowledge scores were also compared with the general population. Consecutive newly-referred patients attending the sleep laboratory for diagnostic polysomnography were invited to participate. Those who consented (n = 97) were asked to complete a touchscreen survey. Apnea-hypopnea index to measure sleep disorder severity and anthropometric measurements were obtained from the clinic. A quarter of participants were diagnosed with severe obstructive sleep apnea; and a majority (88%) were classed as being overweight or obese. The overall mean nutrition knowledge score was 58.4 +/- 11.6 (out of 93). Nutrition knowledge was not associated with sleep disorder severity, body mass index or gender. The only significant difference detected was in relation to age, with older (= 35 years) participants demonstrating greater knowledge in the 'food choices' domain compared with their younger counterparts (1834 years; P < 0.030). Knowledge scores were similar to the general population. The findings suggest that nutrition knowledge alone is not an important target for weight control interventions for people with obstructive sleep apnea. However, given the complexities of sleep disorders, it may complement other strategies.

Date: Sep

Short Title: Evaluating multisite multiprofessional simulation
training for a hyperacute stroke service using the Behaviour Change
Wheel

DOI: 10.1186/s12909-015-0423-1

Article Number: 143

Accession Number: WOS:000360676000002

Abstract: Background: Stroke is a clinical priority requiring early specialist assessment and treatment. A London (UK) stroke strategy was introduced in 2010, with Hyper Acute Stroke Units (HASUs) providing specialist and high dependency care. To support increased numbers of specialist staff, innovative multisite multiprofessional simulation training under a standard protocol-based curriculum took place across London. This paper reports on an independent evaluation of the HASU training programme. The main aim was to evaluate mechanisms for behaviour change within the training design and delivery, and impact upon learners including potential transferability to the clinical environment. Methods: The evaluation utilised the Behaviour Change Wheel framework. Procedures included: mapping training via the framework; examination of course material; direct and video-recorded observations of courses; pre-post course survey sheet; and follow up in-depth interviews with candidates and faculty. Results: Patient management skills and trainee confidence were reportedly increased post-course (post-course median 6 [IQ range 5-6.33]; pre-course median 5 [IQ range 4.67-5.83]; $z = 6.42$, $P < .001$). Thematic analysis showed that facilitated 'debrief' was the key agent in supporting both clinical and non-clinical skills. Follow up interviews in practice showed some sustained effects such as enthusiasm for role, and a focus on situational awareness, prioritization and verbalising thoughts. Challenges in standardising a multi-centre course included provision for local context/identity. Conclusions: Pan-London simulation training under the London Stroke Model had positive outcomes in terms of self-reported skills and motivation. These effects persisted to an extent in practice, where staff could recount applications of learning. The evaluation demonstrated that a multiple centre simulation programme congruent with clinical practice can provide valuable standard training opportunities that support patient care.

Short Title: Adapting sleep hygiene for community interventions: a qualitative investigation of sleep hygiene behaviors among racially/ethnically diverse, low-income adults

ISSN: 2352-7218

DOI: 10.1016/j.sleh.2019.12.009

Accession Number: WOS:000528187500013

Abstract: Background: Despite the high prevalence of inadequate sleep in racially/ethnically diverse, low-income adults, there is scant research targeting sleep health interventions among underserved populations. Sleep hygiene (SH) recommendations may help promote sleep health for the general population; however, they likely require tailoring to optimize uptake and effectiveness in the "real world" given socio-contextual factors. As an initial step to developing contextually appropriate and effective community-based SH interventions, we conducted qualitative research to understand SH behaviors, beliefs, and barriers in a low-income, ethnically diverse sample of adults. Methods: We recruited 24 racially/ethnically diverse adults from an affordable housing community who self-reported sleeping ≤ 6 hours on average. Participants were invited to either an individual interview ($n = 5$) or a focus group ($n = 3$). A deductive, thematic-analysis approach was employed. Data collection and interpretation were informed by the Socio-Contextual Model of Behavior Change. Results: There was evidence of high acceptability of SH and interest in improving sleep health. Barriers to implementing SH were multifaceted, including individual (knowledge, motivation, habits, medical issues, stress, trauma), interpersonal (caregiving), organizational (job strain), and environmental (noise) factors. Conclusions: Future strategies for adapting behavioral SH interventions should target knowledge, skill development, and behavioral change domains, such as motivation, social support, and self-efficacy. In addition, adapting SH beyond the clinical context for a high-need community population requires attention to multilevel sociocontextual factors that contribute to sleep health, particularly chronic stress, prior trauma, and adverse sleeping environments. Development of novel trauma-informed SH interventions may promote effective and safe implementation. (C) 2019 National Sleep Foundation. Published by Elsevier Inc. All rights reserved.

DOI: 10.1123/jpah.2020-0388

Accession Number: WOS:000636800500006

Abstract: Background: Exercise referral schemes in England offer referred participants an opportunity to take part in an exercise prescription in a nonclinical environment. The aim of these schemes is to effect clinical health benefits, yet there is limited evidence of schemes' effectiveness, which could be due to the heterogeneity in design, implementation, and evaluation. Additionally, there has been no concerted effort to map program characteristics. Objective: To understand what key delivery approaches are currently used within exercise referral schemes in England. Methods: Across England, a total of 30 schemes with a combined total of 85,259 exercise referral scheme participants completed a Consensus on Exercise Reporting Template-guided questionnaire. The questionnaire explored program delivery, nonexercise components, and program management. Results: Results found that program delivery varied, though many schemes were typically 12 weeks in length, offering participants 2 exercise sessions in a fitness gym or studio per week, using a combination of exercises. Adherence was typically measured through attendance, with nonexercise components and program management varying by scheme. Conclusion: This research provides a snapshot of current delivery approaches and supports the development of a large-scale mapping exercise to review further schemes across the whole of the United Kingdom in order to provide evidence of best practice and delivery approaches nationwide.

Article Number: e0267284

Accession Number: WOS:000885891700014

Abstract: Despite significant investment to increase recycling facilities and kerbside collection of waste materials, plastic packaging is frequently discarded as litter, resulting in significant environmental harm. This research uses qualitative methods to explore the contextual and psychological factors that influence plastic waste disposal behaviour from the perspectives of consumers. This research also reports key results from a brief online survey exploring consumer perspectives toward plastics and plastic recycling. A total of N = 18 adults living in Northern Ireland (NI) participated in a semi-structured interview and N = 756 adults living in NI took part in an online survey. Interview data was analysed via a semi directed content analysis approach, using the COM-B behaviour change model as a guiding framework. Survey data underwent descriptive and frequency analysis. Collectively, the findings suggest that environmental concern exists among consumers generally, but there is a degree of ambivalence toward recycling that reflects a gap between intentions to recycle and actual recycling behaviour. Plastic recycling behaviour is hindered by three common barriers: 1. confusion and uncertainty about which plastic materials can be recycled (exacerbated by the abundance of plastic products available) 2. perceiving plastic recycling to be less of a personal priority in daily life 3. perceiving that local government and manufacturers have a responsibility to make plastic recycling easier. As recycling is simply not a priority for many individuals, efforts should instead be placed on providing greater scaffolding to make the process of recycling less tedious, confusing, and more habitual. Visual cues on product packing and recycling resources can address ambiguity about which plastic materials can/cannot be recycled and increasing opportunities to recycle (via consistent availability of recycling bins) can reduce the physical burden of accessing recycling resources. Such interventions, based on environmental restructuring and enablement, may increase motivations to recycle by reducing the cognitive and physical burden of recycling, supporting healthier recycling habits.

Abstract: Previous research exploring the psychological, social, and environmental barriers to recycling has predominantly focused on consumer attitude and behaviour. However, the plastic system involves a chain of stakeholders with a role in decision-making and actions in relation to plastic production and management post-use, affirming the need to explore the barriers to recycle across various other stakeholders implicated in the lifecycle of plastic product and packaging. To expand this evidence-base, N = 12 in-depth qualitative semi-structured interviews explored the perspectives of some of the stakeholders responsible for various aspects of the plastic life cycle (fast moving consumer goods industry, retailers, and waste management professionals). Using a semi-directed content analysis approach via NVivo, three overarching themes were extracted from the data: 1) Disempowerment and lost opportunities 2) Solutions and opportunities reside with use of legislation 3) The circular economy stakeholders need motivation, and to be more knowledgeable. The themes suggest that stakeholders implicated in the plastic lifecycle lack the drive and perceived personal and organizational efficacy to generate meaningful change in the plastic system. These barriers are exacerbated by a lack of collegial partnerships between stakeholders to facilitate knowledge transfer and collective action. This study recommends greater collaboration and communication between stakeholders implicated in the end-to-end plastic "chain", and makes a renewed call for further legislation, having shed light on important socio-political and pragmatic barriers to reducing plastic waste.

Abstract: Health care needs to continuously evolve and innovate to maintain the health of populations. Technology has the potential to enable better patient engagement and ownership, as well as optimise therapeutic interventions and data-science approaches to facilitate improved health care decisions. Yet, to date, technological innovation has not resulted in the rate of change that could have been predicted from other sectors. This article discusses multiple reasons for this and proposes a newly tested and deployed solution: the technology clinical trial. The technology clinical trial methodology has been developed through working directly with patients, clinical and medical device trial experts. This approach enables researchers to use the complex environment of health care as an opportunity to transform the pace of innovation and create new care pathways. Instead of testing a single innovation, researchers can 'step back' and systematically review all areas of the patient's journey for potential optimization. Then integrate novel data science, technological advances, process updates, behavioural science, and patient engagement to co-create a streamlined multidisciplinary solution. As a result, this research has the potential for larger advances due to the emergent benefits that can arise when the individual elements work together as a whole. These potential benefits are then robustly tested, characterised and measured in the trial environment to ensure that future application of the innovative pathway is supported by the robust empirical data health care requires.

ISSN: 1198-0052

DOI: 10.3390/curroncol29070403

Accession Number: WOS:000831842900001

Abstract: Globally, there is increasing emphasis on value-based cancer care. Rising healthcare costs and reduced health care spending and budgets, especially in low- and middle-income countries (LMICs), call for patients, providers, and healthcare systems to apply the Choose Wisely (CW) approach. This approach seeks to advance a dialogue on avoiding unnecessary medical tests, treatments, and procedures. Several factors have been described as barriers and facilitators to the implementation of the Choosing Wisely recommendations in high-income countries but none for LMICs. In this review, we attempt to classify potential barriers to the Choose Wisely implementation relative to the sources of behavior and potential intervention functions that can be implemented in order to reduce these barriers.

Short Title: New York City Physicians' Views of Providing Long-Acting Reversible Contraception to Adolescents

ISSN: 1544-1709

DOI: 10.1370/afm.1450

Accession Number: WOS:000336793700006

Abstract: PURPOSE Although the US adolescent pregnancy rate is high, use of the most effective reversible contraceptives-intrauterine devices (IUDs) and implantable contraception-is low. Increasing use of long-acting reversible contraception (LARC) could decrease adolescent pregnancy rates. We explored New York City primary care physicians' experiences, attitudes, and beliefs about counseling and provision of LARC to adolescents. METHODS We conducted in-depth

telephone interviews with 28 family physicians, pediatricians, and obstetrician-gynecologists using an interview guide based on an implementation science theoretical framework. After an iterative coding and analytic process, findings were interpreted using the capability (knowledge and skills), opportunity (environmental factors), and motivation (attitudes and beliefs) conceptual model of behavior change. RESULTS Enablers to IUD counseling and provision include knowledge that nulliparous adolescents are appropriate IUD candidates (capability) and opportunity factors, such as (1) a clinical environment supportive of adolescent contraception, (2) IUD availability in clinic, and (3) the ability to insert IUDs or easy access to an someone who can. Factors enabling motivation include belief in the overall positive consequences of IUD use; this is particularly influenced by a physicians' perception of adolescents' risk of pregnancy and sexually transmitted disease. Physicians rarely counsel about implantable contraception because of knowledge gaps (capability) and limited access to the device (opportunity). CONCLUSION Knowledge, skills, clinical environment, and physician attitudes, all influence the likelihood a physician will counsel or insert LARC for adolescents. Interventions to increase adolescents' access to LARC in primary care must be tailored to individual clinical practice sites and practicing physicians, the methods must be made more affordable, and residency programs should offer up-to-date, evidence-based teaching.

Title: Public preferences for vaccination and antiviral medicines under different pandemic flu outbreak scenarios

Journal: BMC Public Health

Volume: 15

Date: Feb

Short Title: Public preferences for vaccination and antiviral medicines under different pandemic flu outbreak scenarios

DOI: 10.1186/s12889-015-1541-8

Article Number: 190

Accession Number: WOS:000350325200001

Abstract: Background: During the 2009-2010 A(H1N1) pandemic, many people did not seek care quickly enough, failed to take a full course of antivirals despite being authorised to receive them, and were not vaccinated. Understanding facilitators and barriers to the uptake of vaccination and antiviral medicines will help inform campaigns in future pandemic influenza outbreaks. Increasing uptake of vaccines and antiviral medicines may need to address a range of drivers of behaviour. The aim was to identify facilitators of and barriers to being vaccinated and taking antiviral medicines in uncertain and severe pandemic influenza scenarios using a

theoretical model of behaviour change, COM-B. Methods: Focus groups and interviews with 71 members of the public in England who varied in their at-risk status. Participants responded to uncertain and severe scenarios, and to messages giving advice on vaccination and antiviral medicines. Data were thematically analysed using the theoretical framework provided by the COM-B model. Results: Influences on uptake of vaccines and antiviral medicines –capabilities, motivations and opportunities –are part of an inter-related behavioural system and different components influenced each other. An identity of being healthy and immune from infection was invoked to explain feelings of invulnerability and hence a reduced need to be vaccinated, especially during an uncertain scenario. The identity of being a 'healthy person' also included beliefs about avoiding medicine and allowing the body to fight disease 'naturally'. This was given as a reason for using alternative precautionary behaviours to vaccination. This identity could be held by those not at-risk and by those who were clinically at-risk. Conclusions: Promoters and barriers to being vaccinated and taking antiviral medicines are multi-dimensional and communications to promote uptake are likely to be most effective if they address several components of behaviour. The benefit of using the COM-B model is that it is at the core of an approach that can identify effective strategies for behaviour change and communications for the future. Identity beliefs were salient for decisions about vaccination. Communications should confront identity beliefs about being a 'healthy person' who is immune from infection by addressing how vaccination can boost wellbeing and immunity. Abstract: Introduction WHO recommends that all women have the option to have a companion of their choice throughout labour and childbirth. Despite clear benefits of labour companionship, including better birth experiences and reduced caesarean section, labour companionship is not universally implemented. In Thailand, there are no policies for public hospitals to support companionship. This study aims to understand factors affecting implementation of labour companionship in Thailand. Methods This is formative qualitative research to inform the 'Appropriate use of caesarean section through QUALity DECision-making by women and providers' (QUALI-DEC) study, to design, adapt and implement a strategy to optimise use of caesarean section. We use in-depth interviews and readiness assessments to explore perceptions of healthcare providers, women and potential companions about labour companionship in eight Thai public hospitals. Qualitative data were analysed using thematic analysis, and narrative summaries of the readiness assessment were generated. Factors potentially affecting implementation were mapped to the Capability, Opportunity, and Motivation behaviour change model (COM-B). Results 127 qualitative interviews and eight readiness assessments are included in this analysis. The qualitative findings were grouped in four themes: benefits of labour companions, roles of labour companions, training for labour companions and factors affecting implementation. The findings showed that healthcare providers, women and their relatives all had positive attitudes towards having labour companions. The readiness assessment highlighted implementation challenges related to training the companion, physical space constraints, overcrowding and facility policies, reiterated by the qualitative reports. Discussion If labour companions are well-trained on how to best support women, help them to manage pain and engage with healthcare teams, it may be a feasible intervention to implement in Thailand. However, key barriers to introducing labour companionship must be addressed to maximise the likelihood of success mainly related to training and space. These findings will be integrated into the QUALI-DEC implementation strategies.

Short Title: Barriers to effective management of type 2 diabetes in primary care: qualitative systematic review

ISSN: 0960–1643

DOI: 10.3399/bjgp16X683509

Accession Number: WOS:000369147100008

Abstract: Background Despite the availability of evidence-based guidance, many patients with type 2 diabetes do not achieve treatment goals. Aim To guide quality improvement strategies for type 2 diabetes by synthesising qualitative evidence on primary care physicians' and nurses' perceived influences on care. Design and setting Systematic review of qualitative studies with findings organised using the Theoretical Domains Framework. Method Databases searched were MEDLINE, Embase, CINAHL, PsycInfo, and ASSIA from 1980 until March 2014. Studies included were Englishlanguage qualitative studies in primary care of physicians' or nurses' perceived influences on treatment goals for type 2 diabetes. Results A total of 32 studies were included: 17 address general diabetes care, 11 glycaemic control, three blood pressure, and one cholesterol control. Clinicians struggle to meet evolving treatment targets within limited time and resources, and are frustrated with resulting compromises. They lack confidence in knowledge of guidelines and skills, notably initiating insulin and facilitating patient behaviour change. Changing professional boundaries have resulted in uncertainty about where clinical responsibility resides. Accounts are often couched in emotional terms, especially frustrations over patient compliance and anxieties about treatment intensification. Conclusion Although resources are important, many barriers to improving care are amenable to behaviour change strategies. Improvement strategies need to account for differences between clinical targets and consider tailored rather than 'one size fits all' approaches. Training targeting knowledge is necessary but insufficient to bring about major change; approaches to improve diabetes care need to delineate roles and responsibilities, and address clinicians' skills and emotions around treatment intensification and facilitation of patient behaviour change.

DOI: 10.3390/nu14051037

Article Number: 1037

Accession Number: WOS:000768497400001

Abstract: Delegation of malnutrition care to dietitian assistants can positively influence patient, healthcare, and workforce outcomes. However, nutrition care for hospital inpatients with or at risk of malnutrition remains primarily individually delivered by dietitians—an approach that is not considered sustainable. This study aimed to identify barriers and enablers to delegating malnutrition care activities to dietitian assistants. This qualitative descriptive study was nested within a broader quality assurance activity to scale and spread systematised and interdisciplinary malnutrition models of care. Twenty-three individual semi-structured interviews were completed with nutrition and dietetic team members across seven hospitals. Inductive thematic analysis was undertaken, and barriers and enablers to delegation of malnutrition care to dietitian assistants were grouped into four themes: working with the human factors; balancing value and risk of delegation; creating competence, capability, and capacity; and recognizing contextual factors. This study highlights novel insights into barriers and enablers to delegating malnutrition care to dietitian assistants. Successful delegation to dietitian assistants requires the unique perspectives of humans as individuals and in their collective healthcare roles, moving from words to actions that value delegation; engaging in processes to improve competency, capability, and capacity of all; and being responsive to climate and contextual factors.

Short Title: Identifying Low Value Malnutrition Care Activities for De-Implementation and Systematised, Interdisciplinary Alternatives-A Multi-Site, Nominal Group Technique Approach

DOI: 10.3390/nu13062063

Article Number: 2063

Accession Number: WOS:000666161300001

Abstract: Malnutrition risk is identified in over one-third of inpatients; reliance on dietetics-delivered nutrition care for all "at-risk" patients is unsustainable, inefficient, and ineffective. This study aimed to identify and prioritise low-value malnutrition care activities for de-implementation and articulate systematised interdisciplinary opportunities. Nine workshops, at eight purposively sampled hospitals, were undertaken using the nominal group technique. Participants were asked "What highly individualised malnutrition care activities do you think we could replace with systematised, interdisciplinary malnutrition care?" and "What systematised, interdisciplinary opportunities do you think we should do to provide more effective and efficient nutrition care in our ward/hospital?" Sixty-three participants were provided five votes per question. The most voted de-implementation activities were low-value nutrition reviews (32); education by dietitian (28); assessments by dietitian for patients with malnutrition screening tool score of two (22); assistants duplicating malnutrition screening (19); and comprehensive, individualised nutrition assessments where unlikely to add value (15). The top voted alternative opportunities were delegated/skill shared interventions (55), delegated/skill shared education (24), abbreviated malnutrition care processes where clinically appropriate (23), delegated/skill shared supportive food/fluids (14), and mealtime assistance (13). Findings highlight opportunities to de-implement perceived low-value malnutrition care activities and replace them with systems and skill shared alternatives across hospital settings. DOI: 10.3390/healthcare9040446

Article Number: 446

Accession Number: WOS:000643063900001

Abstract: Approximately one-third of adult inpatients are malnourished with substantial associated healthcare burden. Delegation frameworks facilitate improved nutrition care delivery and high-value healthcare. This study aimed to explore knowledge, attitudes, and practices of dietitians and dietitian assistants regarding delegation of malnutrition care activities. This multi-site study was nested within a nutrition care implementation program, conducted across Queensland (Australia) hospitals. A quantitative questionnaire was conducted across eight sites; 87 dietitians and 37 dietitian assistants responded and descriptive analyses completed. Dietitians felt guidelines to support delegation were inadequate (agreement: <50% for assessment/diagnosis, care coordination, education, and monitoring and evaluation); dietitian assistants perceived knowledge and guidelines to undertake delegated tasks were adequate (agreement: >50% food and nutrient delivery, education, and monitoring and evaluation). Dietitians and dietitian assistants reported confidence to delegate/receive delegation (dietitian agreement: >50% across all care components; dietitian assistant agreement: >50% for assessment/diagnosis, food and nutrient delivery, education, monitoring and evaluation). Practice of select nutrition care activities were routinely performed by dietitians, rather than assistants ($p < 0.001$ across all nutrition care components). The process for care delegation needs to be improved. Clarity around barriers and enablers to delegation of care prior to implementing reforms to the current models of care is key. Short Title: A qualitative study of the infant feeding beliefs and behaviours of mothers with low educational attainment

DOI: 10.1186/s12887-016-0601-2

Article Number: 69

Accession Number: WOS:000376759600002

Abstract: Background: Infancy is an important period for the promotion of healthy eating, diet and weight. However little is

known about how best to engage caregivers of infants in healthy eating programs. This is particularly true for caregivers, infants and children from socioeconomically disadvantaged backgrounds who experience greater rates of overweight and obesity yet are more challenging to reach in health programs. Behaviour change interventions targeting parent-infant feeding interactions are more likely to be effective if assumptions about what needs to change for the target behaviours to occur are identified. As such we explored the precursors of key obesity promoting infant feeding practices in mothers with low educational attainment. Methods: One-on-one semi-structured telephone interviews were developed around the Capability Opportunity Motivation Behaviour (COM-B) framework and applied to parental feeding practices associated with infant excess or healthy weight gain. The target behaviours and their competing alternatives were (a) initiating breastfeeding/formula feeding, (b) prolonging breastfeeding/replacing breast milk with formula, (c) best practice formula preparation/sub-optimal formula preparation, (d) delaying the introduction of solid foods until around six months of age/ introducing solids earlier than four months of age, and (e) introducing healthy first foods/introducing unhealthy first foods, and (f) feeding to appetite/use of non-nutritive (i.e., feeding for reasons other than hunger) feeding. The participants' education level was used as the indicator of socioeconomic disadvantage. Two researchers independently undertook thematic analysis. Results: Participants were 29 mothers of infants aged 2-11 months. The COM-B elements of Social and Environmental Opportunity, Psychological Capability, and Reflective Motivation were the key elements identified as determinants of a mother's likelihood to adopt the healthy target behaviours although the relative importance of each of the COM-B factors varied with each of the target feeding behaviours. Conclusions: Interventions targeting healthy infant feeding practices should be tailored to the unique factors that may influence mothers' various feeding practices, taking into account motivational and social influences.

Short Title: Improving outcomes for patients hospitalized with gout: a systematic review

ISSN: 1462-0324

DOI: 10.1093/rheumatology/keab539

Accession Number: WOS:000757902800025

Abstract: Objectives Hospital admissions for gout flares have increased dramatically in recent years, despite widely available, effective medications for the treatment and prevention of flares. We conducted a systematic review to evaluate the effectiveness and implementation of interventions in patients hospitalized for gout flares. Methods A search was conducted in MEDLINE, Embase and the Cochrane library, from database inception to 8 April 2021, using the terms 'gout' and 'hospital' and their synonyms. Studies were included if they evaluated the effectiveness and/or implementation of interventions during hospital admissions or emergency department attendances for gout flares. Risk of bias assessments were performed for included studies. Results Nineteen articles were included. Most studies were small, retrospective analyses performed in single centres, with concerns for bias. Eleven studies (including five randomized controlled trials) reported improved patient outcomes following pharmacological interventions with known efficacy in gout, including allopurinol, prednisolone, NSAIDs and anakinra. Eight studies reported improved outcomes associated with non-pharmacological interventions: inpatient rheumatology consultation and a hospital gout management protocol. No studies to date have prospectively evaluated strategies designed to prevent re-admissions of patients hospitalized for gout flares. Conclusion There is an urgent need for high-quality, prospective studies of strategies for improving uptake of urate-lowering therapies in hospitalized patients, incorporating prophylaxis against flares and treat-to-target optimization of serum urate levels. Such studies are essential if the epidemic of hospital admissions from this treatable condition is to be countered.

Title: Building staff capability, opportunity, and motivation to provide smoking cessation to people with cancer in Australian cancer treatment centres: development of an implementation intervention framework for the Care to Quit cluster randomised controlled trial

Journal: Health Services and Outcomes Research Methodology

Date: 2022 Sep

Short Title: Building staff capability, opportunity, and motivation

to provide smoking cessation to people with cancer in Australian cancer treatment centres: development of an implementation intervention framework for the Care to Quit cluster randomised controlled trial

ISSN: 1387-3741

DOI: 10.1007/s10742-022-00288-6

Accession Number: WOS:000861136100001

Abstract: Few rigorous studies provide a clear description of the methodological approach of developing an evidence-based implementation intervention, prior to implementation at scale. This study describes the development, mapping, rating, and review of the implementation strategies for the Care to Quit smoking cessation trial, prior to application in nine cancer services across Australia. Key stakeholders were engaged in the process from conception through to rating, reviewing and refinement of strategies and principles. An initial scoping review identified 21 barriers to provision of evidence-based smoking cessation care to patients with cancer, which were mapped to the Theoretical Domains Framework and Behaviour Change Wheel (BCW) to identify relevant intervention functions. The mapping identified 26 relevant behaviour change techniques, summarised into 11 implementation strategies. The implementation strategies were rated and reviewed against the BCW Affordability, Practicality, Effectiveness and cost-effectiveness, Acceptability, Side-effects/safety, and Equity criteria by key stakeholders during two interactive workshops to facilitate a focus on feasible interventions likely to resonate with clinical staff. The implementation strategies and associated intervention tools were then collated by form and function to provide a practical guide for implementing the intervention. This study illustrates the rigorous use of theories and frameworks to arrive at a practical intervention guide, with potential to inform future replication and scalability of evidence-based implementation across a range of health service settings.

Title: Using automated active infrared counters to estimate footfall on urban park footpaths: behavioural stability and validity testing

Journal: International Journal of Behavioral Nutrition and Physical Activity

Volume: 20

Issue: 1

Date: Apr

Short Title: Using automated active infrared counters to estimate footfall on urban park footpaths: behavioural stability and validity testing

DOI: 10.1186/s12966-023-01438-w

Article Number: 49

Accession Number: WOS:000976657700001

Abstract: BackgroundUsing infrared counters is a promising unobtrusive method of assessing footfall in urban parks. However, infrared counters are susceptible to reliability and validity issues, and there is limited guidance for their use. The aims of this study were to (1) determine how many weeks of automated active infrared count data would provide behaviourally stable estimates of urban park footfall for each meteorological season, and (2) determine the validity of automated active infrared count estimates of footfall in comparison to direct manual observation counts.MethodsThree automated active infrared counters collected daily footfall counts for 365 days on three footpaths in an urban park within Northampton, England, between May 2021 – May 2022. Intraclass correlation coefficients were used to compare the behavioural stability of abbreviated data collection schedules with total median footfall within each meteorological season (Spring, Summer, Autumn, Winter). Public holidays, events, and extreme outliers were removed. Ten one-hour manual observations were conducted at the site of an infrared counter to determine the validity of the infrared counter.ResultsAt least four-weeks (28 days) of infrared counts are required to provide 'good' to 'excellent' (Intraclass correlation > 0.75, > 0.9, respectively) estimates of median daily footfall per meteorological season in an urban park. Infrared counters had, on average, -4.65 counts per hour (95% LoA -12.4, 3.14; Mean absolute percentage error 13.7%) lower counts compared to manual observation counts during one-hour observation periods (23.2 +/- 15.6, 27.9 +/- 18.9 counts per hour, respectively). Infrared counts explained 98% of the variance in manual observation counts. The number of groups during an observation period explained 78% of the variance in the difference between infrared and manual counts.ConclusionsAbbreviated data collection schedules can still obtain estimates of urban park footfall. Automated active infrared counts are strongly associated with manual counts; however, they tend to underestimate footfall, often due to people in groups. Methodological and practical recommendations are provided.

Date: Mar

Short Title: The role of evidence, context, and facilitation in an implementation trial: implications for the development of the PARIHS framework

ISSN: 1748-5908

DOI: 10.1186/1748-5908-8-28

Article Number: 28

Accession Number: WOS:000318418100002

Abstract: Background: The case has been made for more and better theory-informed process evaluations within trials in an effort to facilitate insightful understandings of how interventions work. In this paper, we provide an explanation of implementation processes from one of the first national implementation research randomized controlled trials with embedded process evaluation conducted within acute care, and a proposed extension to the Promoting Action on Research Implementation in Health Services (PARIHS) framework.

Methods: The PARIHS framework was prospectively applied to guide decisions about intervention design, data collection, and analysis processes in a trial focussed on reducing peri-operative fasting times. In order to capture a holistic picture of implementation processes, the same data were collected across 19 participating hospitals irrespective of allocation to intervention. This paper reports on findings from data collected from a purposive sample of 151 staff and patients pre- and post-intervention. Data were analysed using content analysis within, and then across data sets.

Results: A robust and uncontested evidence base was a necessary, but not sufficient condition for practice change, in that individual staff and patient responses such as caution influenced decision making. The implementation context was challenging, in which individuals and teams were bounded by professional issues, communication challenges, power and a lack of clarity for the authority and responsibility for practice change. Progress was made in sites where processes were aligned with existing initiatives.

Additionally, facilitators reported engaging in many intervention implementation activities, some of which result in practice changes, but not significant improvements to outcomes.

Conclusions: This study provided an opportunity for reflection on the comprehensiveness of the PARIHS framework. Consistent with the underlying tenant of PARIHS, a multi-faceted and dynamic story of implementation was evident. However, the prominent role that individuals played as part of the interaction between evidence and context is not currently explicit within the framework. We propose that successful implementation of evidence into practice is a planned facilitated process involving an interplay between individuals, evidence, and context to promote evidence-informed practice. This proposal will enhance the potential of the PARIHS framework for explanation, and ensure theoretical development both informs and responds to the evidence base for implementation.

Title: Supporting lifestyle change in obese pregnant mothers through
the wearable internet-of-things (SLIM) -intervention for overweight
pregnant women: Study protocol for a quasi-experimental trial

Journal: Plos One

Volume: 18

Issue: 1

Date: Jan

Short Title: Supporting lifestyle change in obese pregnant mothers
through the wearable internet-of-things (SLIM) -intervention for
overweight pregnant women: Study protocol for a quasi-experimental
trial

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0279696

Article Number: e0279696

Accession Number: WOS:000945885400001

Abstract: ObjectivesTo assess, in terms of self-efficacy in weight
management, the effectiveness of the SLIM lifestyle intervention
among overweight or obese women during pregnancy and after delivery,
and further to exploit machine learning and event mining approaches
to build personalized models. Additionally, the aim is to evaluate
the implementation of the SLIM intervention.MethodsThis prospective
trial, which is a non-randomized, quasi-experimental, pre-post
intervention, includes an embedded mixed-method process evaluation.
The SLIM Intervention is delivered by public health nurses (n = 9)
working in maternity clinics. The public health nurses recruited
overweight women (n = 54) at their first antenatal visit using
convenience sampling. The core components of the intervention i.e.
health technology, motivational interviewing, feedback, and goal
setting, are utilized in antenatal visits in maternity clinics
starting from gestational week 15 or less and continuing to 12 weeks
after delivery. Mixed effect models are used to evaluate change over
time in self-efficacy, weight management and weight change. Simple
mediation models are used to assess calories consumed and moderate
to vigorous physical activity (MVPA) as mediators between self-
efficacy and weight change. Signal processing and machine learning
techniques are exploited to extract events from the data collected
via the Oura ring and smartphone-based questionnaires.DiscussionThe
SLIM intervention was developed in collaboration with overweight
women and public health nurses working in maternity clinics. This
study evaluates the effectiveness of the intervention among
overweight women in increasing self-efficacy and achieving a healthy
weight; thus, impacting the healthy lifestyle and long-term health
of the whole family. The long-term objective is to contribute to
women's health by supporting weight-management through behavior
change via interventions conducted in maternity clinics.

Article Number: 103251

Accession Number: WOS:000685125000008

Abstract: Background: Different techniques and approaches have been used for substance use prevention worldwide. No reviews of prevention interventions in Africa exist; hence this study aimed to systematically review interventions undertaken in Sub-Saharan Africa to prevent substance use in children and young people. Methods: MEDLINE, EMBASE, Cochrane Central, CAB, PsycINFO, CINAHL, SCOPUS, ERIC, and Web of Science databases were searched. Studies were included if they evaluated a substance use prevention intervention for children and young people in a Sub-Saharan African Country between 2000 and 2020. A narrative synthesis was used to explore and describe the data. Results: Eighteen studies, mostly from South Africa, were included. Most (10/18) of the interventions were school-based. Only two of the included studies were considered having a strong quality concerning the risk of bias, and some studies poorly reported the interventions. School-based interventions, although successful in improving knowledge, had little or no effects on substance use. Overall, most studies that reported a statistically significant reduction in substance use-related outcomes were brief interventions, individual-focused, and involved participants who were already exposed to substance use. These were mostly delivered by trained professionals using motivational interviewing or cognitive behavioural therapy or both. Conclusion: School-based programs present an opportunity for substance use prevention efforts in the Sub-Saharan region in Africa. Such programs may benefit from an improved focus on individual students. There is a need for improving the quality of design, implementation, and reporting of substance use interventions within the region.

motivation-for-behavior model: a multi-country survey of adolescents

and young adults

DOI: 10.3389/fpubh.2022.875801

Article Number: 875801

Accession Number: WOS:000837089000001

Abstract: The use of cigarettes among adolescents and young adults (AYA) is an important issue. This study assessed the association between regular and electronic-cigarettes use among AYA and factors of the Capability-Motivation-Opportunity-for-Behavior-change (COM-B) model. A multi-country survey was conducted between August-2020 and January-2021, Data was collected using the Global-Youth-Tobacco-Survey and Generalized-Anxiety-Disorder-7-item-scale. Multi-level logistic-regression-models were used. Use of regular and electronic-cigarettes were dependent variables. The explanatory variables were capability-factors (COVID-19 status, general anxiety), motivation-factors (attitude score) and opportunity-factors (country-level affordability scores, tobacco promotion-bans, and smoke free-zones) controlling for age and sex. Responses of 6,989-participants from 25-countries were used. Those who reported that they were infected with COVID-19 had significantly higher odds of electronic-cigarettes use (AOR = 1.81, P = 0.02). Normal or mild levels of general anxiety and negative attitudes toward smoking were associated with significantly lower odds of using regular-cigarettes (AOR = 0.34, 0.52, and 0.75, P < 0.001) and electronic-cigarettes (AOR = 0.28, 0.45, and 0.78, P < 0.001). Higher affordability-score was associated with lower odds of using electronic-cigarettes (AOR = 0.90, P = 0.004). Country-level-smoking-control policies and regulations need to focus on reducing cigarette affordability. Capability, motivation and opportunity factors of the COM-B model were associated with using regular or electronic cigarettes.

Short Title: Interprofessional Interventions Involving Pharmacists and Targeting the Medicines Management Process Provided to Older People Residing in Nursing Homes: A Systematic Review and Meta-Analysis of Randomised Controlled Trials

ISSN: 1170-229X

DOI: 10.1007/s40266-022-00978-3

Accession Number: WOS:000864234200001

Abstract: Background Nursing home residents are often prescribed multiple medications, which increases their susceptibility to drug-related problems. The medicines management process involves multiple stages, for example, assessing, prescribing, dispensing, delivering and storing, administering, reviewing and monitoring. The medicine management process aims to optimise medicine use and associated patient outcomes. Interprofessional interventions of healthcare professionals from different disciplines in many clinical settings, including the nursing home setting, have shown success in improving patients' clinical outcomes. However, reporting of the pharmacist's role and the impact of these interventions has been unclear.

Objectives We aimed to systematically identify and describe interprofessional interventions involving pharmacists that target the medicine management process in nursing homes by (a) describing interprofessional interventions and the role of pharmacists within, (b) describing the impact of these interventions, (c) exploring which of the medicine management process stages were targeted and (d) identifying any reported theoretical underpinning. Methods EMBASE, MEDLINE, CINAHL, SCOPUS, PsycInfo, Cochrane library, Web of Science and clinical trial registers were searched from the inception date until August 2021. Randomised controlled trials reporting interprofessional interventions involving pharmacists, targeting at least one stage of the medicine management process and provided to nursing home residents with a mean age ≥ 65 years, were included. The search had no restriction on outcomes measured.

Included randomised controlled trials were assessed for quality and risk of bias using the Jadad scale and Cochrane Collaboration tool, respectively. The overall certainty of outcomes was assessed using GRADEpro. If present, details about theoretical underpinning were extracted using the theory coding scheme. Fixed and random-effects models were used to calculate the pooled effect estimates to compare outcomes between intervention and control groups, where feasible, or a narrative description was reported. Results Eighteen manuscripts describing interprofessional interventions involving pharmacists were identified: medication review ($n = 14$), education ($n = 3$) and medication simplification ($n = 1$) based interventions. The pharmacists' most frequent role was the provision of medicine-related recommendations, and they worked mostly with general practitioners and nurses. Residents/family members contributed in

44% of included interventions. A meta-analysis identified that interventions were significantly associated with significant improvements in prescribing appropriateness (standard mean difference - 0.20; 95% confidence interval - 0.33 to - 0.77; I² = 27%) but not with hospitalisation and mortality. None of the included studies reported a theoretical underpinning to intervention development. Conclusions This systematic review provides a detailed description of the impact of interprofessional practice, involving pharmacists, which targets at least one stage of the medicine management process in the nursing home setting. The findings suggest that future research should prioritise improving prescribing inappropriateness rather than the number of long-term medications prescribed. It remains unknown if interventions are designed using theory and, therefore, it is not clear whether theory-derived interventions are more effective than those without a theoretical element.

Short Title: Mixed-methods evaluation of a continuing education approach to improving district hospital care for children in Lao PDR

ISSN: 1360-2276

DOI: 10.1111/tmi.13726

Accession Number: WOS:000758080900001

Abstract: Objective To understand the impact of a multifaceted intervention on improving acute hospital care provided to children in two district hospitals in northern Lao PDR. Methods We developed a continuing education intervention, which integrated separate program content using a common pool of facilitators and low-fidelity simulation scenarios. Coaching was delivered over one year through two-day hospital visits to each hospital six to eight weeks apart with visits incorporating feedback. A comparative case study was conducted between two hospital sites. Medical record abstraction from inpatient cases was performed at each visit. Focus groups and interviews with staff were conducted to understand perceived changes to case management. Results Inpatient case management scores showed incremental improvement over time, from 50% at baseline to 80% at

the end of one year at Hospital A and 52% to 97% at Hospital B. The key themes that emerged from the qualitative data from both hospitals were the value of the educational method and increased belief in capability. Hospital B showed more incremental and sustained improvement. Qualitative data revealed that the directors of Hospital B demonstrated modelling and behavioural reinforcement. Conclusion Improving the quality of care in low-resource settings is feasible. A hands-on practical approach with repeated coaching visits reinforced by feedback can lead to behaviour change. Optimal impact requires harnessing leadership and motivation for change among health workers.

Accession Number: WOS:000795955200001

Abstract: Background Documenting an indication when prescribing antimicrobials is considered best practice; however, a better understanding of the evidence is needed to support broader implementation of this practice. Objectives We performed a scoping review to evaluate antimicrobial indication documentation as it pertains to its implementation, prevalence, accuracy and impact on clinical and utilisation outcomes in all patient populations. Eligibility criteria Published and unpublished literature evaluating the documentation of an indication for antimicrobial prescribing. Sources of evidence A search was conducted in MEDLINE, Embase, CINAHL and International Pharmaceutical Abstracts in addition to a review of the grey literature. Charting and analysis Screening and extraction was performed by two independent reviewers. Studies were categorised inductively and results were presented descriptively. Results We identified 123 peer-reviewed articles and grey literature documents for inclusion. Most studies took place in a hospital setting (109, 89%). The median prevalence of antimicrobial indication documentation was 75% (range 4%-100%). Studies evaluating

the impact of indication documentation on prescribing and patient outcomes most commonly examined appropriateness and identified a benefit to prescribing or patient outcomes in 17 of 19 studies. Qualitative studies evaluating healthcare worker perspectives (n=10) noted the common barriers and facilitators to this practice.

Conclusion There is growing interest in the importance of documenting an indication when prescribing antimicrobials. While antimicrobial indication documentation is not uniformly implemented, several studies have shown that multipronged approaches can be used to improve this practice. Emerging evidence demonstrates that antimicrobial indication documentation is associated with improved prescribing and patient outcomes both in community and hospital settings. But setting-specific and larger trials are needed to provide a more robust evidence base for this practice.

Title: Development of a Chronic Disease Management Program for Stroke Survivors Using Intervention Mapping: The Stroke Coach

Journal: Archives of Physical Medicine and Rehabilitation

Volume: 98

Issue: 6

Pages: 1195-1202

Date: Jun

Short Title: Development of a Chronic Disease Management Program for Stroke Survivors Using Intervention Mapping: The Stroke Coach

ISSN: 0003-9993

DOI: 10.1016/j.apmr.2017.01.019

Accession Number: WOS:000402776600017

Abstract: Objective: To describe the systematic development of the Stroke Coach, a theory- and evidence-based intervention to improve control of lifestyle behavior risk factors in patients with stroke. Design: Intervention development. Setting: Community. Participants: Individuals who have had a stroke. Interventions: We used intervention mapping to guide the development of the Stroke Coach. Intervention mapping is a systematic process used for intervention development and composed of steps that progress from the integration of theory and evidence to the organization of realistic strategies to facilitate the development of a practical intervention supported by empirical evidence. Social cognitive theory was the underlying premise for behavior change, whereas control theory methods were directed toward sustaining the changes to ensure long-term health benefits. Practical evidence-based strategies were linked to behavioral determinants to improve stroke risk factor control. Main

Outcome Measures: Not applicable. Results: The Stroke Coach is a patient-centered, community-based, telehealth intervention to promote healthy lifestyles after stroke. Over 6 months, participants receive seven 30- to 60-minute telephone sessions with a lifestyle coach who provides education, facilitates motivation for lifestyle modification, and empowers participants to self-management their stroke risk factors. Participants also receive a self-management manual and a self-monitoring kit. Conclusions: Through the use of intervention mapping, we developed a theoretically sound and evidence-grounded intervention to improve risk factor control in patients with stroke. If empirical evaluation of the Stroke Coach produces positive results, the next step will be to develop an implementation intervention to ensure successful uptake and delivery of the program in community and outpatient settings. ISSN: 0194-2638

DOI: 10.3109/01942638.2015.1127866

Accession Number: WOS:000380051200007

Abstract: Aims: To pilot efficacy of a tailored multifaceted implementation program to change clinical practice of occupational therapists (OTs) providing upper limb (UL) therapy for children with unilateral cerebral palsy (UCP). Methods: This before and after study piloted a multifaceted implementation program comprising audit/feedback, barrier identification, and education. Medical chart audits were conducted prior to and 12 months after the intervention. Primary process outcomes included proportion of children with UCP with (1) goals set; (2) goals measured; (3) received contemporary motor learning approach; (4) an adequate dose (30-40 hours); and (5) measured UL outcomes. Results: Three teams of OTs (n = 9) participated. Forty-three audits at baseline and 53 at 12 months post-implementation program were conducted. Average time to complete audits was 10 min and four out of the five evidence criteria had

complete data extracted from files. Changes in clinical behavior included greater measurement of goals before (+17%) and after (+22%) therapy; use of constraint therapy (+38%), bimanual therapy (+26%), home programs (+14%); measurement of UL outcomes before (+29%) and after (+23%) therapy. Children receiving the target dose increased from 0 to 10%. Conclusions: A tailored multifaceted implementation program was feasible to implement and led to meaningful changes in clinical practice behavior.

Title: A longitudinal examination of dyadic distress patterns following a skills intervention for carers of adolescents with anorexia nervosa

Journal: European Child & Adolescent Psychiatry

Volume: 25

Issue: 12

Pages: 1337-1347

Date: Dec

Short Title: A longitudinal examination of dyadic distress patterns following a skills intervention for carers of adolescents with anorexia nervosa

ISSN: 1018-8827

DOI: 10.1007/s00787-016-0859-9

Accession Number: WOS:000387658500008

Abstract: Family interventions in anorexia nervosa (AN) have been developed to ameliorate maladaptive patterns of patient-carer interaction that can play a role in illness maintenance. The primary aim of this study is to examine the inter-relationship between baseline and post-treatment distress in dyads of carers and patients with AN to examine the interdependence between carers and patients. The secondary aim is to examine whether a carer skills intervention [Experienced Carer Helping Others (ECHO)] impacts on this inter-relationship. Dyads consisting of treatment-seeking adolescents with AN and their primary carer (n = 149; mostly mothers) were randomised to receive a carer skills intervention (ECHO) in addition to treatment as usual (TAU), or TAU alone, as part of a larger clinical trial. Carers and patients completed a standardised measure of psychological distress (The Depression, Anxiety, and Stress Scale) at baseline and 12 months post-treatment. The Actor Partner Interdependence Model was used to examine longitudinal changes in interdependence by treatment group. As expected, post-treatment

levels of distress were related to baseline levels in both groups (actor effects). Moreover, carer distress at 12 months was related to patient distress at baseline for the TAU (partner effects), but not for the ECHO group. Finally, carers' distress change was not a significant predictor of patients' body mass index (BMI) change in the two treatment conditions. These findings are limited to predominantly mother-offspring dyads and may not generalise to other relationships. The ECHO intervention which is designed to teach carers skills in illness management and emotion regulation may be an effective addition to TAU for ameliorating interdependence of distress in patients and their primary carers over time.

Short Title: The Influence of Health Behavior Theory on Implementation Practice and Science: Brief Review and Commentary

DOI: 10.3390/pharmacy10050115

Article Number: 115

Accession Number: WOS:000875965300001

Abstract: As research defines new treatments and policies to improve the health of patients, an increasing challenge has been to translate these insights into routine clinical practice to benefit patients and society. An important exploration is how theories of human behavior change fit into the science of implementation and quality improvement. In this paper, we begin with a brief review of the intellectual roots of implementation science and quality improvement, followed by a discussion of how theories and principles of behavior change can inform both goals and challenges in using behavior change theories. The insights offered through health behavior change theory have led to changes in how we plan for implementation and select, develop, design and tailor implementation interventions and strategies. While the degree to which organizational and external contexts influence the behavior of

providers in these organizations varies widely, some degree of context external to the individual is important and needs adequate consideration. In short, health behavior change theory is essential but not sufficient to integrate in most implementation efforts, where priority must be given to both individual factors and contexts in which individuals operate.

DOI: 10.1136/bmjopen-2014-006448

Article Number: e006448

Accession Number: WOS:000363455400018

Abstract: Objective: To develop a conceptual model for effective use of telehealth in the management of chronic health conditions, and to use this to develop and evaluate an intervention for people with two exemplar conditions: raised cardiovascular disease risk and depression. Design: The model was based on several strands of evidence: a metareview and realist synthesis of quantitative and qualitative evidence on telehealth for chronic conditions; a qualitative study of patients' and health professionals' experience of telehealth; a quantitative survey of patients' interest in using telehealth; and review of existing models of chronic condition management and evidence-based treatment guidelines. Based on these evidence strands, a model was developed and then refined at a stakeholder workshop. Then a telehealth intervention ('Healthlines') was designed by incorporating strategies to address each of the model components. The model also provided a framework for evaluation of this intervention within parallel randomised controlled trials in the two exemplar conditions, and the accompanying process evaluations and economic evaluations. Setting: Primary care.

Results: The TElehealth in CHronic Disease (TECH) model proposes that attention to four components will offer interventions the best chance of success: (1) engagement of patients and health professionals, (2) effective chronic disease management (including

subcomponents of self-management, optimisation of treatment, care coordination), (3) partnership between providers and (4) patient, social and health system context. Key intended outcomes are improved health, access to care, patient experience and cost-effective care. Conclusions: A conceptual model has been developed based on multiple sources of evidence which articulates how telehealth may best provide benefits for patients with chronic health conditions. It can be used to structure the design and evaluation of telehealth programmes which aim to be acceptable to patients and providers, and cost-effective.

Short Title: Movement Foundations. The perceived impact of a digital rehabilitation tool for returning to fitness following a period of illness, including COVID-19 infection: a qualitative study

DOI: 10.1136/bmjsem-2023-001557

Article Number: e001557

Accession Number: WOS:000965299700002

Abstract: Digital interventions can increase physical activity (PA) levels in adults. However, the COVID-19 pandemic highlighted the complexities faced when guiding people to start or return to PA following illness or inactivity. A digital tool, Movement Foundations, was developed to provide remote guidance on building strength and capacity across functional movement patterns, with graduated progression based on user responses and input. This qualitative study aimed to explore the perceived impacts of using the tool. Nine participants aged over 35 years from the healthcare and academic healthcare sectors were recruited to use it and were subsequently interviewed. Thematic analysis identified three themes falling under the overarching concept of 'Capability, Opportunity and Motivation-Behaviour (COM-B) Plus', encompassing: skills and

capacity for movement; opportunities, motivations and barriers for movement; and a personalised, safe space in which to develop. Participants felt that the digital tool increased their capacity and confidence in movement and positively impacted their daily activities. External factors such as illness and stress clouded perceptions of the impacts of PA. Time, work pressures and needing equipment were still considered significant barriers to PA. Still, participants appreciated the flexibility and non-prescriptive nature of the tool and felt that it helped movement to become opportunistic and habitual. Increased capacity for PA and feeling the subsequent physical and mental effects positively influenced motivation. Structure and guidance, with graduated progress, were seen as protective. Guided self-reflection helped participants understand their capacity and limitations with regard to movement and promoted motivation. Although acquiring technical skills to guide movement may be important for those recovering from illness, participants found that a structure promoting individualised guidance, graduated progression and guided self-reflection were important motivational factors for continuing use. Digital interventions should consider these aspects when seeking to promote habitual PA.

Title: Carbohydrate for endurance athletes in competition questionnaire (CEAC-Q): validation of a practical and time-efficient tool for knowledge assessment

Journal: Sport Sciences for Health

Volume: 18

Issue: 1

Pages: 235-247

Date: Mar

Short Title: Carbohydrate for endurance athletes in competition questionnaire (CEAC-Q): validation of a practical and time-efficient tool for knowledge assessment

ISSN: 1824-7490

DOI: 10.1007/s11332-021-00799-8

Accession Number: WOS:000683503000001

Abstract: Purpose Despite unequivocal evidence demonstrating high carbohydrate (CHO) availability improves endurance performance, athletes often report under-eating CHO during competition. Such findings may be related to a lack of knowledge though currently there are no practical or time-efficient tools to assess CHO knowledge in athletes. Accordingly, we aimed to validate a novel questionnaire to rapidly assess endurance athletes' knowledge of competition CHO guidelines. Methods The Carbohydrate for Endurance

Athletes in Competition Questionnaire (CEAC-Q) was created by research-active practitioners, based on contemporary guidelines. The CEAC-Q comprised 25 questions divided into 5 subsections (assessing CHO metabolism, CHO loading, pre-event meal, during-competition CHO and recovery) each worth 20 points for a total possible score of 100. Results A between-group analysis of variance compared scores in three different population groups to assess construct validity: general population (GenP; n= 68), endurance athletes (EA; n= 145), and sports dietitians/nutritionists (SDN; n=60). Total scores were different (mean +/- SD) in all pairwise comparisons of GenP (17 +/- 20%), EA (46 +/- 19%) and SDN (76 +/- 10%, p <0 .001). Subsection scores were also significantly different between the groups, with mean subsection scores of 3.4 +/- 4.7% (GenP), 9.2 +/- 5.2% (EA) and 15.2 +/- 3.5% (SDN, p < 0.001). Test-retest reliability of the total CEAC-Q was determined in EA (r =0.742, p <0.001). Conclusion Taking similar to 10 min to complete, the CEAC-Q is a new psychometrically valid, practical and time-efficient tool for practitioners to assess athletes' knowledge of CHO for competition and guide subsequent nutrition intervention.

Short Title: Ethical preparedness in health research and care: the role of behavioural approaches

ISSN: 1472-6939

DOI: 10.1186/s12910-022-00853-1

Article Number: 115

Accession Number: WOS:000885002600001

Abstract: Background Public health scholars have long called for preparedness to help better negotiate ethical issues that emerge during public health emergencies. In this paper we argue that the concept of ethical preparedness has much to offer other areas of health beyond pandemic emergencies, particularly in areas where rapid technological developments have the potential to transform aspects of health research and care, as well as the relationship between them. We do this by viewing the ethical decision-making process as a behaviour, and conceptualising ethical preparedness as providing a health research/care setting that can facilitate the promotion of this behaviour. We draw on an implementation science and behaviour change model, COM-B, to demonstrate that to be ethically prepared requires having the capability (ability),

opportunity, and motivation (willingness) to work in an ethically prepared way. Methods We use two case examples from our empirical research—one pandemic and one non-pandemic related—to illustrate how our conceptualisation of ethical preparedness can be applied in practice. The first case study was of the UK NHSX COVID-19 contact tracing application case study involved eight in-depth interviews with people involved with the development/governance of this application. The second case involved a complex case regarding familial communication discussed at the UK Genethics Forum. We used deductive qualitative analysis based on the COM-B model categories to analyse the transcribed data from each case study. Results Our analysis highlighted that being ethically prepared needs to go beyond merely equipping health professionals with skills and knowledge, or providing research governance actors with ethical principles and/or frameworks. To allow or support these different actors to utilise their skills and knowledge (or principles and frameworks), a focus on the physical and social opportunity is important, as is a better understanding the role of motivation. Conclusions To understand ethical preparedness, we need to view the process of ethical decision-making as a behaviour. We have provided insight into the specific factors that are needed to promote this behaviour—using examples from both in the pandemic context as well as in areas of health research and medicine where there have been rapid technological developments. This offers a useful starting point for further conceptual work around the notion of being ethically prepared.

Short Title: Guidance for Implementing Video Consultations in Danish

General Practice: Rapid Cycle Coproduction Study

DOI: 10.2196/27323

Article Number: e27323

Accession Number: WOS:000853674900034

Abstract: Background: The COVID-19 pandemic has changed various spheres of health care. General practitioners (GPs) have widely replaced face-to-face consultations with telephone or video consultations (VCs) to reduce the risk of COVID-19 transmission.

Using VCs for health service delivery is an entirely new way of practicing for many GPs. However, this transition process has largely been conducted with no formal guidelines, which may have caused implementation barriers. This study presents a rapid cycle coproduction approach for developing a guide to assist VC implementation in general practice. Objective: The aim of this paper is to describe the developmental phases of the VC guide to assist general practices in implementing VCs and summarize the evaluation made by general practice users. Methods: The development of a guide for VC in general practice was structured as a stepped process based on the coproduction and prototyping processes. We used an iterative framework based on rapid qualitative analyses and interdisciplinary collaborations. Thus, the guide was developed in small, repeated cycles of development, implementation, evaluation, and adaptation, with a continuous exchange between research and practice. The data collection process was structured in 3 main phases. First, we conducted a literature review, recorded observations, and held informal and semistructured interviews. Second, we facilitated coproduction with stakeholders through 4 workshops with GPs, a group interview with patient representatives, and individual revisions by GPs. Third, nationwide testing was conducted in 5 general practice clinics and was followed by an evaluation of the guide through interviews with GPs. Results: A rapid cycle coproduction approach was used to explore the needs of general practice in connection with the implementation of VC and to develop useful, relevant, and easily understandable guiding materials. Our findings suggest that a guide for VCs should include advice and recommendations regarding the organization of VCs, the technical setup, the appropriate target groups, patients' use of VCs, the performance of VCs, and the arrangements for booking a VC. Conclusions: The combination of coproduction, prototyping, small iterations, and rapid data analysis is a suitable approach when contextually rich, hands-on guide materials are urgently needed. Moreover, this method could provide an efficient way of developing relevant guide materials for general practice to aid the implementation of new technology beyond the pandemic period.

Title: The perspectives of Australian speech pathologists in providing evidence-based practices to children with autism

Journal: International Journal of Language & Communication Disorders

Volume: 57

Issue: 6

Pages: 1229–1243

Date: Nov

Short Title: The perspectives of Australian speech pathologists in providing evidence-based practices to children with autism

ISSN: 1368–2822

DOI: 10.1111/1460–6984.12736

Accession Number: WOS:000807561000001

Abstract: Background Bridging the research–practice gap in autism communication services is an identified priority for improving services. Limited research has investigated the views of practitioners regarding this research–practice gap. Investigation of the barriers experienced and facilitators used in clinical practice may assist to identify scalable and sustainable strategies to increase use of evidence–based practices (EBPs) in the delivery of communication services to children with autism. **Aims** To elucidate how Australian speech pathologists engage with external evidence and how communication outcomes are measured to demonstrate the effectiveness of service provision to children with autism. **Methods & Procedures** A total of 15 Australian speech pathologists, with experience ranging from less than 1 to more than 16 years, participated in three focus groups. Data from focus groups were analysed using reflexive thematic analysis within an interpretive phenomenological paradigm. **Outcomes & Results** Seven themes were identified. Participants reported on the diversity of individuals with autism, their experiences of resource constraints, seeking collegial advice and accessing a diverse range of evidence sources, the role of clinical expertise in translating evidence to practice, the barriers experienced in outcome measurement and use of stakeholders to facilitate data collection to demonstrate outcomes. **Conclusions & Implications** Individual practitioner skill and beliefs are facilitators to translating research to practice. Interventions to improve clinician use of EBP should address the skill and belief barriers, aiming to increase a clinician's EBP self–efficacy and increasing their expectation that investing in EBP activities will result in improved services for children with autism. Modelling and reflective practice are two strategies that may have an application as interventions to improve EBP use in clinical practice. **What this paper adds** What is already known on the subject Constrained resources, especially lack of time, is a barrier to routine uptake of best available evidence in clinical services for children with autism. **What this paper adds to existing knowledge** In this study, the perception that speech pathologists lacked time to engage in EBP activities was linked with the speech pathologist's research skill and their beliefs about the benefits of engaging in EBP. Speech Pathologists reported using a range of information sources, as "evidence" but also reported feeling uneasy when using evidence of disputable, or unknown quality. Accessibility and relevance to their individual client were highly prioritised in selecting evidence. Clinical expertise was an essential skill for research translation. **What are the potential or actual clinical implications of this work?** Interventions which target professional beliefs and research

translation capability are requisite for motivating speech pathologists to improve their use of EBP. Modelling of EBP use, individual reflective practice and collegial active listening to facilitate reflective practice, might be useful strategies which target beliefs and capability of individual speech pathologists; thereby changing their EBP use.

Issue: 8

Short Title: Combined cognitive-behavioural and mindfulness programme for people living with dystonia: a proof-of-concept study

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2016-011495

Article Number: e011495

Accession Number: WOS:000382336700130

Abstract: Objectives: To design and test the delivery of an intervention targeting the non-motor symptoms of dystonia and pilot key health and well-being questionnaires in this population. Design: A proof-of-concept study to test the delivery, acceptability, relevance, structure and content for a 3-day group residential programme for the management of dystonia. Setting: Participants were recruited from a single botulinum toxin clinic. The intervention was delivered in the community. Participants: 14 participants consented to take part (2 withdrew prior to the starting of intervention). The average age was 60 years (range 44-77), 8 of whom were female. After drop-out, 9 participants completed the 3-day programme.

Intervention: A 3-day group residential programme. Primary and secondary outcome measures: Process evaluation and interviews were carried out before and after the intervention to explore participant's views and expectations, as well as experiences of the intervention. Select questionnaires were completed at baseline, 1-month and 3-month follow-up. Results: Although participants were not sure what to expect from the programme, they found it informative and for many this together with being in a group with other people with dystonia legitimised their condition. Mindfulness was accepted and adopted as a coping strategy. This was reflected in the 1-month follow-up. Conclusions: We successfully delivered a 3-day residential programme to help those living with dystonia manage their condition. Further improvements are suggested. The

quantitative outcome measures were acceptable to this group of patients with dystonia.

Title: The CFHealthHub Learning Health System: Using Real-Time Adherence Data to Support a Community of Practice to Deliver Continuous Improvement in an Archetypal Long-Term Condition

Journal: Healthcare

Volume: 11

Issue: 1

Date: Jan

Short Title: The CFHealthHub Learning Health System: Using Real-Time Adherence Data to Support a Community of Practice to Deliver Continuous Improvement in an Archetypal Long-Term Condition

DOI: 10.3390/healthcare11010020

Article Number: 20

Accession Number: WOS:000909215100001

Abstract: CFHealthHub is a learning health system active in over 50% of adult CF Centres in England, supporting people with CF to develop habits of self-care around adherence to preventative inhaled therapy. This is achieved through the delivery of a behaviour change intervention, alongside collection of objective adherence data. As is common to long-term conditions, adherence to prescribed therapy is low, despite clear evidence of beneficial long-term impact on outcomes. This article explains how CFHealthHub is underpinned by coherent conceptual frameworks. We discuss how application of implementation and quality improvement strategies has facilitated CFHealthHub's progression from a pilot study to a large, randomised control trial and now to a learning health system, becoming embedded within routine care. CFHealthHub is now able to support real-time health technology assessments, quality improvement and research trials and is in the process of being implemented in routine clinical care across participating centres.

Short Title: Perceptions of national guidelines and their (non) implementation in mental healthcare: a deductive and inductive content analysis

ISSN: 1748-5908

DOI: 10.1186/s13012-015-0234-0

Article Number: 43

Accession Number: WOS:000352605700001

Abstract: Background: National guidelines are being produced at an increasing rate, and politicians and managers are expected to promote these guidelines and their implementation in clinical work. However, research seldom deals with how decision-makers can perceive these guidelines or their challenges in a cultural context. Therefore, the aim of this study was twofold: to investigate how well Promoting Action on Research Implementation in Health Services (PARIHS) reflected the empirical reality of mental healthcare and to gain an extended understanding of the perceptions of decision-makers operating within this context, in regard to the implementation of evidence-based guidelines. Methods: The study took place in the southeast of Sweden and employed a qualitative design. The data were collected through 23 interviews with politicians and managers working either in the county council or in the municipalities. The transcribed text was analysed iteratively and in two distinct phases, first deductively and second inductively by means of qualitative content analysis. Results: Our deductive analysis showed that the text strongly reflected two out of three categorisation matrices, i.e. evidence and context representing the PARIHS framework. However, the key element of facilitation was poorly mirrored in the text. Results from the inductive analysis can be seen in light of the main category sitting on the fence; thus, the informants' perceptions reflected ambivalence and contradiction. This was illustrated by conflicting views and differences in culture and ideology, a feeling of security in tradition, a certain amount of resistance to change and a lack of role clarity and clear directions. Together, our two analyses provide a rich description of an organisational culture that is highly unlikely to facilitate the implementation of the national guidelines, together with a distrust of the source behind such guidelines, which stands in stark contrast to the high confidence in the knowledge of experienced people in authority within the organisational context. Conclusions: Our findings have highlighted that, regardless of by whom guidelines are released, they are not likely to be utilised or implemented if those who are responsible for implementing them do not trust the source. This aspect (i.e. contextual trust) is not covered by PARIHS.

Abstract: The need to provide sound evidence of the costs and benefits of real-world public health interventions has driven advances in the development and analysis of designs other than the controlled trial in which individuals are randomized to an experimental condition. Attention to methodological quality is of critical importance to ensure that any evaluation can accurately answer three fundamental questions: (a) Has a change occurred, (b) did the change occur as a result of the intervention, and (c) is the degree of change significant? A range of alternatives to the individual randomized controlled trial (RCT) can be used for evaluating such interventions, including the cluster RCT, stepped wedge design, interrupted time series, multiple baseline, and controlled prepost designs. The key features and complexities associated with each of these designs are explored.

Date: Sep

Short Title: Impact of behavioural factors on the household water consumption in urban areas

ISSN: 0965-0903

DOI: 10.1680/jmuen.21.00032

Accession Number: WOS:000813454200001

Abstract: Gaps in understanding what influences household water consumption have led water providers failing to convince customers to report sustainable practices. To this end, this study aimed to answer the question, 'How do social and cultural factors influence water consumption in urban areas?' The response to this issue has been identified through an investigation that involved a group of selected factors, whose analysis was based on collected survey data from participants in Lagos-Nigeria, Salvador-Brazil, Sao Paulo-Brazil, London-UK and Los Angeles-USA. The capability-opportunity-motivation-behaviour model was used as a data analysis framework to identify influences. The investigation revealed that motivation is the most reported driver of water consumption. In a scale from 0 (lowest) to 5 (highest), this component presented the highest scores in Lagos (3.93), Salvador (4.13), Sao Paulo (3.88), London (4.13) and Los Angeles (3.59). The capability dimension had the second-highest weight in Lagos, Salvador, Sao Paulo and Los Angeles, with scores of 2.80, 3.60, 3.60 and 3.20, respectively. Participants from London have opportunity (score = 2.88) as the second influential pillar in water consumption. These findings are aimed at helping to best drive water-saving practices by gaining insight into factors underpinning water consumption in a structured manner.

Accession Number: WOS:000761566300001

Abstract: Background The use of non-pharmaceutical interventions (NPI) is one of the main tools used in the coronavirus disease 2019 (COVID-19) pandemic response, including physical distancing, frequent hand washing, face mask use, respiratory hygiene and use of contact tracing apps. Literature on compliance with NPI during the COVID-19 pandemic is limited. Methods We studied this compliance and associated factors in Portugal, between 28th October 2020 and 11th January 2021 (Portuguese second and third waves of the pandemic), using logistic regressions. Data were collected through a web-based survey and included questions regarding NPI compliance, COVID-19-related concerns, perception of institutions' performance, agreement with the measures implemented and socio-demographic characteristics. Results From the 1263 eligible responses, we found high levels of compliance among all COVID-19 related NPI, except for the contact tracing app. Females and older participants showed the highest compliance levels, whereas the opposite was observed for previously infected participants. There was heterogeneity of COVID-19 NPI compliance across Portuguese regions and a clear gradient between concern, government performance's perception or agreement and compliance. Conclusions Results suggested areas for further study with important implications for pandemic management and communication, for future preparedness, highlighting other factors to be accounted for when recommending policy measures during public health threats.

Short Title: CPD of the future: a partnership between quality improvement and competency-based education

ISSN: 0308-0110

DOI: 10.1111/medu.13407

Accession Number: WOS:000418336000018

Abstract: Context Many of those involved in continuing professional development (CPD) over the past 10 years have engaged in discussions about its goals and activities. Whereas in the past CPD was viewed as an education intervention directed towards the medical expert role, recent research highlights the need to expand the scope of CPD and to promote its more explicit role in improving patient care and health outcomes. Recent developments in quality improvement (QI) and competency-based medical education (CBME), guided by appropriate theories of learning and change, can shed light on how the field might best advance. This paper describes principles of QI and CBME and how they might contribute to CPD, explores theoretical perspectives that inform such an integration and suggests a future model of CPD. Discussion Continuing professional development seeks to improve patient outcomes by increasing physician knowledge and skills and changing behaviours, whereas QI takes the approach of system and process change. Combining the strengths of a CPD approach with strategies known to be effective from the field of QI has the potential to harmonise the contributions of each, and thereby to lead to better patient outcomes. Similarly, competency-based CPD is envisioned to place health needs and patient outcomes at the centre of a CPD system that will be guided by a set of competencies to enhance the quality of practice and the safety of the health system. Conclusions We propose that the future CPD system should adhere to the following principles: it should be grounded in the everyday workplace, integrated into the health care system, oriented to patient outcomes, guided by multiple sources of performance and outcome data, and team-based; it should employ the principles and strategies of QI, and should be taken on as a collective responsibility by physicians, CPD provider organisations, regulators and the health system. Continuing professional development of the future will draw upon the principles and strategies of quality improvement and competency-based education, and be grounded in the workplace and health care system

Short Title: Behavior Change After 20 Months of a Radio Campaign Addressing Key Lifesaving Family Behaviors for Child Survival: Midline Results From a Cluster Randomized Trial in Rural Burkina Faso

ISSN: 2169-575X

DOI: 10.9745/ghsp-d-15-00153

Accession Number: WOS:000372977100007

Abstract: Background: In Burkina Faso, a comprehensive 35-month radio campaign addressed key, multiple family behaviors for improving under-5 child survival and was evaluated using a repeated cross-sectional, cluster randomized design. The primary outcome of the trial was postneonatal under-5 child mortality. This paper reports on behavior change achieved at midline. Method: Fourteen community radio stations in 14 geographic areas were selected based on their high listenership. Seven areas were randomly allocated to receive the intervention while the other 7 areas served as controls. The campaign was launched in March 2012. Cross-sectional surveys of about 5,000 mothers of under-5 children, living in villages close to the radio stations, were conducted at baseline (from December 2011 to February 2012) and at midline (in November 2013), after 20 months of campaigning. Statistical analyses were based on cluster-level summaries using a difference-in-difference (DiD) approach and adjusted for imbalances between arms at baseline. In addition, routine health facility data were analyzed for evidence of changes in health facility utilization. Results: At midline, 75% of women in the intervention arm reported recognizing radio spots from the campaign. There was some evidence of the campaign having positive effects on care seeking for diarrhea (adjusted DiD, 17.5 percentage points; 95% confidence interval [CI], 2.5 to 32.5; $P = .03$), antibiotic treatment for fast/difficult breathing (adjusted DiD, 29.6 percentage points; 95% CI, 3.5 to 55.7; $P = .03$), and saving money during pregnancy (adjusted DiD, 12.8 percentage points; 95% CI, 1.4 to 24.2; $P = .03$). For other target behaviors, there was little or no evidence of an impact of the campaign after adjustment for baseline imbalances and confounding factors. There was weak evidence of a positive correlation between the intensity of broadcasting of messages and reported changes in target behaviors. Routine health facility data were consistent with a greater increase in the intervention arm than in the control arm in all-cause under-5 consultations (33% versus 17%, respectively), but the difference was not statistically significant ($P = .40$). Conclusion: The radio campaign reached a high proportion of the primary target population, but the evidence for an impact on key child survival-related behaviors at midline was mixed.

Title: Risk-based stratified primary care for common musculoskeletal pain presentations: qualitative findings from the STarT MSK cluster randomised controlled trial

Journal: BMC Primary Care

Volume: 23

Issue: 1

Date: Dec

Short Title: Risk-based stratified primary care for common musculoskeletal pain presentations: qualitative findings from the STarT MSK cluster randomised controlled trial

DOI: 10.1186/s12875-022-01924-3

Article Number: 326

Accession Number: WOS:000899481400001

Abstract: Background: The STarT MSK cluster randomised controlled trial (RCT) investigated the clinical-and cost-effective-ness of risk-based stratified primary care versus usual care for patients with back, neck, shoulder, knee or multi-site pain. Trial quantitative results showed risk-based stratified care was not superior to usual care for patients' clinical outcomes, but the intervention led to some changes in GP clinical decision-making. This paper reports a linked qualitative study exploring how risk-based stratified care was perceived and used in the trial, from the perspectives of clinicians and patients. Methods: Semi-structured interviews were conducted with 27 patients, and focus groups and interviews with 20 clinicians (GPs and physiotherapists) in the intervention arm of the trial. Data were analysed thematically and findings explored using Normalisation Process Theory (NPT) and the COM-B model. Main findings: Risk-based stratified care (subgrouping and matching treatments) was found to have "coherence" (i.e. made sense) to several clinicians and patients, in that it was well-integrated in practice, and supported clinical decision-making. However, for some GPs stratified care was less "meaningful", as the risk-stratification tool did not fit with usual ways of consulting and added to already time-pressured consultations. GPs reported giving more patients written information/advice due to easier access to electronic information leaflets through the trial template and were motivated to refer patients to physiotherapy as they believed the trial resulted in faster physiotherapy access (although this was not the case). Patients and clinicians reported that risk-based stratified care influenced conversations in the consultation, prompting greater attention to psychosocial factors, and facilitating negotiation of treatment options. Physiotherapists saw benefits in receiving information about patients' risk subgroup on referral forms. Conclusion: These findings provide context for interpreting some of the trial outcomes, particularly in relation to changes in clinical decision-making when risk-based stratified care was used. Findings also indicate potential reasons for lack of GP engagement with risk-based stratified care. Positive outcomes were identified that were not captured in the quantitative data, specifically that risk-based stratified care positively influenced some GP-patient conversations and facilitated negotiation of

treatment options.

Title: Interventions for reducing sedentary behaviour in people with stroke

Journal: Cochrane Database of Systematic Reviews

Issue: 6

Short Title: Interventions for reducing sedentary behaviour in people with stroke

ISSN: 1469-493X

DOI: 10.1002/14651858.CD012996.pub2

Article Number: Cd012996

Accession Number: WOS:000669649600016

Abstract: Background Stroke survivors are often physically inactive as well as sedentary, and may sit for long periods of time each day. This increases cardiometabolic risk and has impacts on physical and other functions. Interventions to reduce or interrupt periods of sedentary time, as well as to increase physical activity after stroke, could reduce the risk of secondary cardiovascular events and mortality during life after stroke. Objectives To determine whether interventions designed to reduce sedentary behaviour after stroke, or interventions with the potential to do so, can reduce the risk of death or secondary vascular events, modify cardiovascular risk, and reduce sedentary behaviour. Search methods In December 2019, we searched the Cochrane Stroke Trials Register, CENTRAL, MEDLINE, Embase, CINAHL, PsycINFO, Conference Proceedings Citation Index, and PEDro. We also searched registers of ongoing trials, screened reference lists, and contacted experts in the field. Selection criteria Randomised trials comparing interventions to reduce sedentary time with usual care, no intervention, or waiting-list control, attention control, sham intervention or adjunct intervention. We also included interventions intended to fragment or interrupt periods of sedentary behaviour. Data collection and analysis Two review authors independently selected studies and performed 'Risk of bias' assessments. We analyzed data using random-effects meta-analyses and assessed the certainty of the evidence with the GRADE approach. Main results We included 10 studies with 753 people with stroke. Five studies used physical activity interventions, four studies used a multicomponent lifestyle intervention, and one study used an intervention to reduce and interrupt sedentary behaviour. In all studies, the risk of bias was high or unclear in two or more domains. Nine studies had high risk

of bias in at least one domain. The interventions did not increase or reduce deaths (risk difference (RD) 0.00, 95% confidence interval (CI) -0.02 to 0.03; 10 studies, 753 participants; low-certainty evidence), the incidence of recurrent cardiovascular or cerebrovascular events (RD -0.01, 95% CI -0.04 to 0.01; 10 studies, 753 participants; low-certainty evidence), the incidence of falls (and injuries) (RD 0.00, 95% CI -0.02 to 0.02; 10 studies, 753 participants; low-certainty evidence), or incidence of other adverse events (moderate-certainty evidence). Interventions did not increase or reduce the amount of sedentary behaviour time (mean difference (MD) +0.13 hours/day, 95% CI -0.42 to 0.68; 7 studies, 300 participants; very low-certainty evidence). There were too few data to examine effects on patterns of sedentary behaviour. The effect of interventions on cardiometabolic risk factors allowed very limited meta-analysis. Authors' conclusions Sedentary behaviour research in stroke seems important, yet the evidence is currently incomplete, and we found no evidence for beneficial effects. Current World Health Organization (WHO) guidelines recommend reducing the amount of sedentary time in people with disabilities, in general. The evidence is currently not strong enough to guide practice on how best to reduce sedentariness specifically in people with stroke. More high-quality randomised trials are needed, particularly involving participants with mobility limitations. Trials should include longer-term interventions specifically targeted at reducing time spent sedentary, risk factor outcomes, objective measures of sedentary behaviour (and physical activity), and long-term follow-up.

Title: Improving knowledge translation of clinical practice guidelines for epilepsy

Journal: Epilepsy & Behavior

Volume: 92

Pages: 265-268

Date: Mar

Short Title: Improving knowledge translation of clinical practice guidelines for epilepsy

ISSN: 1525-5050

DOI: 10.1016/j.yebeh.2019.01.016

Accession Number: WOS:000461905800041

Abstract: Background: Clinical practice guidelines (CPGs) have the potential to improve quality of care. However, implementation of

CPGs into the clinical care of people with epilepsy is less than optimal. This study aimed to examine barriers and facilitators to the use of CPGs for the care of people with epilepsy. Methods: A cross-sectional survey of Canadian neurologists was conducted to evaluate CPG use, barriers and facilitators of CPG use, and factors associated with CPG use among neurologists. The barriers and facilitators of CPG use among neurologists that manage people with epilepsy were compared with those who do not. Results: Of 311 responders (response rate = 38.7%), 78.7% indicated that they manage people with epilepsy. Neurologists that manage people with epilepsy did not differ from those who do not with regard to demographic characteristics nor in the proportion that report using CPGs in their clinical practice. The barriers and facilitators of CPG use were largely similar between neurologist that do and do not manage people with epilepsy: except applicability of CPGs tended to be less commonly endorsed as a barrier to CPG use by those who manage people with epilepsy compared with those who do not. Conclusions: This study suggests that knowledge, applicability, motivation, resources, and targeting of CPGs to appropriate audience are barriers and facilitators of CPG use among neurologists who manage people with epilepsy. The similarity between barriers and facilitators of CPG use among neurologists who manage people with epilepsy compared with those who do not provides support for the use of a knowledge translation (KT) strategy tailored to these barriers and facilitators of CPG use, and targeted towards neurologists. Implementation of epilepsy CPGs has the potential to improve the quality of care for people with epilepsy. (C) 2019 Elsevier Inc. All rights reserved.

Article Number: e0205280

Accession Number: WOS:000446921100076

Abstract: Objectives Clinical practice guidelines have the potential to improve care, but are often not optimally implemented. Improving guideline use in clinical practice may improve care. The objective of this study was to identify the barriers and facilitators (determinants) of guidelines use among neurologists and to propose a strategy to improve guideline implementation. Methods This was a mixed-methods study design. A quantitative, population-based, cross-sectional survey of Canadian neurologists was conducted. Associations between guidelines use and determinants of guidelines use were examined. Focus groups and interviews were conducted using purposeful sampling of the population. Determinants of guideline use were mapped to interventions to establish a strategy for guideline implementation among neurologists. Results 38.7% (n = 311) of neurologists responded to the survey. Typically, respondents had been practicing for 16.6 years and worked in an academic institution in an urban setting. Being male and having an academic affiliation was associated with guideline use. Determinants of guideline use differed between guideline users and non-users; non-users consistently rating determinants lower than users, especially applicability. Two focus groups and one interview (n = 11) identified six main themes of determinants of guideline use: Credibility, knowledge, applicability, resources, motivation, and target audience; which was congruent with the quantitative data. The proposed knowledge translation strategy contains three pillars: guidelines development, dissemination, and interventions. Conclusions Several determinants of guideline use not commonly discussed in the literature were identified (applicability, target audience, credibility). The proposed implementation strategy is a valuable resource for guideline developers and policy/decision-makers to improve knowledge translation of guidelines among neurologists.

Title: Developing clinical practice guidelines for epilepsy: A report from the ILAE Epilepsy Guidelines Working Group

Journal: Epilepsia

Volume: 56

Issue: 12

Pages: 1859-1869

Date: Dec

Short Title: Developing clinical practice guidelines for epilepsy: A report from the ILAE Epilepsy Guidelines Working Group

ISSN: 0013-9580

DOI: 10.1111/epi.13217

Accession Number: WOS:000366524500004

Abstract: Clinical practice guidelines (CPGs) contain evidence-based recommendations to guide clinical care, policy development, and quality of care improvement. A recent systematic review of epilepsy guidelines identified considerable variability in the quality of available guidelines. Although excellent frameworks for CPG development exist, processes are not followed uniformly internationally, and resources to develop CPGs may be limited in certain settings. An International League Against Epilepsy (ILAE) working group was charged with proposing methodology to guide the development of future epilepsy-specific CPGs. A comprehensive literature search (1985–2014) identified articles related to CPG development and handbooks. Guideline handbooks were included if they were publicly available, and if their methodology had been used to develop CPGs. The working group's expertise also informed the creation of methodologies and processes to develop future CPGs for the ILAE. Five handbooks from North America (American Academy of Neurology), Europe (Scottish Intercollegiate Guidelines Network & National Institute for Health and Care Excellence), Australia (National Health and Medical Research Council), World Health Organization (WHO), and additional references were identified to produce evidence-based, consensus-driven methodology for development of epilepsy-specific CPGs. Key components of CPG development include the following: identifying the topic and defining the scope; establishing a working group; identifying and evaluating the evidence; formulating recommendations and determining strength of recommendations; obtaining peer reviews; dissemination, implementation, and auditing; and updating and retiring the CPG. A practical handbook and toolkit was developed. The resulting CPG development toolkit should facilitate the development of high-quality ILAE CPGs to improve the care of persons with epilepsy.

Title: Developing the logic framework underpinning a whole-systems approach to childhood overweight and obesity prevention: Amsterdam Healthy Weight Approach

Journal: Obesity Science & Practice

Volume: 7

Issue: 5

Pages: 591-605

Date: Oct

Short Title: Developing the logic framework underpinning a whole-systems approach to childhood overweight and obesity prevention: Amsterdam Healthy Weight Approach

ISSN: 2055-2238

DOI: 10.1002/osp4.505

Accession Number: WOS:000646327400001

Abstract: Background: Whole-systems approaches (WSAs) are well placed to tackle the complex local environmental influences on overweight and obesity, yet there are few examples of WSAs in practice. Amsterdam Healthy Weight Approach (AHWA) is a long-term, municipality-led program to improve children's physical activity, diet, and sleep through action in the home, neighborhood, school, and city. Adopting a WSA, local political, physical, social, educational, and healthcare drivers of childhood obesity are viewed as a complex adaptive system. Since 2013, AHWA has reached >15,000 children. During this time, the estimated prevalence of 2-18-year-olds with overweight or obesity in Amsterdam has declined from 21% in 2012 to 18.7% in 2017. Declining trends are rarely observed in cities. There is a need to formally articulate AHWA program theory in order to: (i) inform future program evaluation which can interpret this decline within the context of AHWA and (ii) contribute a real-life example of a WSA to the literature. Methods: This study aimed to formally document the program theory of AHWA to permit future evaluation. A logic framework was developed through extensive document review and discussion, during program implementation. Results: The working principles of the WSA underpinning AHWA were made explicit in an overarching theory of change, articulated in a logic framework. The framework was operationalized using an illustrative example of sugar intake. Conclusions: The logic framework will inform AHWA development, monitoring, and evaluation and responds to a wider need to outline the working principles of WSAs in public health.

Volume: 26

Issue: 1

Pages: 108-118

Date: Feb

Short Title: Acceptability of integrating smoking cessation treatment into routine care for people with mental illness: A qualitative study

ISSN: 1369-6513

DOI: 10.1111/hex.13580

Accession Number: WOS:000866143400001

Abstract: Introduction Improving Access to Psychological Therapies (IAPTs) Services could offer smoking cessation treatment to improve physical and psychological outcomes for service users, but it currently does not. This study aimed to understand participants' views and experiences of receiving a novel smoking cessation intervention as part of the ESCAPE trial (intEgrating Smoking Cessation treatment As part of usual Psychological care for dEpression and anxiety). We used the Capability, Opportunity and Motivation Model of Behaviour (COM-B) to understand the (i) acceptability of the integrated smoking cessation treatment, (ii) views of psychological well-being practitioners' (PWPs) ability to deliver the smoking cessation treatment and (iii) positive and negative impacts of smoking cessation treatment. Methods This was a qualitative study embedded within a feasibility randomized-controlled trial (ESCAPE) in primary care services in the United Kingdom (IAPT). Thirty-six participants (53% female) from both usual care and intervention arms of the ESCAPE trial, including both quitters and nonquitters, were interviewed using semi-structured interviews. Data were analysed using a framework approach to thematic analysis, using the COM-B as a theoretical frame. Results Psychological Capability: Integrated smoking cessation treatment was acceptable and encouraged participants to reflect on their mental health. Some participants found it difficult to understand nicotine withdrawal symptoms. Motivation: Participants were open to change during the event of presenting to IAPT. Some described being motivated to take part in the intervention by curiosity, to see whether quitting smoking would help their mental health. Physical Opportunity: IAPT has a natural infrastructure for supporting integrated treatment, but there were some barriers such as session duration and interventions feeling segmented. Social Opportunity: Participants viewed PWPs as having good interpersonal skills to deliver a smoking cessation intervention. Conclusion People with common mental illness generally accepted integrated smoking cessation and mental health treatment. Smoking cessation treatment fits well within IAPT's structure; however, there are barriers to implementation. Patient or Public Contribution Before data collection, we consulted with people with lived experience of smoking and/or mental illness and lay public members regarding the aims, design and interview schedules. After analysis, two people with lived experience of smoking and mental illness individually gave feedback on the final themes and quotes.

Date: Oct
Short Title: Assessment of a Nurse Led Energy Behavior Change
Intervention in an NHS Community Hospital Ward
DOI: 10.3390/en14206523
Article Number: 6523
Accession Number: WOS:000716871600001
Abstract: This paper investigates a nurse led, energy conservation
behavioral intervention, in hospital wards of an NHS (National
Health Service) community hospital (Trust). The information based
intervention was adapted from "Operation TLC ", developed by
environmental behavioral change charity Global Action Plan, and St
Bartholomew's Health NHS Trust, London. For this study, three
identical older persons' acute-care wards in terms of patient type,
nursing levels, layout, electrical fittings (lighting & small
power), elevation and orientation (one control ward and two
intervention wards) were evaluated over a nine-month period. The
paper demonstrates a co-dependent relationship between the
quantitative data from the electricity and light monitors on the
wards with the qualitative data gathered from staff comfort surveys
and focus groups, and Trust policies. Our results show a 13%
reduction in electricity consumption, primarily from preventing
nursing staff in the intervention group from using prohibited
secondary space heaters at night during the heating season and the
introduction of a "quiet time " in the intervention group. During
quiet time lights in the intervention group were turned off for an
hour after lunch to encourage rest for patients to provide time for
nursing staff to complete administrative tasks. Electricity
reductions achieved during the intervention period were observed to
continue into the 3-month post intervention period but at a reduced
level.</p>

Short Title: Market characteristics and zoonotic disease risk perception in Cameroon bushmeat markets

ISSN: 0277-9536

DOI: 10.1016/j.socscimed.2020.113358

Article Number: 113358

Accession Number: WOS:000604584500001

Abstract: Behavioral practices are one of the key factors facilitating zoonotic disease transmission, especially in individuals who have frequent contact with wild animals, yet practices of those who work and live in high-risk animal-human interfaces, such as wild animal 'bushmeat' markets in the Congo Basin are not well documented in the social, health and medical sciences. This region, where hunting, butchering, and consumption of wild animal meat is frequent, represents a hotspot for disease emergence, and has experienced zoonotic disease spillover events, traced back to close human-animal contact with bats and non-human primates. Using a One Health approach, we conducted wildlife surveillance, human behavioral research, and concurrent human and animal biological sampling to identify and characterize factors associated with zoonotic disease emergence and transmission. Research was conducted through the USAID Emerging Pandemic Threats program between 2010 and 2019 including qualitative studies of bushmeat markets, with selected study sites prioritized based on proximity to bushmeat markets. Sites included two hospitals where we conducted surveillance of individuals with syndromes of acute febrile illness, community sites where we enrolled actors of the animal value chain (ie. hunters, middlemen, transporters), and bushmeat markets, where we enrolled bushmeat vendors, butchers, market managers, cleaners, and shoppers. Mixed methods research was undertaken at these sites and included investigation of bushmeat market dynamics through observational research, focus group discussions, quantitative questionnaires, and interviews. Participants were asked about their risk perception of zoonotic disease transmission and specific activities related to bushmeat trade, local market conditions, and regulations on bushmeat trade in Cameroon. Risks associated with blood contact and animal infection were not well understood by most market actors. As bushmeat markets are an important disease interface, as seen with CoVID19, risk mitigation measures in markets and bushmeat alternative strategies are discussed.

Short Title: Opportunities and Capabilities to Perform Pelvic Floor Muscle Training Are Critical for Participation: A Systematic Review and Qualitative Meta-Synthesis

ISSN: 0031-9023

DOI: 10.1093/ptj/pzac106

Article Number: pzac106

Accession Number: WOS:000871400200003

Abstract: Objective Pelvic floor muscle training (PFMT) is considered a behavioral task that requires the interaction of physical, social, and cognitive processes. Enablers and barriers to participation in PFMT have been explored primarily in women. This review aimed to identify the barriers and enablers that influence participation in PFMT in all adult populations. Methods A systematic review and meta-synthesis of qualitative literature was conducted. The inclusion criteria comprised qualitative studies with populations of people aged 18 years and older who have been recommended for PFMT. Line-by-line coding and an inductive thematic analysis identified themes that were applied to the Theoretical Domains Framework and Capabilities, Opportunities, and Motivation Behavioral Model to determine behavioral influences on PFMT. Results Twenty full-text articles met inclusion criteria. PFMT was mostly influenced by individual opportunities impacted by social determinants and competing demands. Capability of carrying out PFMT was impacted by knowledge, understanding, and appropriate skill acquisition linked to self-efficacy. Conclusion Increasing opportunities and capabilities for engagement in PFMT are the most important factors in optimizing positive behavior changes. Ways to address these factors include clear patient communication to boost confidence in skill acquisition and using technology to encourage autonomy and improve convenience. Future research should address the impact of health professionals' beliefs about patient participation, assess the role of social values and gender roles, and explore the timing of the implementation of behavioral change strategies to improve PFMT. Impact This is believed to be the first systematic review and qualitative meta-synthesis to consider the enablers and barriers to participation in PFMT for all adult populations, purposes, and symptom complexes. Patient opportunities and capabilities are the greatest influencers on participation and self-

efficacy. Individualized treatment approaches that acknowledge and address social influencers and competing demands will optimize self-efficacy and participation. Lay Summary If you have pelvic floor muscle dysfunction, your opportunities and capabilities are the greatest influencers on participation and self-efficacy in PFMT. Your physical therapist can design individualized treatment approaches that acknowledge and address social influencers and competing demands to help you optimize participation.

Short Title: Feasibility of supported self-management with a pictorial action plan to improve asthma control

DOI: 10.1038/s41533-022-00294-8

Article Number: 34

Accession Number: WOS:000855767800001

Abstract: Supported self-management reduces asthma-related morbidity and mortality. This paper is on a feasibility study, and observing the change in clinical and cost outcomes of pictorial action plan use is part of assessing feasibility as it will help us decide on outcome measures for a fully powered RCT. We conducted a pre-post feasibility study among adults with physician-diagnosed asthma on inhaled corticosteroids at a public primary-care clinic in Malaysia. We adapted an existing pictorial asthma action plan. The primary outcome was asthma control, assessed at 1, 3 and 6 months. Secondary outcomes included reliever use, controller medication adherence, asthma exacerbations, emergency visits, hospitalisations, days lost from work/daily activities and action plan use. We estimated potential cost savings on asthma-related care following plan use. About 84% (n = 59/70) completed the 6-months followup. The proportion achieving good asthma control increased from 18 (30.4%) at baseline to 38 (64.4%) at 6-month follow-up. The proportion of at least one acute exacerbation (3 months: % difference -19.7; 95% CI -34.7 to -3.1; 6 months: % difference -20.3; 95% CI -5.8 to -3.2),

one or more emergency visit (1 month: % difference -28.6; 95% CI -41.2 to -15.5; 3 months: % difference -18.0; 95% CI -32.2 to -3.0; 6 months: % difference -20.3; 95% CI -34.9 to -4.6), and one or more asthma admission (1 month: % difference -14.3; 95% CI -25.2 to -5.3; 6 months: % difference -11.9; 95% CI -23.2 to -1.8) improved over time. Estimated savings for the 59 patients at 6-months follow-up and for each patient over the 6 months were RM 15,866.22 (USD3755.36) and RM268.92 (USD63.65), respectively. Supported self-management with a pictorial asthma action plan was associated with an improvement in asthma control and potential cost savings in Malaysian primary-care patients.

Short Title: Efficacy, Feasibility and Acceptability of a Mediterranean Diet Intervention on Hormonal, Metabolic and Anthropometric Measures in Overweight and Obese Women with Polycystic Ovary Syndrome: Study Protocol

DOI: 10.3390/metabo12040311

Article Number: 311

Accession Number: WOS:000786979900001

Abstract: Polycystic ovary syndrome (PCOS) is a common endocrine condition in reproductive-aged women associated with metabolic, reproductive and psychological features. Lifestyle modification (diet/physical activity) is considered first-line treatment for PCOS. However, there is limited high-quality evidence to support

therapeutic dietary interventions for PCOS beyond general population-based healthy eating guidelines. Adherence to a Mediterranean diet (MedDiet), with or without energy restriction, improves cardiometabolic health in populations including persons with or at high risk of cardiovascular disease and type 2 diabetes. However, there is limited research examining the MedDiet in PCOS. Therefore, this 12 week randomized controlled trial will investigate the efficacy of a MedDiet on cardiometabolic and hormonal parameters and explore its acceptability and feasibility in PCOS. Forty-two overweight and obese women with PCOS (aged 18–45 years) will be randomized to receive dietary advice consistent with Australian Dietary Guidelines or an ad libitum MedDiet intervention. All participants will receive fortnightly counselling to facilitate behaviour change. The primary outcomes will be changes in insulin resistance, glucose, total testosterone and sex hormone-binding globulin. Secondary outcomes include changes in body weight and feasibility and acceptability of the MedDiet intervention. The results of this study will provide further evidence on specific dietary approaches for management of PCOS.

Title: Facilitating pharmacy staff's conversations about non-medical medication switches: Development and testing of a communication training

Journal: Research in Social & Administrative Pharmacy

Volume: 19

Issue: 5

Pages: 738-745

Date: May

Short Title: Facilitating pharmacy staff's conversations about non-medical medication switches: Development and testing of a communication training

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2023.01.014

Accession Number: WOS:000955202900001

Abstract: Background: Non-medical medication switches, a change to another medicine or medication label not motivated by medical reasons, occur frequently. Switches often lead to negative patient emotions, such as confusion and anger. Pharmacy staff's communication, i.e. delivering the message and addressing patients' emotions is crucial, but experienced as difficult. Objective: To develop and test a communication training for the pharmacy team to

facilitate medication switch conversations. Methods: A communication training was developed based on the 'breaking bad news model' and 'positive message framing' strategies, and incorporating needs and preferences from practice. The training consisted of an e-learning with theory and reflective exercises, a half-day live training session, and an online reflection session. The Kirkpatrick training evaluation model (levels one 'reaction' and two 'learning') was used to evaluate the training. Quantitative data were analyzed using descriptive statistics and interview data was transcribed verbatim and analyzed thematically. Results: Twelve pharmacists and 27 pharmacy technicians from 15 Dutch pharmacies participated in the training. According to Kirkpatrick's model level one, the major learning outcome was to give space to patients to express their emotions and/or concerns (e.g. more silences in the conversations). For level two, most participants valued practicing the conversations, role-playing, and receiving feedback. The majority of the participants indicated that they had sufficient tools and practice during the live training to apply the strategies in daily practice. A few participants still needed time and practice, or missed examples to apply the strategies. Conclusion: The communication training based on the two strategies was well-received and participants felt well-equipped post-training. The take-away for participants was to give space to patients to express their emotions. Using these strategies and skills, pharmacy teams can tailor their medication counseling to patients' emotions and concerns during non-medical medication switches to better support patients in proper medication use.

Title: Dutch GPs'views on prescribing mifepristone and misoprostol: a mixed-methods study

Journal: British Journal of General Practice

Date: 2022 Jul

Short Title: Dutch GPs'views on prescribing mifepristone and misoprostol: a mixed-methods study

ISSN: 0960-1643

DOI: 10.3399/bjgp.2021.0704

Accession Number: WOS:000831106300001

Abstract: Background The World Health Organization has indicated that GPs can safely and effectively provide mifepristone and misoprostol for medical termination of pregnancy (TOP). Dutch GPs are allowed to treat miscarriages with mifepristone and misoprostol, but few do so. Current Dutch abortion law prohibits GPs from prescribing these medications for medical TOP. Medical TOP is

limited to the specialised settings of abortion clinics and hospitals. Recently, the House of Representatives debated shifting abortion to the domain of primary care, following the example of France and the Republic of Ireland. This would improve access to sexual and reproductive health care, and increase choices for women. Nevertheless, little is known about GPs' willingness to provide medical TOP and miscarriage management. Aim To gain insight into Dutch GPs' willingness to prescribe mifepristone and misoprostol for medical TOP and miscarriages, as well as the anticipated barriers. Design and setting Mixed-methods study among Dutch GPs. Method A questionnaire provided quantitative data that were analysed using descriptive methods. Thematic analyses were performed on qualitative data collected through in-depth interviews. Results The questionnaire was sent to 575 GPs; the response rate was 22.1% (n = 127). Of the responders, 84.3% (n = 107) were willing to prescribe mifepristone and misoprostol, with 58.3% (n = 74) willing to provide this medication for both medical TOP and miscarriage management. A total of 57.5% (n = 73) of participants indicated a need for training. The main barriers influencing participants' willingness to provide medical TOP and miscarriage management were lack of experience, lack of knowledge, time constraints, and a restrictive abortion law. Conclusion Over 80.0% of responders were willing to prescribe mifepristone and misoprostol for medical TOP or miscarriages. Training, (online) education, and a revision of the abortion law are recommended.

Short Title: Using behavioral theories to study health-promoting behaviors in palliative care research

ISSN: 0269-2163

DOI: 10.1177/02692163221147946

Accession Number: WOS:000919972000001

Abstract: Background: Behavioral theories are often used to better understand and change health-promoting behaviors and develop evidence-based interventions. However, researchers often lack of

knowledge on how to use these theories in palliative care and people confronted with serious illness. Clear examples or guidelines are needed. Aim: To describe how behavioral theories can be used to gain insight into critical factors of health-promoting behavior in seriously ill people, using a case example of "starting a conversation about palliative care with the physician" for people with incurable cancer. Methods: We used a health promotion approach. Step 1: We chose a theory. Step 2: We applied and adapted the selected theory by performing interviews with the target population which resulted in a new behavioral model. Step 3: We operationalized the factors of this model. An expert group checked content validity. We tested the questionnaire cognitively. Step 4: We conducted a survey study and performed logistic regression analyses to identify the most important factors. Results: Step 1: We selected the Theory of Planned Behavior. Step 2: This theory was applicable to the target behavior, but needed extending. Step 3: The final survey included 131 items. Step 4: Attitudinal factors were the most important factors associated with the target behavior of starting a conversation about palliative care with the physician. Conclusions: This paper describes a method applied to a specific example, offering guidance for researchers and practitioners interested in understanding and changing a target behavior and its factors in seriously ill people.

Title: Effect of Behavior Change Techniques Targeting Clinicians to Improve Advance Care Planning in Heart Failure: A Systematic Review and Meta-Analysis

Journal: Annals of Behavioral Medicine

Volume: 55

Issue: 5

Pages: 383-398

Date: May

Short Title: Effect of Behavior Change Techniques Targeting Clinicians to Improve Advance Care Planning in Heart Failure: A Systematic Review and Meta-Analysis

ISSN: 0883-6612

DOI: 10.1093/abm/kaaa075

Accession Number: WOS:000654711500001

Abstract: Background National and international guidelines recommend advance care planning (ACP) for patients with heart failure. But clinicians seem hesitant to engage with ACP. Purpose Our aim was to identify behavioral interventions with the greatest potential to engage clinicians with ACP in heart failure. Methods A systematic

review and meta-analysis. We searched CINAHL, Cochrane Central Register of Controlled Trials, Database of Systematic Reviews, Embase, ERIC, Ovid MEDLINE, Science Citation Index, and PsycINFO for randomized controlled trials (RCTs) from inception to August 2018. Three reviewers independently extracted data, assessed risk of bias (Cochrane risk of bias tool), the quality of evidence (Grading of Recommendation Assessment, Development, and Evaluation), and intervention synergy according to the behavior change wheel and behavior change techniques (BCTs). Odds ratios (ORs) were calculated for pooled effects. Results Of 14,483 articles screened, we assessed the full text of 131 studies. Thirteen RCTs including 3,709 participants met all of the inclusion criteria. The BCTs of prompts/cues (OR: 4.18; 95% confidence interval [CI]: 2.03-8.59), credible source (OR: 3.24; 95% CI: 1.447.28), goal setting (outcome; OR: 2.67; 95% CI: 1.564.57), behavioral practice/rehearsal (OR: 2.64; 95% CI: 1.50-4.67), instruction on behavior performance (OR: 2.49; 95% CI: 1.63-3.79), goal setting (behavior; OR: 2.12; 95% CI: 1.57-2.87), and information about consequences (OR: 2.06; 95% CI: 1.40-3.05) showed statistically significant effects to engage clinicians with ACP. Conclusion Certain BCTs seem to improve clinicians' practice with ACP in heart failure and merit consideration for implementation into routine clinical practice. DOI: 10.1002/hsr2.87

Article Number: e87

Accession Number: WOS:000697868000001

Abstract: Objective There is a paucity of research on physicians' perspectives on involving patients to achieve safer care. This study aims to explore determinants of patient participation for safer care, according to physicians in Swedish health care. Methods We used a deductive descriptive design, applying qualitative content analysis based on the Capability-Opportunity-Motivation-Behaviour framework. Semi-structured interviews were conducted with 13 physicians in different types of health care units, to achieve a

heterogeneous sample. The main outcome measure was barriers and facilitators to patient participation of potential relevance for patient safety. Results Analysis of the data yielded 14 determinants (ie, subcategories) functioning as barriers and/or facilitators to patient participation of potential relevance for patient safety. These determinants were mapped to five categories: physicians' capability to involve patients in their care; patients' capability to become involved in their care, as perceived by the physicians; physicians' opportunity to achieve patient participation in their care; physicians' motivation to involve patients in their care; and patients' motivation to become involved in their care, as perceived by the physicians. Conclusion There are many barriers to patient participation to achieve safer care. There are also facilitators, but these tend to depend on initiatives of individual physicians and patients, because organizational-level support may be lacking. Many of the determinants are interdependent, with physicians' perceived time constraints influencing other barriers.

Article Number: e36316

Accession Number: WOS:000862887800011

Abstract: Background: Cancer screening provision in resource-constrained settings tends to be opportunistic, and uptake tends to be low, leading to delayed presentation and treatment and poor survival. Objective: The aim of this study was to identify, review, map, and summarize findings from different types of literature reviews on the use of mobile health (mHealth) technologies to improve the uptake of cancer screening. Methods: The review methodology was guided by the PRISMA-ScR (Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews). Ovid MEDLINE, PyscINFO, and Embase were searched from inception to May 2021. The eligible criteria included reviews that focused on studies of interventions that used mobile phone devices to promote and deliver cancer screening and described the

effectiveness or implementation of mHealth intervention outcomes. Key data fields such as study aims, types of cancer, mHealth formats, and outcomes were extracted, and the data were analyzed to address the objective of the review. Results: Our initial search identified 1981 titles, of which 12 (0.61%) reviews met the inclusion criteria (systematic reviews: n=6, 50%; scoping reviews: n=4, 33%; rapid reviews: n=1, 8%; narrative reviews: n=1, 8%). Most (57/67, 85%) of the interventions targeted breast and cervical cancer awareness and screening uptake. The most commonly used mHealth technologies for increasing cancer screening uptake were SMS text messages and telephone calls. Overall, mHealth interventions increased knowledge about screening and had high acceptance among participants. The likelihood of achieving improved uptake-related outcomes increased when interventions used >1 mode of communication (telephone reminders, physical invitation letters, and educational pamphlets) together with mHealth. Conclusions: mHealth interventions increase cancer screening uptake, although multiple modes used in combination seem to be more effective.

ISSN: 1178-2005

DOI: 10.2147/copd.S358426

Accession Number: WOS:000844593500001

Abstract: After hospitalization due to acute COPD exacerbations, patient-manageable behaviors influence rehospitalization frequency. This study's aim was to develop a hospital-ward-initiated Behaviour-Change-Wheel (BCW)-based intervention targeting patients' key health behaviors, with the aim to increase quality of life and reduce rehospitalization frequency. Intervention development was performed by University Hospital Zurich working groups and followed the three BCW stages for each of the three key literature-identified problems: insufficient exacerbation management, lack of physical activity and ongoing smoking. In stage one, by analyzing published evidence –

including but not limited to patients' perspective – and health professionals' perspectives regarding these problems, we identified six target behaviors. In stage two, we identified six corresponding intervention functions. As our policy category, we chose developing guidelines and service provision. For stage three, we defined eighteen basic intervention packages using 46 Behaviour Change Techniques in our basic intervention. The delivery modes will be face-to-face and telephone contact. In the inpatient setting, this behavioral intervention will be delivered by a multi-professional team. For at least 3 months following discharge, an advanced nursing practice team will continue and coordinate the necessary care package via telephone. The intervention is embedded in a broader self-management intervention complemented by integrated care components. The BCW is a promising foundation upon which to develop our COPD intervention. In future, the interaction between the therapeutic care team-patient relationships and the delivery of the behavioral intervention will also be evaluated.

Title: What a great idea! Someone should evaluate that

Journal: Australian Health Review

Volume: 40

Issue: 3

Pages: 270-272

Short Title: What a great idea! Someone should evaluate that

ISSN: 0156-5788

DOI: 10.1071/ah14215

Accession Number: WOS:000383123100006

Abstract: How often, as clinicians, do we see a really clever idea implemented in the workplace? In rural health in particular, creative work-around solutions are relatively commonplace. However, the evaluation and promotion of these ideas is less so, and this leads to lost opportunities for perpetuating these clever ideas. This paper explores one rural clinician's experience of what can happen if, instead of appreciating and complementing a great idea, that step of evaluating the great idea is taken. A reflective narrative was created, beginning with a corridor conversation ('What a great idea! Someone should evaluate that...'), continuing through a formal research project and ending with the impact of that project and the way its findings were communicated and implemented. The narrative outlines the effect of evaluating one great idea at the individual, workplace, organisational, state and national levels. Clinicians are well placed to identify great ideas in practice. Making the decision to evaluate these ideas can lead to personal

growth, professional discovery and organisational benefits. With motivation and organisational support, who knows where evaluation may lead?

Short Title: The process of health behaviour change following participation in a randomised controlled trial targeting prediabetes: A qualitative study

ISSN: 0742-3071

DOI: 10.1111/dme.14748

Article Number: e14748

Accession Number: WOS:000727655600001

Abstract: Aim To explore how participating in a randomised controlled trial affected motivation, barriers and strategies in the process of health behaviour change among individuals with prediabetes. Methods An extension to the PRE-D trial, a qualitative study investigated the efficacy of glucose-lowering interventions (metformin, dapagliflozin or exercise) compared with a control group among individuals with prediabetes and overweight/obesity. Data were collected through separate focus group interviews with participants using semi-structured interview guides inspired by health behaviour change theories. Interviews were audio-recorded, transcribed verbatim and analysed using thematic analysis with an inductive-deductive approach. Results Four interrelated themes emerged from interviews: (1) 'self-construction of prediabetes', on how participants understood the term 'prediabetes', (2) 'altered health image', on how participants' health perceptions were affected, (3) 'personal strategies for health behaviour change', on different ways to attempt to implement behaviour changes and (4) 'the process of health behaviour change', on how participants progressed and relapsed while trying to change behaviour. Themes relate to the health belief model, self-determination theory, self-efficacy and the trans-theoretical model of change. Participants shared their experiences and thoughts during interviews and inspired each other, which led some participants to develop a new perspective on prediabetes severity and increased their motivation for behaviour change. Conclusions How participants perceived and accepted,

rejected or neglected prediabetes appeared to affect their health images and whether they realised a need for behaviour change. Their achievements during interventions, health literacy, self-efficacy and perceived support from their social networks, professionals and technological aids influenced the maintenance of health behaviour changes.

Short Title: A cross-sectional survey assessing the influence of theoretically informed behavioural factors on hand hygiene across seven countries during the COVID-19 pandemic

DOI: 10.1186/s12889-021-11491-4

Article Number: 1432

Accession Number: WOS:000677614900001

Abstract: Background Human hygiene behaviours influence the transmission of infectious diseases. Changing maladaptive hygiene habits has the potential to improve public health. Parents and teachers can play an important role in disinfecting surface areas and in helping children develop healthful handwashing habits. The current study aims to inform a future intervention that will help parents and teachers take up this role using a theoretically and empirically informed behaviour change model called the Capabilities-Opportunities-Motivations-Behaviour (COM-B) model. Methods A cross-sectional online survey was designed to measure participants' capabilities, opportunities, and motivations to [1] increase their children's handwashing with soap and [2] increase their cleaning of surface areas. Additional items captured how often participants believed their children washed their hands. The final survey was administered early in the coronavirus pandemic (May and June 2020) to 3975 participants from Australia, China, India, Indonesia, Saudi Arabia, South Africa, and the United Kingdom. Participants self-identified as mums, dads, or teachers of children 5 to 10 years old. ANOVAs analyses were used to compare participant capabilities, opportunities, and motivations across countries for handwashing and surface disinfecting. Multiple regressions analyses were conducted for each country to assess the predictive relationship between the COM-B components and children's handwashing. Results The ANOVA

analyses revealed that India had the lowest levels of capability, opportunity, and motivation, for both hand hygiene and surface cleaning. The regression analyses revealed that for Australia, Indonesia, and South Africa, the capability component was the only significant predictor of children's handwashing. For India, capability and opportunity were significant. For the United Kingdom, capability and motivation were significant. Lastly, for Saudi Arabia all components were significant. Conclusions The discussion explores how the Behaviour Change Wheel methodology could be used to guide further intervention development with community stakeholders in each country. Of the countries assessed, India offers the greatest room for improvement, and behaviour change techniques that influence people's capability and opportunities should be prioritised there.

ISSN: 1359-107X

DOI: 10.1111/bjhp.12545

Accession Number: WOS:000667650600001

Abstract: Objectives To examine whether the phrasing of a hospital appointment invitation influences patient preference to attend in person or by video. The study also explores patient capabilities, opportunities, and motivations to attend video consultations. Design A randomized controlled trial followed by a cross-sectional survey. Methods Participants (1,481 total, 780 females) were residents of the United Kingdom who self-identified as being diagnosed with a chronic disease. Participants considered one of three hypothetical invitations. In one group, participants were invited to attend in person. Those in another group were invited to attend by video. These participants could either accept the invitation or request the other option. In the final 'active choice' group, participants were asked to choose to attend either in-person or by video appointment. Then, all participants responded to open- and closed-ended items about attending video consultations. Results When the default option was in person, 25% of participants chose video consultation, compared with 41% in the active choice group (RR = 1.65, 95% CI:

1.37–1.99, $p < .001$) and 65% in the default video group (RR = 2.60, 95% CI: 2.20–2.96, $p < .001$). Closed-ended responses suggested that younger patients and those with previous experience were more likely to prefer video consultations. Most open-ended responses contained themes about opportunities, followed by motivations and then capabilities. Conclusions Patients are more likely to express a preference to attend by video when video is the default option. The real-world effectiveness of this intervention is more likely to be realized where hospitals also support patient capabilities, opportunities, and motivations.

Short Title: An exploratory randomised controlled trial evaluating text prompts in Lebanon to encourage health-seeking behaviour for hypertension

ISSN: 1368-5031

DOI: 10.1111/ijcp.13669

Article Number: e13669

Accession Number: WOS:000562751700001

Abstract: Aims of the study The current study evaluates the effectiveness of an opportunistic mobile screening on the percentage of people who are aware of whether they may be hypertensive (in an observational study) and the effectiveness of reminder prompts on the percentage of people who seek further medical attention (in a randomised controlled trial). Methods used to conduct the study The screening of 1227 participants (529 female) was conducted during the registration period of the 2018 Beirut International Marathon in Lebanon. Next, 266 participants whose screening indicated hypertension (64 Female) were randomly allocated to a treatment group or a control group in a 1:1 fashion. The treatment group received a reminder prompt to seek further medical attention for their potential hypertension and the control group did not. The overt nature of the text message meant that participants in the treatment group could not be blinded to their group allocation. The

primary outcome is participants' self-reports of whether they sought further medical attention. Results of the study For the opportunistic screening, a 25% prevalence rate and a 24% awareness rate of hypertension was indicated. A McNemar analysis suggested that the screening increased participant awareness ($X^2(N = 1227) = 72.16, P < .001$). For the randomised controlled trial, 219 participants provided follow-up data via a phone call (82% retention). A Chi-squared analysis suggested that the reminder prompt successfully encouraged more participants to seek further medical attention, 45.5% treatment group vs 28.0% control group ($X^2(1, N = 219) = 7.19, P = .007, \phi = 0.18$). Conclusions drawn and clinical implications Extra support in the form of a brief reminder message can increase the percentage of people who seek further medical attention after attending an opportunistic screening at a marathon event. The discussion reviews how the results align with previous research, strengths and limitations of the current study, and implications for future research and practice.

Short Title: The effectiveness and feasibility of an online educational program for improving evidence-based practice literacy: an exploratory randomized study of US chiropractors

DOI: 10.1186/s12998-016-0109-8

Article Number: 27

Accession Number: WOS:000381795500001

Abstract: Background: Online education programs are becoming a popular means to disseminate knowledge about evidence-based practice (EBP) among healthcare practitioners. This mode of delivery also offers a viable and potentially sustainable solution for teaching consistent EBP content to learners over time and across multiple geographical locations. We conducted a study with 3 main aims: 1) develop an online distance-learning program about the principles of evidence-based practice (EBP) for chiropractic providers; 2) test the effectiveness of the online program on the attitudes, skills, and use of EBP in a sample of chiropractors; and 3) determine the feasibility of expanding the program for broader-scale

implementation. This study was conducted from January 2013 to September 2014. Methods: This was an exploratory randomized trial in which 293 chiropractors were allocated to either an online EBP education intervention or a waitlist control. The online EBP program consisted of 3 courses and 4 booster lessons, and was developed using educational resources created in previous EBP educational programs at 4 chiropractic institutions. Participants were surveyed using a validated EBP instrument (EBASE) with 3 rescaled (0 to 100) subscores: Attitudes, Skills, and Use of EBP. Multiple regression was used to compare groups, adjusting for personal and practice characteristics. Satisfaction and compliance with the program was evaluated to assess feasibility. Results: The Training Group showed modest improvement compared to the Waitlist Group in attitudes (Delta = 6.2, $p < .001$) and skills (Delta = 10.0, $p < .001$) subscores, but not the use subscore (Delta = -2.3, $p = .470$). The majority of participants agreed that the educational program was 'relevant to their profession' (84 %) and 'was worthwhile' (82 %). Overall, engagement in the online program was less than optimal, with 48 % of the Training Group, and 42 % of the Waitlist Group completing all 3 of the program courses. Conclusions: Online EBP training leads to modest improvements in chiropractors' EBP attitudes and skill, but not their use of EBP. This online program can be delivered to a wide national audience, but requires modification to enable greater individualization and peer-to-peer interaction. Our results indicate that it is feasible to deliver an online EBP education on a broad scale, but that this mode of education alone is not sufficient for making large changes in chiropractors' use of EBP.

Title: Improving rural and remote practitioners' knowledge of the diabetic foot: findings from an educational intervention

Journal: Journal of Foot and Ankle Research

Volume: 9

Date: Jul

Short Title: Improving rural and remote practitioners' knowledge of the diabetic foot: findings from an educational intervention

DOI: 10.1186/s13047-016-0157-2

Article Number: 26

Accession Number: WOS:000381384100002

Abstract: Background: This study aimed to determine knowledge of

national guidelines for diabetic foot assessment and risk stratification by rural and remote healthcare professionals in Western Australia and their implementation in practice. Assessment of diabetic foot knowledge, availability of equipment and delivery of foot care education in a primary healthcare setting at baseline enabled evaluation of the effectiveness of a diabetic foot education and training program for generalist healthcare professionals.

Methods: This study employed a quasi-experimental pre-test/post-test study design. Healthcare practitioners' knowledge, attitudes and practice of diabetic foot assessment, diabetic foot risks, risk stratification, and use of the 2011 National Health and Medical Research Council Guidelines were investigated with an electronic pre-test survey. Healthcare professionals then undertook a 3-h education and training workshop before completing the electronic post-test knowledge, attitudes and practice survey. Comparison of pre-test/post-test survey findings was used to assess the change in knowledge, attitudes and intended practice due to the workshops.

Results: Two hundred and forty-six healthcare professionals from two rural and remote health regions of Western Australia participated in training workshops. Monofilaments and diabetes foot care education brochures, particularly brochures for Aboriginal people, were reported as not readily available in rural and remote health services. For most participants (58 %), their post-test knowledge score increased significantly from the pre-test score. Use of the Guidelines in clinical settings was low (19 %). The healthcare professionals' baseline diabetic foot knowledge was adequate to correctly identify the high risk category. However, stratification of the intermediate risk category was poor, even after training.

Conclusion: This study reports the first assessment of Western Australia's rural and remote health professionals' knowledge, attitudes and practices regarding the diabetic foot. It shows that without training, generalists' levels of knowledge concerning the diabetic foot was low and they were unlikely to assess foot risk. The findings from this study in a rural and remote setting cast doubt on the ability of generalist healthcare professionals to stratify risk appropriately, especially for those at intermediate risk, without clinical decision support tools.

Short Title: Investigation of a Mobile Health Texting Tool for Embedding Patient-Reported Data Into Diabetes Management (i-Matter): Development and Usability Study

DOI: 10.2196/18554

Article Number: e18554

Accession Number: WOS:000853347700013

Abstract: Background: Patient-reported outcomes (PROs) are increasingly being used in the management of type 2 diabetes (T2D) to integrate data from patients' perspective into clinical care. To date, the majority of PRO tools have lacked patient and provider involvement in their development, thus failing to meet the unique needs of end users, and lack the technical infrastructure to be integrated into the clinic workflow. Objective: This study aims to apply a systematic, user-centered design approach to develop i-Matter (investigating a mobile health [mHealth] texting tool for embedding patient-reported data into diabetes management), a theory-driven, mobile PRO system for patients with T2D and their primary care providers. Methods: i-Matter combines text messaging with dynamic data visualizations that can be integrated into electronic health records (EHRs) and personalized patient reports. To build i-Matter, we conducted semistructured group and individual interviews with patients with T2D and providers, a design thinking workshop to refine initial ideas and design the prototype, and user testing sessions of prototypes using a rapid-cycle design (ie, design-test-modify-retest). Results: Using an iterative user-centered process resulted in the identification of 6 PRO messages that were relevant to patients and providers: medication adherence, dietary behaviors, physical activity, sleep quality, quality of life, and healthy living goals. In user testing, patients recommended improvements to the wording and timing of the PRO text messages to increase clarity and response rates. Patients also recommended including motivational text messages to help sustain engagement with the program. The personalized report was regarded as a key tool for diabetes self-management by patients and providers because it aided in the identification of longitudinal patterns in the PRO data, which increased patient awareness of their need to adopt healthier behaviors. Patients recommended adding individualized tips to the journal on how they can improve their behaviors. Providers preferred having a separate tab built into the EHR that included the personalized report and highlighted key trends in patients' PRO data over the past 3 months. Conclusions: PRO tools that capture patients' well-being and the behavioral aspects of T2D management are important to patients and providers. A clinical trial will test the efficacy of i-Matter in 282 patients with uncontrolled T2D.

Accession Number: WOS:000762588700001
Abstract: Background The BetterBack model of care (MoC) for low back pain (LBP) was recently developed in Swedish physiotherapy (PT) primary care. Objective To evaluate if PTs' adherence to LBP clinical practice guidelines (CPGs) improves after implementation of the BetterBack MoC (intervention). Methods This was a stepped, single-blinded cluster randomized controlled trial. Patients nested in the three clusters were allocated to routine care (n = 222) or intervention (n = 278). The primary outcome was referral to

specialist consultation. This was among five best practice recommendations divided into an assessment quality index (no referral to specialist consultation and no medical imaging) and a treatment quality index (use of educational interventions; use of exercise interventions; no use of non-evidence-based physiotherapy). For overall adherence, patients had to be treated with all five recommendations fulfilled. Logistic regression was used for between-group comparisons. Results The proportion of patients receiving referral to specialist consultation during the PT treatment period was low in both groups with no between-group differences. However, patients in the intervention group showed significantly higher assessment quality index, treatment quality index and overall adherence compared to routine care. Adherence to the separate recommendations showed improved stratified number of visits, use of exercise was maintained high, patient educational intervention increased and use of non-evidence-based physiotherapy decreased. A reduction of medical imaging during the physiotherapy treatment period was also observed. Conclusions The adoption of CPGs could be substantially improved by introducing a MoC through PT training and supportive materials.

Title: General and paediatric dentists' knowledge, attitude and practises regarding the use of Silver Diammine Fluoride for the management of dental caries: a national survey in the Netherlands

Journal: BMC Oral Health

Volume: 22

Issue: 1

Date: Nov

Short Title: General and paediatric dentists' knowledge, attitude and practises regarding the use of Silver Diammine Fluoride for the management of dental caries: a national survey in the Netherlands

ISSN: 1472-6831

DOI: 10.1186/s12903-022-02475-w

Article Number: 458

Accession Number: WOS:000877704200001

Abstract: Background Silver Diammine Fluoride (SDF) is a topical medication used to arrest cavitated carious lesions non-invasively. The primary aim was to investigate, and analyse the relationships between; knowledge, attitudes and practises (including barriers and facilitators) for SDF use in the management of dental caries by general dental practitioners (GDPs) and paediatric dentists (PDs) in

the Netherlands. A secondary aim was to explore any differences in these, between these groups. Methods A randomly selected sample of 600 Dutch GDPs (out of 9,502 respectively) and all 57 registered Dutch PDs were invited to participate in this cross-sectional survey, consisting of four sections: (1) participant characteristics, (2) knowledge (through responses to summative questions), (3) attitudes (through statement agreement using 5-point Likert scale), and (4) practises, use, barriers and facilitators (through multiple choice questions). Results The response rates were: GDPs 23% (n = 140) and PDs 47% (n = 27). Knowledge: out of 15 questions to test understanding of SDF, the mean number of correct answers were GDPs 6.7; standard deviation (SD) 2.6 and PDs 7.4, SD 2.2 with no significant difference. The mean overall attitude score showed positive attitudes towards SDF use for both groups. Compared to GDPs, PDs were more likely to use SDF ($p < 0.001$) and expected to increase their use ($p = 0.037$). The main barrier for users was parental acceptance (47%) and for non-users it was lack of knowledge (60%). The main facilitator for both users and non-users was gaining knowledge through courses and workshops, followed by written information leaflets about SDF for parents. Conclusion Less than half of the knowledge questions about SDF were answered correctly. Despite low knowledge, attitude towards SDF use was positive. Practitioners believed that its use would be facilitated by professionals having more accessible information and training and by the availability of parent information leaflets. Furthermore, SDF is used more frequently by PDs than GDPs.

Abstract: A growing number of interventions use websites, mobile applications, and wearable devices to deliver and enhance mental health treatments. These technologies are used more often and are more effective when provided along with human support. Integrating human support, however, requires developed models for providing this support. This article presents the Efficiency Model of Support, a new model for understanding the provision of human support in the

context of behavioral intervention technologies. The Efficiency Model of Support defines the ratio of benefit accrued from an intervention to resources devoted to it as a critical consideration in support provision. The Efficiency Model of Support serves to consolidate the current findings and guide future research and practice with regard to human support and technology.

Abstract: A pressing task for future energy systems is the design and operation of systems that integrate large shares of renewable energy while improving overall system efficiency. Because buildings consume about 32% of the total global final energy use, they are of vital importance. In recent years, technical and socioeconomic studies, as well as hands-on experience, have concluded that the integration and participation of consumer are crucial for smart energy systems. To reach challenging climate goals, individual consumer, social environment, physical environment, digital realities and economical conditions must be considered and integrated in successful solutions and business models. However, a holistic discussion of all these elements is scarce. This paper presents a comprehensive review of necessary steps and obstacles during the development and implementation of user centric business models, including a detailed discussion of required data and computational methods as well as psychological aspects of consumer participation. In addition, we aim to identify current challenges and future research needs. (C) 2020 The Authors. Published by Elsevier B.V.

Title: Understanding dentists' management of deep carious lesions in permanent teeth: a systematic review and meta-analysis

Journal: Implementation Science

Volume: 11

Date: Oct

Short Title: Understanding dentists' management of deep carious lesions in permanent teeth: a systematic review and meta-analysis

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0505-4

Article Number: 142

Accession Number: WOS:000385594300002

Abstract: Background: Increasing evidence supports selective/incomplete (SE) or stepwise (SW) instead of non-selective/ complete tissue removal for deep carious lesions in vital teeth, mainly as pulpal risks are significantly reduced. Our aims were to analyze the proportion of dentists who utilize SE/SW for deep lesions in permanent teeth and to identify barriers and facilitators of utilizing SE/SW. Methods: We included studies that were original, and reported on the proportion of dentists utilizing SE/SW (quantitative studies), or reported on barriers or facilitators of such utilization (qualitative studies). Electronic databases (PubMed, CENTRAL, Embase, PsycINFO) were searched and screening and data extraction performed by two reviewers. Random-effects meta-analysis and meta-regression were used for quantitative synthesis of the proportion of dentists utilizing SE/SW. Thematic analysis was performed to assess barriers and facilitators on SE/SW utilization. Identified themes were translated into the constructs of the theoretical domains framework. Results: From 1728 articles, nine studies were included, all using quantitative methods. Four thousand one hundred ninety-nine dentists had been surveyed. The mean (95% CI) proportion of dentists using SE/SW for deep lesions was 53 % (44/62 %). More recent studies reported significantly higher proportions ($p < 0.05$). Reported estimates and thematic analysis found dentists' age and an understanding of the disease caries and the scientific rationale behind different removal strategies to affect dentists' behavior. Guidelines, peers, and the social and professional identity were further associated with the motivation of utilizing SE/SW. Environmental incentives, sanctions, or restrictions, mainly of financial but also regulatory character, impacted on decision-making, as did the specific indication (the patient, the tooth) and the beliefs on how well different treatments perform. Conclusions: Around half of all dentists rejected evidence-based carious tissue removal strategies. A range of factors can be addressed for improving implementation. Future studies should use mixed qualitative-quantitative methods to yield a deeper understanding of dentists' decision-making.

Abstract: In September 2010, the first International Scientific Tendinopathy Symposium (ISTS) was held in Umea, Sweden, to establish a forum for original scientific and clinical insights in this growing field of clinical research and practice. The second ISTS was organised by the same group and held in Vancouver, Canada, in September 2012. This symposium was preceded by a round-table meeting in which the participants engaged in focused discussions, resulting in the following overview of tendinopathy clinical and research issues. This paper is a narrative review and summary developed during and after the second ISTS. The document is designed to highlight some key issues raised at ISTS 2012, and to integrate them into a shared conceptual framework. It should be considered an update and a signposting document rather than a comprehensive review. The document is developed for use by physiotherapists, physicians, athletic trainers, massage therapists and other health professionals as well as team coaches and strength/conditioning managers involved in care of sportspeople or workers with tendinopathy.

Accession Number: WOS:000770538700002

Abstract: Introduction Patients are sensitive to both the frequency and costs of dental recall visits. Shared decision making (SDM) is a principle of patient-centred care, advocated by the National Institute for Health and Care Excellence and policymakers, whereby joint decisions are made between clinicians and patients. Aims To explore NHS dentists' and patients' attitudes towards SDM in decisions about recall interval. Methods Semi-structured telephone interviews were conducted with 25 NHS patients and 25 NHS general dental practitioners in Wales, UK. Transcripts were thematically analysed. Results While many patients would be happy to accept changes to their recall interval, most wanted to be seen at least annually. Most patients were willing to be guided by their dentist in decisions about recall interval, as long as consideration was given to issues such as time, travel and cost. This contrasted with the desire to actively participate in decisions about operative treatment. Although the dentists' understanding of SDM varied, practitioners considered it important to involve patients in decisions about their care. However, dentists perceived that time, patient anxiety and concerns about potential adverse outcomes were barriers to the use of SDM. Conclusions Since there is uncertainty about the most clinically effective and cost-effective dental recall strategy, patient preference may play a role in these decisions.

Abstract: Background: Knowledge translation (KT) aims to close the research-practice gap in order to realize and maximize the benefits of research within the practice setting. Previous studies have investigated KT strategies in nursing and medicine; however, the present study is the first systematic review of the effectiveness of a variety of KT interventions in five allied health disciplines: dietetics, occupational therapy, pharmacy, physiotherapy, and speech-language pathology. Methods: A health research librarian developed and implemented search strategies in eight electronic databases (MEDLINE, CINAHL, ERIC, PASCAL, EMBASE, IPA, Scopus, CENTRAL) using language (English) and date restrictions (1985 to March 2010). Other relevant sources were manually searched. Two reviewers independently screened the titles and abstracts, reviewed full-text articles, performed data extraction, and performed quality assessment. Within each profession, evidence tables were created, grouping and analyzing data by research design, KT strategy, targeted behaviour, and primary outcome. The published descriptions of the KT interventions were compared to the Workgroup for Intervention Development and Evaluation Research (WIDER)

Recommendations to Improve the Reporting of the Content of Behaviour Change Interventions. Results: A total of 2,638 articles were located and the titles and abstracts were screened. Of those, 1,172 full-text articles were reviewed and subsequently 32 studies were included in the systematic review. A variety of single (n = 15) and multiple (n = 17) KT interventions were identified, with educational meetings being the predominant KT strategy (n = 11). The majority of primary outcomes were identified as professional/process outcomes (n = 25); however, patient outcomes (n = 4), economic outcomes (n = 2), and multiple primary outcomes (n = 1) were also represented.

Generally, the studies were of low methodological quality. Outcome reporting bias was common and precluded clear determination of intervention effectiveness. In the majority of studies, the interventions demonstrated mixed effects on primary outcomes, and only four studies demonstrated statistically significant, positive effects on primary outcomes. None of the studies satisfied the four WIDER Recommendations. Conclusions: Across five allied health professions, equivocal results, low methodological quality, and outcome reporting bias limited our ability to recommend one KT strategy over another. Further research employing the WIDER Recommendations is needed to inform the development and implementation of effective KT interventions in allied health.

Title: Barriers and facilitators to becoming an alcohol and other drug nurse practitioner in Australia: A mixed methods study

Journal: International Journal of Mental Health Nursing

Date: 2023 Feb

Short Title: Barriers and facilitators to becoming an alcohol and other drug nurse practitioner in Australia: A mixed methods study

ISSN: 1445-8330

DOI: 10.1111/inm.13125

Accession Number: WOS:000932463900001

Abstract: Alcohol and other drug (AOD) nurse practitioners have an advanced scope of practice that allows them to diagnose, prescribe pharmacological treatments for alcohol and other substance use disorders, and monitor physical and mental health. The Behaviour Change Wheel (BCW) is used to understand barriers and facilitators to implementation by applying three conditions of behaviour change (capability, opportunity, and motivation—the COM-B framework). The aim of this paper is to describe the current AOD nurse practitioner workforce, and to explore barriers and facilitators to AOD nurse practitioner uptake in Australia. A mixed method approach was used in this study: a survey to determine the current state of the AOD nurse practitioner workforce (n = 41) and qualitative interviews with 14 participants to determine barriers to endorsement and ongoing work as a nurse practitioner. Interview transcripts were analysed using thematic analysis and mapped to the COM-B framework. The AOD nurse practitioner is a highly specialized provider of holistic care to people who use alcohol and other drugs, with AOD nurse practitioners performing advanced roles such as prescribing and medication management. However, there are several barriers to the further uptake of AOD nurse practitioners in Australia, including varied organizational support, a lack of support for the higher study required to become a nurse practitioner and a lack of available positions. Arguably, nurse practitioners are key to addressing prescriber shortages inherent in AOD treatment settings. In addition, they are equipped to provide true holistic care. We recommend that barriers are addressed to expand the AOD nurse practitioner workforce in Australia.

Short Title: Does a school-based intervention to engage parents change opportunity for handwashing with soap at home? Practical experience from the Mikono Safi trial in Northwestern Tanzania

ISSN: 1935-2735

DOI: 10.1371/journal.pntd.0010438

Article Number: e0010438

Accession Number: WOS:000830263700044

Abstract: Background School-based de-worming is advocated as a strategy for reducing the burden of soil-transmitted helminth (STH) infections among children. However, re-infection tends to occur rapidly, suggesting that comprehensive water, sanitation, and hygiene (WASH) improvements may be needed to prevent this. We qualitatively assessed the influence of parental engagement activities on parents' motivation to improve WASH infrastructure and hygiene practices at home in the context of a school-based de-worming programme. Methodology We conducted a longitudinal qualitative study nested within the Mikono Safi trial, designed to assess the effect of a WASH intervention on STH infection prevalence in children. Meetings were organized for parents/guardians at schools where they were given information about STH infection, the role of WASH in STH infection prevention, and actionable steps they could take at home. During the meetings, parents/guardians received information about their own child's STH infection status. Twenty purposively selected households were visited and interviewed 3 times over a period of about 8-months. We employed thematic analysis; findings are reported following the Capability-Opportunity-Motivation and Behaviour (COM-B) framework. Principal findings The engagement strategy improved parents'/guardians' knowledge and skills about handwashing with soap and its benefits. Parents/guardians reported that the sessions had motivated them to improve WASH infrastructure at home. Of 20 households included in this study, 17 renovated or built new latrines and 18 installed handwashing facilities. However, only 8 households established and maintained handwashing stations with both soap and water at 8 months. Conclusions The engagement of parents/guardians in a school-based WASH education intervention as part of the Mikono Safi trial resulted in increased knowledge and motivation about handwashing and sanitation. This led to improvements in sanitation facilities and handwashing opportunities at home. However, long-term success in

provision of water and soap was limited, indicating that sustained engagement may be required to encourage households to ensure these materials are consistently available at home.

Title: Where Does the Time Go? Displacement of Device-Measured Sedentary Time in Effective Sedentary Behaviour Interventions: Systematic Review and Meta-Analysis

Journal: Sports Medicine

Volume: 52

Issue: 9

Pages: 2177-2207

Date: Sep

Short Title: Where Does the Time Go? Displacement of Device-Measured Sedentary Time in Effective Sedentary Behaviour Interventions: Systematic Review and Meta-Analysis

ISSN: 0112-1642

DOI: 10.1007/s40279-022-01682-3

Accession Number: WOS:000795646700001

Abstract: Background Research has shown the effectiveness of sedentary behaviour interventions on reducing sedentary time. However, no systematic review has studied where the reduced sedentary time after such interventions is displaced to. Objective Our objective was to synthesize the evidence from interventions that have reduced sedentary behaviour and test the displacement of sedentary time into physical activity (light physical activity [LPA], moderate-to-vigorous physical activity [MVPA], standing, and stepping). Methods Two independent researchers performed a systematic search of the EBSCOhost, PubMed, Scopus, and Web of Science electronic databases. Meta-analyses were performed to examine the time reallocated from sedentary behaviour to physical activity during working time and the whole day in intervention trials (randomized/non-randomized controlled/non-controlled). Results A total of 36 studies met all the eligibility criteria and were included in the systematic review, with 26 studies included in the meta-analysis. Interventions showed a significant overall increase in worksite LPA (effect size [ES] 0.24; 95% confidence interval [CI] 0.05 to 0.43; $P < 0.013$) and daily LPA (ES 0.62; 95% CI 0.34 to 0.91; $P = 0.001$). A statistically significant increase in daily MVPA was observed (ES 0.47; 95% CI 0.26 to 0.67; $P < 0.001$). There was a significant overall increase in worksite standing time (ES 0.76; 95% CI 0.56 to 0.95; $P < 0.001$), daily standing time (ES

0.52; 95% CI 0.38 to 0.65; $P < 0.001$), and worksite stepping time (ES 0.12; 95% CI 0.04 to 0.20; $P = 0.002$). Conclusions Effective interventions aimed at reducing sedentary behaviour result in a consistent displacement of sedentary time to LPA and standing time, both at worksites and across the whole day, whereas changes in stepping time or MVPA are dependent on the intervention setting. Strategies to reduce sedentary behaviour should not be limited to worksite settings, and further efforts may be required to promote daily MVPA.

Title: Exploring the Black Box of an mHealth Intervention (LIFE4YOUth): A Qualitative Process and Outcome Evaluation of End-User Engagement

Journal: International Journal of Environmental Research and Public Health

Volume: 19

Issue: 21

Date: Nov

Short Title: Exploring the Black Box of an mHealth Intervention (LIFE4YOUth): A Qualitative Process and Outcome Evaluation of End-User Engagement

DOI: 10.3390/ijerph192114022

Article Number: 14022

Accession Number: WOS:000881079100001

Abstract: The effectiveness of mHealth interventions rely on whether the content successfully activate mechanisms necessary for behavior change. These mechanisms may be affected by end-users' experience of the intervention content. The aim of this study was to explore how the content of a novel mHealth intervention (LIFE4YOUth) was understood, interpreted, and applied by high school students, and the consequences of engaging with the content. Qualitative content analysis was used inductively and deductively to analyze interview data ($n = 16$) based on think-aloud techniques with Swedish high school students aged 16-19 years. Theoretical constructs from social cognitive theory framed the deductive analysis. The analysis resulted in four categories which describe central activities of intervention engagement among end-users: defining, considering, centralizing, and personalizing. End-users engaged in these activities to different degrees as illustrated by four typologies: Literal, Vague, Rigid, and Creative engagement. Most informants knew about the risks and benefits of health behaviors, but engagement

with intervention content generally increased informants' awareness. In conclusion, this study provides in-depth knowledge on the cognitive process when engaging with mHealth content and suggests that deliberate and flexible engagement most likely deepens end-users' understanding of why and how health behavior change can be managed.

Title: Impact of an Online Sleep and Circadian Education Program on University Students' Sleep Knowledge, Attitudes, and Behaviours

Journal: International Journal of Environmental Research and Public Health

Volume: 18

Issue: 19

Date: Oct

Short Title: Impact of an Online Sleep and Circadian Education Program on University Students' Sleep Knowledge, Attitudes, and Behaviours

DOI: 10.3390/ijerph181910180

Article Number: 10180

Accession Number: WOS:000708001900001

Abstract: University students consistently report poor sleep. We conducted a before-and-after study to evaluate the impact of an online 10-week course on undergraduate students' sleep knowledge, attitudes, and behaviours at 6-month follow-up. Data were collected via baseline course surveys (August-September 2020) and follow-up surveys distributed via email (February-March 2021). $n = 212$ students completed baseline surveys and $n = 75$ (35%) completed follow-up. Students retained to follow-up possessed higher baseline sleep knowledge and received higher course grades. At the 6-month follow-up, sleep knowledge had increased (mean score out of 5: 3.0 vs. 4.2, $p < 0.001$). At baseline, 85% of students aimed to increase their sleep knowledge and 83% aimed to improve their sleep. At follow-up, 91% reported being more knowledgeable and 37% reported improved sleep. A novel Stages of Change item revealed that 53% of students' attitudes towards their sleep behaviours had changed from baseline. There was a reduction in sleep latency at follow-up (mean 33.3 vs. 25.6 min, $p = 0.015$), but no change in the total Pittsburgh Sleep Quality Index score. In summary, completion of an online course led to increased sleep and circadian knowledge and changed sleep attitudes, with no meaningful change in sleep behaviours.

Future interventions should consider components of behavioural change that go beyond the knowledge-attitudes-behaviour continuum.

Title: National policies for the promotion of physical activity and
healthy nutrition in the workplace context: a behaviour change wheel
guided content analysis of policy papers in Finland

Journal: BMC Public Health

Volume: 18

Date: Aug

Short Title: National policies for the promotion of physical
activity and healthy nutrition in the workplace context: a behaviour
change wheel guided content analysis of policy papers in Finland

DOI: 10.1186/s12889-017-4574-3

Article Number: 87

Accession Number: WOS:000406754200002

Abstract: Background: Health policy papers disseminate
recommendations and guidelines for the development and
implementation of health promotion interventions. Such documents
have rarely been investigated with regard to their assumed
mechanisms of action for changing behaviour. The Theoretical Domains
Framework (TDF) and Behaviour Change Techniques (BCT) Taxonomy have
been used to code behaviour change intervention descriptions, but to
our knowledge such "retrofitting" of policy papers has not
previously been reported. This study aims first to identify targets,
mediators, and change strategies for physical activity (PA) and
nutrition behaviour change in Finnish policy papers on workplace
health promotion, and second to assess the suitability of the
Behaviour Change Wheel (BCW) approach for this purpose. Method: We
searched all national-level health policy papers effectual in
Finland in August 2016 focusing on the promotion of PA and/or
healthy nutrition in the workplace context (n = 6). Policy
recommendations targeting employees' nutrition and PA including
sedentary behaviour (SB) were coded using BCW, TDF, and BCT
Taxonomy. Results: A total of 125 recommendations were coded in the
six policy papers, and in two additional documents referenced by
them. Psychological capability, physical opportunity, and social
opportunity were frequently identified (22%, 31%, and 24%,
respectively), whereas physical capability was almost completely
absent (1%). Three TDF domains (knowledge, skills, and social
influence) were observed in all papers. Multiple intervention
functions and BCTs were identified in all papers but several
recommendations were too vague to be coded reliably. Influencing
individuals (46%) and changing the physical environment (44%) were
recommended more frequently than influencing the social environment
(10%). Conclusions: The BCW approach appeared to be useful for

analysing the content of health policy papers. Paying more attention to underlying assumptions regarding behavioural change processes may help to identify neglected aspects in current policy, and to develop interventions based on recommendations, thus helping to increase the impact of policy papers.

Short Title: Feasibility of the SINERGIAPS ("Sinergias entre profesionales y pacientes para una Atencion Primaria Segura") intervention for improving patient safety in primary care

ISSN: 0263-2136

DOI: 10.1093/fampra/cmac015

Accession Number: WOS:000767465300001

Abstract: Aim The primary aim was to examine the feasibility of intervention delivery and of trial procedures. Secondary aims were to study the intervention uptake; its acceptability and perceived utility; and its potential to improve safety culture and avoidable hospital admissions. Methods We conducted a 3-month, single-arm feasibility study in 10 primary care (PC) centres in Spain. Centres received information regarding patients' experiences of safety (through the Patient Reported Experiences and Outcomes of Safety in Primary Care [PREOS-PC] questionnaire), and were instructed to plan safety improvements based on that feedback. We used a bespoke online tool to recruit PC professionals, collect patient feedback, and deliver it to the centres, and to collect outcome data (patient safety culture [Medical Office Survey on Patient Safety Culture, MOSPSC questionnaire]). We measured recruitment and follow-up rates and intervention uptake (based on the number of safety improvement plans registered). We conducted semistructured interviews with 9 professionals to explore the intervention acceptability and perceived utility. Results Of 256 professionals invited, 120 (47%) agreed to participate, and 97 completed baseline and postintervention measures. Of 780 patients invited, 585 (75%)

completed the PREOS-PC questionnaire. Five of 10 centres (50%) designed an improvement plan, providing 27 plans in total (range per centre, 1-14). The intervention was perceived as a novel strategy for improving safety, although the healthcare professionals identified several factors limiting its acceptability and utility: lack of feedback at the individual professional level; potentially unrepresentative sample of patients providing feedback; and number of educational materials deemed overwhelming. Discussion It is feasible to deliver the proposed intervention so long as the identified limitations are addressed.

Article Number: e0261308

Accession Number: WOS:000773555700029

Abstract: Early presentation for childhood cataract surgery is an important first step in preventing related visual impairment and blindness. In the absence of neonatal eye screening programmes in developing countries, the early identification of childhood cataract remains a major challenge. The primary aim of this study was to identify potential barriers to accessing childhood cataract services from the perspective of parents and carers, as a critical step towards increasing the timely uptake of cataract surgery. In-depth interviews were conducted using a pre-designed topic guide developed for this study to seek the views of parents and carers in nine

geographic locations across eight states in India regarding their perceived barriers and enablers to accessing childhood cataract services. A total of 35 in-depth interviews were conducted including 30 at the hospital premises and 5 in the participants' homes. All interviews were conducted in the local language and audio taped for further transcription and analysis. Data were organised using NVivo 11 and a thematic analysis was conducted utilising the Theoretical Domains Framework (TDF), an integrative framework of behavioural theories. The themes identified from interviews related to 11 out of 12 TDF domains. TDF domains associated with barriers included: 'Environmental context and resources', 'Beliefs about consequences' and 'Social influences'. Reported enablers were identified in three theoretical domains: 'Social influences', 'Beliefs about consequences' and 'Motivations and goals'. This comprehensive TDF approach enabled us to understand parents' perceived barriers and enablers to accessing childhood cataract services, which could be targeted in future interventions to improve timely uptake.

Title: Hospital-Based Antimicrobial Stewardship Programs Used in Low- and Middle-Income Countries: A Scoping Review

Journal: Microbial Drug Resistance

Volume: 28

Issue: 5

Pages: 566-584

Date: May

Short Title: Hospital-Based Antimicrobial Stewardship Programs Used in Low- and Middle-Income Countries: A Scoping Review

ISSN: 1076-6294

DOI: 10.1089/mdr.2021.0363

Accession Number: WOS:000787115200001

Abstract: The burden of antimicrobial resistance (AMR) is considerable in many low- and middle-income countries (LMICs), and it is important to describe the antimicrobial stewardship program (ASP) activities found in these countries and report their impact. Importantly, as these programs target prescribing behavior, the factors influencing prescription of antimicrobials must also be taken into account. This scoping review aimed to (1) describe hospital-based ASP activities, (2) report methods used to measure the impact of ASPs, and (3) explore factors influencing antimicrobial prescribing behavior in LMICs. PubMed was searched from database inception until April 2021. Factors influencing antimicrobial prescribing behavior were canvassed using the Capability-Opportunity-Motivation and Behavior framework. Most of

ASP studies in LMICs were predominantly conducted in tertiary care and university-based hospitals. Audit of antimicrobial prescriptions with feedback and restrictive-based strategies was the main reported activity. Total antimicrobial consumption was the main method used to measure the impact of ASPs. Positive outcomes were observed for both clinical and microbiological outcomes; however, these were measured from nonrandomized controlled trials. Dominant factors identified through the behavioral framework were a limited awareness of AMR as a local problem, a perception that overprescription of antimicrobials had limited consequences and was mainly driven by a motivation to help improve patient outcomes. In addition, antimicrobial prescribing practices were largely influenced by existing hierarchy among prescribers. Our scoping review suggests that LMICs need to evaluate antimicrobial appropriateness as an added measure to assess impact. Furthermore, improvements in the access of microbiology and diagnostic facilities and ensuring ASP champions are recruited from senior prescribers will positively influence antimicrobial prescribing behavior, helping improve stewardship of antimicrobials in these countries.

Title: Barriers and Facilitators for Information Exchange during Over-The-Counter Consultations in Community Pharmacy: A Focus Group Study

Journal: Pharmacy

Volume: 5

Issue: 4

Date: Dec

Short Title: Barriers and Facilitators for Information Exchange during Over-The-Counter Consultations in Community Pharmacy: A Focus Group Study

DOI: 10.3390/pharmacy5040065

Accession Number: WOS:000419192100012

Abstract: Consumers are confident managing minor ailments through self-care, often self-medicating from a range of over-the-counter (OTC) medicines available from community pharmacies. To minimise risks, pharmacy personnel endeavour to engage in a consultation when consumers present with OTC enquiries however they find consumers resistant. The aim was to determine stakeholder perspectives regarding barriers and facilitators for information exchange during OTC consultations in community pharmacies and to understand the

elicited themes in behavioural terms. Focus groups were undertaken with community pharmacist, pharmacy assistant and consumer participants. Independent duplicate analysis of transcription data was conducted using inductive and framework methods. Eight focus groups involving 60 participants were conducted. Themes that emerged indicated consumers did not understand pharmacists' professional role, they were less likely to exchange information if asking for a specific product than if asking about symptom treatment, and they wanted privacy. Consumers were confident to self-diagnose and did not understand OTC medicine risks. Pharmacy personnel felt a duty of care to ensure consumer safety, and that with experience communication skills developed to better engage consumers in consultations. They also identified the need for privacy. Consumers need education about community pharmacists' role and responsibilities to motivate them to engage in OTC consultations. They also require privacy when doing so.

Short Title: Changes in self-determined motivation for exercise in people with mental illness participating in a community-based exercise service in Australia
ISSN: 0966-0410
DOI: 10.1111/hsc.13588
Accession Number: WOS:000704054800001
Abstract: Exercise has diverse benefits for physical and mental health in people with mental illness; however, it is unclear how to effectively promote exercise motivation in this group. The aim of this study is to evaluate the effectiveness of interventions utilising exercise instruction or behavioural counselling with people with mental illness to improve self-determined motivation for exercise, and physical and mental health. Participants were adults (aged 18+ years) receiving mental health services. Participants could choose from two 8-week programs comprising weekly group-based sessions delivered by an exercise physiologist: (a) exercise instruction in a gym (GYM) or (b) behavioural counselling (MOT). Self-determined motivation was measured using the Behaviour Regulations for Exercise Questionnaire (BREQ3). Physical health indicators included waist circumference, blood pressure, leg strength (sit-to-stand test), physical capacity (six-minute walk test) and self-reported exercise. Mental health was assessed using

the Kessler-6 scale of psychological distress. Most of the 95 participants chose exercise instruction (GYM = 60; MOT = 35). At baseline, participants who chose MOT had higher external motivation, body mass index, waist circumference and psychological distress, and a higher proportion had multiple physical comorbidities than those who chose GYM. More self-determined motivation was associated with meeting physical activity guidelines. Post-intervention, GYM participants had significant improvements in self-determined motivation, psychological distress and sit-to-stand test; MOT participants had significant improvements in integrated regulation, self-reported exercise and physical functioning. In conclusion, exercise instruction can improve self-determined motivation; however, more intensive behavioural counselling support may be needed to improve self-determined motivation. Counselling programs can increase exercise behaviour and may appeal more to people with poorer health and more external motivation. Findings have high ecological validity and applicability to real-world implementation of exercise interventions. To accommodate people with diverse conditions and motivations, motivational counselling should be combined with practical exercise support, and participants afforded the autonomy to decide their level of involvement.

Title: Knowledge, Attitudes and Practices toward Dengue Fever, Vector Control, and Vaccine Acceptance Among the General Population in Countries from Latin America and Asia Pacific: A Cross-Sectional Study (GEMKAP)

Journal: Vaccines

Volume: 11

Issue: 3

Date: Mar

Short Title: Knowledge, Attitudes and Practices toward Dengue Fever, Vector Control, and Vaccine Acceptance Among the General Population in Countries from Latin America and Asia Pacific: A Cross-Sectional Study (GEMKAP)

DOI: 10.3390/vaccines11030575

Article Number: 575

Accession Number: WOS:000968372800001

Abstract: Dengue represents a major public health concern. With effective vaccines in development, it is important to identify

motivational factors to maximize dengue vaccine uptake. A cross-sectional, quantitative, electronic survey was administered to a nationally representative adult population (n = 3800) in Argentina, Brazil, Colombia, Mexico, Indonesia, Malaysia, and Singapore. Willingness to vaccinate against dengue, and Knowledge, Attitudes, and Practices (KAP) toward dengue, vector control, prevention, and vaccination were determined. The Capability, Opportunity, Motivation for Behavior change (COM-B) framework was used to identify factors correlated with dengue vaccine(s) uptake. KAP scores (standardized, 0–100% scale) resulted in a low global score for Knowledge (48%) and Practice (44%), and a moderate score for Attitude (66%); scores were comparable across countries. Of all respondents, 53% had a high willingness (Score: 8–10/10) to vaccinate against dengue, which was higher (59%) in Latin America (Argentina, Brazil, Colombia, Mexico) than in Asia Pacific (40%) (Indonesia, Malaysia, Singapore). Key factors significantly ($p < 0.05$) associated with increased willingness to vaccinate included accessibility to the public (subsidies and incentives) and trust in the healthcare system and government. A common approach to dengue prevention across endemic countries—with some country-specific customization, including education, vaccination, and vector control (multi-pronged)—may reduce dengue burden and improve outcomes.

Title: Towards changing healthcare workers' behaviour: a qualitative study exploring non-compliance through appraisals of infection prevention and control practices

Journal: Journal of Hospital Infection

Volume: 90

Issue: 2

Pages: 126-134

Date: Jun

Short Title: Towards changing healthcare workers' behaviour: a qualitative study exploring non-compliance through appraisals of infection prevention and control practices

ISSN: 0195-6701

DOI: 10.1016/j.jhin.2015.01.023

Accession Number: WOS:000354577600006

Abstract: Background: Improving behaviour in infection prevention and control (IPC) practice remains a challenge, and understanding the determinants of healthcare workers' (HCWs) behaviour is

fundamental to develop effective and sustained behaviour change interventions. Aim: To identify behaviours of HCWs that facilitated non-compliance with IPC practices, focusing on how appraisals of IPC duties and social and environmental circumstances shaped and influenced non-compliant behaviour. This study aimed to: (1) identify how HCWs rationalized their own behaviour and the behaviour of others; (2) highlight challenging areas of IPC compliance; and (3) describe the context of the working environment that may explain inconsistencies in IPC practices. Methods: Clinical staff at a National Health Service hospital group in London, UK were interviewed between December 2010 and July 2011 using qualitative methods. Responses were analysed using a thematic framework. Findings: Three ways in which HCWs appraised their behaviour were identified through accounts of IPC policies and practices: (1) attribution of responsibilities, with ambiguity about responsibility for certain IPC practices; (2) prioritization and risk appraisal, which demonstrated a divergence in values attached to some IPC policies and practices; and (3) hierarchy of influence highlighted that traditional clinical roles challenged work relationships. Conclusions: Overall, behaviours are not entirely independent of policy rules, but often an amalgamation of local normative practices, individual preferences and a degree of professional isolation. Title: Physical Activity and Cardiac Self-Efficacy Levels During Early Recovery After Acute Myocardial Infarction: A Jordanian Study

Journal: Journal of Nursing Research

Volume: 29

Issue: 1

Date: Feb

Short Title: Physical Activity and Cardiac Self-Efficacy Levels During Early Recovery After Acute Myocardial Infarction: A Jordanian Study

ISSN: 1682-3141

DOI: 10.1097/jnr.0000000000000408

Accession Number: WOS:000616468600003

Abstract: Background Regular physical activity is important for patients with established coronary heart disease as it favorably influences their coronary risk profile. General self-efficacy is a powerful predictor of health behavior change that involves increases

in physical activity levels. Few studies have simultaneously measured physical activity and self-efficacy during early recovery after a first acute myocardial infarction (AMI). Purpose The aims of this study were to assess changes in objectively measured physical activity levels at 2 weeks (T2) and 6 weeks (T3) and self-reported cardiac self-efficacy at hospital discharge (T1) and at T2 and T3 in patients recovering from AMI. Methods A repeated-measures design was used to recruit a purposive sample of patients from a single center in Jordan who were diagnosed with first AMI and who did not have access to cardiac rehabilitation. A body-worn activity monitor (activPAL) was used to objectively measure free-living physical activity levels for 7 consecutive days at two time points (T2 and T3). An Arabic version of the cardiac self-efficacy scale was administered at T1, T2, and T3. Paired t tests and analysis of variance were used to examine differences in physical activity levels and cardiac self-efficacy scores, respectively. Results A sample of 100 participants was recruited, of which 62% were male. The mean age of the sample was 54.5 +/- 9.9 years. No statistically significant difference in physical activity levels was measured at 2 weeks (T2) and 6 weeks (T3). Cardiac self-efficacy scores improved significantly between T1, T2, and T3 across subscales and global cardiac self-efficacy. Conclusions/Implications for Practice Participants recovering from AMI in Jordan did not increase their physical activity levels during the early recovery phase, although cardiac self-efficacy scores improved. This may be because the increase in cardiac self-efficacy was not matched by the practical skills and knowledge required to translate this positive psychological construct into behavioral change. This study provides a first step toward understanding the complex relationship between cardiac self-efficacy and physical activity in this population. The authors hope that these findings support the design of culturally appropriate interventions to increase physical activity levels in this population.

Accession Number: WOS:000598752500003

Abstract: Marine Invasive Alien Species (IAS) can have devastating impacts on the environment, infrastructure and human well-being. Prevention measures, such as biosecurity, are essential to reducing the introduction and spread of IAS and are central to international and national IAS policy. Understanding the motivations of stakeholders can help determine the effectiveness of existing policy instruments on behaviour. 14 semi-structured interviews were conducted between two case study stakeholder groups in England and Wales (marine shellfish aquaculture industry and the recreational boating sector) in early 2018. Biosecurity practices were deeply embedded in the heavily regulated practices to control shellfish disease within the shellfish industry. Motivations to undertake biosecurity were driven by economic incentives, and penalties for non-compliance with legislation controlling disease. In contrast, there are little regulatory policy instruments to drive IAS biosecurity within the recreational boating sector, which instead relies heavily on voluntary instruments to motivate stakeholders and encourage behavioural changes. Behavioural changes, however, were restricted by lack of infrastructure and enforcement. Our findings suggest it is important to use a combination of approaches to achieve behavioural changes but recognising where regulations and penalties cannot be enforced, voluntary instruments are likely to be most effective. Existing social norms and investment into infrastructure should 'nudge' individuals into socially desirable behaviours, especially in the recreational boating sector. For policy makers and regulators, this research reveals the importance of tailoring biosecurity strategies to different stakeholder groups as motivations and collective experience differ.

Title: A qualitative formative evaluation of a patient facing intervention to improve care transitions for older people moving from hospital to home

Journal: Health Expectations

Volume: 25

Issue: 6

Pages: 2796-2806

Date: Dec

Short Title: A qualitative formative evaluation of a patient facing

intervention to improve care transitions for older people moving from hospital to home

ISSN: 1369-6513

DOI: 10.1111/hex.13560

Accession Number: WOS:000849546000001

Abstract: Background The Partners at Care Transitions (PACTs) intervention was developed to support older people's involvement in hospital to improve outcomes at home. A booklet, question card, record sheet, induction leaflet, and patient-friendly discharge letter support patients to be more involved in their health and wellbeing, medications, activities of daily living and post-discharge care. We aimed to assess intervention acceptability, identify implementation tools, and further develop the intervention. **Methods** This was a qualitative formative evaluation involving three wards from one hospital. We recruited 25 patients aged 75 years and older. Ward staff supported intervention delivery. Data were collected in wards and patients' homes, through semi-structured interviews, observation, and documentary analysis. Data were analysed inductively and iteratively with findings sorted according to the research aims. **Results** Patients and staff felt there was a need for, and understood the purpose of, the PACT intervention. Most patients read the booklet but other components were variably used. Implementation challenges included time, awareness, and balancing intervention benefits against risks. Changes to the intervention and implementation included clarifying the booklet's messages, simplifying the discharge letter to reduce staff burden, and using prompts and handouts to promote awareness. **Conclusion** The PACT intervention offers a promising new way to improve care transitions for older people by supporting patient involvement in their care. After further development of the intervention and implementation package, it will undergo further testing. **Patient or Public Contribution** This study regularly consulted a panel representing the local patient community, who supported the development of this intervention and its implementation.

Title: Assessing the Effectiveness and Acceptability of a Personalized Mobile Phone App in Improving Adherence to Oral Hygiene Advice in Orthodontic Patients: Protocol for a Feasibility Study and a Randomized Controlled Trial

Journal: Jmir Research Protocols

Volume: 10

Issue: 1

Date: Jan

Short Title: Assessing the Effectiveness and Acceptability of a Personalized Mobile Phone App in Improving Adherence to Oral Hygiene Advice in Orthodontic Patients: Protocol for a Feasibility Study and a Randomized Controlled Trial

ISSN: 1929-0748

DOI: 10.2196/18021

Article Number: 18021

Accession Number: WOS:000639613000044

Abstract: Background: Orthodontic treatment is a common health care intervention; treatment duration can be lengthy (2-3 years on average), and adherence to treatment advice is therefore essential for successful outcomes. It has been reported that up to 43% of patients fail to complete treatment, and there are currently no useful predictors of noncompletion. Given that the National Health Service England annual expenditure on primary-care orthodontic treatment is in excess of 200 pound million (US \$267 million), noncompletion of treatment represents a significant inefficient use of public resources. Improving adherence to treatment is therefore essential. This necessitates behavior change, and interventions that improve adherence and are designed to elicit behavioral change must address an individual's capability, opportunity, and motivation. Mobile phones are potentially an invaluable tool in this regard, as they are readily available and can be used in a number of ways to address an individual's capability, opportunity, and motivation. **Objective:** This study will assess the effectiveness and acceptability of a personalized mobile phone app in improving adherence to orthodontic treatment advice by way of a randomized controlled trial. **Methods:** This study will be conducted in 2 phases at the Eastman Dental Hospital, University College London Hospitals Foundation Trust. Phase 1 is feasibility testing of the My Braces app. Participants will be asked to complete the user version of the Mobile Application Rating Scale. The app will be amended following analysis of the responses, if appropriate. Phase 2 is a randomized controlled trial to test the effectiveness and acceptability of the My Braces app. **Results:** This study was approved by the London - Bloomsbury Research Ethics Committee on November 5, 2019 (reference 19/L0/1555). No patients have been recruited to date. The anticipated start date for recruitment to phase 1 is October 2020. **Conclusions:** Given the availability, affordability, and versatility of mobile phones, it is proposed that they will aid in improving adherence to treatment advice and hence improve treatment completion rates. If effective, the applicability of this methodology to developing behavior change/modification interventions and improving adherence to treatment across health care provides an exciting opportunity.

Article Number: 10901981211034738

Accession Number: WOS:000694822700001

Abstract: There are high rates of tobacco smoking among people who experience mental illness (MI). While videos are an effective method of disseminating health-related information, there is limited research investigating the effectiveness of video-delivered education promoting smoking cessation among people living with MI. This formative study aimed to investigate the effectiveness and acceptability of targeted video resources providing smoking cessation information and advice to smokers with MI. This study used a mixed-method design; 29 Australian smokers living with MI completed a preinterview survey including 12 questions assessing knowledge about smoking cessation, watched six videos developed by the research team providing information about smoking cessation, took part in semistructured interviews about the videos' quality, content, and format, and then completed a postinterview survey identical to the preinterview survey to assess changes in smoking cessation-related knowledge. A Wilcoxon signed rank test was used to calculate changes in cessation-related knowledge, and thematic analysis was used to identify common themes in qualitative data. We found a statistically significant increase in participants' smoking cessation-related knowledge scores after watching the videos. Participants indicated an overall high level of acceptability of the videos' quality, content, and format, and findings from the semistructured interviews reflected these favorable views. This study's findings provide a new understanding of the effectiveness and acceptability of customized video-based education to promote smoking cessation among people living with MI, and can be used to inform the content and focus of video resources aimed at increasing knowledge about smoking cessation for people experiencing MI.

Issue: 4

Pages: 233-243

Date: Dec

Short Title: Systematic Review of Clinician-Reported Barriers to Provision of Smoking Cessation Interventions in Hospital Inpatient Settings

DOI: 10.1017/jsc.2017.25

Accession Number: WOS:000448123600007

Abstract: Background: Although the hospital inpatient setting arguably provides an ideal opportunity to engage patients in smoking cessation interventions, this is done infrequently. We therefore aimed to systematically review the perceived barriers to the implementation of smoking cessation interventions in the hospital inpatient setting. Methods: A systematic literature search was conducted specific to hospital-based healthcare workers' perceived barriers to implementing smoking cessation interventions. Reported barriers were categorised using the capability, opportunity and motivation (COM-B) framework. Results: Eighteen studies were selected for inclusion, which consisted of cross-sectional surveys and interviews. The most commonly identified barrier in capability was lack of knowledge (56% of studies); in Opportunity, it was a lack of time (78%); while in Motivation, a lack of perceived patient motivation to quit smoking (44%). Seventeen other barriers were also endorsed, but less frequently. Conclusion: Healthcare workers report a plethora of barriers to providing smoking cessation interventions in hospital settings, which cover all aspects of the COM-B framework. These impediments need to be addressed in a multidisciplinary approach, at clinical, educational, and administrative levels, to improve intervention provision.

Short Title: How is success achieved by individuals innovating for patient safety and quality in the NHS?

DOI: 10.1186/s12913-017-2589-1

Article Number: 640

Accession Number: WOS:000410192500003

Abstract: Background: Innovation in healthcare is said to be notoriously difficult to achieve and sustain yet simultaneously the health service is under intense pressure to innovate given the ever increasing demands placed upon it. Whilst many studies have looked at diffusion of innovation from an organisational perspective, few have sought to understand how individuals working in healthcare innovate successfully. We took a positive deviance approach to understand how innovations are achieved by individuals working in the NHS. Method: We conducted in depth interviews in 2015 with 15 individuals who had received a national award for being a successful UK innovator in healthcare. We invited only those people who were currently (or had recently) worked in the NHS and whose innovation focused on improving patient safety or quality. Thematic analysis was used. Findings: Four themes emerged from the data: personal determination, the ability to broker relationships and make connections, the ways in which innovators were able to navigate organisational culture to their advantage and their ability to use evidence to influence others. Determination, focus and persistence were important personal characteristics of innovators as were skills in being able to challenge the status quo. Innovators were able to connect sometimes disparate teams and people, being the broker between them in negotiating collaborative working. The culture of the organisation these participants resided in was important with some being able to use this (and the current patient safety agenda) to their advantage. Gathering robust data to demonstrate their innovation had a positive impact and was seen as essential to its progression. Conclusions: This paper reveals a number of factors which are important to the success of innovators in healthcare. We have uncovered that innovators have particular personal traits which encourage a propensity towards change and action. Yet, for fruitful innovation to take place, it is important for relational networks and organisational culture to be receptive to change.

Abstract: Program theory, that is, the specific idea about how a program causes the intended or observed outcomes, should be the central aspect of any realist evaluation or synthesis. The methods used for explicating or building initial rough program theories (IRPTs) in realist research are varied and arguably often underreported. In addition, preexisting psychological and sociological theories, at a higher level of abstraction, could be used to a greater extent to inform their development. This article illustrates a method for building IRPTs for use in realist research evaluation and synthesis. This illustration involves showing how the IRPTs were developed in a realist evaluation concerning sexual health services for young people. In this evaluation, a broad framework of abstract theories was constructed early in the process to support IRPT building and frame more specific program theories as they were developed. These abstract theories were selected to support theorizing at macro-, meso-, and microlevels of social structure. This article discusses the benefits of using this method to build initial theories for particular types of interventions that are large, complex, and messy. It also addresses challenges relating to the selection of suitable theories.

Volume: 57

Issue: 3

Pages: 205-215

Date: Apr

Short Title: Activation Versus Change as a Principle Underlying Intervention Strategies to Promote Health Behaviors

ISSN: 0883-6612

DOI: 10.1093/abm/kaac045

Accession Number: WOS:000851541900001

Abstract: Background and Purpose Interventions are effective in promoting health behavior change to the extent that (a) intervention strategies modify targets (i.e., mechanisms of action), and (b) modifying targets leads to changes in behavior. To complement taxonomies that characterize the variety of strategies used in behavioral interventions, we outline a new principle that specifies how strategies modify targets and thereby promote behavior change. We distinguish two dimensions of targets—value (positive vs. negative) and accessibility (activation level)—and show that

intervention strategies operate either by altering the value of what people think, feel, or want (target change) or by heightening the accessibility of behavior-related thoughts, feelings, and goals (target activation). Methods and Results We review strategies designed to promote target activation and find that nudges, cue-reminders, goal priming, the question-behavior effect, and if-then planning are each effective in generating health behavior change, and that their effectiveness accrues from heightened accessibility of relevant targets. We also identify several other strategies that may operate, at least in part, via target activation (e.g., self-monitoring, message framing, anticipated regret inductions, and habits). Conclusions The Activation Vs. Change Principle (AVCP) offers a theoretically grounded and parsimonious means of distinguishing among intervention strategies. By focusing on how strategies modify targets, the AVCP can aid interventionists in deciding which intervention strategies to deploy and how to combine different strategies in behavioral trials. We outline a research agenda that could serve to further enhance the design and delivery of interventions to promote target activation.

Short Title: "I can't do it": A qualitative study exploring case and contact experiences with COVID-19 contact tracing

DOI: 10.1186/s12889-022-14265-8

Article Number: 1963

Accession Number: WOS:000871960000003

Abstract: Background Low engagement in contact tracing for COVID-19 dramatically reduces its impact, but little is known about how experiences, environments and characteristics of cases and contacts influence engagement. Methods We recruited a convenience sample of COVID-19 cases and contacts from the New Haven Health Department's contact tracing program for interviews about their contact tracing experiences. We analyzed transcripts thematically, organized themes using the Capability, Opportunity, Motivation, Behavior (COM-B) model, and identified candidate interventions using the linked Behavior Change Wheel Framework. Results We interviewed 21 cases and 12 contacts. Many felt physically or psychologically incapable of

contact tracing participation due to symptoms or uncertainty about protocols. Environmental factors and social contacts also influenced engagement. Finally, physical symptoms, emotions and low trust in and expectations of public health authorities influenced motivation to participate. Conclusion To improve contact tracing uptake, programs should respond to clients' physical and emotional needs; increase clarity of public communications; address structural and social factors that shape behaviors and opportunities; and establish and maintain trust. We identify multiple potential interventions that may help achieve these goals.

Title: Development of an inflammatory bowel disease (IBD) Patient-Reported Experience Measure (PREM): A patient-led consensus work and 'think aloud' study for a quality improvement programme

Journal: Health Expectations

Volume: 26

Issue: 1

Pages: 213-225

Date: Feb

Short Title: Development of an inflammatory bowel disease (IBD) Patient-Reported Experience Measure (PREM): A patient-led consensus work and 'think aloud' study for a quality improvement programme

ISSN: 1369-6513

DOI: 10.1111/hex.13647

Accession Number: WOS:000879184800001

Abstract: Background Patient-Reported Experience Measures (PREMs) are key in improving healthcare quality, but no PREM exists for inflammatory bowel disease (IBD). This study aimed to co-produce a PREM with IBD service users for IBD service evaluation and quality improvement programme. Methods A pool of 75 items was drawn from published survey instruments covering interactions with services and aspects of living with IBD. In Stage 1, during two workshops, eight expert service users reduced candidate items through a ranked-choice voting exercise and suggested further items. During Stage 2, 18 previously uninvolved people with IBD assessed the face and content validity of the candidate items in 'Think Aloud' interviews. During two final workshops (Stage 3), the expert service users removed, modified and added items based on the interview findings to produce a final version of the PREM. Results Stage 1 generated a draft working PREM mapped to the following four domains: Patient-Centred

Care; Quality; Accessibility; Communication and Involvement. The PREM included a set of nine items created by the expert group which shifted the emphasis from 'self-management' to 'living with IBD'. Stage 2 interviews showed that comprehension of the PREM was very good, although there were concerns about the wording, IBD-relevance and ambiguity of some items. During the final two workshops in Stage 3, the expert service users removed 7 items, modified 15 items and added seven new ones based on the interview findings, resulting in a 38-item PREM. Conclusions This study demonstrates how extensive service user involvement can inform PREM development. Patient or Public Contribution Patients were involved as active members of the research team and as research participants to co-produce and validate a PREM for IBD services. In Stage 1, eight expert service users ('the expert group') reduced candidate items for the PREM through a voting exercise and suggested new items. During Stage 2, 18 previously uninvolved people with IBD (the 'think aloud' participants) assessed the validity of the candidate items in 'Think Aloud' interviews as research participants. In Stage 3, the expert group removed, changed and added items based on the interview findings to produce a final version of the 38-item PREM. This study shows how service user involvement can meaningfully inform PREM development.

Short Title: What Is Dissemination and Implementation Science?: An Introduction and Opportunities to Advance Behavioral Medicine and Public Health Globally

ISSN: 1070-5503

DOI: 10.1007/s12529-020-09848-x

Accession Number: WOS:000516135500001

Abstract: There has been a well-documented gap between research (e.g., evidence-based programs, interventions, practices, policies,

guidelines) and practice (e.g., what is routinely delivered in real-world community and clinical settings). Dissemination and implementation (D&I) science has emerged to address this research-to-practice gap and accelerate the speed with which translation and real-world uptake and impact occur. In recent years, there has been tremendous development in the field and a growing global interest, but much of the introductory literature has been U.S.-centric. This piece provides an introduction to D&I science and summarizes key concepts and progress of the field for a global audience, provides two case studies that highlight examples of D&I research globally, and identifies opportunities and innovations for advancing the field of D&I research globally.

Short Title: A quality improvement project to standardise decontamination procedures in a single NHS board in Scotland

ISSN: 1757-1774

DOI: 10.1177/1757177420947477

Accession Number: WOS:000775101600006

Abstract: Background: A project was designed to improve decontamination procedures in our hospitals. This included: improving skills with training provided within clinical areas, simplifying procedures to reduce variation and increasing access to decontamination products. Aim: To make it easy for healthcare workers (HCWs) to do the right thing and for HCWs to be confident that they were doing the right thing. Methods: A pre-intervention survey of 120 HCWs in 10 wards on three hospital sites identified variations in the products used, variations in precautions taken and deficits in HCWs' capabilities due to unmet training needs.

Intervention: We streamlined the available products, provided an education programme and then undertook a second survey involving 133 HCWs in 12 wards. Results: Significant improvements were attained in the reported time taken to clean and disinfect ($P < 0.0001$) and in HCW capability ($P < 0.0001$) (reported training received); other improvements in the use of appropriate products and the use of

personal protective equipment were evident. The key finding was that a large, previously unrecognised, unmet training need existed; only 44% of HCWs in the pre-intervention survey reported having received training on the topic. Conclusion: The utility of a pre-intervention survey is critical to knowing whether any change becomes improvement and to set the priorities for change. By focusing on the process rather than the outcomes, greater improvements can be attained. The assumption that all nurses know how to clean is erroneous.

Short Title: Interventions for the prevention of adrenal crisis in
adults with primary adrenal insufficiency: a systematic review

ISSN: 0804-4643

DOI: 10.1530/eje-21-1248

Accession Number: WOS:000861744400002

Abstract: Objective: The incidence of adrenal crisis (AC) remains
high, particularly for people with primary adrenal insufficiency,
despite the introduction of behavioural interventions. The present
study aimed to identify and evaluate available evidence of
interventions aiming to prevent AC in primary adrenal insufficiency.

Design: This study is a systematic review of the literature and
theoretical mapping. Methods: MEDLINE, MEDLINE in Process, EMBASE,
ERIC, Cochrane CENTRAL, CINAHL, PsycINFO, the Health Management
Information Consortium and trial registries were searched from
inception to November 2021. Three reviewers independently selected
studies and extracted data. Two reviewers appraised the studies for
the risk of bias. Results: Seven observational or mixed methods
studies were identified where interventions were designed to prevent
AC in adrenal insufficiency. Patient education was the focus of all
interventions and utilised the same two behaviour change techniques,
'instruction on how to perform a behaviour' and 'pharmacological
support'. Barrier and facilitator themes aiding or hindering the
intervention included knowledge, behaviour, emotions, skills, social
influences and environmental context and resources. Most studies did
not measure effectiveness, and assessment of knowledge varied across
studies. The study quality was moderate. Conclusion: This is an
emerging field with limited studies available. Further research is
required in relation to the development and assessment of different

behaviour change interventions to prevent AC.

ISSN: 0003-9993

DOI: 10.1016/j.apmr.2022.07.004

Accession Number: WOS:000886977800020

Abstract: People with aphasia have been systematically excluded from stroke research or included without the necessary modifications, threatening external study validity. In this paper, we propose that 1) the inclusion of people with aphasia should be considered as standard in stroke research irrespective of discipline and that 2) modifications should be made to stroke research procedures to support people with aphasia to achieve meaningful and valid inclusion. We argue that outright exclusion of this heterogenous population from stroke research based purely on a diagnosis of aphasia is rarely required and present a rationale for deliberate inclusion of people with aphasia in stroke research. The purpose of this paper is fourfold: 1) to highlight the issue and implications of excluding people with aphasia from stroke research; 2) to acknowledge the current barriers to including people with aphasia in stroke research; 3) to provide stroke researchers with methods to enable inclusion, including recommendations, resources, and guidance; and 4) to consider research needed to develop aphasia inclusive practices in stroke research. Title: Interventions to change clinicians' behavior related to
suicide prevention care in the emergency department: a scoping
review

Journal: Jbi Evidence Synthesis

Volume: 20

Issue: 3

Pages: 788-846

Date: Mar

Short Title: Interventions to change clinicians' behavior related to
suicide prevention care in the emergency department: a scoping
review

DOI: 10.11124/jbies-21-00149

Accession Number: WOS:000844306000004

Abstract: Objective: The objective of this scoping review was to
explore, characterize, and map the literature on interventions and
intervention components implemented to change emergency department
clinicians' behavior related to suicide prevention using the
Behaviour Change Wheel as a guiding theoretical framework.

Introduction: An emergency department is a critical place for
suicide prevention, yet patients are often discharged without proper
suicide risk assessments or referrals. In response, we must support
emergency department clinicians' behavior change to follow evidence-
based suicide prevention strategies. However, reviews to date have
yet to systematically and theoretically examine the functional
mechanisms of interventions and how these characteristics can
influence emergency department clinicians' behaviors related to
suicide prevention care. Inclusion criteria: This review considered
interventions that targeted emergency department clinicians'
behavior change related to suicide prevention. Behavior change
referred to observable practice changes as well as proxy measures of
behavior change, including changes in knowledge and attitude.

Methods: This review followed JBI methodology for scoping reviews.
Searches included PubMed, PsycINFO, CINAHL, Embase, and gray
literature, including targeted Google searches for relevant
organizations/websites, ProQuest Dissertations and Theses Global,
and Scopus conference papers (using a specific filter). This review
did not apply any date limits, but our search was limited to the
English language. Data extraction was undertaken using a charting
table developed specifically for the review objective. Narrative

descriptions of interventions were coded using the Behaviour Change Wheel's intervention functions. Reported outcome measures were categorized. Findings were tabulated and synthesized narratively. Results: This review included a total of 70 sources, describing 66 different interventions. Forty-one studies were included from the database searches, representing a mixture of experimental (n = 2), quasi-experimental (n = 24), non-experimental (n = 12), qualitative (n = 1), and mixed methods (n = 2) approaches. An additional 29 citations were included from gray literature searches. One was a pilot mixed methods study, and the rest were interventions. Identified interventions comprised a wide range of Behaviour Change Wheel intervention functions to change clinicians' behavior: education (n = 48), training (n = 40), enablement (n = 36), persuasion (n = 21), environmental restructuring (n = 18), modeling (n = 7), and incentivization (n = 2). Based on the Behaviour Change Wheel analysis, many interventions targeted more than one determinant of behavior change, often employing education and training to improve clinicians' knowledge and skills simultaneously. Among the 42 studies that reported outcome measures, effectiveness was measured at clinician (n = 38), patient (n = 4), or organization levels (n = 6). Few studies reported implementation outcomes, such as measures of reach (n = 4), adoption (n = 5), or fidelity (n = 1). There were no evaluation data reported on the interventions identified through Google searches. Conclusions: Interventions included in this review were diverse and leveraged a range of mechanisms to change emergency department clinicians' behavior. However, most interventions relied solely on education and/or training to improve clinicians' knowledge and/or skills. Future research should consider diverse intervention functions to target both individual- and organization-level barriers for a given context. The ultimate goal for changing emergency department clinicians' behavior is to improve patient health outcomes related to suicide-related thoughts and behaviors; however, current research has most commonly evaluated clinicians' behavior in isolation of patient outcomes. Future studies should consider reporting patient-level outcomes alongside clinician-level outcomes.

Short Title: Interventions to change clinicians' behavior in relation to suicide prevention care in the emergency department: a scoping review protocol

DOI: 10.11124/jbies-20-00307

Accession Number: WOS:000696252700018

Abstract: Objective: This review aims to explore, characterize, and map the literature on interventions implemented to change emergency department clinicians' behavior related to suicide prevention using the Behavior Change Wheel as a guiding theoretical framework.

Introduction: An emergency department is a critical place for suicide prevention, yet many patients who present with suicide-related thoughts and behaviors are discharged without proper assessment or appropriate treatment. Supporting clinicians (who provide direct clinical care, including nurses, physicians, and allied health professionals) to make the desired behavior change following evidence-based suicide prevention care is an essential step toward improving patient outcomes. However, reviews to date have yet to take a theoretical approach to investigate interventions implemented to change clinicians' behavior. Inclusion criteria: This review will consider literature that includes interventions that target emergency department clinicians' behavior related to suicide prevention. Behavior change refers to observable practice changes as well as proxy measures of behavior change, including knowledge and attitudes. There are many ways in which an intervention can change clinicians' behavior (eg, education, altering service delivery). This review will include a wide range of interventions that target behavior change regardless of the type, but will exclude interventions that exclusively target patients. Methods: Multiple databases will be searched: PubMed, PsycINFO, CINAHL, and Embase. We will also include gray literature, including Google search, ProQuest Dissertations and Theses Global, and Scopus conference papers. Full texts of included studies will be reviewed, critically appraised, and extracted. Extracted data will be coded to identify intervention functions using the Behavior Change Wheel. Findings will be summarized in tables accompanied by narrative reports.

Short Title: Information and communication technology-based interventions for suicide prevention implemented in clinical settings: a scoping review protocol

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2021-056232

Article Number: e056232

Accession Number: WOS:000749001500023

Abstract: Introduction There is a surplus of information and communication technology (ICT)-based interventions for suicide prevention. However, it is unclear which of these ICT-based interventions for suicide prevention have been implemented in clinical settings. Furthermore, evidence shows that implementation strategies have often been mismatched to existing barriers. In response, the authors recognise the critical need for prospectively assessing the barriers and facilitators and then strategically developing implementation strategies. This review is part of a multiphase project to develop and test tailored implementation strategies for mobile app-based suicide prevention in clinical settings. The overall objective of this scoping review is to identify and characterise ICT-based interventions for all levels of suicide prevention in clinical settings. Additionally, this review will identify and characterise the barriers and facilitators to implementing these ICT-based interventions as well as reported measures and outcomes. The findings will directly inform the subsequent phase to maximise implementation and inform future efforts for implementing other types of ICT-based interventions related to suicide prevention in clinical settings. Methods and analysis This review will adhere to the methods described by the Joanna Briggs Institute for conducting scoping reviews. The reporting will follow the Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for scoping review checklist. The following databases will be searched: Medline, PsycInfo, Embase, Cumulative Index to Nursing & Allied Health Literature (CINAHL), Web of Science and Library, Information Science & Technology Abstracts (LISTA). Two reviewers will independently screen the articles and extract data using a standardised data collection tool. Then, authors will characterise extracted data using frameworks, typology and taxonomies to address the proposed review questions. Ethics and dissemination Ethics approval is not required for this scoping review. Authors will share the results in a peer-reviewed, open access publication and conference presentations. Furthermore, the findings will be shared with relevant health organisations through lay language summaries and informal presentations.

Short Title: Care Bundle to Improve Oxygen Maintenance and Events

DOI: 10.1097/pq9.0000000000000639

Article Number: e639

Accession Number: WOS:000948616600003

Abstract: Introduction:Prolonged periods spent outside the target range of oxygen saturation (SpO₂) in preterm infants, along with frequent desaturation events, predispose them to retinopathy of prematurity (ROP) and long-term neurodevelopmental impairment. The primary aim of this study was to increase the mean time spent within the target SpO₂ range (WTR) by 10% and to reduce the frequency of desaturation events by 5 events per patient day, respectively, within 18 months of implementing a care bundle. Methods:This study was completed in a 46-bed neonatal intensive care unit (NICU), involving 246 staff members and led by a quality improvement team. The change interventions included implementing new practice guidelines, reviewing daily summaries of SpO₂ maintenance, daily infant wellness assessment, standardizing workflow, and responding to SpO₂ alarms. In addition, we collected staff satisfaction and compliance with change interventions, resource use, and morbidity and mortality data at discharge. Results:The mean time spent WTR increased from 65.3% to 75.3%, and the frequency of desaturation events decreased from 25.1 to 16.5 events per patient day, respectively, with a higher magnitude of benefit in infants on days with supplemental oxygen. Postimplementation, the duration of high-frequency ventilation and supplemental oxygen were lower, but morbidity and mortality rates were similar. Staff satisfaction with training workshops, coaching, use of the infant wellness assessment tool, and SpO₂ alarm management algorithms were 74%, 82%, 80%, and 74%, respectively. Conclusion:Implementing a care bundle to improve oxygen maintenance and reduce desaturation events increased the time spent WTR and reduced the frequency of desaturation events.

Abstract: Introduction During the COVID-19 pandemic music therapy managers in hospitals were responsible for supporting their teams through relentless planning and implementation of change, including working virtually and in-person. The Creative Arts Therapies Managers' Network was established as a group of eight music therapy managers to formulate and appraise thinking and generate and refine meaningful constructs to sustain their own capacities as managers. Method Weekly meetings for the period April to July 2020 were recorded, transcribed and analyzed to generate themes that reflected these managers' early pandemic experiences. Results Each manager used these themes as a basis for reflection to write stories that represented their lived experiences in that period. Discussion These stories are discussed using theoretical constructs which inform them, including aspects of identity, moral dilemmas, relentless uncertainty, and resilience in response to uncertainty. These stories and underpinning considerations illuminate previously unexplored experiences of music therapy managers in hospitals. Short Title: Promoting and Maintaining Changes in Smoking Behavior for Patients Following Discharge from a Smoke-free Mental Health Inpatient Stay: Development of a Complex Intervention Using the Behavior Change Wheel

ISSN: 1462-2203

DOI: 10.1093/ntr/ntac242

Accession Number: WOS:000892016600001

Abstract: Introduction Evidence suggests that smokers can successfully quit, remain abstinent or reduce smoking during a smoke-free mental health inpatient stay, provided behavioral/ pharmacological support are offered. However, few evidence-based strategies to prevent the return to prehospital smoking behaviors post-discharge exist. Aims and Methods We report the development of an intervention designed to support smoking-related behavior change following discharge from a smoke-free mental health stay. We followed the Behavior Change Wheel (BCW) intervention development process. The target behavior was supporting patients to change their smoking behaviors following discharge from a smoke-free mental health stay. Using systematic reviews, we identified the barriers and enablers, classified according to the Theoretical Domains Framework (TDF). Potential intervention functions to address key influences were identified by consulting the BCW and Behavior Change Technique (BCT) taxonomy. Another systematic review identified effectiveness of BCTs in this context. Stakeholder consultations were conducted to prioritize and refine intervention content. Results Barriers and enablers to supporting smoking cessation were identified within the domains of environmental context and resources (lack of staff time); knowledge (ill-informed interactions about smoking); social influences, and intentions (lack of intention to deliver support). Potential strategies to address these influences included goal setting, problem-solving, feedback, social support, and information on health consequences. A strategy for operationalizing these techniques into intervention components was agreed upon: Pre-discharge evaluation sessions, a personalized resource folder, tailored behavioral and text message support post-discharge, and a peer interaction group, delivered by a trained mental health worker. Conclusions The intervention includes targeted resources to support smoking-related behavior change in patients following discharge from a smoke-free mental health setting. Implications Using the BCW and TDF supported a theoretically and empirically informed process to define and develop a tailored intervention that acknowledges barriers and enablers to supporting smoking cessation in mental health settings. The result is a novel complex theory- and evidence-based intervention that will be formally tested in a randomized controlled feasibility study.

Title: Broken biosecurity? Veterinarians' framing of biosecurity on
dairy farms in England

Journal: Preventive Veterinary Medicine

Volume: 132

Pages: 20-31

Date: Sep

Short Title: Broken biosecurity? Veterinarians' framing of
biosecurity on dairy farms in England

ISSN: 0167-5877

DOI: 10.1016/j.prevetmed.2016.06.001

Accession Number: WOS:000384867800003

Abstract: There is seen to be a need for better biosecurity – the control of disease spread on and off farm – in the dairy sector. Veterinarians play a key role in communicating and implementing biosecurity measures on farm, and little research has been carried out on how veterinarians see their own and farmers' roles in improving biosecurity. In order to help address this gap, qualitative interviews were carried out with 28 veterinarians from Royal College of Veterinary Surgeon farm accredited practices in England. The results were analysed using a social ecology framework and frame analysis to explore not only what barriers vets identified, but also how vets saw the problem of inadequate biosecurity as being located. Veterinarians' frames of biosecurity were analysed at the individual, interpersonal and contextual scales, following the social ecology framework, which see the problem in different ways with different solutions. Farmers and veterinarians were both framed by veterinarians as individualised groups lacking consistency. This means that best practice is not spread and veterinarians are finding it difficult to work as a group to move towards a "predict and prevent" model of veterinary intervention. But diversity and individualism were also framed as positive and necessary among veterinarians to the extent that they can tailor advice to individual farmers. Veterinarians saw their role in educating the farmer as not only being about giving advice to farmers, but trying to convince the farmer of their perspective and values on disease problems. Vets felt they were meeting with limited success because vets and farmers may be emphasising different framings of biosecurity. Vets emphasise the individual and interpersonal frames that disease problems are a problem on farm that can and should be controlled by individual farmers working with vets. According to vets, farmers may emphasise the contextual frame that biosecurity is largely outside of their control on dairy farms

because of logistical, economic and geographical factors, and so some level of disease on dairy farms is not entirely unexpected or controllable. There needs to be a step back within the vet-farmer relationship to realise that there may be different perspectives at play, and within the wider debate to explore the question of what a biosecure dairy sector would look like within a rapidly changing agricultural landscape. Short Title: Speech language pathologists' practice with children of parents with an acquired communication disability: A preliminary study

ISSN: 1443-9646

DOI: 10.1017/BrImp.2020.11

Accession Number: WOS:000847208900002

Abstract: Background: Parental acquired communication disability has long-lasting impacts on children, including increased child stress and behavioural problems. However, speech-language pathologists' (SLPs) current practice in providing information, education and counselling support to these children is unknown. Therefore, we explored SLPs' perceived needs, current practices and barriers and facilitators to working with children of people with acquired communication disability (PwCD). Methods: An online survey sought information on Australian SLPs' current practices in providing education and counselling to children of PwCD. Perceived barriers and facilitators were mapped to the COM-B, a model that considers Capability, Opportunity and Motivation as domains that influence behaviour. Results: 75% of participants (n = 76) perceived a need to provide both information and counselling, but 'never' or 'rarely' provided either aspect of care. Barriers relating to 'Opportunity' were most frequently identified, such as not having access to children in therapy and lack of parental support/engagement. Capability (e.g., knowledge and skills) and Motivation

(e.g., confidence) barriers were also identified. Conclusions: There is potential for SLPs to provide services to children of PwCD either directly through information and/or counselling-type interactions or indirectly through referral to other services. This study highlights the need for more research into these areas of practice.

Title: Impact of COVID-19 School-Related Policies in Ontario on Parents' School Lunch Packing Habits

Journal: Canadian Journal of Dietetic Practice and Research

Volume: 84

Issue: 1

Pages: 10-16

Date: Mar

Short Title: Impact of COVID-19 School-Related Policies in Ontario on Parents' School Lunch Packing Habits

ISSN: 1486-3847

DOI: 10.3148/cjdpr-2022-022

Accession Number: WOS:000972447200003

Abstract: Purpose: COVID-19 has disrupted the daily routines of many Canadian families. In Ontario, provincially mandated public health measures have resulted in significant changes to school policies, including those related to food. The impact of COVID-19 related school food policies on parental lunch packing habits is unknown; therefore, this study investigated how school-related COVID-19 policies have impacted parental school lunch packing habits.

Methods: Parents (N = 287) of school-aged children were recruited from parent-specific Facebook groups across Ontario, Canada, to complete an online survey regarding lunch packing habits. This survey was developed based on findings from a previously conducted scoping review. Open-ended survey responses were inductively

analyzed. Results: Three over-arching themes were constructed: (1) Food Programs and COVID-19; (2) Schedule Changes; and (3) School Policy Changes. Parents explained that the cancellation or modification of food programs at schools, changes to the length of time children are given to eat at school, and removal of access to microwaves, garbage cans, and teacher assistance during lunch have forced parents to change their lunch packing habits.

Conclusion: Findings from this study demonstrate a need for better support to help ease the burden parents experience when packing their child's school lunch, during an already extremely stressful time.

Title: Therapeutic Inertia in Prescribing Biologics for Patients with Moderate-to-Severe Asthma: Workshop Summary

Journal: Patient Preference and Adherence

Volume: 15

Pages: 705-712

Short Title: Therapeutic Inertia in Prescribing Biologics for Patients with Moderate-to-Severe Asthma: Workshop Summary

ISSN: 1177-889X

DOI: 10.2147/ppa.S303841

Accession Number: WOS:000638110700001

Abstract: Moderate-to-severe asthma represents about a quarter of the nearly 10% of Americans diagnosed with asthma. Many patients with moderate-to-severe asthma have uncontrolled symptoms that lead to exacerbations requiring oral corticosteroids. There are many factors contributing to poor asthma control, including poor adherence to prescribed therapies, the under-prescribing of biologics and therapeutic inertia. We convened an eight-member panel from fields of primary care, pulmonology, immunology, health services and clinical research, behavioral science and pharmaceutical medical affairs, with the goal of identifying contributing factors and solutions to therapeutic inertia with asthma biologics. We used the Capability, Opportunity, and Motivation (COM-B) model to classify patient and provider behavior towards therapeutic inertia. The model incorporates existing behavior theories and is driven by the interaction of capability, opportunity, and motivation. We used a Delphi method to identify and develop six primary solutions: 1) integration of patient-centered outcomes into asthma management practice; 2) provider education about asthma treatment; 3) moderate-to-severe asthma care delivery redesign; 4) harmonized, evidence-based protocol for the management of moderate-to-severe asthma; 5) designated coordinator approach for optimal asthma management; and 6) a case coordination digital support tool. Integration of patient-centered outcomes into asthma management practice and provider education were identified as having the highest potential to impact therapeutic and clinical inertia. The COM-B model is effective in identifying improvement within therapeutic inertia targeting the capabilities, opportunities, and motivations of patients, providers, and payer systems.

Short Title: Consumer Acceptance of Alternative Proteins: A Systematic Review of Current Alternative Protein Sources and Interventions Adapted to Increase Their Acceptability

DOI: 10.3390/su142215370

Article Number: 15370

Accession Number: WOS:000887629400001

Abstract: Conventional meat consumption has triggered an environmental burden along with effects on different disease spectrums according to existing research. The dietary patterns adopted by consumers significantly impact both planetary and individual health. Interventions are needed to support the protein transition. However, there is not yet an overview of interventions towards acceptance of novel proteins available. This systemic review highlights different varieties of alternative proteins and interventions adopted to increase the acceptance of alternative protein sources. Educational intervention, persuasion, training, and modeling approaches are summarized in this review. Furthermore, behavioral models triggering the consumer's response towards different alternative proteins are also discussed. The systemic review highlights that consumer acceptance varies among different alternative proteins. Food choice motives, familiarity, food neophobia, disgust, and cultural norms are among the various drivers of consumer acceptance. A comparison of these drivers indicates inconsistencies, presenting the need for future research.

Short Title: Advancing Australian public health initiatives targeting dementia risk reduction

ISSN: 1440-6381

DOI: 10.1111/ajag.13049

Accession Number: WOS:000762928100001

Abstract: Public health initiatives aim to improve health outcomes for populations by preventing disease and ill-health consequences of environmental hazards and natural or human-made disasters. Whilst public health initiatives have been used successfully to modify behaviours for chronic diseases, many initiatives targeting reduced dementia risk in older adults suffer from conceptual and statistical flaws that greatly limit their usefulness. The limited success in modifying lifestyle dementia risk factors has led us to fall short in building a successful roadmap to dementia risk reduction. Here we argue for adopting a population-level, holistic approach to dementia risk reduction strategies across the lifespan. This approach is supplemented by 10 strategies that focus on improving social policies, harnessing existing policy, legislature and incentive schemes, and identifying feasible approaches to increase recreational and transport-related physical activity to creating best practice health care that supports healthy brain ageing for all.

Short Title: Toward a theory-based specification of non-pharmacological treatments in aging and dementia: Focused reviews and methodological recommendations

ISSN: 1552-5260

DOI: 10.1002/alz.12188

Accession Number: WOS:000623284000010

Abstract: Introduction: Non-pharmacological treatments (NPTs) have the potential to improve meaningful outcomes for older people at risk of, or living with dementia, but research often lacks methodological rigor and continues to produce mixed results.

Methods: In the current position paper, experts in NPT research have specified treatment targets, aims, and ingredients using an umbrella framework, the Rehabilitation Treatment Specification System.

Results: Experts provided a snapshot and an authoritative summary of the evidence for different NPTs based on the best synthesis efforts, identified main gaps in knowledge and relevant barriers, and provided directions for future research. Experts in trial methodology provide best practice principles and recommendations for those working in this area, underscoring the importance of prespecified protocols. Discussion: We conclude that the evidence strongly supports various NPTs in relation to their primary targets, and discuss opportunities and challenges associated with a unifying theoretical framework to guide future efforts in this area.

Short Title: Predictors of physical activity promotion in clinical practice: a cross-sectional study among medical doctors

DOI: 10.1186/s12909-022-03686-z

Article Number: 624

Accession Number: WOS:000842539100002

Abstract: Background Physical activity is a major determinant of physical and mental health. International recommendations identify health professionals as pivotal agents to tackle physical inactivity. This study sought to characterize medical doctors' clinical practices concerning the promotion of patients' physical activity, while also exploring potential predictors of the frequency and content of these practices, including doctors' physical activity level and sedentary behaviours. Methods A cross-sectional study assessed physical activity promotion in clinical practice with a self-report questionnaire delivered through the national medical prescription software (naturalistic survey). Physical activity and sedentary behaviours were estimated using the International Physical Activity Questionnaire (short form). Indicators of medical doctors' attitudes, knowledge, confidence, barriers, and previous training concerning physical activity promotion targeting their patients were also assessed. Multiple regression analysis was performed to identify predictors of physical activity promotion frequency by medical doctors, including sociodemographic, attitudes and knowledge-related variables, and physical activity behaviours as independent variables. Results A total of 961 medical doctors working in the Portuguese National Health System participated (59% women, mean age 44 +/- 13 years) in the study. The majority of the participants (84.6%) reported to frequently promote patients' physical activity. Five predictors of physical activity promotion frequency emerged from the multiple regression analysis, explaining 17.4% of the dependent variable ($p < 0.001$): working in primary healthcare settings ($p = 0.037$), having a medical specialty ($p = 0.030$), attributing a high degree of relevance to patients' physical activity promotion in healthcare settings ($p < 0.001$), being approached by patients to address physical activity ($p < 0.001$), and having higher levels of physical activity ($p = 0.001$). Conclusions The sample of medical doctors approached reported a high level of engagement with physical activity promotion. Physical activity promotion frequency seems to be influenced by the clinical practice setting, medical career position and specialty, attitudes towards physical activity, and perception of patients' interest on the

topic, as well as medical doctors' own physical activity levels.

Article Number: e14886

Accession Number: WOS:000814898200001

Abstract: Aim Globally, type 2 diabetes care is often fragmented and still organised in a provider-centred way, resulting in suboptimal care for many individuals. As healthcare systems seek to implement digital care innovations, it is timely to reassess stakeholders' priorities to guide the redesign of diabetes care. This study aimed to identify the needs and wishes of people with type 2 diabetes, and specialist and primary care teams regarding optimal diabetes care to explore how to better support people with diabetes in a metropolitan healthcare service in Australia. Methods Our project was guided by a Participatory Design approach and this paper reports part of the first step, identification of needs. We conducted four focus groups and 16 interviews (November 2019-January 2020) with 17 adults with type 2 diabetes and seven specialist clinicians from a diabetes outpatient clinic in Brisbane, Australia, and seven primary care professionals from different clinics in Brisbane. Data were analysed using reflexive thematic analysis, building on the Capability, Opportunity, Motivation and Behaviour model. Results People with diabetes expressed the wish to be equipped, supported and recognised

for their efforts in a holistic way, receive personalised care at the right time and improved access to connected services. Healthcare professionals agreed and expressed their own burden regarding their challenging work. Overall, both groups desired holistic, personalised, supportive, proactive and coordinated care pathways. Conclusions We conclude that there is an alignment of the perceived needs and wishes for improved diabetes care among key stakeholders, however, important gaps remain in the healthcare system.

Title: Factors influencing participants' engagement with an interactive text-message intervention to improve sun protection behaviors: "SunText" randomized controlled trial

Journal: Translational Behavioral Medicine

Volume: 12

Issue: 3

Pages: 433-447

Date: Mar

Short Title: Factors influencing participants' engagement with an interactive text-message intervention to improve sun protection behaviors: "SunText" randomized controlled trial

ISSN: 1869-6716

DOI: 10.1093/tbm/ibab135

Accession Number: WOS:000764671300001

Abstract: There is growing evidence suggesting that text-message-based interventions are effective to promote sun protection behaviors. However, it is still unclear how engagement and adherence with the intervention messages can be optimized through intervention design. This study evaluated the effect of different combinations of personalized and two-way interactive messages on participant engagement with a theory-based skin cancer prevention intervention. In the SunText study conducted in February-July 2019 in Queensland, Australia participants 18-40 years were randomized to four different text message schedules using a Latin square design. This study analyzed if the order and intensity in which the schedules were received were associated with participants' level of engagement, and if this differed by demographic factors. Out of the 389 participants enrolled in the study, 375 completed the intervention period and remained for analysis. The overall intervention engagement rate was

71% and decreased from the beginning to the end of the study (82.2%–61.4%). The group starting with personalized, but not interactive messaging showed the lowest engagement rate. The intervention involving interactive messages three times a week for 4 weeks achieved the highest engagement rate. The intervention with increasing frequency (personalized and interactive three times a week for 2 weeks; then daily for 2 weeks) had lower engagement than intervention with constant or decreasing frequency. Engagement with two-way interactive messages was high across all intervention groups. Results suggest enhanced engagement with constant or decreasing message frequency compared to increasing frequency. Notes: Silva, Carina, V Horsham, Caitlin Kou, Kou Baade, Peter Soyer, H. Short Title: "Follow the Whistle: Physical Activity Is Calling You": Evaluation of Implementation and Impact of a Portuguese Nationwide Mass Media Campaign to Promote Physical Activity

DOI: 10.3390/ijerph17218062

Article Number: 8062

Accession Number: WOS:000589130700001

Abstract: To raise perceived capability (C), opportunity (O) and motivation (M) for physical activity (PA) behaviour (B) among adults, the Portuguese Directorate-General of Health developed a mass media campaign named "Follow the Whistle", based on behaviour change theory and social marketing principles. Comprehensive formative and process evaluation suggests this media-led campaign used best-practice principles. The campaign adopted a population-wide approach, had clear behavioural goals, and clear multi-strategy implementation. We assessed campaign awareness and initial impact using pre (n = 878, 57% women) and post-campaign (n = 1319, 58% women) independent adult population samples via an online questionnaire, comprising socio-demographic factors, campaign

awareness and recall, and psychosocial and behavioural measures linked to the COM-B model. PA was assessed with IPAQ and the Activity Choice Index. The post-campaign recall was typical of levels following national campaigns (24%). Post-campaign measures were higher for key theory-based targets (all $p < 0.05$), namely self-efficacy, perceived opportunities to be more active and intrinsic motivation. The impact on social norms and self-efficacy was moderated by campaign awareness. Concerning PA, effects were found for vigorous activity ($p < 0.01$), but not for incidental activity. Overall the campaign impacted key theory-based intermediate outcomes, but did not influence incidental activity, which highlights the need for sustained and repeated campaign efforts.

Short Title: Current and Long-Term Physical Activity Among Adults with Multiple Sclerosis in the United States: COM-B Variables as Explanatory Factors

ISSN: 1070-5503

DOI: 10.1007/s12529-020-09946-w

Accession Number: WOS:000606304100002

Abstract: Background Physical activity is an evidence-based, safe second-line approach for improved multiple sclerosis (MS) symptoms and disease progression. This study examined the contributions of Capability-Opportunity-Motivation-Behavior (COM-B) factors for understanding engagement in current and long-term physical activity among persons with MS in the United States (U.S.). Method Adults with MS in the U.S. (N = 854) completed an online survey that included questions regarding demographic and clinical characteristics, COM-B constructs, Godin Leisure Time Exercise

Questionnaire (GLTEQ), and Physical Activity Staging Questionnaire (PASQ). Participants were classified into groups based on the GLTEQ regarding current physical activity behavior and PASQ for long-term physical activity behavior. MANOVA and discriminant function analysis (DFA) identified COM-B constructs that differentiated physical activity groups. Results MANOVA analyses indicated that all COM-B constructs were significantly different for both GLTEQ current physical activity groups (Wilks's lambda = .5, $F(44, 1432) = 14.8$) and PASQ long-term physical activity groups (Wilks's lambda = .4, $F(44, 1464) = 16.9$) status except Information Provision. DFA analysis regarding GLTEQ identified a function including exclusively Capability and Motivation sources of behavior that differentiated current physical activity groups such as intention and self-efficacy. DFA for PASQ identified a different function of the Capability and Motivation sources of behavior that differentiated long-term physical activity groups; the primary differentiating variables were action control and intention. Conclusion Our results identify internal factors as the primary COM-B predictors of current and long-term physical activity among adults with MS in the U.S., and health promotion interventions may focus on assessing individual competencies and behavioral regulation for changing physical activity in MS.

ISSN: 0002-9637

DOI: 10.4269/ajtmh.20-1634

Accession Number: WOS:000727213500015

Abstract: Sharing of sanitation is common in low-income settlements in Sub-Saharan Africa. However, shared (limited) sanitation facilities have been thought to pose health risks due to poor hygiene levels. Interventions to improve user behavior and cleanliness of shared sanitation are few, both in literature and in practice. This study details the codesign and testing of strategies to improve the cleanliness of shared sanitation facilities in low-income areas of Kisumu City in Kenya. The strategies included a

cleaning plan, monitoring system, and discussions among users, and were codesigned through workshops with stakeholders and group discussions with landlords and tenants. These strategies were tested in 38 compound houses through the Trials of Improved Practices approach over a 5-month period. Field staff visited the compounds, observed the cleanliness of the shared toilets, and through discussions, encouraged users to develop a formal cleaning system and a monitoring plan. The discussions built social capital and collective action and facilitated uptake of the cleaning plan with notable improvements in cleanliness of shared toilets. The results support the acceptability of shared sanitation in low-income settlements, the importance of codesigning and coproducing solutions with users, and the need to evaluate the effects of these strategies on cleanliness of shared sanitation.

DOI: 10.1186/s12889-020-09768-1

Article Number: 1632

Accession Number: WOS:000583179700001

Abstract: Background The sharing of sanitation facilities is a common practice in low-income areas in sub-Saharan Africa. However, shared sanitation is currently categorized as a limited sanitation service, and may therefore not count towards meeting the global goals. These shared facilities are often the only option available for most residents in low-income settlements, and improving their cleanliness and overall management is key to reducing open defecation and risk of disease. This study sought to investigate barriers and opportunities for improved cleanliness of shared sanitation facilities in low-income settlements of Kisumu city, Kenya. Methods Thirty-nine in-depth interviews and 11 focus group discussions were held with residents – mainly tenants and landlords – of a low-income settlement in Kisumu. Analysis followed a thematic approach to define the problem, specify the target behaviour and identify the changes needed. Results Sanitation facilities were

mainly pit latrines, typically shared among landlords and tenants. Participants singled out behavioural (poor use of the shared toilets) and social (lack of cooperation in cleaning) challenges that led to unclean shared toilets. Available opportunities for improvement included instituting clear cleaning plans, improving communication among users, and enhanced problem-solving mechanisms between landlords and tenants. These approaches could form the basis for designing intervention strategies for improving the cleanliness of shared sanitation facilities. Conclusion The results highlight the need to focus on social aspects for improvement of cleanliness in shared sanitation facilities in low-income settlements. Through a social approach, shared sanitation facilities can be managed appropriately to provide the millions of low-income residents in Kenya an opportunity to access sanitation. This study provides further evidence on approaches for improved management of shared sanitation facilities in line with the World Health Organization's (WHO) Joint Monitoring Program's (JMP) recommendation for high quality shared facilities.

Accession Number: WOS:000428752700007

Abstract: The aim of this study is to understand if motives to drink are associated to certain patterns of drinking and specific socio-demographic drinkers' characteristics. As part of the Portugal Health Behaviour in School-aged Children survey, developed with 5050 pupils (47.7% of boys), attending the 6th, 8th, and 10th grade levels and with a mean age of 13.98 years (SD = 1.85), the present study was carried out using the "Drinking Motive Questionnaire Revised Short Form" (Kuntsche & Kuntsche, 2009) in order to investigate the drinking motives among young people and its relationship with neighborhood characteristics, gender, age, and drinking patterns. Results showed that social motives are the most

frequent, followed by enhancement, coping, and conformity motives. Statistically significant differences were found between gender and grade (a proxy for age), being essentially the boys who consume more socially and the boys of the 8th grade that reported to consume for enhancement motives, cope with negative emotions, or to affirm themselves within peers group. Differences between the place of residence and consumption patterns are also found, showing that pupils who live in a neighborhood marked by many night entertainment venues, violence and theft, along with its location in an isolated area, have a significantly higher average in the four motives. Considering the drinking pattern, drinking to cope or for conformity motives are more common during the week and during the day, while drinking for social motives is more frequent during the day. Implications of the results for health and educational public policies are discussed.

Short Title: Models of addiction and types of interventions: An integrative look

ISSN: 1925-7066

DOI: 10.7895/ijadr.v4i1.198

Accession Number: WOS:000360501700003

Abstract: Background: Use of psychoactive substances and problem gambling create serious harm to individuals who engage in these practices and to society as a whole (World Health Organization, 2002). The European Monitoring Centre for Drugs and Drug Addiction (EMCDDA) regularly monitors drug-related problems and interventions, as well as the efficiency of interventions. The scope and methodology of monitoring, however, depends on the conceptualization of "addiction." Methods: The relevant literature was screened for models and theories relating to "addiction," resulting in a systematic overview of the concepts and related approaches (EMCDDA, 2013). Using this as a background, different approaches for interventions and their theoretical bases are discussed. Results:

Models of addiction follow two approaches. Most of these focus on the individual addict, involving constructs such as emotions, drive states, habits, choice, and goal-oriented processes, or else taking a more integrative or change-oriented view. Others are population-based models, including social network, economic, communication, and organizational system models. While substance- and non-substance-related addictions differ in a number of respects, they share key elements: a repeated powerful motivation to engage in a particular behavior, acquired through enacting the behavior, despite the experience or risk of significant harm. Nine different types of intervention to combat addiction found in the literature involve attempts to change one or more of three factors that interact to underpin behavior: capability, opportunity, and motivation (the "COM-B" model). The models of addiction reviewed may serve as a basis for such interventions.

ISSN: 0958-9287

DOI: 10.1177/09589287231164343

Accession Number: WOS:000963559800001

Abstract: We empirically test an integral model for healthcare and child support benefits take-up using a probability sample of the Dutch population (N = 905). To examine how different psychological factors, in conjunction, explain take-up, we apply model averaging with Akaike's Information Criterion (AIC(C)). For both types of benefits, people's perceptions of eligibility best explain take-up. For healthcare benefits, take-up also relates to perceptions of need. Exploratory analyses suggest that for healthcare benefits but not for child support benefits, executive functions, self-efficacy, fear of reclaims, financial stress, and welfare stigma explain perceived eligibility. We find no support for knowledge, support, and administrative burden as explanatory factors in take-up. We discuss the results in relation to the Capability Opportunity Motivation Behaviour (COM-B) model for developing behavioural change interventions.

Short Title: Virtual Arm Boot Camp (V-ABC): study protocol for a mixed-methods study to increase upper limb recovery after stroke with an intensive program coupled with a grasp count device

DOI: 10.1186/s13063-022-06047-9

Article Number: 129

Accession Number: WOS:000752912000001

Abstract: Background: Encouraging upper limb use and increasing intensity of practice in rehabilitation are two important goals for optimizing upper limb recovery post stroke. Feedback from novel wearable sensors may influence practice behaviour to promote achieving these goals. A wearable sensor can potentially be used in conjunction with a virtually monitored home program for greater patient convenience, or due to restrictions that preclude in-person visits, such as COVID-19. This trial aims to (1) determine the efficacy of a virtual behaviour change program that relies on feedback from a custom wearable sensor to increase use and function of the upper limb post stroke; and (2) explore the experiences and perceptions of using a program coupled with wearable sensors to increase arm use from the perspective of people with stroke.

Methods: This mixed-methods study will utilize a prospective controlled trial with random allocation to immediate or 3-week delayed entry to determine the efficacy of a 3-week behaviour change program with a nested qualitative description study. The intervention, the Virtual Arm Boot Camp (V-ABC) features feedback from a wearable device, which is intended to increase upper limb use post stroke, as well as 6 virtual sessions with a therapist. Sixty-four adults within 1-year post stroke onset will be recruited from seven rehabilitation centres. All outcomes will be collected virtually. The primary outcome measure is upper limb use measured by grasp counts over 3 days from the wearable sensor (TENZR) after the 3-week intervention. Secondary outcomes include upper limb function (Arm Capacity and Movement Test) and self-reported function (Hand Function and Strength subscale from the Stroke Impact Scale).

Outcome data will be collected at baseline, post-intervention and at 2 months retention. The qualitative component will explore the experiences and acceptability of using a home program with a wearable sensor for increasing arm use from the point of view of individuals with stroke. Semi-structured interviews will be conducted with participants after they have experienced the

intervention. Qualitative data will be analysed using content analysis. Discussion: This study will provide novel information regarding the efficacy and acceptability of virtually delivered programs to improve upper extremity recovery, and the use of wearable sensors to assist with behaviour change.

Short Title: A feasibility randomised controlled trial of a motivational interviewing-based intervention for weight loss maintenance in adults

ISSN: 1366-5278

DOI: 10.3310/hta19500

Accession Number: WOS:000357936600001

Abstract: Background: Obesity has significant health and NHS cost implications. Relatively small reductions in weight have clinically important benefits, but long-term weight loss maintenance (WLM) is challenging. Behaviour change interventions have been identified as key for WLM. Motivation is crucial to supporting behaviour change, and motivational interviewing (MI) has been identified as a successful approach to changing health behaviours. The study was designed as an adequately powered, pragmatic randomised controlled trial (RCT); however, owing to recruitment issues, the study became a feasibility trial. Objectives: To assess recruitment, retention, feasibility, acceptability, compliance and delivery of a 12-month intervention to support WLM. Secondary objectives were to assess the impact of the intervention on body mass index (BMI) and other secondary outcomes. Design: Three-arm individually randomised controlled trial comprising an intensive arm, a less intensive arm and a control arm. Setting: Community setting in South Wales and the East Midlands. Participants: Individuals aged 18-70 years with a

current or previous BMI of ≥ 30 kg/m² who could provide evidence of at least 5% weight loss during the previous 12 months.

Intervention: Participants received individually tailored MI, which included planning and self-monitoring. The intensive arm received six face-to-face sessions followed by nine telephone sessions. The less intensive arm received two face-to-face sessions followed by two telephone sessions. The control arm received a leaflet advising them on healthy lifestyle. Main outcome measures: Feasibility outcomes included numbers recruited, retention and adherence. The primary effectiveness outcome was BMI at 12 months post randomisation. Secondary outcomes included waist circumference, waist-to-hip ratio, physical activity, proportion maintaining weight loss, diet, quality of life, health service resource usage, binge eating and well-being. A process evaluation assessed intervention delivery, adherence, and participants' and practitioners' views. Economic analysis aimed to assess cost-effectiveness in terms of quality-adjusted life-years (QALYs). Results: A total of 170 participants were randomised. Retention was good (84%) and adherence was excellent (intensive, 83%; less intensive, 91%). The between-group difference in mean BMI indicated the intensive arm had BMIs 1.0 kg/m² lower than the controls [95% confidence interval (CI) -2.2 kg/m² to 0.2 kg/m²]. Similarly, a potential difference was found in weight (average difference of 2.8 kg, 95% CI -6.1 kg to 0.5 kg). The intensive arm had odds of maintaining on average 43% [odds ratio (OR) 1.4, 95% CI 0.6 to 3.5] higher than controls. None of these findings were statistically significant. Further analyses controlling for level of adherence indicated that average BMI was 1.2 kg/m² lower in the intensive arm than the control arm (95% CI -2.5 kg/m² to 0.0 kg/m²). The intensive intervention led to a statistically significant difference in weight (mean -3.7 kg, 95% CI -7.1 kg to -0.3 kg). The other secondary outcomes showed limited evidence of differences between groups. The intervention was delivered as planned, and both practitioners and participants were positive about the intervention and its impact. Although not powered to assess cost-effectiveness, results of this feasibility study suggest that neither intervention as currently delivered is likely to be cost-effective in routine practice. Conclusion: This is the first trial of an intervention for WLM in the UK, the intervention is feasible and acceptable, and retention and adherence were high. The main effectiveness outcome showed a promising mean difference in the intensive arm. Owing to the small sample size, we are limited in the conclusions we can draw. However, findings suggest that the intensive intervention may facilitate long-term weight maintenance and, therefore, further testing in an effectiveness trial may be indicated. Research examining WLM is in its infancy, further research is needed to develop our understanding of WLM and to expand theory to inform the development of interventions to be tested in rigorously designed RCTs with cost-effectiveness assessed.

Title: Elements of Integrated Palliative Care in Chronic Heart
Failure Across the Care Continuum: A Scoping Review

Journal: Heart Lung and Circulation

Volume: 31

Issue: 1

Pages: 32-41

Date: Jan

Short Title: Elements of Integrated Palliative Care in Chronic Heart
Failure Across the Care Continuum: A Scoping Review

ISSN: 1443-9506

DOI: 10.1016/j.hlc.2021.08.012

Accession Number: WOS:000733109100011

Abstract: Background Individuals with chronic heart failure
experience high symptom burden, reduced quality of life and high
health care utilisation. Although there is growing evidence that a
palliative approach, provided concurrently with usual treatment
improves outcomes, the method of integrating palliative care for
individuals living with chronic heart failure across the care
continuum remains elusive. Aim To examine the key elements of
integrated palliative care recommended for individuals living with
chronic heart failure across the care continuum. Design Scoping
review. Data sources Databases searched were CINAHL, Ovid MEDLINE,
Scopus and OpenGrey. Studies written in English and containing key
strategic elements specific to chronic heart failure were included.
Search terms relating to palliative care and chronic heart failure
and the Joanna Briggs Institute methodology for scoping reviews was
used. Results Seventy-nine (79) articles were selected that
described key elements to integrate palliative care for individuals
with chronic heart failure. This review identifies four levels of
key strategic elements: 1) clinical; 2) professional; 3)
organisational and 4) system-level integration. Implementing
strategies across these elements facilitates integrated palliative
care for individuals with chronic heart failure. Conclusions Inter-
sectorial collaborations across systems and the intersection of
health and social services are essential to delivering integrated,
person-centred palliative care. Further research focussing on

patient and family needs at a system-level is needed. Research with strong theoretical underpinnings utilising implementation science methods are required to achieve and sustain complex behaviour change to translate key elements.

Short Title: From principles to practice: embedding clinical reasoning as a longitudinal curriculum theme in a medical school programme

ISSN: 2194-8011

DOI: 10.1515/dx-2021-0031

Accession Number: WOS:000737396200001

Abstract: There is consensus that clinical reasoning (CR) is crucial for increasing the value of diagnosis, medical decision-making and error reduction. These skills should be developed throughout medical education, starting with undergraduate study. International guidance provides principles for CR curricula but interventions to date, are short term in nature. In this report, we describe the creation of a longitudinal, spiral CR curriculum within a large UK medical school programme (2500 students). A working group drove systematic evidence-based reform of existing structures. We utilised recognised models for curriculum development and mapping, relating learning outcomes to competency frameworks. Application of multiple teaching methodologies, rooted in enquiry-based learning and reported in CR literature, encourage metacognition for information-processing and illness script development. Development of CR is emphasised with recurrent, progressive learning opportunities, each stage purposefully building upon previous experiences. Formative and summative assessment approaches to drive learning, encouraging students' ability to apply and articulate CR, is constructed via Miller's Prism of Clinical Competence. Implementation of pedagogy is contingent on faculty development. Whilst many clinicians practice sound CR, the ability to articulate it to students is often a novel

skill. Engagement in faculty development was strengthened through cross-institutional recognition of teaching workload and flexibility of delivery. We report lessons learned from the implementation phase and plans for measuring impact.

Pages: E184-E191

Date: Mar

Short Title: What to give the patient who has everything? A qualitative study of prescribing for multimorbidity in primary care

ISSN: 0960-1643

DOI: 10.3399/bjgp15X684001

Accession Number: WOS:000356962500007

Abstract: Background Using clinical guidelines in the management of patients with multimorbidity can lead to the prescription of multiple and sometimes conflicting medications. Aim To explore how GPs make decisions when prescribing for multimorbid patients, with a view to informing intervention design. Design and setting In-depth qualitative interviews incorporating chart-stimulated recall with purposively sampled GPs in the Republic of Ireland. Method Grounded theory analysis with iterative theory development. Results Twenty GPs were interviewed about 51 multimorbid cases. In these cases, GPs integrated information from multiple sources including the patient, specialists, and evidencebased medicine. Difficulties arose when recommendations or preferences conflicted, to which GPs responded by 'satisficing': accepting care that they deemed satisfactory and sufficient for a particular patient. Satisficing was manifest as relaxing targets for disease control, negotiating compromise with the patient, or making 'best guesses' about the most appropriate course of action to take. In multimorbid patients perceived as stable, GPs preferred to 'maintain the status quo' rather than rationalise medications, even in cases with significant polypharmacy. Proactive changes in medications were facilitated by continuity of care, sufficient consultation time, and open lines of communication with the patient, other healthcare professionals, and other GPs. Conclusion GPs respond to conflicts in the management of multimorbid patients by making compromises between patient-centred

and evidence-based care. These findings will be used to inform interventions that aim to care in multimorbidity.

Accession Number: WOS:000361713600001

Abstract: Background: Multimorbidity, the presence of two or more chronic conditions, affects over 60 % of patients in primary care. Due to its association with polypharmacy, the development of interventions to optimise medication management in patients with multimorbidity is a priority. The Behaviour Change Wheel is a new approach for applying behavioural theory to intervention development. Here, we describe how we have used results from a review of previous research, original research of our own and the Behaviour Change Wheel to develop an intervention to improve medication management in multimorbidity by general practitioners (GPs), within the overarching UK Medical Research Council guidance on complex interventions. Methods: Following the steps of the Behaviour Change Wheel, we sought behaviours associated with medication management in multimorbidity by conducting a systematic review and qualitative study with GPs. From the modifiable GP behaviours identified, we selected one and conducted a focused behavioural analysis to explain why GPs were or were not engaging in this behaviour. We used the behavioural analysis to determine the intervention functions, behavioural change techniques and implementation plan most likely to effect behavioural change.

Results: We identified numerous modifiable GP behaviours in the systematic review and qualitative study, from which active medication review (rather than passive maintaining the status quo) was chosen as the target behaviour. Behavioural analysis revealed

GPs' capabilities, opportunities and motivations relating to active medication review. We combined the three intervention functions deemed most likely to effect behavioural change (enablement, environmental restructuring and incentivisation) to form the Multimorbidity Collaborative Medication Review And Decision Making (MY COMRADE) intervention. MY COMRADE primarily involves the technique of social support: two GPs review the medications prescribed to a complex multimorbid patient together. Four other behavioural change techniques are incorporated: restructuring the social environment, prompts/cues, action planning and self-incentives. Conclusions: This study is the first to use the Behaviour Change Wheel to develop an intervention targeting multimorbidity and confirms the usability and usefulness of the approach in a complex area of clinical care. The systematic development of the MY COMRADE intervention will facilitate a thorough evaluation of its effectiveness in the next phase of this work.

Short Title: Supporting families managing childhood eczema: developing and optimising eczema care online using qualitative research

ISSN: 0960-1643

DOI: 10.3399/bjgp.2021.0503

Accession Number: WOS:000800280900001

Abstract: Background Childhood eczema is often poorly controlled owing to underuse of emollients and topical corticosteroids (TCS). Parents/carers report practical and psychosocial barriers to managing their child's eczema, including child resistance. Online interventions could potentially support parents/carers; however, rigorous research developing such interventions has been limited. Aim To develop an online behavioural intervention to help parents/carers manage and co-manage their child's eczema. Design and setting Intervention development using a theory-, evidence-, and person-

based approach (PBA) with qualitative research. Method A systematic review and qualitative synthesis of studies (n = 32) and interviews with parents/carers (n = 30) were used to identify barriers and facilitators to effective eczema management, and a prototype intervention was developed. Think-aloud interviews with parents/carers (n = 25) were then used to optimise the intervention to increase its acceptability and feasibility. Results Qualitative research identified that parents/ carers had concerns about using emollients and TCS, incomplete knowledge and skills around managing eczema, and reluctance to transitioning to co-managing eczema with their child. Think-aloud interviews highlighted that, while experienced parents/carers felt they knew how to manage eczema, some information about how to use treatments was still new. Techniques for addressing barriers included providing a rationale explaining how emollients and TCS work, demonstrating how to use treatments, and highlighting that the intervention provided new, up-to-date information. Conclusion Parents/carers need support in effectively managing and co-managing their child's eczema. The key output of this research is Eczema Care Online for Families, an online intervention for parents/carers of children with eczema, which is being evaluated in a randomised trial.

Short Title: Key factors underlying the willingness of patients with cancer to participate in medication redispensing

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2021.12.004

Accession Number: WOS:000831754300013

Abstract: Background: Redispensing medication unused by patients to other patients could reduce the environmental burden of medication waste. Simultaneously, associated financial loss could be reduced, particularly for expensive medication such as oral anticancer drugs. An important determinant for successful medication redispensing is patient participation. Objective(s): To identify key factors underlying the willingness of patients with cancer to participate in the redispensing of unused oral anticancer drugs. Methods: Semi-structured interviews via telephone or video call were conducted with adult patients diagnosed with cancer from two Dutch hospitals. The interview guide was framed using the COM-B model for behavioural change, to elicit patients' capability, opportunity and motivation to participate in medication redispensing. Questions were related to patients' willingness to accept redispensed medication, reasons thereof, perceived concerns and needs. Inductive thematic analysis was applied. Results: Seventeen patients (aged 38–82 years, 71% female), with nine different types of cancer participated. The majority of participants supported medication redispensing. Four categories of key factors underlying the willingness of patients with cancer to participate in medication redispensing were identified. First, the driver for participation was having positive societal impact, relating to affordability and sustainability of healthcare. Second, having trust in product quality was a requirement, influenced by preconceived beliefs, quality assurance and patients' knowledge of this process. Third, a facilitator for participating in medication redispensing was adequate provision of information. This concerned awareness of medication waste, information about medication redispensing, support from healthcare providers and other patients, and insight into medication dispensing history. Last, a convenient process for returning unused medication to pharmacies would facilitate participation in medication redispensing. Conclusions: The willingness of patients with cancer to participate in medication redispensing relates to a drive for achieving positive societal impact, provided that medication is of high quality, there is adequate information provision and a convenient process.

Abstract: Aims Foodservices are a strong contributor to global environmental impact. Systemic change is required to lead the transformation towards environmentally sustainable foodservices. However, guidance to support foodservices to be more environmentally sustainable is lacking. The aim was to explore food-related environmentally sustainable strategies and their transferability to foodservices in a range of settings, to inform a framework for future application and research. Methods A constructivist grounded theory study design was used. Semi-structured interviews with foodservice sustainability consultants, who support foodservice organisations to improve environmental sustainability, were conducted. Interviews were recorded, transcribed, and coded line-by-line. Ten consultants were purposively sampled for diversity in location, organisation type, funding model, and services provided. Codes were collapsed into categories, to inform the development of themes and a framework for the implementation of strategies. Results Four sub-themes were created under an overarching theme of 'Transforming the Foodservice System': embedding leadership, shifting perspective, constructing collaborative networks, and fostering momentum. A range of implementation strategies were captured within the sub-themes. Conclusion These themes informed the development of a practical application framework for implementing sustainable strategies in foodservices that is useful for practice and future research in the area.

Abstract: Social influencers are widely known as the promoters of purchase behavior as well as for their potential to change health behaviors among individuals in their social networks. For social influencers to be successful in changing behaviors, it is essential that they convey their message in an authentic, original, credible, and persistent manner. In the context of health behavior interventions, this requires a focus on the motivation of social influencers to engage in the intervention. This perspective article describes the importance of motivating social influencers to engage in the desired health behaviors themselves and to promote it within their social network. We briefly describe the current state of knowledge and our empirical experience in implementing health interventions with social influencers. Using insights from self-determination theory, we demonstrate how social influencers can be motivated optimally in health behavior interventions and, thereby, improving the success of the intervention. To illustrate these insights and guide intervention practice, we provide concrete examples of techniques that can be applied in health interventions involving social influencers. We conclude with directions for further research and intervention practice to improve the delivery of health behavior interventions.

Title: Putting sheep scab in its place: A more relational approach

Journal: Preventive Veterinary Medicine

Volume: 206

Date: Sep

Short Title: Putting sheep scab in its place: A more relational approach

ISSN: 0167-5877

DOI: 10.1016/j.prevetmed.2022.105711

Article Number: 105711

Accession Number: WOS:000830851100005

Abstract: Since the reintroduction of sheep scab within the UK, its prevalence has increased despite several industry-led initiatives to control and manage the disease. Some studies have suggested that initiatives or policies should instead focus on specific places, such as geographically high-risk areas for sheep scab, which could allow for a more targeted approach. However, this risk of sheep scab

has been measured in set geographical areas, without the reference to the interplay of topography, host, pathogen and the way in which humans socially and culturally define risk and place, potentially limiting the effectiveness of preventative initiatives. Therefore, the aim of the current study was to understand how place influences sheep farmers' approaches to the identification and management of the risk of sheep scab in their flocks. Qualitative data was collected from 43 semi-structured interviews with sheep farmers from England, Scotland, and Wales and was analysed by using the constant comparative approach. The codes were grouped into four concepts that influenced farmers' decision-making strategies for sheep scab control: perception of place; risk identification; risk categorisation; and risk management. These concepts were used as an analytical framework to identify three different 'places': 'uncontrollable places', 'liminal places' and 'protective places'. Each place reflects a different sheep scab control strategy used by farmers and shaped by their perceptions of place and risk. The 'uncontrollable places' category represented farmers who were located in areas that were geographically high-risk for sheep scab and who experienced a high frequency of sheep scab infestations in their flocks. The risk posed by their local landscape and neighbouring farmers, who neglected to engage in preventative behaviours, led them to feel unable to engage in effective risk management. Thus, they viewed scab as uncontrollable. The farmers within the 'liminal places' category were characterised as farmers who were located in high-risk areas for sheep scab, but experienced low levels of sheep scab infestations. These farmers characterised the risks associated with sheep scab management in terms of needing to protect their reputation and felt more responsibility for controlling sheep scab, which influenced them to engage in more protective measures. The farmers within the 'protective places' category were characterised as farming within low-risk areas and thus experienced a low level of sheep scab infestations. These farmers also described their risk in terms of their reputation and the responsibility they held for protecting others. However, they sought to rely on their low geographical risk of sheep scab as a main source of protection and therefore did not always engage in protective measures. These results suggest that place-based effects have significant impacts on sheep farmers' beliefs and behaviours and thus should be considered by policymakers when developing future strategies for sheep scab control.

Short Title: Women's views and experiences of a mobile phone-based intervention to support post-abortion contraception in Cambodia

DOI: 10.1186/s12978-017-0329-y

Article Number: 72

Accession Number: WOS:000403285300002

Abstract: Background: The MOBILE Technology for Improved Family Planning (MOTIF) trial assessed a mobile phone-based intervention comprising voice messages and counsellor support to increase post-abortion contraception at four Marie Stopes International clinics in Cambodia. The aim of this process evaluation was to assess women's views and experiences of receiving the MOTIF intervention, gain insights into the mechanism of action of the intervention and seek recommendations for improvements. **Methods:** We conducted a qualitative study comprising 15 semi-structured interviews with women who had received the intervention and undertook a simple thematic analysis. **Results:** We identified themes relating to communication via mobile phone, supporting contraception use, broader post-abortion care, interaction with family and friends and suggestions for improvement. The majority of women were positive about the mobile phone-based intervention to support contraception use and reported it to be a convenient way to ask questions or get advice without going to a health centre, although a few women found the voice messages intrusive. The intervention supported contraception use by provision of information, encouragement, reminders to return to clinic, reassurance and advice for problems and had a positive effect on contraceptive uptake and continuation. Women reported a sense of being cared for and received support for additional physical and emotional issues. Most women thought that the duration of the intervention and frequency of messages were acceptable. **Conclusions:** The majority of women were positive about the mobile phone-based intervention which provided support for contraception use as well as additional physical and emotional issues. The study provides some insights into how the intervention might have worked and considers how the intervention could be improved.

Short Title: Mobile Technology for Improved Family Planning (MOTIF): the development of a mobile phone-based (mHealth) intervention to support post-abortion family planning (PAFP) in Cambodia

DOI: 10.1186/s12978-015-0112-x

Article Number: 1

Accession Number: WOS:000367809400001

Abstract: Background: The objective of this paper is to outline the formative research process used to develop the MOTIF mobile phone-based (mHealth) intervention to support post-abortion family planning in Cambodia. Methods: The formative research process involved literature reviews, interviews and focus group discussions with clients, and consultation with clinicians and organisations implementing mHealth activities in Cambodia. This process led to the development of a conceptual framework and the intervention. Results: Key findings from the formative research included identification of the main reasons for non-use of contraception and patterns of mobile phone use in Cambodia. We drew on components of existing interventions and behaviour change theory to develop a conceptual framework. A multi-faceted voice-based intervention was designed to address health concerns and other key determinants of contraception use. Conclusions: Formative research was essential in order to develop an appropriate mHealth intervention to support post-abortion contraception in Cambodia. Each component of the formative research contributed to the final intervention design.

Title: Managing vulnerabilities in practitioner decision-making within sport psychology services: Responding to the evidence base

Journal: Journal of Applied Sport Psychology

Volume: 35

Issue: 3

Pages: 433-454

Date: Jul

Short Title: Managing vulnerabilities in practitioner decision-making within sport psychology services: Responding to the evidence base

ISSN: 1041-3200

DOI: 10.1080/10413200.2022.2044406

Accession Number: WOS:000782693200001

Abstract: This position paper examines decision-making in sport

psychology practitioners from a dual processing perspective. Based on the work of Kahneman and Tversky, we draw upon cognitive and social psychology research to explore key decision-making vulnerabilities in the context of the sport psychology practitioner. We examine the influence of classic heuristics and biases, exploring issues such as: an exclusive focus on the inside view; tunnel vision; focusing on disposition as opposed to situation; the sport environment as a complex adaptive system; formulas for success; phase transitions; and conflating skill and luck. When considering how to combat such decision-making vulnerabilities, we explore a 'counterintuitive' approach developed by Mauboussin to mitigating these, and explain how sport psychology practitioners can apply such strategies. We suggest counterweight strategies, including: raising awareness of how biases and heuristics may be affecting our decision-making; diversifying our perspectives; proactively seeking critical feedback from diverse sources; creating useful checklists; and performing 'pre-mortems'. Likewise, we explore strategies for future research on decision-making in sport psychology practitioners. Lay summary: This position paper draws on research from social, cognitive and sport psychology to explore key decision-making vulnerabilities in the context of the sport psychology practitioner. We provide evidence-based suggestions to mitigate these vulnerabilities, and strategies for how practitioners can apply these ideas in their practice. Implications for Practice A dual-processing approach has considerable potential for highlighting, and mitigating against, key decision-making vulnerabilities in sport psychology practitioners The systematic use of evidence-based strategies could greatly enhance decision-making quality in practitioners.

DOI: 10.4088/JCP.20m13575
Accession Number: WOS:000898548000027
Abstract: Objective: To examine the relationship between maternal

postnatal depression and completion of infant vaccinations. Methods: We conducted a cohort study using data from The Health Improvement Network (THIN), a large UK primary care electronic health record database. We identified 196,329 mother–infant pairs in which the infant was born between 2006 and 2015. Postnatal depression was identified through antidepressant prescriptions or diagnoses or symptoms of depression in first year after childbirth. Primary outcome was completion of three 5–in–1 vaccination doses in infants before 1 year of age; this vaccine protects against diphtheria, tetanus, whooping cough, polio, and Haemophilus influenzae type b. We used Poisson regression models to compare likelihood of infant 5–in–1 vaccine uptake among children of women with a record of postnatal depression to likelihood among those without. Results: Of the 196,329 women, 20,802 (10.6%) had a record of postnatal depression and/or antidepressant prescription. There was no difference in infants' 5–in–1 vaccination completion between those of mothers with a record and those of mothers' without (adjusted incidence rate ratio [IRR] = 1.01; 95% CI, 0.99–1.02). Those from more socially deprived areas were less likely to complete infant vaccinations compared to those from the least deprived areas (IRR = 0.92; 95% CI, 0.90–0.93). Likelihood of completing infant vaccination decreased over time, comparing 2014–2015 to 2006–2007 (IRR = 0.90; 95% CI, 0.89–0.92). Conclusions: Among mothers who engage with primary care, maternal postnatal depression is not associated with lower rates of infant vaccination, though more research is needed to conclude if either more severe depression or unrecognized depression is associated with lower completion rates. ISSN: 1758–0846

DOI: 10.1111/aphw.12300

Accession Number: WOS:000686516200001

Abstract: This paper aims to outline the development of a

theoretically informed and evidence-based intervention strategy to underpin interventions to support the well-being of doctors during COVID-19 and beyond; delineate new ways of working were employed to ensure a rapid and rigorous process of intervention development and present the resulting novel framework for intervention development. The research comprised four workstreams: literature review (WS1), qualitative study (WS2), intervention development and implementation (WS3) and evaluation (WS4). Due to time constraints, we employed a parallel design for WS1-3 with the findings of WS1-2 informing WS3 on a continual basis. WS3 was underpinned by the Behaviour Change Wheel. We recruited expert panels to assist with intervention development. We reflected on decisions taken to facilitate the rapid yet rigorous process of intervention development. The empirical output was a theoretically informed and evidence-based intervention strategy to underpin interventions to support doctors' well-being during COVID-19 and beyond. The methodological output was a novel framework that facilitates rapid and rigorous development of interventions. The intervention strategy provides a foundation for development and evaluation of tailored interventions to support doctors' well-being. The novel framework provides guidance for the development of interventions where the situation demands a rapid yet rigorous development process.

Abstract: Background: Cognitive problems are a common and debilitating symptom of multiple sclerosis (MS). Screening and treatment for cognitive problems are recommended, however these are not routinely delivered in UK clinics. We collected and synthesised stakeholder perspectives to develop a care pathway for cognitive problems in MS and produce a logic model, illustrating how this pathway might operate. Methods: Forty-nine stakeholders, including people with MS and care providers, participated in semi-structured interviews and focus groups. Participants viewed information that illustrated how the pathway might work and provided feedback. Data, transcribed verbatim and analysed using Framework Analysis, were mapped onto a preliminary logic model and accompanying thematic framework. Results: The proposed pathway was perceived as helpful in providing standardised support for a neglected MS symptom. Training packages, online cognitive screening, and triaging decisions were viewed as crucial activities. Shared responsibility, a person-centred approach, and addressing the complexity of cognitive problems were important engagement mechanisms. Allocating time during clinic appointments and within staff workloads were essential resources for implementation. Conclusion: Our co-constructed MS cognitive screening and management pathway will be evaluated for clinical and cost-effectiveness in a trial. However, in the interim, clinicians can adapt and implement this pathway in their own services and evaluate it locally.

ISSN: 1750-2640

DOI: 10.1111/irv.12406

Accession Number: WOS:000388754800003

Abstract: The aim of this review was to identify factors predicting actual or intended adherence to antivirals as treatment or prophylaxis for influenza. Literature from inception to March 2015 was systematically reviewed to find studies reporting predictors of adherence to antivirals and self-reported reasons for non-adherence to antivirals. Twenty-six studies were included in the review; twenty identified through the literature search and six through other means. Of these studies, 18 assessed predictors of actual adherence to antivirals, whereas eight assessed predictors of intended adherence. The most commonly found predictor of, and self-reported reason for, non-adherence was the occurrence of side effects. Other predictors include perceptions surrounding self-efficacy, response efficacy and perceived personal consequences as well as social influences of others' experiences of taking antivirals. Predictors identified in this review can be used to help inform communications to increase adherence to antivirals in both seasonal and pandemic influenza.

Article Number: 475

Accession Number: WOS:000767215600003

Abstract: Background Behaviour is key to suppressing the COVID-19 pandemic. Maintaining behaviour change can be difficult. We

investigated engagement with hand cleaning, reducing the number of outings, and wearing a face covering over the course of the pandemic. Methods We used a series of 64 cross-sectional surveys between 10 February 2020 and 20 January 2022 (n approximate to 2000 per wave). Surveys investigated uptake of hand cleaning behaviours, out of home activity (England only, n approximate to 1700 per wave) and wearing a face covering (England only, restricted to those who reported going out shopping in the last week, n approximate to 1400 per wave). Results Reported hand cleaning has been high throughout the pandemic period (85 to 90% of participants consistently reporting washing their hands thoroughly and regularly with soap and water frequently or very frequently). Out of home activity has mirrored the easing and re-introduction of restrictive measures. Total number of outings were higher in the second national lockdown than in the first and third lockdowns. Wearing a face covering increased steadily between April to August 2020, plateauing until the end of measurement in May 2021, with approximately 80% of those who had been out shopping in the previous week reporting wearing a face covering frequently or very frequently. Conclusions Engagement with protective behaviours increased at the start of the pandemic and has remained high since. The greatest variations in behaviour reflected changes to Government rules. Despite the duration of restrictions, people have continued to adopt personal protective behaviours that were intended to prevent the spread of COVID-19. Notes: Smith, Louise E. Potts, Henry W. W. Short Title: Protocol for a feasibility study of a cancer symptom awareness campaign to support the rapid diagnostic centre referral pathway in a socioeconomically deprived area: Targeted Intensive Community-based campaign To Optimise Cancer awareness (TIC-TOC)

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-063280

Article Number: e063280

Accession Number: WOS:000869915100017

Abstract: Introduction Rapid diagnostic centres (RDCs) are being implemented across the UK to accelerate the assessment of vague suspected cancer symptoms. Targeted behavioural interventions are needed to augment RDCs that serve socioeconomically deprived populations who are disproportionately affected by cancer, have lower cancer symptom awareness and are less likely to seek help for cancer symptoms. The aim of this study is to assess the feasibility and acceptability of delivering and evaluating a community-based vague cancer symptom awareness intervention in an area of high socioeconomic deprivation. Methods and analysis Intervention materials and messages were coproduced with local stakeholders in Cwm Taf Morgannwg, Wales. Cancer champions will be trained to deliver intervention messages and distribute intervention materials using broadcast media (eg, local radio), printed media (eg, branded pharmacy bags, posters, leaflets), social media (eg, Facebook) and attending local community events. A cross-sectional questionnaire will include self-reported patient interval (time between noticing symptoms to contacting the general practitioner), cancer symptom recognition, cancer beliefs and barriers to presentation, awareness of campaign messages, healthcare resource use, generic quality of life and individual and area-level deprivation indicators. Consent rates and proportion of missing data for patient questionnaires (n=189) attending RDCs will be measured. Qualitative interviews and focus groups will assess intervention acceptability and barriers/facilitators to delivery. Ethics and dissemination Ethical approval for this study was given by the London-West London & GTAC Research Ethics (21/L0/0402). This project will inform a potential future controlled study to assess intervention effectiveness in reducing the patient interval for vague cancer symptoms. The results will be critical to informing national policy and practice regarding behavioural interventions to support RDCs in highly deprived populations.

Short Title: Feasibility, Utility, and Limitations of a Rapid Community Behavioral Diagnosis for Social Distancing During the 2020 Coronavirus Pandemic

ISSN: 0890-1171

DOI: 10.1177/0890117120932460journals.sagepub.com/home/ahp

Accession Number: WOS:000599911300009

Abstract: Purpose: To evaluate the feasibility, utility, and limitations of a rapid community behavioral diagnosis (RCBD) for social distancing behaviors to prevent coronavirus transmission during a global coronavirus pandemic. Design: Using social media for recruitment, we partnered with a local community task force to administer a brief online survey. Setting: Residential urban community. Sample: Eighty-four community members, the majority of whom were white, female, college educated completed the survey. Measures: Theory of planned behavior constructs: behavioral intentions, attitudes, perceived norms, and perceived behavioral control for 3 social distancing behaviors: maintaining a 6-foot distance, avoiding places people congregate, and staying home as much as possible. Analysis: Path analyses were conducted to understand significant determinants of intentions for each behavior to guide the development of locally tailored health promotion messages. Results: The RCBD was implemented, and results were communicated to the community within 1 week. Intentions were high across the 3 behaviors but lowest for staying home as much as possible. Younger participants had lower intentions of maintaining a 6-foot distance than older participants. For each behavior, specific recommendations for health promotion messaging emerged based on how attitudes, norms, and perceived behavioral control related to intentions. Conclusion: In a situation where local community action is paramount for reducing coronavirus transmission, this RCBD process is feasible and useful for informing local health promotion.

Article Number: e067967

Accession Number: WOS:000924512900007

Abstract: Objectives Vestibular dysfunction is common in patients with acute traumatic brain injury (aTBI). Persisting vestibular symptoms (ie, dizziness and imbalance) are linked to poor physical, psychological and socioeconomic outcomes. However, routine management of vestibular dysfunction in aTBI is not always standard practice. We aimed to identify and explore any healthcare professional barriers or facilitators to managing vestibular dysfunction in aTBI. Design A qualitative approach was used. Data were collected using face to face, semi-structured interviews and analysed using the Framework approach. Setting Two major trauma centres in London, UK. Participants 28 healthcare professionals participated: 11 occupational therapists, 8 physiotherapists and 9 surgical/trauma doctors. Results Vestibular assessment and treatment were not routinely undertaken by trauma ward staff. Uncertainty regarding responsibility for vestibular management on the trauma ward was perceived to lead to gaps in patient care. Interestingly, the term dizziness was sometimes perceived as an 'invisible' and vague phenomenon, leading to difficulties identifying or 'proving' dizziness and a tendency for making non-specific diagnoses. Barriers to routine assessment and treatment included limited knowledge and skills, a lack of local or national guidelines, insufficient training and concerns regarding the practical aspects of managing vestibular dysfunction. Of current trauma ward staff, therapists were identified as appropriate healthcare professionals to adopt new behaviours regarding management of a common form of vestibular dysfunction (benign paroxysmal positional vertigo). Strategies to support this behaviour change include heightened clarity around role, implementation of local or national guidelines, improved access to training and multidisciplinary support from experts in vestibular dysfunction. Conclusions This study has highlighted that role and knowledge barriers exist to multidisciplinary management of vestibular dysfunction in aTBI. Trauma ward therapists were identified as the most appropriate healthcare professionals to adopt new behaviours. Several strategies are proposed to facilitate such behaviour change.

Short Title: Connecting breast cancer survivors for exercise: protocol for a two-arm randomized controlled trial

ISSN: 2052-1847

DOI: 10.1186/s13102-021-00341-w

Article Number: 128

Accession Number: WOS:000707360200001

Abstract: Background Peer-based exercise interventions that cultivate new opportunities for support with a fellow cancer survivor may result in increased exercise volume. It is not clear whether adding qualified exercise professional (QEP) support to peer-based interventions improves health outcomes. Therefore, the purpose of this study is to determine whether breast cancer survivor (BCS) dyads who receive 10 weekly sessions of virtually delivered QEP support have improved outcomes compared to BCS dyads who do not receive QEP support. **Methods** Participants Adult BCS with medical clearance for exercise, who have an internet-connected device, and currently engage in < 150 min of moderate-intensity exercise per week. Intervention BCS will be matched using evidence-based criteria. The intervention group will receive dyadic exercise information sessions and a program tailored by a QEP for 10 weeks (intervention period) and have access to the QEP for an additional 4 weeks (tapering period). The control will not receive any QEP support. **Outcomes** The primary outcome is post-intervention self-reported exercise volume. Secondary outcomes include device-assessed exercise volume (i.e., Fitbit), social support, and health-related quality of life. **Randomization** 108 participants, matched in dyads, will be randomized 1:1 to the MatchQEP or Match groups using a web-based scheme. **Statistical analysis** Outcomes will be measured at baseline, post-intervention, post-tapering, and at 12 weeks post-intervention follow-up. **Discussion** The findings from this RCT will determine if matched BCS dyads who receive 10 weeks of virtually delivered QEP support have higher levels of self-report and device-measured exercise, social support, and health related quality of life compared to matched dyads without QEP-delivered exercise guidance. To our knowledge this will be the first study to assess the combined effect of peer- and QEP support on exercise volume. **Project findings** will inform and optimize intervention methods aimed to increase exercise among BCS through accessible exercise supports. **Trial Registration:** The study is registered on ClinicalTrials.gov (study identifier: NCT04771975, protocol Version Number: 2, date: July 22, 2021).

Title: Development of a Behavior Change Intervention to Encourage
Timely Cancer Symptom Presentation Among People Living in Deprived
Communities Using the Behavior Change Wheel

Journal: Annals of Behavioral Medicine

Volume: 52

Issue: 6

Pages: 474-488

Date: Jun

Short Title: Development of a Behavior Change Intervention to
Encourage Timely Cancer Symptom Presentation Among People Living in
Deprived Communities Using the Behavior Change Wheel

ISSN: 0883-6612

DOI: 10.1007/s12160-016-9849-x

Accession Number: WOS:000436231800004

Abstract: Background Targeted public awareness interventions are
needed to improve earlier cancer diagnosis and reduce socioeconomic
inequalities in cancer outcomes. The health check (intervention) is
a touchscreen questionnaire delivered by trained lay advisors that
aims to raise awareness of cancer symptoms and risk factors and
encourage timely help seeking. Purpose This study aimed to apply the
Behavior Change Wheel to intervention refinement by identifying
barriers and facilitators to timely symptom presentation among
people living in socioeconomically deprived communities. Methods
Primary data (six focus groups with health professionals, community
partners and public) and secondary data (systematic review of
barriers and facilitators to cancer symptom presentation) were
mapped iteratively to the Behavior Change Wheel. Results Barriers
and facilitators were identified from the systematic review and
focus groups comprising 14 members of the public aged over 40, 14
community partners, and 14 healthcare professionals. Barriers
included poor symptom knowledge and lack of motivation to engage in
preventive or proactive behaviors. Facilitators included cues/
prompts to action, general practitioner preparedness to listen, and
social networks. The following behavior change techniques were
selected to address identified barriers and facilitators:
information about health consequences, prompts/cues, credible
sources, restricting physical and social environment, social
support, goal setting, and action planning. Conclusions The Behavior
Change Wheel triangulated findings from primary and secondary data
sources. An intervention combining education and enablement could
encourage timely symptom presentation to primary care among people
living in socioeconomically deprived communities. Social
encouragement and support is needed to increase symptom knowledge,

challenge negative cancer beliefs, and prompt decisions to engage with the healthcare system.

Title: Facilitating personal hygiene choices for renal patients with central venous lines: a multi-phase study

Journal: Australian Journal of Advanced Nursing

Volume: 39

Issue: 3

Pages: 24-32

Date: Jun-Aug

Short Title: Facilitating personal hygiene choices for renal patients with central venous lines: a multi-phase study

ISSN: 0813-0531

DOI: 10.37464/2020.393.738

Accession Number: WOS:000863111400004

Abstract: This study explored personal hygiene options of renal patients that maintain the integrity of central venous catheter exit site dressings between dialysis sessions. Background: Infection is a major life-limiting risk for patients undergoing haemodialysis via a central venous catheter. Meticulous attention to keeping the exit site dressings clean and dry is an essential defence in preventing local and systemic infections. It is difficult to maintain the integrity of water-resistant dressings in tropical environments. Study Design: A three-phase exploratory study was

conducted in a northern Australian Renal Service. Methods: Phase 1 employed a cross-sectional, anonymous, online survey of renal nurses about the acceptability and feasibility of two hygiene options for patients: bathing wipes and a waterproof dressing cover. The survey also canvassed their concerns about the options. Descriptive statistics were used to summarise Likert-scale responses and content analysis was used for responses to open-ended survey questions.

Phase 2 used conversational-style interviews with patients about their hygiene preferences, how they endeavoured to keep their dressings dry, and their impressions regarding the proposed options.

Phase 3 was a series of case studies of patients trialling the provided options over a six-week period. Participants were progressively recruited to this phase and were provided with the product/s of their choice at each dialysis session; renal nurses also assessed the integrity of the dressings at each dialysis session. Research nurses discussed with the participants their

experiences with the options. Results: Phase 1: Nurses (N=37, response rate 58.7%) considered both options acceptable and feasible for patients, noting some practical concerns related to their use. Phase 2: Patients (N=27, 100% participation rate) described hygiene preferences and difficulties they encountered with keeping dressings dry. Only one participant had a bath, as per written advice. All were enthusiastic about trying the proposed options. Phase 3: Patients (N=22) appreciated being able to shower without wetting their exit site dressings. Individuals were inventive in modifying the application and use of the waterproof cover according to their body shape and the central venous catheter exit site location. Although participants liked both options, the waterproof covering was most popular and most frequently used. Intactness of the dressings was 83% during the trial; there were no central venous catheter-associated infections during the study. Conclusion: Self-management and choice were motivating factors for participants. Patients embraced being able to keep their dressings dry and intact during personal hygiene in a tropical environment. Implications for research, policy, and practice: Patients demonstrated their willingness to undertake a more active role in their dressing care, while exercising choice with respect to personal hygiene. Studies that further increase patients' participation in other aspects of their self-care warrant further investigation. The organisation is pursuing options for the ongoing provision of the products used in this study and how their use can be monitored in clinical practice. What is already known about the topic? Intact dressings provide an important line of defence against infection in the vulnerable population of patients receiving dialysis via central lines. Hygiene needs are also an important consideration for quality of life, empowerment, and autonomy. Patients' current attempts to meet their own hygiene needs often result in a disruption to the intactness of the dressing site and predispose them to systemic infections. What this paper adds center dot This study facilitated exploration of two feasible hygiene options in an open and culturally safe manner, from both patients' and nurses' perspectives. center dot The opportunity to perform personal hygiene according to individual preferences resulted in a willingness of participants to undertake a more active role in the care of their dressing. center dot The identification of two acceptable and feasible personal hygiene options has the potential of removing one of the many lifestyle modifications faced by people who undergo haemodialysis via a central venous catheter.

Title: Self-reported management among people with rotator cuff related shoulder pain: An observational study

Journal: Musculoskeletal Science and Practice

Volume: 51

Date: Feb

Short Title: Self-reported management among people with rotator cuff related shoulder pain: An observational study

ISSN: 2468-7812

DOI: 10.1016/j.msksp.2020.102305

Article Number: 102305

Accession Number: WOS:000618327100020

Abstract: Background: Rotator cuff related shoulder pain is the most common cause of shoulder pain. Whilst guidelines recommend conservative management prior to imaging, injection or surgical management, recent findings suggest that patients experience management contrary to guideline recommendations. Objectives: The aim of this study was to investigate self-reported management among people with rotator cuff related shoulder pain (RCRSP) and their beliefs towards management. Materials and methods: Cross-sectional survey of people with RCRSP recruited when referred for imaging (n = 120). Electronic survey about demographic factors, management people had had (including imaging, injections, surgery, exercise, adjuncts), and beliefs about treatments. The frequency of various treatments was reported (separately for each cohort and traumatic onset) as well as the timing of interventions related to first-line care. Results: Most people had tried exercise (99/120, 82.5%) but only one in five people reported exercise was helpful, and one in six reported it was unhelpful or made their symptoms worse. Approximately a third of the cohort reported not receiving activity modification advice (34.2%, 41/120), those that did received inconsistent information. People with both traumatic (imaging 31/43, 72.1%; injections 13/24, 54.2%, surgery 8/21, 38.1%) and atraumatic onset pain (imaging 43/77, 55.8%; injections 31/51, 60.8%, surgery 4/19, 21.1%) had similarly high rates of intervention prior to trialling conservative management. Patient beliefs in regards to management showed trends towards interventionalist care. Conclusion: Patient reported management of RCRSP is often inconsistent with guideline recommended management.

Short Title: Supporting antimicrobial stewardship in Ghana: evaluation of the impact of training on knowledge and attitudes of healthcare professionals in two hospitals

DOI: 10.1093/jacamr/dlaa092

Article Number: dlaa092

Accession Number: WOS:000733835400009

Abstract: Background: A Commonwealth Partnership for Antimicrobial Stewardship was created between the Scottish Antimicrobial Prescribing Group (SAPG), Ghana Police Hospital and Keta Municipal Hospital. During a scoping visit, requirements for implementing antimicrobial stewardship (AMS), areas for improvement and training needs were identified. Methods: A multidisciplinary team from SAPG and health psychologists from The Change Exchange developed and delivered multi-professional evidence-based teaching incorporating behavioural science, supported by partner pharmacists in each hospital. Four sessions were delivered over 2 days to 60 participants across both sites. Before and after the sessions, participants were asked to complete a knowledge quiz and a behaviours survey. Results were analysed using t-tests. Results: Comparison of the participants' pre- and post-test quiz scores (Keta Municipal Hospital 9.4 and 10.9, Ghana Police Hospital 9.2 and 11.1, respectively) demonstrated statistically significant improvement in knowledge of antimicrobial resistance and appropriate use of antibiotics. Comparison of survey responses before and after the education sessions indicated that the education had a positive impact on participants' attitudes towards the issue of antimicrobial resistance, their role in AMS and confidence in using the Ghana Standard Treatment Guidelines. Participants were also more likely to question colleagues about compliance with guidelines. Forty-eight participants (80%) completed a training evaluation and all responded positively. Conclusions: The education sessions appeared to be successful in improving knowledge and behaviours of hospital staff. Cascade of an abbreviated version of the training by partner pharmacists and AMS teams in Ghana will ensure that all staff have the opportunity to develop skills and knowledge to support AMS. Short Title: Exploring the Use of Antibiotics for Dental Patients in a Middle-Income Country: Interviews with Clinicians in Two Ghanaian Hospitals

ISSN: 2079-6382

DOI: 10.3390/antibiotics11081081

Article Number: 1081

Accession Number: WOS:000846408200001

Abstract: Background: Antimicrobial resistance is a global problem driven by the overuse of antibiotics. Dentists are responsible for about 10% of antibiotics usage across healthcare worldwide. Factors influencing dental antibiotic prescribing are numerous, with some differences in low- and middle-income countries compared with high-income countries. This study aimed to explore the antibiotic prescribing behaviour and knowledge of teams treating dental patients in two Ghanaian hospitals. Methods: Qualitative interviews were undertaken with dentists, pharmacists, and other healthcare team members at two hospitals in urban and rural locations. Thematic and behaviour analyses using the Actor, Action, Context, Target, Time framework were undertaken. Results: Knowledge about 'antimicrobial resistance and antibiotic stewardship' and 'people and places' were identified themes. Influences on dental prescribing decisions related to the organisational context (such as the hierarchical influence of colleagues and availability of specific antibiotics in the hospital setting), clinical issues (such as therapeutic versus prophylactic indications and availability of sterile dental instruments), and patient issues such as hygiene in the home environment, delays in seeking professional help, ability to access antibiotics in the community without a prescription and patient's ability to pay for the complete prescription. Conclusions: This work provides new evidence on behavioural factors influencing dental antibiotic prescribing, including resource constraints which affect the availability of certain antibiotics and diagnostic tests. Further research is required to fully understand their influence and inform the development of new approaches to optimising antibiotic use by dentists in Ghana and potentially other low- and middle-income countries.

Short Title: An explorative study with convenience vegetables in urban Nigeria–The Veg-on-Wheels intervention

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0273309

Article Number: e0273309

Accession Number: WOS:000954789800001

Abstract: Nigerian consumers have been found to view vegetables as healthy and health is a principal motivation for consumption; however, consumers also experience barriers related to preparation time and availability of vegetables. We therefore conducted a Veg-on-Wheels intervention, in which ready-to-cook, washed and pre-cut green leafy vegetables (GLV) were kept cool and sold for five weeks at convenient locations near workplaces and on the open market in Akure, Nigeria. Surveys were conducted prior to the intervention with 680 consumers and during the final week of the intervention with 596 consumers near workplaces and 204 consumers at the open market. Both buyers and non-buyers of the intervention were included; 49% buyers in the workplace sample and 47% in the open market sample. The Veg-on-Wheels intervention was successful, with high awareness, positive attitudes and high customer satisfaction. GLV intake was higher for Veg-on-Wheels buyers compared with non-buyers after the intervention, i.e., 10.8 vs. 8.0 portions per week, respectively. Also the intake of other vegetables was higher in the intervention group. The motives and barriers for buyers and non-buyers differed across the selling locations: main barriers were trust in the vendor and GLV source. These trust issues and vendor preferences were viewed as more important to respondents at the market than those near workplaces. This study is the first intervention study on the selling of ready-to-cook convenience vegetables in urban Nigeria. It shows that a market exists for convenience vegetables and that they have the potential to increase vegetable intake. Insights on both the food environment and consumers' motives and behaviour was crucial for designing and evaluating the intervention.

Short Title: Do solar households want demand response and shared electricity data? Exploring motivation, ability and opportunity in Australia

ISSN: 2214-6296

DOI: 10.1016/j.erss.2021.102480

Article Number: 102480

Accession Number: WOS:000744094700009

Abstract: The success of Australia's energy transition is dependent on households' motivation, ability and opportunity to participate in it. This involves technologically-mediated participation in demand response, such as sharing control of solar or battery assets or sharing electricity data use/generation data with third parties. Applying the Motivation Opportunity Ability (MOA) framework, this paper uses in-depth interviews and speculative design with 39 Australian solar panel owners ("prosumers") to understand the values and concerns driving their motivation and ability to participate. Fairness, autonomy, control, trust, privacy and collectivism affect participants' motivation to curtail energy use, share control of solar/battery assets and share energy data, yet motivation does not guarantee ability to participate. The paper contributes and operationalises a provisional method for scoring Motivation, Ability in the MOA framework, toward better understanding customers' potential use or participation in future energy technologies and interactions. This quantification overcomes limitations of existing scoring systems which do not adequately account for negative (rather than simply low) motivation. Findings suggest that increasing users' ability with emergent technologies requires first increasing familiarity and further avenues for more involved consumer participation in the design of energy futures.

Issue: 8

Short Title: Protocol for a qualitative study exploring the perception of need, importance and acceptability of a digital diabetes prevention intervention for women with gestational diabetes mellitus during and after pregnancy in Malaysia (Explore-MYGODDESS)

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2020-044878

Article Number: e044878

Accession Number: WOS:000700920300017

Abstract: Introduction Women who develop gestational diabetes mellitus (GDM) have an increased risk of developing type 2 diabetes, and to reduce this risk the women have to adopt healthy behaviour changes. Although previous studies have explored the challenges and facilitators to initiate behaviour change among women with GDM, there is limited data from Malaysian women. Thus, this study will explore the factors affecting the uptake of healthy behaviour changes and the use of digital technology among women and their healthcare providers (HCPs) to support healthy behaviour changes in women with GDM. Methods and analysis The study will be modelled according to the Capability, Opportunity, Motivation and Behaviour and Behaviour Change Wheel techniques, and use the DoTTI framework to identify needs, solutions and testing of a preliminary mobile app, respectively. In phase 1 (design and development), a focus group discussion (FGDs) of 5-8 individuals will be conducted with an estimated 60 women with GDM and 40 HCPs (doctors, dietitians and nurses). Synthesised data from the FGDs will then be combined with content from an expert committee to inform the development of the mobile app. In phase 2 (testing of early iterations), a preview of the mobile app will undergo alpha testing among the team members and the app developers, and beta testing among 30 women with GDM or with a history of GDM, and 15 HCPs using semi-structured interviews. The outcome will enable us to optimise an intervention using the mobile app as a diabetes prevention intervention which will then be evaluated in a randomised controlled trial. Ethics and dissemination The project has been approved by the Malaysia Research Ethics Committee. Informed consent will be obtained from all participants. Outcomes will be presented at both local and international conferences and submitted for publications in peer-reviewed journals.

Short Title: Beyond the ecocentric: Diverse values and attitudes influence engagement in pro-environmental behaviours

DOI: 10.1002/pan3.10400

Accession Number: WOS:000854582400001

Abstract: Changing human behaviour and social systems are key to reversing the global biodiversity crisis. Pro-environmental behaviour is guided by values and connection with nature, but because they have mostly been studied separately, the interplay between values and nature connection in influencing pro-environmental behaviour remains unclear. In particular, it is uncertain whether people who hold anthropocentric values have a less positive connection with nature than those who hold ecocentric values, and whether nature protection behaviours differ between people with different values or strengths of connection to nature. We used a stratified survey of 2100 respondents across Australia to measure orientation towards nature. We created segments based on individual values and connection with nature and characterised each segment based on demographics, nature-exposure, pro-environmental behaviours, support for environmental policies and political alignment. We discovered that a quarter of respondents had anthropocentric values alongside a strong connection with nature. Moreover, of those with a strong connection with nature, people with anthropocentric values more frequently undertook certain pro-environmental behaviours than those with ecocentric values. Our findings indicate that the strong expression of pro-environmental behaviour is not limited to people with ecocentric values. Rather, people with different values and strengths of connection to nature engage in different types of impactful nature protection behaviours, challenging stereotypes about those with anthropocentric values. These results further suggest that behavioural intervention strategies could be tailored to reach sectors of society with various combinations of values and strengths of connection to nature, thus maximising the expression of pro-environmental behaviour across the entire population. Title: Adherence to and the Maintenance of Self-Management Behaviour
in Older People with Musculoskeletal Pain-A Scoping Review and
Theoretical Models

Journal: Journal of Clinical Medicine

Volume: 10

Issue: 2

Date: Jan

Short Title: Adherence to and the Maintenance of Self-Management
Behaviour in Older People with Musculoskeletal Pain-A Scoping Review
and Theoretical Models

DOI: 10.3390/jcm10020303

Article Number: 303

Accession Number: WOS:000611300900001

Abstract: (1) Background: Adherence to and the maintenance of
treatment regimens are fundamental for pain self-management and
sustainable behavioural changes. The first aim was to study older
adults' (>65 years) levels of adherence to and maintenance of
musculoskeletal pain self-management programmes in randomized
controlled trials. The second aim was to suggest theoretical models
of adherence to and maintenance of a behaviour. (2) Methods: The
study was conducted in accordance with the recommendations for a
scoping review and the PRISMA-ScR checklist. Capability, motivation
and opportunity were used to categorize the behavioural change
components in the theoretical models. (3) Results: Among the four
studies included, components targeting adherence were reported in
one study, and maintenance was reported in two studies. Adherence
was assessed by the treatment attendance rates, and maintenance was
assessed by the follow-up data of outcome measures. For adherence,
the capability components were mostly about education and the
supervision, grading and mastery of exercise to increase self-
efficacy. The motivation components included the readiness to
change, self-monitoring and goal setting; and the opportunity
components included booster sessions, feedback and social support.
For maintenance, the capability components consisted of identifying
high-risk situations for relapse and problem-solving skills. The
motivation components included self-regulation and self-efficacy for
problem solving, and the opportunity components included
environmental triggers and problem solving by using social support.
(4) Conclusion: There are several behavioural change components that
should be used to increase older adults' levels of adherence to and
maintenance of a pain self-management behaviour.

Short Title: Impacts of the COVID-19 pandemic on human-nature interactions: Pathways, evidence and implications

DOI: 10.1002/pan3.10201

Accession Number: WOS:000660704700001

Abstract: The coronavirus (COVID-19) pandemic and the global response have dramatically changed people's lifestyles in much of the world. These major changes, as well as the associated changes in impacts on the environment, can alter the dynamics of the direct interactions between humans and nature (hereafter human-nature interactions) far beyond those concerned with animals as sources of novel human coronavirus infections. There may be a variety of consequences for both people and nature. Here, we suggest a conceptual framework for understanding how the COVID-19 pandemic might affect the dynamics of human-nature interactions. This highlights three different, but not mutually exclusive, pathways: changes in (a) opportunity, (b) capability and (c) motivation. Through this framework, we also suggest that there are several feedback loops by which changes in human-nature interactions induced by the COVID-19 pandemic can lead to further changes in these interactions such that the impacts of the pandemic could persist over the long term, including after it has ended. The COVID-19 pandemic, which has had the most tragic consequences, can also be viewed as a 'global natural experiment' in human-nature interactions that can provide unprecedented mechanistic insights into the complex processes and dynamics of these interactions and into possible strategies to manage them to best effect. Short Title: Towards a unified understanding of human–nature interactions
ISSN: 2398–9629
DOI: 10.1038/s41893–021–00818–z
Accession Number: WOS:000729644200006
Abstract: Interest in the direct interactions between individual people and nature has grown rapidly. This attention encompasses multiple academic disciplines and practical perspectives. A central challenge thus lies in creating a rich cross–disciplinary understanding of these interactions, rather than one that might become characterized by little conceptual, terminological and methodological unity. Here, to facilitate the former outcome, we bring together concepts and theories about direct human–nature interactions drawn from diverse disciplines within a unified conceptual framework. Using this framework, we discuss the linkages among key concepts and theories, identify important knowledge gaps and suggest directions for future research. Understanding interactions between people and nature is increasingly vital. This Perspective argues that synthesizing concepts and theories from diverse disciplines is crucial, and suggests a conceptual framework for unifying this effort and science.

Title: Understanding recruitment and retention in the NHS community pharmacy stop smoking service: perceptions of smoking cessation advisers
Journal: Bmj Open
Volume: 6
Issue: 7
Short Title: Understanding recruitment and retention in the NHS community pharmacy stop smoking service: perceptions of smoking cessation advisers
ISSN: 2044–6055
DOI: 10.1136/bmjopen–2015–010921
Article Number: e010921
Accession Number: WOS:000382252100117
Abstract: Objectives: To understand views of pharmacy advisers about smoker recruitment and retention in the National Health Service community pharmacy stop smoking programme. Design: Thematic

framework analysis of semistructured, in-depth interviews applying the Theoretical Domains Framework and COM-B behaviour change model. We aimed to identify aspects of adviser behaviour that might be modified to increase numbers joining and completing the programme. Participants: 25 stop smoking advisers (13 pharmacists and 12 support staff). Setting: 29 community pharmacies in 3 inner east London boroughs. Results: Advisers had preconceived ideas about smokers likely to join or drop out and made judgements about smokers' readiness to quit. Actively recruiting smokers was accorded low priority due in part to perceived insufficient remuneration to the pharmacy and anticipated challenging interactions with smokers. Suggestions to improve smoker recruitment and retention included developing a more holistic and supportive approach using patient-centred communication. Training counter assistants were seen to be important as was flexibility to extend the programme duration to fit better with smokers' needs. Conclusions: Cessation advisers feel they lack the interpersonal skills necessary to engage well with smokers and help them to quit. Addressing advisers' behaviours about active engagement and follow-up of clients, together with regular skills training including staff not formally trained as cessation advisers, could potentially boost numbers recruited and retained in the stop smoking programme. Adjustments to the pharmacy remuneration structure to incentivise recruitment and to allow personalisation of the programme for individual smokers should also be considered. Title: Attitudes and beliefs regarding the use of herbs and supplementary medications with COVID-19: A systematic review

Journal: Research in Social & Administrative Pharmacy

Volume: 19

Issue: 3

Pages: 343-355

Date: Mar

Short Title: Attitudes and beliefs regarding the use of herbs and supplementary medications with COVID-19: A systematic review

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2022.11.004

Accession Number: WOS:000964736400001

Abstract: Background and aim: There is growing interest in using herbs and supplementary medications to treat and/or prevent COVID-19, evidenced by multiple reports exploring their effectiveness and safety. From a health psychology perspective, the

desire to use herbs and supplementary medications to prevent and/or treat COVID-19 is a health behavior which is attributed to attitudes and beliefs. This systematic review critically appraised and synthesized the data from studies investigating these attitudes and beliefs. Methods: EMBASE, PubMed, ScienceDirect, Scopus, Cochrane (library), and WebOfScience were searched from inception to December 13, 2021 for studies investigating attitudes and beliefs on the use of herbs and supplementary medications to treat and/or prevent COVID-19. Results: A total of 17 articles were identified for inclusion. All except one were of cross-sectional design. Participants across most studies had a positive attitude towards using herbs and supplementary medications. They believed that herbs and supplementary medications were effective and were confident in their value in preventing and/or treating COVID-19 symptoms. The majority of included studies had significant flaws in study design and reporting, including inconsistent definitions of herbs and supplementary medications, a lack of theoretical models and conceptual frameworks underpinning the study of beliefs and attitudes, in addition to methodological issues of robustness affecting the validity and reliability of data. Conclusion: The use of herbs and supplementary medicines to prevent and/or treat COVID-19 could well be driven by a positive attitude stemming from beliefs of effectiveness and safety. There is a need for well-designed studies on attitudes and beliefs that are driven by health behavior theories to permit generalizability of findings and establish more conclusive relationships between beliefs, attitudes and the decision to use herbs and supplementary medications to treat and/or prevent COVID-19.

Short Title: An evidence-based toolbox for the design and implementation of selective-prevention primary-care initiatives targeting cardio-metabolic disease

DOI: 10.1016/j.pmedr.2019.100979

Article Number: 100979

Accession Number: WOS:000645563600018

Abstract: Cardio-metabolic diseases (CMD; cardiovascular disease, type 2 diabetes, chronic kidney disease) represent a global public health problem. Worldwide, nearly half a billion people are currently diagnosed with diabetes, and cardiovascular disease is the leading cause of death. Most of these diseases can be assuaged/prevented through behavior change. However, the best way to implement preventive interventions is unclear. We aim to fill this knowledge gap by creating an evidence-based and adaptable "toolbox" for the design and implementation of selective prevention initiatives (SPI) targeting CMD. We built our toolbox based on evidence from a pan-European research project on primary-care SPIs targeting CMD. The evidence includes (1) two systematic reviews and two surveys of patient and general practitioner barriers and facilitators of engaging with SPIs, (2) a consensus meeting with leading experts to establish optimal SPI design, and (3) a feasibility study of a generic, evidence-based primary-care SPI protocol in five European countries. Our results related primarily to the five different national health-care contexts from which we derived our data. On this basis, we generated 12 general recommendations for how best to design and implement CMD-SPIs in primary care. We supplement our recommendations with practical, evidence-based suggestions for how each recommendation might best be heeded. The toolbox is generic and adaptable to various national and systemic settings by clinicians and policy makers alike. However, our product needs to be kept up-to-date to be effective and we implore future research to add relevant tools as they are developed.

Title: A Comprehensive 6A Framework for Improving Patient Self-Management of Hypertension Using mHealth Services: Qualitative Thematic Analysis

Journal: Journal of Medical Internet Research

Volume: 23

Issue: 6

Date: Jun

Short Title: A Comprehensive 6A Framework for Improving Patient Self-Management of Hypertension Using mHealth Services: Qualitative

Thematic Analysis

ISSN: 1438-8871

DOI: 10.2196/25522

Article Number: e25522

Accession Number: WOS:000664310700005

Abstract: Background: Hypertension affects over 15% of the world's population and is a significant global public health and socioeconomic challenge. Mobile health (mHealth) services have been increasingly introduced to support hypertensive patients to improve their self-management behaviors, such as adherence to pharmacotherapy and lifestyle modifications. Objective: This study aims to explore patients' perceptions of mHealth services and the mechanisms by which the services support them to self-manage their hypertension. Methods: A semistructured, in-depth interview study was conducted with 22 outpatients of the General Hospital of Ningxia Medical University from March to May 2019. In 2015, the hospital introduced an mHealth service to support community-dwelling outpatients with self-management of hypertension. Content analysis was conducted by following a grounded theory approach for inductive thematic extraction. Constant comparison and categorization classified the first-level codes with similar meanings into higher-level themes. Results: The patient-perceived mechanisms by which the mHealth service supported their self-management of hypertension were summarized as 6A: access, assessment, assistance, awareness, ability, and activation. With the portability of mobile phones and digitization of information, the mHealth service provided outpatients with easy access to assess their vital signs and self-management behaviors. The assessment results gave the patients real-time awareness of their health conditions and self-management performance, which activated their self-management behaviors. The mHealth service also gave outpatients access to assistance, which included health education and self-management reminders. Both types of assistance could also be activated by abnormal assessment results, that is, uncontrolled or deteriorating blood pressure values, discomfort symptoms, or not using the service for a long period. With its scalable use to handle any possible information and services, the mHealth service provided outpatients with educational materials to learn at their own pace. This led to an improvement in self-management awareness and ability, again activating their self-management behaviors. The patients would like to see further improvements in the service to provide more useful, personalized information and reliable services. Conclusions: The mHealth service extended the traditional hypertension care model beyond the hospital and clinician's office. It provided outpatients with easy access to otherwise inaccessible hypertension management services. This led to process improvement for outpatients to access health assessment and health care assistance and improved their awareness and self-management ability, which activated their hypertension self-management behaviors. Future studies can apply the 6A framework to guide the design, implementation, and evaluation of mHealth services for outpatients to self-manage chronic conditions.

Article Number: 96

Accession Number: WOS:000853846100001

Abstract: Grape growers are often constrained by available time and labor to conduct trials that deliver informative results. Spatially distributed trial designs coupled with data collection using sensing technologies can introduce efficiencies and also account for the impact of land variability on trial results. Various spatial approaches have been proposed, yet how farmers perceive them is largely unknown. We collaborated with four wine businesses in Australia to explore how grape growers and viticultural consultants perceive a simplified spatial approach to experimentation involving one or more vineyard rows or "strips." In each case, the simplified strip approach was applied alongside growers' or consultants' own methods to compare the perceived value of different methods. The Theory of Planned Behavior was used as an analytical framework to identify factors influencing participants' intentions towards adopting the strip approach. Our findings show that growers and consultants perceived several advantages of the strip approach over their own methods. Key factors impeding uptake were resource constraints for collecting trial data and lack of skills and knowledge to use and analyze spatial data to position the trial and interpret results. These constraints highlight the need to support growers and consultants who see value in this approach by developing automated and affordable measurements for viticultural variables beyond yield, and by providing training on how to analyze and interpret spatial and response data. This study provides novel insights for private and public sectors on where to focus efforts to facilitate adoption of spatial approaches to On-Farm Experimentation by specific target audiences.

Abstract: The European Commission (EU) has launched the strategy
"Europe 2020" aimed to turn the EU into a smart, sustainable and
inclusive economy delivering high levels of employment, productivity
and social cohesion. A prerequisite for the success of Europe 2020
is the availability of a healthy population and a healthy work
force. An action worth highlighting is raising corporate social
responsibility (CSR). The aim of this paper is to present how health
literacy can become a strategic asset in CSR through the
introduction of the Collaborative Venture on Health Literacy and the
development of a business case on health literacy meeting targets of
Europe 2020. A scope study revealed that a majority of companies
within the network of CSR Europe already show health-related
employee programs on their corporate websites, but only a few are
focused specifically on advancing health literacy. The gap leaves
potential opportunities for interventions based on research and good
practices, where businesses through CSR can create a health-friendly
environment and stimulate the workforce to manage their own health,
seek information, and make decisions in terms of promoting health
and well-being, thereby transforming information into knowledge and
increased awareness among employees.

Abstract: Background: COVID-19 has brought unprecedented demands to general practitioners (GPs) worldwide. We examined their knowledge, preparedness, and experiences managing COVID-19 in Australia.

Methods: A cross-sectional online survey of GPs members of the Royal Australian College of General Practitioners (RACGP) was conducted between June and September 2020. Results: Out of 244 survey responses, a majority of GPs (76.6%) indicated having good knowledge of COVID-19, relying mostly on state/territory department of health (84.4%) and the RACGP (76.2%) websites to source up-to-date information. Most felt prepared to manage patients with COVID-19 (75.7%), yet over half reported not receiving training in the use of PPE. The majority were concerned about contracting SARS-CoV-2, more stressed than usual, and have heavier workloads. Their greatest challenges included scarcity of PPE, personal distress, and information overload. Conclusion: Access to PPE, training, accurate information, and preparedness are fundamental for the successful role of general practices during outbreaks. Short Title: Study protocol: randomised controlled hybrid type 2 trial evaluating the scale-up of two arts interventions for postnatal depression and Parkinson's disease

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2021-055691

Article Number: e055691

Accession Number: WOS:000754603900005

Abstract: Introduction Research on the benefits of 'arts' interventions to improve individuals' physical, social and psychological well-being is growing, but evidence on implementation and scale-up into health and social care systems is lacking. This protocol reports the SHAPER-Implement programme (Scale-up of Health-Arts Programmes Effectiveness-Implementation Research), aimed at studying the impact, implementation and scale-up of: Melodies for Mums (M4M), a singing intervention for postnatal depression; and Dance for Parkinson's (PD-Ballet) a dance intervention for Parkinson's disease. We examine how they could be embedded in clinical pathways to ensure their longer-term sustainability.

Methods and analysis A randomised two-arm effectiveness-implementation hybrid type 2 trial design will be used across M4M/PD-Ballet. We will assess the implementation in both study arms (intervention vs control), and the cost-effectiveness of implementation. The design and measures, informed by literature and previous research by the study team, were refined through stakeholder engagement. Participants (400 in M4M; 160 in PD-Ballet) will be recruited to the intervention or control group (2:1 ratio). Further implementation data will be collected from stakeholders involved in referring to, delivering or supporting M4M/PD-Ballet (N=25-30 for each intervention). A mixed-methods approach (surveys and semi-structured interviews) will be employed.

'Acceptability' (measured by the 'Acceptability Intervention Measure') is the primary implementation endpoint for M4M/PD-Ballet. Relationships between clinical and implementation outcomes, implementation strategies (eg, training) and outcomes will be explored using generalised linear mixed models. Qualitative data will assess factors affecting the acceptability, feasibility and appropriateness of M4M/PD-Ballet, implementation strategies and longer-term sustainability. Costs associated with implementation and future scale-up will be estimated. Ethics and dissemination SHAPER-PND (the M4M trial) and SHAPER-PD (the PD trial) are approved by the West London and GTAC (20/PR/0813) and the HRA and Health and Care Research Wales (REC Reference: 20/WA/0261) Research Ethics Committees. Study findings will be disseminated through scientific peer-reviewed journals and scientific conferences.

Short Title: Sleep Health Education to Promote Public Health:
Attitudes and Desired Learning Goals among Social Work Students

ISSN: 1937-1918

DOI: 10.1080/19371918.2022.2093304

Accession Number: WOS:000815830900001

Abstract: Social workers are often front line behavioral health providers for underserved populations, many of whom experience sleep disturbances. Inadequate sleep presents a public health challenge and is associated with many adverse physical health and mental health consequences. Social workers are uniquely positioned to promote sleep health among individuals experiencing health inequities. However, sleep is rarely included as part of the curricula in social work programs in the U.S. We conducted qualitative formative research to investigate social work students' perceptions of sleep education and desired sleep learning objectives. Twenty-five social work students were recruited via a listserv e-mail to participate in one of three focus groups. Participants believed sleep education could be beneficial in promoting client health and well-being. Desired learning goals included: (1) the importance of sleep; (2) identify symptoms of sleep deprivation and sleep disorders; (3) environmental and lifestyle factors that impact sleep; (4) behaviors to promote optimal sleep; and (5) sleep health as it relates to special populations (e.g., homelessness, substance using). Social work students expressed a desire to acquire knowledge on sleep health promotion as part of the social work curricula. Sleep education could be of considerable relevance to social work students, practitioners, and the clients they serve.

Title: Approaches to tracheoesophageal voice rehabilitation: a survey of the UK and Irish speech and language therapists' current practice and beliefs

Journal: International Journal of Language & Communication Disorders

Date: 2023 Apr

Short Title: Approaches to tracheoesophageal voice rehabilitation: a survey of the UK and Irish speech and language therapists' current practice and beliefs

ISSN: 1368-2822

DOI: 10.1111/1460-6984.12873

Accession Number: WOS:000961911200001

Abstract: BackgroundAfter total laryngectomy, surgical voice restoration is used to establish communication via tracheoesophageal voice prosthesis. Once voice is established, there is a paucity of information on what speech and language therapists (SLTs) should do to improve tracheoesophageal voice quality to ensure functional communication. No existing surveys or studies investigate this specific question. There is also a disconnect between guidelines, knowledge and clinical practice, whereby clinical guidelines stipulate the requirement for SLT intervention, but do not detail what this entails in the rehabilitation context. Aims(1) To advance understanding of current clinical practice beyond voice prosthesis management and care. (2) To explore what approaches are implemented in clinical practice across the UK and Republic of Ireland to rehabilitate tracheoesophageal voice. (3) To investigate the barriers and facilitators to provision of tracheoesophageal voice therapy. Methods & ProceduresA self-administered 10-min online survey was developed using Qualtrics software and piloted before dissemination. Survey development was informed by the Behaviour Change Wheel to identify barriers, facilitators and additional factors contributing to SLTs' provision of voice therapy to tracheoesophageal speakers. The survey was disseminated via social media and professional networks. Eligibility criteria included SLTs with at least one year post-registration experience and with experience of working with laryngectomy in the past 5 years. Descriptive statistics were used to analyse closed answer questions. Open question responses were analysed using content analysis. Outcomes & ResultsThe survey received 147 responses. Participants were representative of the head and neck cancer SLT workforce. SLTs believe that tracheoesophageal voice therapy is an important aspect of laryngectomy rehabilitation; however, there was a lack of knowledge about therapy approaches and insufficient resources for implementing therapy. SLTs expressed a desire for more training, specific guidelines and a stronger evidence base to inform clinical practice. Some SLTs expressed feelings of frustration and lack of

acknowledgement for the specialist skills required to undertake laryngectomy rehabilitation and tracheoesophageal work in general. Conclusions & Implications The survey identifies the need for a robust training approach and detailed clinical guidelines to promote consistent practice across the profession. The evidence base within this clinical area is emergent, hence there is a need for increased research and clinical audit to inform practice. Under-resourcing was highlighted, which should be considered in service planning to ensure that adequate staff, access to expert practitioners or time ring-fenced for therapy are available for tracheoesophageal speakers to receive the support they require. WHAT THIS PAPER ADDS What is already known on this subject Total laryngectomy results in life-altering changes to communication. Clinical guidelines advocate for speech and language therapy intervention; however, there is no clear information on what SLTs should do to optimize tracheoesophageal voice and the evidence base to support practice is lacking. What this study adds to existing knowledge This survey identifies what interventions SLTs provide in clinical practice to rehabilitate tracheoesophageal voice; and it explores the barriers and facilitators that influence the provision of tracheoesophageal voice therapy. What are the potential or actual clinical implications of this work? Specific training, clinical guidelines, increased research and audit are required to support clinical practice in laryngectomy rehabilitation. Service planning should address the under-resourcing of staff, expert practitioners and therapy allocated time.

Short Title: Exploring physiologic reactions to persuasive information

ISSN: 0048-5772

DOI: 10.1111/psyp.14001

Article Number: e14001

Accession Number: WOS:000745623500001

Abstract: Persuasion aims at changing peoples' motivations and/or behaviors. This study explores how and when physiology reflects persuasion processes and specifically whether individual differences in motivations and behaviors affect psychophysiological reactions to persuasive information. Participants (N = 70) with medium or high meat consumption patterns watched a persuasive video advocating limited meat consumption, while their electrodermal and

cardiovascular physiology was measured. Results indicated that the video increased participants' moral beliefs, perceived behavioral control, and reduction intentions. This study also found an increase in physiologic arousal during the persuasive video and that people with motivations less aligned to the persuasion objective had more physiologic arousal. The findings encourage further psychophysiological persuasion research, especially as these insights can potentially be used to personalize persuasive messages of behavior change applications.

Accession Number: WOS:000740406500001

Abstract: Persuasive technology (PT) can assist in behavior change. PT systems often rely on user models, based on behavior and self-report data, to personalize their functionalities and thereby increase efficiency. This review paper shows how physiological measurements could be used to further improve user models for personalization of PT by means of bio-cybernetic loops and data-driven approaches. Furthermore, we outline the advantages of using physiological measures for personalization compared to self-report and behavior measurement. Additionally, we show how two types of physiological information-physiological states and physiological reactivity-can be relevant for PT adaptations. To illustrate this, we present a model with two types of physiology-based PT adaptations as part of a bio-cybernetic loop; state-based and reactivity-based. Next, we discuss the implications of physiology-aware PT for persuasive design and theory. And lastly, because of the potential impact of such systems, we also consider important ethical implications of physiology-aware PT.

Title: Determinants of physical activity among adults in the United
Kingdom during the COVID-19 pandemic: The DUK-COVID study
Journal: British Journal of Health Psychology
Volume: 26
Issue: 2
Pages: 588-605
Date: May
Short Title: Determinants of physical activity among adults in the
United Kingdom during the COVID-19 pandemic: The DUK-COVID study
ISSN: 1359-107X
DOI: 10.1111/bjhp.12497
Accession Number: WOS:000599527800001
Abstract: Objectives This study examined the impact of the COVID-19
lockdown on the physical activity (PA) of UK adults and potential
motivational determinants of such behaviour. Design and methods A
survey was conducted with 1,521 UK adults recruited through
Prolific.co in early June 2020. Along with demographic information,

questions assessed current PA, changes in PA modalities (i.e., overall, around the home, for transport, in the workplace, in the local neighbourhood, at recreation/sport facilities) related to the lockdown, and beliefs about capabilities, opportunities, and motivations according to the COM-B model. A series of logistic regressions were constructed to examine associations between shifts in the PA modalities and the COM-B components. Results The majority of respondents (57%) had either maintained or increased their levels of PA during the COVID-19 lockdown. However, the proportion meeting PA guidelines (31%) was low and engagement in sedentary-related behaviour for both work and leisure increased substantially during the lockdown. The components of the COM-B model were associated with shifts in PA. In particular, physical opportunity (odds ratios ranging from 1.14 to 1.20) and reflective motivation (odds ratios ranging from 1.11 to 1.25) appeared to be the most consistent predictors of behaviour. Conclusions If UK adults believed they had the physical opportunity and were motivated, they were more likely to have maintained or increased their PA during the COVID-19 lockdown. However, the majority of adults are not meeting the UK guidelines on PA and the prevalence of PA is substantially lower than national surveys prior to the pandemic. Statement of contribution What is already known on this subject? The COVID-19 pandemic has significantly disrupted the daily routines of citizens globally. Engagement in physical activity appears to have declined as a result of the requirement to self-isolate and stay in place. The COM-B model of behaviour change is a useful framework for identifying the correlates and determinants of behaviour. What does this study add? Though most UK adults maintained or increased their engagement in physical activity during the COVID-19 pandemic, the majority did not meet recommended guidelines. Reflective processes and physical opportunity were the primary predictors of change in physical activity.

Title: Factors influencing the prescribing behaviour of independent prescriber optometrists: a qualitative study using the Theoretical Domains Framework

Journal: Ophthalmic and Physiological Optics

Volume: 41

Issue: 2

Pages: 301-315

Date: Mar

Short Title: Factors influencing the prescribing behaviour of independent prescriber optometrists: a qualitative study using the Theoretical Domains Framework

ISSN: 0275-5408

DOI: 10.1111/opo.12782

Accession Number: WOS:000619769000001

Abstract: Purpose Whilst the number of independent prescriber (IP) optometrists in the United Kingdom is increasing, there is limited evidence describing the experiences of these individuals. The Theoretical Domains Framework (TDF) provides an evidence-based approach to understand determinants of behaviour. This conceptual framework can enable mapping to the COM-B behaviour change model and the wider Behaviour Change Wheel to develop interventions to optimise behaviour-change and healthcare processes more systematically. The study aimed to use the TDF to identify the factors that influence independent prescribing behaviour, and to map these findings to the COM-B system to elucidate the relevant intervention functions, in order to identify the support required by optometrist prescribers. Methods Using a qualitative design, semi-structured interviews based on the TDF were undertaken with independent prescriber optometrists. Thematic analysis was used to identify themes inductively, which were then deductively mapped to the TDF and linked to the COM-B. Results Sixteen participants (9 male, 7 female; median age 45 years, range 28-65 years), based in community (n = 10) and hospital (n = 6) settings, were interviewed. Eleven of the TDF domains were found to influence prescribing behaviour. Findings highlighted the need for good communication with patients (TDF domain: Skills, COM-B: Capability); confidence (TDF domain: Beliefs about capabilities, COM-B: Motivation); good networks and relationships with other healthcare professionals, e.g., general practitioners (TDF domain: Social influences, COM-B: Opportunity; TDF domain: Social/professional role and identity, COM-B: Motivation); the need for appropriate structure for remuneration (TDF domain: Reinforcement, COM-B: Motivation; TDF domain: Social/professional role and identity, COM-B: Motivation) and the provision of professional guidelines (TDF domain: Knowledge, COM-B: Capability; TDF domain: Environmental context and resources, COM-B: Opportunity). Conclusions Having identified theory-derived influencers on prescribing decisions by optometrists, the findings can be used to develop a structured intervention, such as a support package to help optimise prescribing by optometrists, with the ultimate goal of eye care quality improvement.

Abstract: In spite of the importance of visual content in academic publishing, biomedical articles do not offer accessible images, mainly because of the lack of text alternatives. According to a process-oriented accessibility philosophy, this article proposes the use of image-related texts, such as captions or mentions, as text alternatives of images, since they are solutions based on the current practices of authors of biomedical images. We also present two tools created to guide authors in writing comprehensive text alternatives. The aim of this proposal is to increase the opportunities of an actual application of accessibility principles within the biomedical academic publishing. (C) 2015 The Authors. Short Title: The Design and Development of a Personalized Leisure Time Physical Activity Application Based on Behavior Change

Theories, End-User Perceptions, and Principles From Empirical Data Mining

DOI: 10.3389/fpubh.2020.528472

Article Number: 528472

Accession Number: WOS:000618224300001

Abstract: Introduction: Many adults do not reach the recommended physical activity (PA) guidelines, which can lead to serious health problems. A promising method to increase PA is the use of smartphone PA applications. However, despite the development and evaluation of multiple PA apps, it remains unclear how to develop and design engaging and effective PA apps. Furthermore, little is known on ways to harness the potential of artificial intelligence for developing personalized apps. In this paper, we describe the design and development of the Playful data-driven Active Urban Living (PAUL): a personalized PA application. **Methods:** The two-phased development process of the PAUL apps rests on principles from the behavior change model; the Integrate, Design, Assess, and Share (IDEAS) framework; and the behavioral intervention technology (BIT) model. During the first phase, we explored whether location-specific information on performing PA in the built environment is an enhancement to a PA app. During the second phase, the other modules of the app were developed. To this end, we first build the theoretical foundation for the PAUL intervention by performing a literature study. Next, a focus group study was performed to translate the theoretical foundations and the needs and wishes in a set of user requirements. Since the participants indicated the need for reminders at a for-them-relevant moment, we developed a self-learning module for the timing of the reminders. To initialize this module, a data-mining study was performed with historical running data to determine good situations for running. **Results:** The results of these studies informed the design of a personalized mobile health (mHealth) application for running, walking, and performing strength exercises. The app is implemented as a set of modules based on the persuasive strategies "monitoring of behavior," "feedback," "goal setting," "reminders," "rewards," and "providing instruction." An architecture was set up consisting of a smartphone app for the user, a back-end server for storage and adaptivity, and a research portal to provide access to the research team. **Conclusions:** The interdisciplinary research encompassing psychology, human movement sciences, computer science, and artificial intelligence has led to a theoretically and empirically driven leisure time PA application. In the current phase, the feasibility of the PAUL app is being assessed.

Short Title: Just-in-Time Prompts for Running, Walking, and Performing Strength Exercises in the Built Environment: 4-Week Randomized Feasibility Study

DOI: 10.2196/35268

Article Number: e35268

Accession Number: WOS:000854086000051

Abstract: Background: App-based mobile health exercise interventions can motivate individuals to engage in more physical activity (PA). According to the Fogg Behavior Model, it is important that the individual receive prompts at the right time to be successfully persuaded into PA. These are referred to as just-in-time (JIT) interventions. The Playful Active Urban Living (PAUL) app is among the first to include 2 types of JIT prompts: JIT adaptive reminder messages to initiate a run or walk and JIT strength exercise prompts during a walk or run (containing location-based instruction videos). This paper reports on the feasibility of the PAUL app and its JIT prompts. Objective: The main objective of this study was to examine user experience, app engagement, and users' perceptions and opinions regarding the PAUL app and its JIT prompts and to explore changes in the PA behavior, intrinsic motivation, and the perceived capability of the PA behavior of the participants. Methods: In total, 2 versions of the closed-beta version of the PAUL app were evaluated: a basic version (Basic PAUL) and a JIT adaptive version (Smart PAUL). Both apps send JIT exercise prompts, but the versions differ in that the Smart PAUL app sends JIT adaptive reminder messages to initiate running or walking behavior, whereas the Basic PAUL app sends reminder messages at randomized times. A total of 23 participants were randomized into 1 of the 2 intervention arms. PA behavior (accelerometer-measured), intrinsic motivation, and the perceived capability of PA behavior were measured before and after the intervention. After the intervention, participants were also asked to complete a questionnaire on user experience, and they were invited for an exit interview to assess user perceptions and opinions of the app in depth. Results: No differences in PA behavior were observed ($Z=-1.433$; $P=.08$), but intrinsic motivation for running and walking and for performing strength exercises significantly increased ($Z=-3.342$; $P<.001$ and $Z=-1.821$; $P=.04$, respectively). Furthermore, participants increased their perceived capability to perform strength exercises ($Z=2.231$; $P=.01$) but not to walk or run ($Z=-1.221$; $P=.12$). The interviews indicated that the participants were enthusiastic about the strength exercise prompts. These were perceived as personal, fun, and relevant to their health. The reminders were perceived as important initiators for PA, but participants from both app groups explained that the reminder

messages were often not sent at times they could exercise. Although the participants were enthusiastic about the functionalities of the app, technical issues resulted in a low user experience.

Conclusions: The preliminary findings suggest that the PAUL apps are promising and innovative interventions for promoting PA. Users perceived the strength exercise prompts as a valuable addition to exercise apps. However, to be a feasible intervention, the app must be more stable.

Abstract: Background: Understanding intervention delivery as intended, particularly in complex interventions, should be underpinned by good quality fidelity assessment. We present the findings from a fidelity assessment embedded as part of a trial of a complex community-based psychosocial intervention, Journeying through Dementia (JtD). The intervention was designed to equip individuals with the knowledge and skills to successfully self-manage, maintain independence, and live well with dementia and involves both group and individual sessions. The methodological challenges of developing a conceptual framework for fidelity assessment and creating and applying purposely designed measures derived from this framework are discussed to inform future studies.

Methods: A conceptual fidelity framework was created out of core components of the intervention (including the intervention manual and training for delivery), associated trial protocols and pre-defined fidelity standards and criteria against which intervention

delivery and receipt could be measured. Fidelity data collection tools were designed and piloted for reliability and usability. Data collection in four selected sites (fidelity sites) was via non-participatory observations of the group aspect of the intervention, attendance registers and interventionist (facilitator and supervisor) self-report. Results: Interventionists from all four fidelity sites attended intervention training. The majority of group participants at the four sites (71%) received the therapeutic dose of 10 out of 16 sessions. Weekly group meeting attendance (including at 'out of venue' sessions) was excellent at 80%. Additionally, all but one individual session was attended by the participants who completed the intervention. It proved feasible to create tools derived from the fidelity framework to assess in-venue group aspects of this complex intervention. Results of fidelity assessment of the observed groups were good with substantial inter-rater reliability between researchers KAPPA 0.68 95% CI (0.58-0.78). Self-report by interventionists concurred with researcher assessments. Conclusions: There was good fidelity to training and delivery of the group aspect of the intervention at four sites. However, the methodological challenges of assessing all aspects of this complex intervention could not be overcome due to practicalities, assessment methods and ethical considerations. Questions remain regarding how we can assess fidelity in community-based complex interventions without impacting upon intervention or trial delivery.

Connectedness in Underserved Communities

ISSN: 0160-6379

DOI: 10.1097/fch.0000000000000321

Accession Number: WOS:000757900700008

Abstract: The lack of environmental supports for healthy lifestyles is a potent factor in the high prevalence of noncommunicable diseases among communities experiencing economic disadvantage. Stronger Austin aimed to increase access to free physical activity (PA) and fitness programming (eg, Zumba) in underserved communities in Austin, Texas, via a partnership and interweaving into context approach in which classes are interwoven into settings with widespread access for residents, including clinics, city-supported housing, parks, recreation centers, and schools. We aimed to better understand the PA-related benefits and opportunities for improvement when adult fitness classes are interwoven into community settings. A mixed-methods design guided the study, which included SOFIT (Structured Observation of Fitness Instruction Time) assessments of class PA (n = 160 participants) and qualitative assessment of highlights and recommendations for class improvement via participant focus groups (n = 24), open-ended questionnaires (n = 258), and instructor interviews (n = 6). Findings indicated high levels of class PA (76.9%–86.9% of 1-hour class spent in moderate-to-vigorous PA; mean of 18 participants per class), with positive social connectedness cited as a key benefit. Challenges and best practices of community-based fitness classes are explored. Stronger Austin's partnership and interweaving into context approach represents a promising model for increasing access to fitness classes in underserved communities.

Accession Number: WOS:000368909300012

Abstract: Adverse and suboptimal health behaviors and habits are responsible for approximately 40 % of preventable deaths, in addition to their unfavorable effects on quality of life and economics. Our current understanding of human behavior is largely based on static "snapshots" of human behavior, rather than ongoing, dynamic feedback loops of behavior in response to ever-changing biological, social, personal, and environmental states. This paper first discusses how new technologies (i.e., mobile sensors, smartphones, ubiquitous computing, and cloud-enabled processing/computing) and emerging systems modeling techniques enable the development of new, dynamic, and empirical models of human behavior that could facilitate just-in-time adaptive, scalable interventions. The paper then describes concrete steps to the creation of robust dynamic mathematical models of behavior including: (1) establishing "gold standard" measures, (2) the creation of a behavioral ontology for shared language and understanding tools that both enable dynamic theorizing across disciplines, (3) the development of data sharing resources, and (4) facilitating improved sharing of mathematical models and tools to support rapid aggregation of the models. We conclude with the discussion of what might be incorporated into a "knowledge commons," which could help to bring together these disparate activities into a unified system and structure for organizing knowledge about behavior.

Abstract: Behavioral contributions to the pathogenesis of prediabetes and Type 2 diabetes (T2D) include lifestyle behaviors including dietary intake, exercise, sedentariness, sleep, and stress. The purpose of this paper is to review evidence for the metabolic pathways by which the behavior is linked to T2D. Evidence for interventions, which change each of the lifestyle behaviors, is discussed. The article will close with a brief discussion on how new technologies may provide opportunities to better understand relationships between moment-to-moment fluctuations in behaviors and diabetes pathogenesis, as well as provide opportunities to personalize and adapt interventions to achieve successful behavior change and maintenance of that change. Especially promising are new technologies, which assist in tracking lifestyle behaviors along with clinical and metabolic outcomes.

Abstract: The use of theory in health behavior change interventions has been recently questioned with mixed results found for theory-

based intervention effectiveness. But theory testing in intervention depends on not only theoretical assumptions, but on auxiliary assumptions too. Specifically, auxiliary assumptions are required to traverse the distance from nonobservational terms in theories and observational terms at the level of the empirical hypotheses in interventions. We believe intervention failures are often due to flaws in auxiliary assumptions rather than assumptions at the theoretical level. We use the theory of planned behavior to illustrate how the consideration of these auxiliary assumptions is important to appraise the effectiveness of interventions informed by theory. We hope that bringing attention to the importance of auxiliary assumptions provides a more nuanced and accurate appraisal of theory utility.

Title: Acute fuelling and recovery practices of academy soccer players: implications for growth, maturation, and physical performance

Journal: Science and Medicine in Football

Date: 2022 Nov

Short Title: Acute fuelling and recovery practices of academy soccer players: implications for growth, maturation, and physical performance

ISSN: 2473-3938

DOI: 10.1080/24733938.2022.2146178

Accession Number: WOS:000882921500001

Abstract: Academy soccer players frequently train in the evening (i.e. 1700-2000 h), hence limited time to nutritionally prepare and recover due to schooling, travel and sleep schedules. Accordingly, we assessed timing and quantity of energy intake in the pre-training and post-training period. Over a 3-day in-season training period, male players (n=48; n=8 from under (U) 12, 13, 14, 15/16, 18 and 23 players) from an English Premier League academy self-reported dietary intake and physical activity levels (via the remote food photography method and activity diary, respectively) in the four hours pre- and post-training. Timing of pre-training energy intake ranged from 40 +/- 28 mins (U15/U16 players) to 114 +/- 71 mins (U18) before training and mean carbohydrate (CHO) intake ranged from 0.8 +/- 0.4 g.kg⁻¹ (U23) to 1.5 +/- 0.9 g.kg⁻¹ (U12). Timing of post-training energy intake ranged from 39 +/- 27 mins (U14) to 70 +/- 84 mins (U23) and mean CHO intake ranged from 1.6 +/- 0.8 g.kg⁻¹ (U12) to 0.9 +/- 0.5 g.kg⁻¹ (U14). In contrast to CHO, all age groups consumed sufficient protein intake in the post-training period (i.e. > 0.3 g.kg⁻¹). We conclude academy soccer players habitually practice sub-optimal fuelling and recovery strategies,

the consequence of which could impair growth, maturation and physical performance.

Accession Number: WOS:000379436400004

Abstract: Workplaces worldwide are a major source of carbon emissions and changing energy use behaviour in these environments has the capacity for large carbon savings. This paper reviews and synthesises empirical evidence to identify what types of behaviour change intervention are most successful at saving energy in an office-type workplace. We draw on the field of health-related behaviour change interventions and adopt the Behaviour Change Wheel (Michie et al., 2014) as a framework through which to assess the success of the interventions reviewed here (n = 22 studies). We find that interventions creating social and physical opportunities for employees to save energy are the most successful i.e. which constitute Enablement (including direct support and greater control to employees), Environmental Restructuring (particularly automated and retrofitted technologies) and Modelling (various forms of social influence). The communal nature of most workplaces demands scrutiny to understand the effect of social influences. We provide recommendations for future research, including the need to consider forms of intervention not yet researched; Coercion, Restriction, and Training. We conclude by calling for further, well evaluated, energy saving behavioural interventions in a variety of workplaces to identify those techniques which offer the greatest success in saving energy and thus reducing carbon emissions. Article Number: e2174

Accession Number: WOS:000587030200001

Abstract: Introduction: Clinical practice guidelines (CPG) are vehicles for translating evidence into practice, but effective CPG-uptake requires targeted training. This mixed methods research project took a staged evidence-based approach to develop and test a tailored training programme (TTP) that addressed organisational and individual factors influencing CPG-uptake by South African physiotherapists treating patients with low back pain in primary healthcare settings. Methods: This multi-stage mixed methods study reports the development, contextualisation and expert content validation of a TTP to improve CPG-uptake. Finally, the TTP was evaluated for its feasibility and acceptability in its current format. Results: The TTP (delivered online and face-to-face) contained minimal theory, and focussing on practical activities, clinical scenarios and discussions. Pre-TTP, physiotherapists expressed skepticism about the relevance of CPG in daily practice. However, post-TTP they demonstrated improved knowledge, confidence, and commitment to CPG-uptake. Discussion: The phased-construction of the TTP addressed South African primary healthcare physiotherapists' needs and concerns, using validated evidence-based educational approaches. The TTP content, delivered by podcasts and face-to-face contact, was feasible and acceptable in terms of physiotherapists' time constraints, and it appeared to be effective in improving all outcome domains. This TTP is now ready for intervention to a wider audience.

Accession Number: WOS:000427179300008

Abstract: This article examines the development and impact of a national knowledge translation project aimed at improving access to evidence and learning on community-centred approaches for health and wellbeing. Structural changes in the English health system meant that knowledge on community engagement was becoming lost and a fragmented evidence base was seen to impact negatively on policy and practice. A partnership started between Public Health England, NHS England and Leeds Beckett University in 2014 to address these issues. Following a literature review and stakeholder consultation, evidence was published in a national guide to community-centred approaches. This was followed by a programme of work to translate the evidence into national strategy and local practice. The article outlines the key features of the knowledge translation framework developed. Results include positive impacts on local practice and national policy, for example adoption within National Institute for Health and Care Evidence (NICE) guidance and Local Authority public health plans and utilization as a tool for local audit of practice and commissioning. The framework was successful in its non-linear approach to knowledge translation across a range of inter-connected activity, built on national leadership, knowledge brokerage, coalition building and a strong collaboration between research institute and government agency.

Abstract: Aims Self-management programmes for type 1 diabetes, such as the UK's Dose Adjustment for Normal Eating (DAFNE), improve short-term clinical outcomes but difficulties maintaining behavioural changes attenuate long-term impact. This study used the Behaviour Change Wheel (BCW) framework to revise the DAFNE intervention to support sustained behaviour change. **Methods** A four-step method was based on the BCW intervention development approach: (1) Identifying self-management behaviours and barriers/enablers to maintain them via stakeholder consultation and evidence synthesis, and mapping barriers/enablers to the Capability, Opportunity, Motivation-Behaviour (COM-B) model. (2) Specifying behaviour change techniques (BCTs) in the existing DAFNE intervention using the Behaviour Change Techniques Taxonomy (BCTTv1). (3) Identifying additional BCTs to target the barriers/enablers using the BCW and BCTTv1. (4) Parallel stakeholder consultation to generate recommendations for intervention revision. Revised materials were co-designed by stakeholders (diabetologists, psychologists, specialist nurses and dieticians). **Results** In all, 34 barriers and 5 enablers to sustaining self-management post-DAFNE were identified. The existing DAFNE intervention contained 24 BCTs, which partially addressed the enablers. In all, 27 BCTs were added, including 'Habit formation', 'Credible source' and 'Conserving mental resources'. In total, 15 stakeholder-agreed recommendations for content and delivery were incorporated into the final DAFNEplus intervention, comprising three co-designed components: (1) face-to-face group learning course, (2) individual structured follow-up sessions and (3) technological support, including blood glucose data management. **Conclusions** This method provided a systematic approach to specifying and revising a behaviour change intervention incorporating stakeholder input. The revised DAFNEplus intervention aims to support the maintenance of behavioural changes by targeting barriers and enablers to sustaining self-management behaviours.

Accession Number: WOS:000918500200001

Abstract: Study designQualitative study.ObjectivesThe benefits of exercise to reduce shoulder pain in people with spinal cord injury (SCI) are well documented. Digital health interventions offer a potential solution to overcome barriers to access rehabilitation support for exercise. The aim of this project was to gain people's perspectives to inform the development of a self-guided web-based exercise intervention. Shoulder Pain Intervention delivered over the interNet (SPIN) is a self-guided web-based intervention to prescribe, monitor, and progress evidence-based exercises for people living with SCI and shoulder pain.SettingCommunity in Auckland, New Zealand.MethodsThe Person-Based Approach was used as the framework. Using an Interpretive Descriptive methodology, data were collected in individual and focus group interviews, exploring participants' perceptions of this intervention idea. Data were analysed using conventional content analysis.ResultsSixteen participants took part and asked Is it right for me?. This had three main sub-themes. Should I use it?, whether I believe it will work for me right now; Can I use it?, whether I can operate the intervention competently and confidently and Will I use it?, whether it will be responsive to my unique needs, and keep me coming back.ConclusionsParticipants expressed their expectations and tipping points when considering using an intervention like this. These findings will inform and guide design and development of an acceptable technology-based intervention to increase the likelihood of engagement with a self-guided web-based exercise programme. The model developed from these themes could be used to inform future self-guided intervention development.

Short Title: Protocol for an evaluation of the Designing Communities to Support Healthy Living in Aging Residents Study

ISSN: 0778-7367

DOI: 10.1186/s13690-021-00691-4

Article Number: 172

Accession Number: WOS:000704970800001

Abstract: Background In collaboration with building developers, the Housing for Health team is contributing to the design of community-based congregate living facilities to support healthy living in older adults. There may also be opportunities to improve the surrounding neighbourhoods by collaborating with the municipalities where the developments are located. We will evaluate whether one or more of these comprehensive interventions lead to changes in the perceived, microscale, and macroscale neighbourhood-built environment (BE) and amenities, and impacts on the physical activity (PA), healthy eating, and social connections of residents. In parallel, we will gather qualitative data to provide a more in-depth understanding of how the BE may facilitate or hinder resident's healthy living outcomes. **Methods** This project employs a quasi-experimental pre-post design with at least one or more intervention and control sites. The quantitative BE evaluation will include pre- and post-intervention assessments of neighbourhood macroscale (e.g., layout of communities) and microscale (e.g., street details and characteristics) changes using Geographical Information Systems (GIS) and Microscale Audit Pedestrian Streetscapes (MAPS) audits, respectively. The quantitative resident evaluation will include self-report (i.e., surveys) and objective assessments (i.e., accelerometers, Global Positioning System [GPS]) of residents at baseline (3-6-months pre-move-in) and follow-up (3-6-months and 9-12-months post-move-in if possible). The qualitative resident-environment component will involve in-depth semi-structured interviews post-intervention with building residents, family members, and stakeholders involved in the design/development and/or operation of the intervention site(s). Participant observations will be completed in the building and neighbourhood environments of the intervention site(s). **Discussion** Findings will provide evidence on whether and how comprehensive changes to the BE and amenities of at least one congregate living facility and the surrounding neighbourhood can impact PA, healthy eating, and social connections of older adults. Successful intervention elements will be scaled up in future work. We will disseminate findings to a broad audience including the scientific community via peer-reviewed publications, conference presentations, and discussion panels; and the private, public, and not-for-profit sectors via reports, public presentations, and/or communications via our partners and their networks.

Short Title: Developing a complex intervention whilst considering implementation: the TANDEM (Tailored intervention for ANxiety and DEpression Management) intervention for patients with chronic obstructive pulmonary disease (COPD)

DOI: 10.1186/s13063-021-05203-x

Article Number: 252

Accession Number: WOS:000637773100002

Abstract: Background: Guidelines now call for a thorough and comprehensive description of the development of healthcare interventions to aid evaluation and understanding of the processes of change. This was the primary aim of this study but we also recognised that effective interventions are commonly not implemented in clinical practice. It is suggested that insufficient attention is given to the implementation process at the development phase of interventions. This study outlines the 5 step iterative process we adopted for considering both implementation and effectiveness issues from the outset of intervention development. We use the development of a complex intervention Tailored intervention for ANxiety and DEpression Management (TANDEM) in patients with chronic obstructive pulmonary disease to illustrate this process. Methods: Intervention development built upon the Medical Research Council framework for developing complex interventions and the person-based approach for development of behavioural interventions. Building an expert team, specifying theory, qualitative data collection and pre-piloting were all critical steps in our intervention development and are described here. Results: Contact with experts in the field, and explicitly building on previous work, ensured efficiency of design. Qualitative work suggested guiding principles for the intervention such as introducing mood in relation to breathlessness, and providing flexible tailoring to patients' needs, whilst implementation principles focused on training selected respiratory professionals and requiring supervision to ensure standards of care. Subsequent steps of intervention development, pre-piloting and intervention refinement led to an intervention that was deemed acceptable and if

successful will be ready for implementation. Conclusions: The TANDEM study was developed efficiently by building on previous work and considering implementation issues from the outset, with the aim that if shown to be effective it will have more rapid translation in to the health care system with accelerated patient benefits.

Article Number: 791339

Accession Number: WOS:000807106900001

Abstract: Musculoskeletal complaints are common in pre-professional and professional classical violinists and these complaints can affect violinists' performance. Therefore, it is important to identify the factors that contribute to healthy performance in this population. Qualitative studies with a variety of stakeholders are able to provide insights from different perspectives into factors influencing healthy performance for the pre-professional and professional classical violinist. In the current small-scale, exploratory study, semi-structured interviews were conducted with various stakeholders; two classical violin students, one classical violin teacher, a physiotherapist, a professional classical violinist, who is also a performance coach, and a health specialist who also graduated as a professional classical violist. Thematic analysis was conducted using Atlas.ti 9. We identified six themes that were indicated as important by the participants in terms of ensuring healthy performance for the pre-professional and professional classical violinist. The themes were: (1) physical aspects (involved in playing the violin); (2) practice routine and techniques; (3) interaction between physical and mental aspects; (4) culture; (5) role of the main subject teacher; and (6) preventive measures. Furthermore, when asked specifically about the development of a physical screening tool, the participants indicated that such a

tool should include multiple factors covering various regions of the body, the inclusion of a questionnaire on risk-factors, and follow-up measurements. Also, collaborations between health professionals and main subject teachers were recommended as part of the screening tool to increase commitment of participating students. The results of the current study are based on the opinions, attitudes, and ideas of a small, selected group of participants only and cannot be generalized to a wider group of violinists. More research is needed regarding factors influencing healthy performance, before conservatoires and professional orchestras can develop programs for a healthy playing environment for pre-professional and professional violinists.

Title: Implementing a new emergency department: a qualitative study of health professionals' change responses and perceptions

Journal: BMC Health Services Research

Volume: 22

Issue: 1

Date: Apr

Short Title: Implementing a new emergency department: a qualitative study of health professionals' change responses and perceptions

DOI: 10.1186/s12913-022-07805-w

Article Number: 447

Accession Number: WOS:000778478300005

Abstract: Background The aim of the study is two-fold. It explores how managers and key employees at the Emergency Department (ED) and specialist departments in a university hospital in the Capital Region of Denmark respond to the planned change to a new ED, and how they perceive the change involved in the implementation of the new ED. The study investigates what happens when health professionals are confronted with implementation of policy that changes their organization and everyday work lives. Few studies provide in-depth investigations of health professionals' reactions to the implementation of new EDs, and particularly how they influence the implementation of a nationwide organizational change framed within a political strategy. Methods The study used semi-structured individual interviews with 51 health professionals involved in implementation activities related to an organizational change of establishing a new ED with new patient pathways for acutely ill patients. The data was deductively analyzed using Leon Coetsee's theoretical framework of change responses, but the analysis also allowed for a more inductive reading of the material. Results Fourteen types of responses to establishing a new ED were identified

and mapped onto six of the seven overall change responses in Coetsee's framework. The participants perceived the change as particularly three changes. Firstly, they wished to create the best possible acute patient pathway in relation to their specialty. Whether the planned new ED would redeem this was disputed. Secondly, participants perceived the change as relocation to a new building, which both posed potentials and worries. Thirdly, both hopeful and frustrated statements were given about the newly established medical specialty of emergency medicine (EM), which was connected to the success of the new ED. Conclusions The study showcases how implementation processes within health care are not straightforward and that it is not only the content of the implementation that determines the success of the implementation and its outcomes but also how these are perceived by managers and employees responsible for the process and their context. In this way, managers must recognize that it cannot be pre-determined how implementation will proceed, which necessitates fluid implementation plans and demands implementation managements skills.

Short Title: Service-user experiences of an integrated psychological intervention for depression or anxiety and tobacco smoking in improving access to psychological therapies services: A qualitative investigation into mechanisms of change in quitting smoking

ISSN: 1369-6513

DOI: 10.1111/hex.13684

Accession Number: WOS:000894635100001

Abstract: IntroductionHigh smoking prevalence leads to increased morbidity and mortality in individuals with depression/anxiety. Integrated interventions targeting both smoking and mood have been found to be more effective than those targeting smoking alone, but

the mechanisms of change of these interventions have not been investigated. This qualitative study aimed to understand participants' experiences of the mechanisms underlying change in smoking behaviour following an integrated cognitive behavioural technique-based intervention for smoking cessation and depression/anxiety. Methods This study was embedded within an ongoing randomized-controlled acceptability and feasibility trial (). Semistructured interviews were conducted with 15 IAPT service users. Data were analysed using thematic analysis. During the interviews, participants were asked open-ended questions about their quitting experience and perception of how the intervention aided their behaviour change. Results Five themes were identified. Acquiring an increased awareness of smoking patterns: participants described an increased understanding of how smoking was contributing towards their mental health difficulty. Developing individualized strategies: participants described acquiring 'a couple of tricks up your sleeve' that were helpful in making smoking cessation feel more 'manageable'. Practitioner style as 'supportive but not lecture-y': participants expressed how important the therapeutic alliance was in helping change their smoking behaviour. Importance of regular sessions: participants expressed the importance of 'having someone that's checking in on you'. Having the opportunity to access the intervention at 'the right time': participants described the intervention as the 'push' that they 'needed'. Conclusions Participants identified key factors towards smoking behaviour change. Perceived increased awareness of how smoking negatively impacted participants' mental health, and the opportunity to be offered smoking cessation treatment in a 'non-judgemental', 'supportive' environment, with regular sessions and individualized strategies contributed to successful smoking cessation outcomes. If similar results are found in more diverse samples, these aspects should be embedded within integrated interventions for smoking cessation and depression/anxiety. Patient or Public Contribution Persons with lived experience of depression, anxiety and tobacco addiction contributed towards the design of the interview schedule, participant information sheets and the debriefing process. This was to ensure that interview questions were relevant, nonjudgemental and acceptable for those who did not manage to quit smoking.

Accession Number: WOS:000378425900009
Abstract: Academic and practitioner interest in how market-based
organizations can drive positive social change (PSC) is steadily
growing. This paper helps to recast how organizations relate to
society. It integrates research on projects stimulating PSCthe
transformational processes to advance societal well-beingthat is
fragmented across different streams of research in management and
related disciplines. Focusing on the mechanisms at play in how
organizations and their projects affect change in targets outside of
organizational boundaries, we (1) clarify the nature of PSC as a
process, (2) develop an integrative framework that specifies two
distinct PSC strategies, (3) take stock of and offer a
categorization scheme for change mechanisms and enabling
organizational practices, and (4) outline opportunities for future
research. Our conceptual framework differentiates between surface-
and deep-level PSC strategies understood as distinct combinations of
change mechanisms and enabling organizational practices. These
strategies differ in the nature and speed of transformation
experienced by the targets of change projects and the resulting
quality (pervasiveness and durability), timing, and reach of social
impact. Our findings provide a solid base for integrating and

advancing knowledge across the largely disparate streams of management research on corporate social responsibility, social entrepreneurship, and base of the pyramid and open up important new avenues for future research on organizing for PSC and on unpacking PSC processes.

Abstract: Conducting research in care homes is difficult, and research originating from care homes is lacking. This article provides reflective insights into the determinants that affect research engagement among UK care home staff. The Capability, Opportunity, Motivation, Behaviour (COM-B) model of behaviour has been used to structure and explore our reflections relating to time, funding and skills. Our reflections suggest that wider determinants influence research engagement among care home staff and that a culture of research within care homes remains in its infancy. Our reflections highlight that more needs to be done to enable and empower care home staff to engage in research.

Short Title: Multilevel Interventions Targeting Obesity: Research Recommendations for Vulnerable Populations

ISSN: 0749-3797

DOI: 10.1016/j.amepre.2016.09.011

Accession Number: WOS:000390667400018

Abstract: Introduction: The origins of obesity are complex and multifaceted. To be successful, an intervention aiming to prevent or treat obesity may need to address multiple layers of biological, social, and environmental influences. Methods: NIH recognizes the importance of identifying effective strategies to combat obesity, particularly in high-risk and disadvantaged populations with heightened susceptibility to obesity and subsequent metabolic sequelae. To move this work forward, the National Heart, Lung, and Blood Institute, in collaboration with the NIH Office of Behavioral and Social Science Research and NIH Office of Disease Prevention convened a working group to inform research on multilevel obesity interventions in vulnerable populations. The working group reviewed relevant aspects of intervention planning, recruitment, retention, implementation, evaluation, and analysis, and then made recommendations. Results: Recruitment and retention techniques used in multilevel research must be culturally appropriate and suited to both individuals and organizations. Adequate time and resources for preliminary work are essential. Collaborative projects can benefit from complementary areas of expertise and shared investigations rigorously pretesting specific aspects of approaches. Study designs need to accommodate the social and environmental levels under study,

and include appropriate attention given to statistical power. Projects should monitor implementation in the multiple venues and include a priori estimation of the magnitude of change expected within and across levels. Conclusions: The complexity and challenges of delivering interventions at several levels of the social – ecologic model require careful planning and implementation, but hold promise for successful reduction of obesity in vulnerable populations. Short Title: A scoping review of theories used to investigate clinician adherence to clinical practice guidelines

ISSN: 2210-7703

DOI: 10.1007/s11096-022-01490-9

Accession Number: WOS:000884666300001

Abstract: Background Routine utilization of evidence-based clinical practice guidelines (CPGs) is an effective strategy to optimize patient care and reduce practice variation. Healthcare professionals' failure to adhere to CPGs introduces risks to both patients and the sustainability of healthcare systems. The integration of theory to investigate adherence provides greater insight into the often complex reasons for suboptimal behaviors. Aim To determine the coverage of literature surrounding the use of theory in studies of CPG adherence, report the key findings and identify the knowledge gaps. Method In April 2021, three bibliographic databases were searched for studies published since January 2010, adopting theory to investigate health professionals' adherence to CPGs. Two reviewers independently screened the articles for eligibility and charted the data. A narrative approach to synthesis was employed. Results The review includes 12 articles.

Studies were limited to primarily investigations of physicians, quantitative designs, single disease states and few countries. The use of behavioral theories facilitated pooling of data of barriers and facilitators of adherence. The domains and constructs of a number of the reported theories are captured within the Theoretical Domains Framework (TDF); the most common barriers aligned with the TDF domain of environmental context and resources, fewer studies reported facilitators. Conclusion There is emerging use of behavioral theories investigating physicians' adherence to CPGs. Although limited in number, these studies present specific insight into common barriers and facilitators, thus providing valuable evidence for refining existing and future implementation strategies. Similar investigations of other health professionals are warranted. Abstract: The effective use of public policy to reduce poverty and inequality in southern Africa requires an increased use of research evidence to inform decision making. There is an absence of clear evidence as to how best to encourage evidence-informed decision making, and how to build capacity among decision makers in the use of research. This paper proposes a demand-focused approach for increasing the use of evidence in policy, presenting strategies supporting 'pull' activities and closer linkages and exchanges between producers and users. The paper shares for discussion a people-focused theory of change for building capacity to use research evidence amongst policy makers in southern Africa.

Accession Number: WOS:000912054700001

Abstract: Nonadherence to medicines is a global problem compromising health and economic outcomes for individuals and society. This article outlines how adherence is defined and measured, and examines the impact, prevalence and determinants of nonadherence. It also discusses how a psychosocial perspective can inform the development of interventions to optimise adherence and presents a series of recommendations for future research to overcome common limitations associated with the medication nonadherence literature. Nonadherence is best understood in terms of the interactions between an individual and a specific disease/treatment, within a social and environmental context. Adherence is a product of motivation and ability. Motivation comprises conscious decision-making processes but also from more 'instinctive', intuitive and habitual processes. Ability comprises the physical and psychological skills needed to adhere. Both motivation and ability are influenced by environmental and social factors which influence the opportunity to adhere as well as triggers or cues to actions which may be internal (e.g. experiencing symptoms) or external (e.g. receiving a reminder). Systematic reviews of adherence interventions show that effective solutions are elusive, partly because few have a strong theoretical basis. Adherence support targeted at the level of individuals will be more effective if it is tailored to address the specific perceptions (e.g. beliefs about illness and treatment) and practicalities (e.g. capability and resources) influencing individuals' motivation and ability to adhere.

Abstract: The investment and excitement surrounding self-driving vehicles are huge. We know from earlier transport innovations that technological transitions can reshape lives, livelihoods, and places in profound ways. There is therefore a case for wide democratic debate, but how should this take place? In this paper, we explore the tensions between democratic experiments and technological ones with a focus on policy for nascent self-driving/automated vehicles. We describe a dominant model of public engagement that imagines increased public awareness leading to acceptance and then adoption of the technology. We explore the flaws in this model, particularly in how it treats members of the public as users rather than citizens and the presumption that the technology is well-defined. Analysing two large public dialogue exercises in which we were involved, our conclusion is that public dialogue can contribute to shifting established ideas about both technologies and the public, but that this reframing demands openness on the part of policymakers and other stakeholders. Rather than seeing public dialogues as individual exercises, it would be better to evaluate the governance of emerging technologies in terms of whether it takes place 'in dialogue'.

Abstract: The success of large-scale COVID-19 vaccination campaigns is contingent upon people being willing to receive the vaccine. Our study explored COVID-19 vaccine hesitancy and its correlates in eight different countries around the globe. We analyzed convenience sample data collected between March 2020 and January 2021 as part of the iCARE cross-sectional study. Univariate and multivariate statistical analyses were conducted to explore the correlates of vaccine hesitancy. We included 32,028 participants from eight countries, and observed that 27% of the participants exhibited vaccine hesitancy, with increases over time. France reported the highest level of hesitancy (47.3%) and Brazil reported the lowest (9.6%). Women, younger individuals (≤ 29 years), people living in rural areas, and those with a lower perceived income were more likely to be hesitant. People who previously received an influenza vaccine were 70% less likely to report COVID-19 vaccine hesitancy. We observed that people reporting greater COVID-19 health concerns were less likely to be hesitant, whereas people with higher personal financial concerns were more likely to be hesitant. Our findings indicate that there is substantial vaccine hesitancy in several countries, with cross-national differences in the magnitude and direction of the trend. Vaccination communication initiatives should target hesitant individuals (women, younger adults, people with lower incomes and those living in rural areas), and should highlight the immediate health, social and economic benefits of vaccination across these settings. Country-level analyses are warranted to understand the complex psychological, socio-environmental, and cultural factors associated with vaccine hesitancy.

Article Number: 101788

Accession Number: WOS:000579940200007

Abstract: Objective: There has been compelling debate about whether interval exercise should be promoted in public health strategies as a means of eliciting the health and fitness adaptations associated with physical activity behavior, particularly among individuals who are inactive. Despite a rapidly growing body of quantitative research, there is a notable absence of qualitative research on the topic. This study used a series of interviews conducted over time to develop a richer understanding of inactive adults' experiences and perceptions of moderate-intensity continuous training (MICT), high-intensity interval training (HIIT), and sprint interval training (SIT) over time and factors that may influence their participation in these types of exercise. Methods: Thirty inactive young adults (18 women, 12 men) completed three lab-based trials of cycling exercise in a random order on separate days: MICT, HIIT, and SIT, and subsequently logged their free-living exercise over four weeks. Interviews were conducted at five timepoints and subjected to a reflexive thematic analysis. Results: Three overarching themes were constructed: (1) interval exercise sounds appealing, but is it for me? (2) exercise trade-offs – the value of interval vs. traditional exercise, and (3) real-world exercise adaptations to make it on your own. Conclusions: The findings emphasize that people respond differently to different forms of exercise and the factors that influence participation in interval or continuous exercise are far more complex than can be captured by quantitative methodologies alone. Results suggest there is indeed a place for interval exercise in exercise plans and programs for the general population and interval exercise can be used concurrently with continuous exercise. Title: Employee Perceptions of Workplace Health Promotion Programs: Comparison of a Tailored, Semi-Tailored, and Standardized Approach

Journal: International Journal of Environmental Research and Public Health

Volume: 15

Issue: 5

Date: May

Short Title: Employee Perceptions of Workplace Health Promotion Programs: Comparison of a Tailored, Semi-Tailored, and Standardized Approach

DOI: 10.3390/ijerph15050881

Article Number: 881

Accession Number: WOS:000435197300049

Abstract: In the design of workplace health promotion programs (WHPPs), employee perceptions represent an integral variable which is predicted to translate into rate of user engagement (i.e., participation) and program loyalty. This study evaluated employee perceptions of three workplace health programs promoting nutritional consumption and physical activity. Programs included: (1) an individually tailored consultation with an exercise physiologist and dietitian; (2) a semi-tailored 12-week SMS health message program; and (3) a standardized group workshop delivered by an expert. Participating employees from a transport company completed program evaluation surveys rating the overall program, affect, and utility of: consultations (n = 19); SMS program (n = 234); and workshops (n = 86). Overall, participants' affect and utility evaluations were positive for all programs, with the greatest satisfaction being reported in the tailored individual consultation and standardized group workshop conditions. Furthermore, mode of delivery and the physical presence of an expert health practitioner was more influential than the degree to which the information was tailored to the individual. Thus, the synergy in ratings between individually tailored consultations and standardized group workshops indicates that low-cost delivery health programs may be as appealing to employees as tailored, and comparatively high-cost, program options. Title: Preparing an integrated self-management support intervention for people living with schizophrenia: Creating collaborative spaces

Journal: Journal of Evaluation in Clinical Practice

Volume: 29

Issue: 1

Pages: 22-31

Date: Feb

Short Title: Preparing an integrated self-management support intervention for people living with schizophrenia: Creating collaborative spaces

ISSN: 1356-1294

DOI: 10.1111/jep.13728

Accession Number: WOS:000815348700001

Abstract: Introduction This article describes the planning and development of a novel self-management support protocol, self-management engaging together (SET) for Health, purposefully designed and embedded within traditional case management services to be accessible to people living with schizophrenia and comorbidities. Drawing on established self-management principles, SET for Health was codesigned by researchers, healthcare providers and clients, to create a practical and meaningful intervention to support the target

group to manage their own health and wellness. Decision making is described behind tailoring the self-management innovation to meet the needs of an at risk, disadvantaged group served by tertiary, public health care in Canada. Method This integrated knowledge translation (IKT) study used a descriptive approach to document the process of planning and operationalizing the SET for Health intervention as a part of routine care in two community-based teams providing predominantly schizophrenia services. Diffusion of innovations literature informed planning. The setting was strategically prepared for organizational change. A situational assessment and theoretical frameworks identified contextual elements to be addressed. Existing established self-management approaches for mental illness were appraised. Results When a review of established approaches revealed incongruence with the aims and context of service delivery, common essential elements were distilled. To facilitate collaborative client-provider self-management conversations and self-management learning opportunities, core components were operationalized by the use of tailored interactive tools. The materials coproduced by clients and providers offered joint reference tools, foundational for capacity-building and recognition of progress. Conclusion Planning and developing a model of self-management support for integration into traditional schizophrenia case management services required attention to the complex social ecological nature of the treatment approach and the workplace context. Demonstration of proof of concept is described in a separate paper.

Title: The Behavior Change Techniques Used in Canadian Online Smoking Cessation Programs: Content Analysis

Journal: Jmir Mental Health

Volume: 9

Issue: 3

Date: Mar

Short Title: The Behavior Change Techniques Used in Canadian Online Smoking Cessation Programs: Content Analysis

ISSN: 2368-7959

DOI: 10.2196/35234

Article Number: e35234

Accession Number: WOS:000787096500006

Abstract: Background: Smoking rates in Canada remain unacceptably high, and cessation rates have stalled in recent years. Online cessation programs, touted for their ability to reach many different populations anytime, have shown promise in their efficacy. The

Government of Canada has therefore funded provincial and national smoking cessation websites countrywide. However, little is known about the behavior change techniques (BCTs) that underpin the content of these websites, which is key to establishing the quality of the websites, as well as a way forward for evaluation. Objective: The purpose of this study, therefore, is to apply the BCTTv1 taxonomy to Canadian provincial and federal websites, and to determine which BCTs they use. Methods: A total of 12 government-funded websites across Canada were included for analysis. Using deductive content analysis and through training in applying the BCTTv1 taxonomy, the website content was coded according to the 93 BCTs across the 16 BCT categories. Results: Of the 16 BCT categories, 14 were present within the websites. The most widely represented BCT categories (used in all 12 websites) included goals and planning, social support, natural consequences, and regulation. Implementation of BCTs within these categories varied across the sites. Conclusions: Analyzing the content of online smoking cessation websites using the BCTTv1 taxonomy is an appropriate method for identifying the behavior change content of these programs. The findings offer programmers and researchers tangible directions for prioritizing and enhancing provincial and national smoking cessation programs, and an evaluation framework to assess smoking cessation outcomes in relation to the web-based content. Abstract: Aims To identify and synthesise peer-reviewed, published literature reporting perceived barriers and facilitators associated with cervical cancer screening attendance in EU member states with organised population-based screening programmes. Methods

Quantitative and qualitative studies reporting perceived barriers/facilitators to attendance for cervical cancer screening were searched for in databases Embase, HMIC, Medline and PsycInfo. Data

were extracted and deductively coded to the Theoretical Domains Framework domains and inductive thematic analysis within domains was employed to identify specific barriers or facilitators to attendance for cervical cancer screening. Results 38 studies were included for data extraction. Five theoretical domains ['Emotion' (89% of the included studies), 'Social influences' (79%), 'Knowledge' (76%), 'Environmental Context and Resources' (74%) and 'Beliefs about Consequences' (68%)] were identified as key domains influencing cervical cancer screening attendance. Conclusion Five theoretical domains were identified as prominent influences on cervical cancer screening attendance in EU member states with organised population-based screening programmes. Further research is needed to identify the relative importance of different influences for different sub-populations and to identify the influences that are most appropriate and feasible to address in future interventions.

DOI: 10.1016/j.xkme.2019.07.014

Accession Number: WOS:000659950100009

Abstract: Rationale & Objective: Peritoneal dialysis (PD) is a home-based kidney replacement therapy used by a growing number of patients with kidney failure. This qualitative study explores the impact of remote management technologies on PD treatment priorities of patients, their care partners, and clinicians. Study Design: Qualitative study, designed and conducted in collaboration with a stakeholder panel that included patients, patient advocates, care partners, and health care professionals. Setting & Participants: 13 health care providers, 13 patients, and 4 care partners with at least 3 months experience with PD were recruited from the United States and United Kingdom through postings in PD clinics, websites, and social media. Methodology: Semi-structured telephone interviews with a purposive sample of participants. Analytical Approach:

Inductive thematic development adapted from a grounded theory approach through analysis of interview transcripts by 3 independent coders. Results: 4 main themes about PD treatments emerged that enabled evaluation of remote management: (1) impact of PD on everyday life, (2) simplifying treatment processes, (3) awareness and visibility of at-home treatments, and (4) support for managing treatments. The relative importance of these themes differed between patients/care partners and health care providers and by use of remote management cyclers. Limitations: Remote management is new to PD, mirrored in the limited penetration of use in the study sample, suggestive of findings reflecting early adoption. Conclusions: Participants welcomed technological advances such as remote management for PD, although priorities differed by stakeholder group. Remote management could potentially influence health care provider decisions about patient suitability for PD, while patients/care partners prioritized pre-emptive and early treatment adjustments. Currently, decisions about access to remote management are outside the control of patients and families, but this may change with more widespread use.

Short Title: Virtual or In-Person: A Mixed Methods Survey to Determine Exercise Programming Preferences during COVID-19

ISSN: 1198-0052

DOI: 10.3390/currenol29100529

Accession Number: WOS:000872626800001

Abstract: A survey was conducted to identify barriers and facilitators to engaging in virtual and in-person cancer-specific exercise during COVID-19. A theory-informed, multi-method, cross-sectional survey was electronically distributed to 192 individuals with cancer investigating preferences towards exercise programming during COVID-19. Respondents had previously participated in an exercise program and comprised two groups: those who had experience with virtual exercise programming ('Virtual') and those who had only taken part in in-person exercise ('In-Person'). Quantitative data were summarized descriptively. Qualitative data were thematically

categorized using framework analysis and findings were mapped to an implementation model. The survey completion response rate was 66% (N = 127). All respondents identified barriers to attending in-person exercise programming during COVID-19 with concerns over the increased risk of viral exposure. Virtual respondents (n = 39) reported: (1) feeling confident in engaging in virtual exercise; and (2) enhanced motivation, accessibility and effectiveness as facilitators to virtual exercise. In-Person respondents (n = 88) identified: (1) technology as a barrier to virtual exercise; and (2) low motivation, accessibility and exercise effectiveness as barriers towards virtual exercise. Sixty-six percent (n = 58) of In-Person respondents reported that technology support would increase their willingness to exercise virtually. With appropriately targeted support, perceived barriers to accessing virtual exercise—including motivation, accessibility and effectiveness—may become facilitators. The availability of technology support may increase the engagement of individuals with cancer towards virtual exercise programming. Title: The impact of height-adjustable desks and classroom prompts on classroom sitting time, social, and motivational factors among adolescents

Journal: Journal of Sport and Health Science

Volume: 12

Issue: 1

Pages: 97-105

Date: Jan

Short Title: The impact of height-adjustable desks and classroom prompts on classroom sitting time, social, and motivational factors among adolescents

ISSN: 2095-2546

DOI: 10.1016/j.jshs.2020.05.002

Accession Number: WOS:000959651000001

Abstract: Purpose: This quasi-experimental study examined the impact of height-adjustable desks in combination with prompts to break up prolonged sit-ting time during class time and identified social and motivational factors associated with breaking up sitting time among adolescents. Teachers' perceptions of strategies were also examined. Methods: Over 17 weeks, 1 classroom in a government secondary school in Melbourne, Australia, was equipped with 27 height-adjustable desks and prompts (posters and desk stickers) to break up classroom sitting time. Teachers received professional development in the use of the desks and prompts. One group of adolescents (n = 55) had 2-5

lessons/week using the height-adjustable desks in an intervention classroom, and a comparison group matched by year level and subject (n = 50) was taught in traditional "seated" classrooms. Adolescents wore an activPAL monitor at baseline (T0), 4 weeks (T1), and 17 weeks (T2) and completed a survey at T0 and T2. Six teachers participated in interviews at T2. Effect sizes were calculated (d). Results: Linear mixed models found that, compared to the traditional "seated" classrooms, the adolescents in the intervention classroom had significantly lower sitting time (T1: -9.7 min/lesson, d = -0.96; T2: -6.7 min/lesson, d = -0.70) and time spent in sitting bouts >15 min (T2: -11.2 min/lesson, d = -0.62), and had significantly higher standing time (T1: 7.3 min/lesson, d = 0.84; T2: 5.8 min/lesson, d = 0.91), number of breaks from sitting (T1: 1.3 breaks/lesson, d = 0.49; T2: 1.8 breaks/lesson, d = 0.67), and stepping time (T1: 2.5 min/lesson, d = 0.66). Intervention classroom adolescents reported greater habit strength (d = 0.58), self-efficacy for breaking up sitting time (d = 0.75), and indicated that having a teacher/classmate remind them to stand as helpful (d = 0.50). Conclusion: This intervention shows promise for targeting sitting behaviors in the classroom and indicates that incorporating social and motivational strategies may further enhance outcomes. Short Title: Advantages of public green spaces in enhancing population health

ISSN: 0169-2046

DOI: 10.1016/j.landurbplan.2018.05.019

Accession Number: WOS:000442710400002

Abstract: Since the burden of chronic diseases is rising globally, there is an urgent need to develop population-level approaches to reducing the risk of chronic diseases. Neighborhood environments, where people spend much of their time, are relevant in this context because they can influence residents' daily behaviors related to health. In particular, public green spaces (PGS) can confer health benefits through facilitating physical activity, contact with nature, and social interaction. PGS may also mitigate socio-economic

inequalities in health. However, despite growing evidence, PGS are generally not fully utilized as a resource for physical activity. Thus, there is substantial scope for enhancing population health through increased visits and active use of PGS. This essay argues that PGS are not only health-enhancing but also practical and workable environmental resources to promote population health. We discuss three "advantages" of using PGS as health promotion initiatives: PGS are easier to modify (than are other structural environmental features); PGS can involve programs to help residents initiate physical activity; and PGS are valued by residents. The essay concludes with a discussion of future research topics, the result of which can be used to convince and assist local authorities and other key stakeholders to use PGS as readily available resources for health promotion.

Article Number: 1701126

Accession Number: WOS:000424355100006

Abstract: In severe asthma, poor control could reflect issues of medication adherence or inhaler technique, or that the condition is refractory. This study aimed to determine if an intervention with (bio) feedback on the features of inhaler use would identify refractory asthma and enhance inhaler technique and adherence. Patients with severe uncontrolled asthma were subjected to a stratified-by-site random block design. The intensive education group received repeated training in inhaler use, adherence and disease management. The intervention group received the same

intervention, enhanced by (bio) feedback-guided training. The primary outcome was rate of actual inhaler adherence. Secondary outcomes included a pre-defined assessment of clinical outcome. Outcome assessors were blinded to group allocation. Data were analysed on an intention-to-treat and per-protocol basis. The mean rate of adherence during the third month in the (bio) feedback group (n=111) was higher than that in the enhanced education group (intention-to-treat, n=107; 73% versus 63%; 95% CI 2.8%–17.6%; p=0.02). By the end of the study, asthma was either stable or improved in 54 patients (38%); uncontrolled, but poorly adherent in 52 (35%); and uncontrolled, but adherent in 40 (27%). Repeated feedback significantly improved inhaler adherence. After a programme of adherence and inhaler technique assessment, only 40 patients (27%) were refractory and adherent, and might therefore need add-on therapy.

Abstract: Objective Underrepresented racial and ethnic minorities are disproportionately affected by systemic lupus erythematosus (SLE). Racial and ethnic minorities also have more severe SLE manifestations that require use of immunosuppressive medications, and often have lower rates of medication adherence. We aimed to explore barriers of adherence to SLE immunosuppressive medications among minority SLE patients. Methods We conducted a qualitative descriptive study using in-depth interviews with a purposive sample of racial minority SLE patients taking oral immunosuppressants (methotrexate, azathioprine, or mycophenolate), and lupus clinic providers and staff. Interviews were audiorecorded, transcribed, and analyzed using applied thematic analysis. We grouped themes using the Capability, Opportunity, Motivation, Behavior conceptual model. Results We interviewed 12 SLE patients (4 adherent, 8 nonadherent) and 12 providers and staff. We identified capability barriers to include external factors related to acquiring medications, specifically cost-, pharmacy-, and clinic-related issues; opportunity barriers to include external barriers to taking medications, specifically logistic- and medication-related issues; and motivation factors to include intrinsic barriers, encompassing patients' knowledge, beliefs, attitudes, and physical and mental health. The most frequently described barriers were cost, side effects, busyness/forgetting, and lack of understanding, although barriers differed by patient and adherence level, with logistic and intrinsic barriers described predominantly by nonadherent patients and side effects described predominantly by adherent patients. Conclusion Our findings suggest that interventions may be most impactful if they are designed to facilitate logistics of taking medications and increase patients' motivation while allowing for personalization to address the individual differences in adherence barriers.

DOI: 10.1080/10454446.2021.1965063

Accession Number: WOS:000684403600001

Abstract: Green consumption refers to consumer decision-making that prioritizes the environmental impacts of purchases. The aim of the current research was to identify factors that influence consumers to purchase sustainable palm oil (SPO) products. Semi-structured interviews were conducted with 13 adult residents of Australia, transcribed, and subjected to framework analysis, with sub-themes classified under main themes of capability, opportunity, and motivation. While several sub-themes emerged, those barriers unique to SPO purchasing behavior included a lack of knowledge combined with contradictory information on the best course of action, palm oil being a hidden ingredient that is often not labeled such, and reduced availability and/or visibility of SPO containing products. These barriers are difficult for consumers to overcome on their own. Policy and structural modifications to procurement and labeling, as well as widespread awareness campaigns with a uniform message, could assist in providing a platform for consumer reform.

Short Title: Purchasing products with sustainable palm oil: designing and evaluating an online intervention for Australian consumers

ISSN: 0814-0626

DOI: 10.1017/aee.2022.27

Accession Number: WOS:000815719400001

Abstract: Widespread tropical deforestation and biodiversity loss in Southeast Asia due to the oil palm industry can be addressed by encouraging consumers to purchase sustainable palm oil (SPO). An online experiment was conducted to assess whether addressing barriers relating to education, motivation and product availability would increase purchasing of SPO. Australian adults (n = 628) were randomly assigned to either: (1) a newly developed interactive educational website on palm oil and SPO; (2) an existing educational video on SPO; or (3) an interactive website on differentiating

between real and fake news (an attentional control condition). All participants completed pre-intervention and immediate post-intervention measures. Most participants (n = 403) completed follow-up measures two weeks later. Multivariate analysis revealed that the interactive website and educational video increased both knowledge and the intention to purchase SPO (compared to the attentional control), but neither significantly impacted follow-up self-reported SPO purchasing behaviour. Low perceived product availability might help explain the intention behaviour gap. Our results suggest that, in addition to increasing consumer knowledge and motivation, promoting sustainable consumption requires creating opportunities for people to engage in the desired behaviour.

Title: Adapting Darnton's Nine Principles Framework for Behaviour Change: The UK Upcycling Case Study

Journal: Sustainability

Volume: 14

Issue: 3

Date: Feb

Short Title: Adapting Darnton's Nine Principles Framework for Behaviour Change: The UK Upcycling Case Study

DOI: 10.3390/su14031919

Article Number: 1919

Accession Number: WOS:000756289200001

Abstract: Design practitioners and academics have increasingly recognised the potential value of design for behaviour change. On the one hand, while existing studies address product or communication design as main interventions, there is a growing interest in design as a useful tool for policy development and service innovation. On the other hand, the interplay between social research, design, and policy development in behaviour intervention is not a new concept or practice, yet studies to suggest and evaluate particular general approaches to policy and design interventions are relatively new and rare. To fill this knowledge gap, this paper adapts Darnton's Nine Principles framework as one promising generic approach, demonstrates how the adapted framework can be applied to the upcycling case study in the UK and evaluates the usefulness of the adapted framework. The study results show that the adapted framework is useful for exploring behaviour and developing interventions in small-scale, exploratory studies, and that it can be applied to other behaviour domains and contexts. The

main contribution of this paper is the demonstration of the potential of Darnton's original and adapted frameworks as a promising general approach useful for policy and design interventions.

Article Number: e0009060

Accession Number: WOS:000666598000001

Abstract: Background Melioidosis, an often-fatal infectious disease caused by the environmental Gram-negative bacillus *Burkholderia pseudomallei*, is endemic in tropical countries. Diabetes mellitus and environmental exposure are important risk factors for melioidosis acquisition. We aim to evaluate the effectiveness of a multifaceted prevention programme for melioidosis in diabetics in northeast Thailand. Methodology/Principal findings From April 2014 to December 2018, we conducted a stepped-wedge cluster-randomized controlled behaviour change trial in 116 primary care units (PCUs) in Ubon Ratchathani province, northeast Thailand. The intervention was a behavioural support group session to help diabetic patients adopt recommended behaviours, including wearing rubber boots and drinking boiled water. We randomly allocated the PCUs to receive the intervention starting in March 2016, 2017 and 2018. All diabetic patients were contacted by phone yearly, and the final follow-up was December 2018. Two primary outcomes were hospital admissions involving infectious diseases and culture-confirmed melioidosis. Of 9,056 diabetics enrolled, 6,544 (72%) received a behavioural support group session. During 38,457 person-years of follow-up, we observed 2,195 (24%) patients having 3,335 hospital admissions involved infectious diseases, 80 (0.8%) melioidosis, and 485 (5%) deaths. In the intention-to-treat analysis, implementation of the intervention was not associated with primary outcomes. In the per-protocol analysis, patients who received a behavioural support group session had lower incidence rates of hospital admissions involving

infectious diseases (incidence rate ratio [IRR] 0.89; 95%CI 0.80–0.99, $p = 0.03$) and of all-cause mortality (IRR 0.54; 95%CI 0.43–0.68, $p < 0.001$). However, the incidence rate of culture-confirmed melioidosis was not significantly lower (IRR 0.96, 95%CI 0.46–1.99, $p = 0.66$). Conclusions/Significance Clear benefits of this multifaceted prevention programme for melioidosis were not observed. More compelling invitations for the intervention, modification of or addition to the behaviour change techniques used, and more frequent intervention may be needed.

Short Title: Barriers and Recommended Interventions to Prevent Melioidosis in Northeast Thailand: A Focus Group Study Using the Behaviour Change Wheel

ISSN: 1935-2735

DOI: 10.1371/journal.pntd.0004823

Article Number: e0004823

Accession Number: WOS:000381017800031

Abstract: Background Melioidosis, an often fatal infectious disease in Northeast Thailand, is caused by skin inoculation, inhalation or ingestion of the environmental bacterium, *Burkholderia pseudomallei*. The major underlying risk factor for melioidosis is diabetes mellitus. Recommendations for melioidosis prevention include using protective gear such as rubber boots and gloves when in direct contact with soil and environmental water, and consuming bottled or boiled water. Only a small proportion of people follow such recommendations. Methods Nine focus group discussions were conducted to evaluate barriers to adopting recommended preventive behaviours. A total of 76 diabetic patients from northeast Thailand participated in focus group sessions. Barriers to adopting the recommended preventive behaviours and future intervention strategies were identified using two frameworks: the Theoretical Domains Framework and the Behaviour Change Wheel. Results Barriers were identified in the following five domains: (i) knowledge, (ii) beliefs about

consequences, (iii) intention and goals, (iv) environmental context and resources, and (v) social influence. Of 76 participants, 72 (95%) had never heard of melioidosis. Most participants saw no harm in not adopting recommended preventive behaviours, and perceived rubber boots and gloves to be hot and uncomfortable while working in muddy rice fields. Participants reported that they normally followed the behaviour of friends, family and their community, the majority of whom did not wear boots while working in rice fields and did not boil water before drinking. Eight intervention functions were identified as relevant for the intervention: (i) education, (ii) persuasion, (iii) incentivisation, (iv) coercion, (v) modeling, (vi) environmental restructuring, (vii) training, and (viii) enablement. Participants noted that input from role models in the form of physicians, diabetic clinics, friends and families, and from the government via mass media would be required for them to change their behaviours. Conclusion There are numerous barriers to the adoption of behaviours recommended for melioidosis prevention. We recommend that a multifaceted intervention at community and government level is required to achieve the desired behaviour changes.

Date: Jun

Short Title: A Multicomponent mHealth-Based Intervention (SWAP IT) to Decrease the Consumption of Discretionary Foods Packed in School Lunchboxes: Type I Effectiveness-Implementation Hybrid Cluster Randomized Controlled Trial

ISSN: 1438-8871

DOI: 10.2196/25256

Article Number: e25256

Accession Number: WOS:000667060200003

Abstract: Background: There is significant opportunity to improve the nutritional quality of foods packed in children's school lunchboxes. Interventions that are effective and scalable targeting

the school and home environment are therefore warranted. Objective: This study aimed to assess the effectiveness of a multicomponent, mobile health-based intervention, SWAP IT, in reducing the energy contribution of discretionary (ie, less healthy) foods and drinks packed for children to consume at school. Methods: A type I effectiveness-implementation hybrid cluster randomized controlled trial was conducted in 32 primary schools located across 3 local health districts in New South Wales, Australia, to compare the effects of a 6-month intervention targeting foods packed in children's lunchboxes with those of a usual care control. Primary schools were eligible if they were not participating in other nutrition studies and used the required school communication app. The Behaviour Change Wheel was used to co-design the multicomponent SWAP IT intervention, which consisted of the following: school lunchbox nutrition guidelines, curriculum lessons, information pushed to parents digitally via an existing school communication app, and additional parent resources to address common barriers to packing healthy lunchboxes. The primary outcome, mean energy (kilojoules) content of discretionary lunchbox foods and drinks packed in lunchboxes, was measured via observation using a validated school food checklist at baseline (May 2019) and at 6-month follow-up (October 2019). Additional secondary outcomes included mean lunchbox energy from discretionary foods consumed, mean total lunchbox energy packed and consumed, mean energy content of core lunchbox foods packed and consumed, and percentage of lunchbox energy from discretionary and core foods, all of which were also measured via observation using a validated school food checklist. Measures of school engagement, consumption of discretionary foods outside of school hours, and lunchbox cost were also collected at baseline and at 6-month follow-up. Data were analyzed via hierarchical linear regression models, with controlling for clustering, socioeconomic status, and remoteness. Results: A total of 3022 (3022/7212, 41.90%) students consented to participate in the evaluation (mean age 7.8 years; 1487/3022, 49.22% girls). There were significant reductions between the intervention and control groups in the primary trial outcome, mean energy (kilojoules) content of discretionary foods packed in lunchboxes (-117.26 kJ; 95% CI -195.59 to -39.83; P=.003). Relative to the control, the intervention also significantly reduced secondary outcomes regarding the mean total lunchbox energy (kilojoules) packed (-88.38 kJ; 95% CI -172.84 to -3.92; P=.04) and consumed (-117.17 kJ; 95% CI -233.72 to -0.62; P=.05). There was no significant difference between groups in measures of student engagement, consumption of discretionary foods outside of school hours, or cost of foods packed in children's lunchboxes. Conclusions: The SWAP IT intervention was effective in reducing the energy content of foods packed for and consumed by primary school-aged children at school. Dissemination of the SWAP IT program at a population level has the potential to influence a significant proportion of primary school-aged children, impacting weight status and associated health care costs.

intervention in secondary schools: 12-month implementation outcomes
from a cluster randomized controlled trial

DOI: 10.1186/s12966-020-01000-y

Article Number: 100

Accession Number: WOS:000561259700002

Abstract: Background: 'Physical Activity 4 Everyone' (PA4E1) was an
efficacious multi-component school-based physical activity (PA)
program targeting adolescents. PA4E1 has seven PA practices. It is
essential to scale-up, evaluate effectiveness and assess
implementation of such programs. Therefore, the aim is to assess the
impact of implementation support on school practice uptake of the
PA4E1 program at 12 and 24 months. Methods: A cluster randomised
controlled trial, utilising a type III hybrid implementation-
effectiveness design, was conducted in 49 randomly selected
disadvantaged Australian Government and Catholic secondary schools.
A blinded statistician randomly allocated schools to a usual
practice control (n = 25) or the PA4E1 program group (n = 24), with
the latter receiving seven implementation support strategies to
support school PA practice uptake of the seven practices retained
from the efficacy trial. The primary outcome was the proportion of
schools adopting at least four of the seven practices, assessed via
telephone surveys with Head Physical Education Teachers and analysed
using exact logistic regression modelling. This paper reports the
12-month outcomes. Results: Schools were recruited from May to
November 2017. At baseline, no schools implemented four of the seven
practices. At 12 months significantly more schools in the program

group had implemented four of the seven practices (16/24, 66.7%) than the control group (1/25, 4%) (OR = 33.0[4.15-1556.4], p < 0.001). The program group implemented on average 3.2 (2.5-3.9) more practices than the control group (p < 0.001, mean 3.9 (SD 1.5) vs 0.7 (1.0)). Fidelity and reach of the implementation support intervention were high (both > 80%). Conclusions: Through the application of multiple implementation support strategies, secondary schools were able to overcome commonly known barriers to implement evidence based school PA practices. As such practices have been shown to result in an increase in adolescent PA and improvements in weight status, policy makers and practitioners responsible for advocating PA in schools should consider this implementation approach more broadly when working with schools. Follow-up is required to determine whether practice implementation is sustained. Notes: Sutherland, Rachel Campbell, Elizabeth McLaughlin, Matthew Nathan, Nicole Wolfenden, Luke Lubans, David R. Short Title: Improving heart failure care with an Experience-Based Co-Design approach: what matters to persons with heart failure and their family members?

DOI: 10.1186/s12913-023-09306-w

Article Number: 294

Accession Number: WOS:000962498500004

Abstract: Background Heart failure is a chronic heart condition. Persons with heart failure often have limited physical capability, cognitive impairments, and low health literacy. These challenges can be barriers to healthcare service co-design with family members and professionals. Experience-Based Co-Design is a participatory healthcare quality improvement approach drawing on patients', family

members' and professionals' experiences to improve healthcare. The overall aim of this study was to use Experience-Based Co-Design to identify experiences of heart failure and its care in a Swedish cardiac care setting, and to understand how these experiences can translate into heart failure care improvements for persons with heart failure and their families. Methods A convenience sample of 17 persons with heart failure and four family members participated in this single case study as a part of an improvement initiative within cardiac care. In line with Experienced-Based Co-Design methodology, field notes from observations of healthcare consultations, individual interviews and meeting minutes from stakeholders' feedback events, were used to gather participants' experiences of heart failure and its care. Reflexive thematic analysis was used to develop themes from data. Results Twelve service touchpoints, organized within five overarching themes emerged. The themes told a story about persons with heart failure and family members struggling in everyday life due to a poor quality of life, lack of support networks, and difficulties understanding and applying information about heart failure and its care. To be recognized by professionals was reported to be a key to good quality care. Opportunities to be involved in healthcare varied. Further, participants' experiences translated into proposed changes to heart failure care such as improved information about heart failure, continuity of care, improved relations, and communication, and being invited to be involved in healthcare. Conclusions Our study findings offer knowledge about experiences of life with heart failure and its care, translated into heart failure service touchpoints. Further research is warranted to explore how these touchpoints can be addressed to improve life and care for persons with heart failure and other chronic conditions.

Abstract: The impact of lifestyle factors has been increasingly

studied and discussed in oral healthcare. Positive lifestyle factors are important in maintaining oral health or controlling disease, but they are not easy to adopt over the long term. Along with public health initiatives within communities and groups, there is a role for behavior change interventions delivered in dental practice settings to improve the periodontal health of individuals. Behavior management is now seen as a part of both prevention and therapy of periodontal diseases. This article summarizes the evidence on behavioral strategies for periodontal health to inform and assist oral healthcare professionals in implementing behavior change in their practice. In addition, strategies for education and training in communication and behavior change techniques are considered.

Short Title: Using Intervention Mapping to Develop a Decision Support System-Based Smartphone App (selfBACK) to Support Self-management of Nonspecific Low Back Pain: Development and Usability Study

ISSN: 1438-8871

DOI: 10.2196/26555

Article Number: e26555

Accession Number: WOS:000766783700001

Abstract: Background: International guidelines consistently endorse the promotion of self-management for people with low back pain (LBP); however, implementation of these guidelines remains a challenge. Digital health interventions, such as those that can be provided by smartphone apps, have been proposed as a promising mode of supporting self-management in people with chronic conditions, including LBP. However, the evidence base for digital health interventions to support self-management of LBP is weak, and detailed descriptions and documentation of the interventions are lacking. Structured intervention mapping (IM) constitutes a 6-step process that can be used to guide the development of complex interventions. Objective: The aim of this paper is to describe the IM process for designing and creating an app-based intervention

designed to support self-management of nonspecific LBP to reduce pain-related disability. Methods: The first 5 steps of the IM process were systematically applied. The core processes included literature reviews, brainstorming and group discussions, and the inclusion of stakeholders and representatives from the target population. Over a period of >2 years, the intervention content and the technical features of delivery were created, tested, and revised through user tests, feasibility studies, and a pilot study. Results: A behavioral outcome was identified as a proxy for reaching the overall program goal, that is, increased use of evidence-based self-management strategies. Physical exercises, education, and physical activity were the main components of the self-management intervention and were designed and produced to be delivered via a smartphone app. All intervention content was theoretically underpinned by the behavior change theory and the normalization process theory. Conclusions: We describe a detailed example of the application of the IM approach for the development of a theory-driven, complex, and digital intervention designed to support self-management of LBP. This description provides transparency in the developmental process of the intervention and can be a possible blueprint for designing and creating future digital health interventions for self-management.

Short Title: Physical activity in patients with rheumatoid arthritis-an agile lifelong behaviour: a qualitative meta-synthesis

ISSN: 2056-5933

DOI: 10.1136/rmdopen-2021-001635

Article Number: e001635

Accession Number: WOS:000648915000001

Abstract: Background Physical activity (PA) in rheumatoid arthritis (RA) is considered a cornerstone in the treatment. To highlight

aspects involved in supporting a positive PA behaviour, it is important to understand the patients' perceptions of the phenomenon. Objective The aim of this qualitative meta-synthesis was to explore and synthesise patient perceptions of PA in RA. Methods A purposeful search was conducted across three online databases (PubMed, CINAHL and Web of Science). The methodological quality of the included studies was appraised, and data were extracted and analysed using an interpretive inductive thematic synthesis. Results Fifteen studies met the inclusion criteria and were included. PA was identified as an agile lifelong behaviour, with one main theme: The disease as a persistent catalyst for or against PA illustrating how the constant presence of the disease itself underlies the entire process of a life with or without regular PA. Seven subthemes: 'considering aggravated symptoms', 'acknowledging the impact on health', 'becoming empowered and taking action', 'keeping informed to increase awareness', 'creating body awareness', 'dealing with social support' and 'feeling satisfied with circumstances and achievements' were interpreted as facilitators and/or challenges. Conclusion This synthesis has identified PA as an agile lifelong behaviour in which the disease pervades all aspects of an individuals' perception of PA. Placed in a theoretical context, our findings outline a model for tailoring PA support to the drivers and determinants of a certain individual, which will improve clinical practice for the benefit of both health professionals and patients with RA. Article Number: 61

Accession Number: WOS:000866472500001

Abstract: Background Medication adherence, one of the most important aspects in the process of optimal medicines use, is unfortunately still a major challenge in modern healthcare, and further research is required into how adherence can be assessed and optimised. The aim of this study was to use a combined method approach of self-report and dried blood spot (DBS) sampling coupled with population pharmacokinetic (PopPK) modelling, to assess adherence to metformin in adult patients with type 2 diabetes. Further aims were to assess metformin exposure levels in patients, determine factors associated with non-adherence with prescribed metformin, and to explore the relationship between adherence and therapeutic outcomes. Methods A combined method approach was used to evaluate metformin adherence in patients with type 2 diabetes who had been prescribed metformin for a minimum period of 6 months. Patients were recruited from consultant-led diabetic outpatient clinics at three hospitals in Northern Ireland, UK. Data collection involved self-reported questionnaires [Medication Adherence Report Scale (MARS), Beliefs about Medicines Questionnaire and Centre for Epidemiologic Studies Depression Scale], direct measurement of metformin concentration in DBS samples, and researcher-led patient interviews. The DBS sampling approach was coupled with population pharmacokinetic (PopPK) modelling, which took account of patient characteristics, metformin dosage and type of formulation prescribed (immediate or sustained release). Results The proportion of patients considered to be adherent to their prescribed metformin, derived from self-reported MARS scores and metformin concentration in DBS samples, was 61.2% (74 out of 121 patients). The majority (n = 103, 85.1%) of recruited patients had metformin exposure levels that fell within the therapeutic range. However, 17 patients (14.1%) had low exposure to metformin and one patient (0.8%) had undetectable metformin level in their blood sample (non-exposure). Metformin self-administration and use of a purchased adherence pill box significantly increased the probability of a patient being classified as adherent based on logistic regression analysis. Both HbA1c and random glucose levels (representing poor glycaemic control) in the present research were, however, not statistically linked to non-adherence to metformin ($P > 0.05$). Conclusions A significant proportion of participating patients were not fully adherent with their therapy. DBS sampling

together with the use of a published PopPK model was a useful, novel, direct, objective approach to estimate levels of adherence in adult patients with type 2 diabetes (61.2%).

Article Number: 261

Accession Number: WOS:000665468700001

Abstract: Foodborne diseases are a global burden, are preventable, and young people are a key population for behaviour change as they gain autonomy. This study aimed to explore young people's needs across several European countries in relation to learning about and implementing food hygiene and food safety. Qualitative focus groups and interviews were conducted in rural and city regions across England, France, Hungary and Portugal. Data were collected to attain data saturation, transcribed, thematically analysed, and mapped to the Theoretical Domains Framework. Twenty-five out of 84 schools approached (29.8%) participated, with data collected from 156 11-18-year-old students. Students had good knowledge of personal hygiene but did not always follow hygiene rules due to forgetfulness, lack of facilities or lack of concern for consequences. Students had limited understanding of foodborne microbes, underestimated the risks and consequences of foodborne illness and perceived the "home" environment as the safest. Young people preferred interactive educational methods. Addressing gaps in young people's food safety knowledge is essential to improve their lack of concern towards foodborne illness and motivate them to follow food hygiene and safety behaviours consistently. Findings have been used to develop educational resources to address gaps in knowledge, skills, attitudes and beliefs.

Title: Features of Computer-Based Decision Aids: Systematic Review,
Thematic Synthesis, and Meta-Analyses
Journal: Journal of Medical Internet Research
Volume: 18
Issue: 1
Date: Jan
Short Title: Features of Computer-Based Decision Aids: Systematic
Review, Thematic Synthesis, and Meta-Analyses
ISSN: 1438-8871
DOI: 10.2196/jmir.4982
Article Number: e20
Accession Number: WOS:000371405200009
Abstract: Background: Patient information and education, such as
decision aids, are gradually moving toward online, computer-based
environments. Considerable research has been conducted to guide
content and presentation of decision aids. However, given the
relatively new shift to computer-based support, little attention has
been given to how multimedia and interactivity can improve upon
paper-based decision aids. Objective: The first objective of this
review was to summarize published literature into a proposed
classification of features that have been integrated into computer-
based decision aids. Building on this classification, the second
objective was to assess whether integration of specific features was
associated with higher-quality decision making. Methods: Relevant
studies were located by searching MEDLINE, Embase, CINAHL, and
CENTRAL databases. The review identified studies that evaluated
computer-based decision aids for adults faced with preference-
sensitive medical decisions and reported quality of decision-making
outcomes. A thematic synthesis was conducted to develop the
classification of features. Subsequently, meta-analyses were
conducted based on standardized mean differences (SMD) from
randomized controlled trials (RCTs) that reported knowledge or
decisional conflict. Further subgroup analyses compared pooled SMDs
for decision aids that incorporated a specific feature to other
computer-based decision aids that did not incorporate the feature,

to assess whether specific features improved quality of decision making. Results: Of 3541 unique publications, 58 studies met the target criteria and were included in the thematic synthesis. The synthesis identified six features: content control, tailoring, patient narratives, explicit values clarification, feedback, and social support. A subset of 26 RCTs from the thematic synthesis was used to conduct the meta-analyses. As expected, computer-based decision aids performed better than usual care or alternative aids; however, some features performed better than others. Integration of content control improved quality of decision making (SMD 0.59 vs 0.23 for knowledge; SMD 0.39 vs 0.29 for decisional conflict). In contrast, tailoring reduced quality of decision making (SMD 0.40 vs 0.71 for knowledge; SMD 0.25 vs 0.52 for decisional conflict). Similarly, patient narratives also reduced quality of decision making (SMD 0.43 vs 0.65 for knowledge; SMD 0.17 vs 0.46 for decisional conflict). Results were varied for different types of explicit values clarification, feedback, and social support. Conclusions: Integration of media rich or interactive features into computer-based decision aids can improve quality of preference-sensitive decision making. However, this is an emerging field with limited evidence to guide use. The systematic review and thematic synthesis identified features that have been integrated into available computer-based decision aids, in an effort to facilitate reporting of these features and to promote integration of such features into decision aids. The meta-analyses and associated subgroup analyses provide preliminary evidence to support integration of specific features into future decision aids. Further research can focus on clarifying independent contributions of specific features through experimental designs and refining the designs of features to improve effectiveness. DOI: 10.1123/jpah.2020-0603

Accession Number: WOS:000625174100010

Abstract: Background: Multiple models and frameworks exist for the measurement and classification of physical activity in adults that are applied broadly across populations but have limitations when applied to youth. The authors propose a conceptual framework specifically designed for classifying youth physical activity. Methods: The Youth Physical Activity Timing, How, and Setting (Y-PATHS) framework is a conceptualization of the when (timing), how, and where (setting) of children's and adolescents' physical activity patterns. The authors developed Y-PATHS using the design thinking process, which includes 3 stages: inspiration, ideation, and implementation. Results: The Y-PATHS includes 3 major components (timing, how, and setting) and 13 subcomponents. Timing subcomponents include (1) school days: in-school, (2) school days: out-of-school, and (3) non-school days. How subcomponents include: (1) functional, (2) transportation, (3) organized, and (4) free play. Setting subcomponents include: (1) natural areas, (2) schools, (3) home, (4) recreational facilities, (5) shops and services, and (6) travel infrastructure. Conclusions: The Y-PATHS is a comprehensive classification framework that can help researchers, practitioners, and policymakers to better understand youth physical activity. Specifically, Y-PATHS can help to identify the domains of youth physical activity for surveillance and research and to inform the planning/evaluation of more comprehensive physical activity programming.

Article Number: e167

Accession Number: WOS:000714175900011

Abstract: Introduction: Little is known about what motivates

residents to report adverse events. The goals of the qualitative study were to: (1) better understand facilitators to residents' event reporting and (2) identify effective interventions that encourage residents to report. Methods: The authors conducted focus groups of upper-level residents from 4 training programs (2 internal medicine, a pediatric, and a combined medicine-pediatric) who rotated at 3 institutions within a large healthcare system in 2016. Quantitative data on reporting experience were gathered. Focus groups were audio recorded and transcribed. Two coders reviewed transcripts using the editing approach and organized codes into themes. Results: Sixty-four residents participated in 8 focus groups. Residents were universally exposed to reportable events and knew how to report. Residents' reporting behavior varied by site according to local culture, with residents filing more reports at the pediatric hospital compared to other sites, but all groups expressed similar general views about facilitators to reporting. Facilitators included familiarity with the investigation process, reporting via telephone, and routine safety educational sessions with safety administrators. Residents identified specific interventions that encouraged reporting at the pediatric hospital, including incorporating an attending physician review of events into sign-out and training on error disclosure. Conclusions: This study provides insight into what motivates resident event reporting and describes concrete interventions to increase reporting. Our findings are consistent with the Theoretical Domains Framework of behavioral change. These strategies could prove successful at other pediatric hospitals to build a culture that values reporting and prepares residents as patient safety champions.

Title: Exploring views on alcohol consumption and digital support for alcohol reduction inUK-basedPunjabi-Sikhmen: A think aloud and interview study

Journal: Drug and Alcohol Review

Volume: 40

Issue: 2

Pages: 231-238

Date: Feb

Short Title: Exploring views on alcohol consumption and digital support for alcohol reduction inUK-basedPunjabi-Sikhmen: A think aloud and interview study

ISSN: 0959-5236

DOI: 10.1111/dar.13172

Accession Number: WOS:000571161600001

Abstract: Introduction and Aims We aimed to explore UK-based Punjabi-Sikh men's views on: (i) alcohol consumption within the

community; (ii) available support for alcohol reduction; and (iii) an evidence-informed alcohol reduction app. Design and Methods Semi-structured interviews and a think aloud method were employed. Participants (n= 15) were male, aged 18-27 years, identified as Punjabi-Sikh, were hazardous or harmful drinkers (i.e. had an Alcohol Use Disorders Identification Test-Consumption score of ≥ 5) and interested in using an app to reduce drinking. Interviews were audio-recorded, transcribed verbatim and analysed with inductive thematic analysis. Results Six themes were developed: (i) fear of drinking to cope; (ii) clash between religious and cultural norms (i.e. an internal conflict between important values); (iii) stigmatisation of mental health issues and lack of knowledge as barriers to help seeking; (iv) perceived usefulness of goal setting, monitoring and feedback (i.e. beliefs about the utility of the app's components for reducing drinking); (v) concerns about accessibility of the app within the Punjabi-Sikh community; and (vi) desire for human support for continued app engagement. Discussion and Conclusions Among UK-based, Punjabi-Sikh men, clashing religious and cultural norms give rise to internal conflict about drinking. Stigmatisation of mental health issues and lack of knowledge of available support leads to reduced help seeking. Respondents believed an evidence-informed alcohol reduction app could be useful, but were concerned about accessibility within the wider community and wanted an element of human support. The potential for a combination of digital and face-to-face support should be explored.

Abstract: Inspired by elements from neuroscience and psychological literature, a computational model of forming and changing of behaviours is presented which can be used as the basis of a human-aware assistance system. The presented computational model simulates the dynamics of mental states of a human during formation and change of behaviour. The application domain focuses on sustainable behavior.

Title: A model of integrated remote monitoring and behaviour change for osteoarthritis

Journal: BMC Musculoskeletal Disorders

Volume: 22

Issue: 1

Date: Aug

Short Title: A model of integrated remote monitoring and behaviour change for osteoarthritis

DOI: 10.1186/s12891-021-04555-4

Article Number: 669

Accession Number: WOS:000685081300011

Abstract: Background The National Institute for Health and Care Excellence recommends the use of digital and mobile health technologies to facilitate behaviour change interventions. Due to its high prevalence and dependence upon patient self-management strategies, osteoarthritis is one musculoskeletal condition which may benefit from such approaches. This is particularly pertinent due to the increasing use of remote monitoring technologies to collect patient data and facilitate self-management in individuals outside of hospital clinics. In practice however, application of digital behaviour change interventions is difficult due to insufficient reporting of behaviour change theories in the current literature. When digital technologies are employed to alter behaviour change in osteoarthritis, they often focus on physical activity. Currently, such interventions focus on self-efficacy but do not often explicitly report the behaviour change techniques they use to facilitate these changes. Methods This paper proposes a new model of integrating specific behaviour change principles (persuasive design) in an integrated model of remote monitoring and digital behaviour change interventions for osteoarthritis. Results There is potential to combine remote monitoring systems of patient data through digital and mobile technologies with behaviour change principles to improve physical activity behaviours in individuals with osteoarthritis. The use of persuasive design principles (e.g. prompts or nudges) through mobile notifications and strategic system design can be directed to

enhance behaviour change. A validated measure of behaviour change, such as the patient activation measure, will allow effective evaluation of such systems. Conclusions Digital behaviour change interventions should be directed towards the underlying principles of behaviour change they employ, although this is not commonly reported in practice. Such interventions can be integrated within remote monitoring pathways using persuasive design techniques to enhance patient activation. This approach can enhance self-management in individuals with musculoskeletal conditions, such as osteoarthritis.

ISSN: 1360-2322

DOI: 10.1111/jar.12826

Accession Number: WOS:000600255600001

Abstract: Background Obesity is higher in people with intellectual disabilities. Aims There are two aims of this explorative paper. Firstly, using a realist lens, to go beyond 'what works' and examine the 'context, mechanisms and outcomes' (CMO) of lifestyle/obesity programmes for this population. Second, using a logic model framework to inform how these programmes could be implemented within practice. Method We explored six-review papers and the individual lifestyle/obesity programmes that these papers reviewed using the CMO framework. Results There were few theoretically underpinned, multi-component programmes that were effective in the short to long-term and many failed to explore the 'context and mechanisms'. We developed a logic model and engaged in two co-production workshops to refine this model. Discussion Using a realist approach, programmes need to be underpinned by both individual and systems change theories, be multi-component, have a closer understanding of the interplay of the 'context and mechanisms', and co-designed using a logic model framework.

Title: Combining the COM-B Model and Habit Theory to Leverage Understanding of Adolescents' Tooth-Brushing Behavior
Journal: Journal of Nonprofit & Public Sector Marketing
Date: 2022 Oct
Short Title: Combining the COM-B Model and Habit Theory to Leverage Understanding of Adolescents' Tooth-Brushing Behavior
ISSN: 1049-5142
DOI: 10.1080/10495142.2022.2130495
Accession Number: WOS:000862007300001
Abstract: Although brushing teeth twice a day is not difficult, a surprisingly large proportion of adolescents do not behave accordingly. This paper brings together the COM-B model and the habit formation theory in order to create a basis for a more comprehensive, customer-oriented, theory-based understanding of the issue. A total of nine focus group interviews were conducted among adolescents to further understand underlying aspects and develop solutions. In findings, barriers related to adolescents tooth brushing behavior were identified in all areas of COM-B model. Especially the role of automatic motivation was highlighted as in mornings tooth brushing seemed not to have a stable place in daily routines. To further understand this issue and develop suitable solutions, habit formation theory together with identified enablers provided effective starting point. This also demonstrated how these two theories can complement each other. The study provides actionable insights for public sector marketers to understand and assists adolescents' tooth-brushing behavior.

Abstract: Background The underuse of interpreters for limited English proficiency (LEP) patient encounters is pervasive, particularly in the emergency department (ED). Objective To measure the outcome of strategies to improve the use of interpreters by ED providers. Methods Pre- and post- intervention evaluation of the unmet need for language assistance (LA) in a public ED. Informed by the Behavior Change Wheel (BCW), strategies included: education, training, technology-based facilitators, local champions and environmental cues. Results Pre-intervention, of the 110 patient charts with interpreter requests, 17 (15.5%) had documentation of an interpreter-mediated encounter or were seen by a certified bilingual provider (unmet need = 84.5%). Post intervention, of the 159 patient charts with interpreter requests, 47 (29.6%) had documentation of an interpreter-mediated encounter or were seen by a certified bilingual provider (unmet need = 70.4%), difference + 0.14 (95% CI = 0.03-0.23). Conclusion In this pilot study, we found a statistically significant increase in the met need for language assistance.

Title: A Systematic Review of Nudge Interventions to Optimize Medication Prescribing

Journal: Frontiers in Pharmacology

Volume: 13

Date: Jan

Short Title: A Systematic Review of Nudge Interventions to Optimize Medication Prescribing

DOI: 10.3389/fphar.2022.798916

Article Number: 798916

Accession Number: WOS:000752681600001

Abstract: Background: The benefits of medication optimization are largely uncontroversial but difficult to achieve. Behavior change interventions aiming to optimize prescriber medication-related decisions, which do not forbid any option and that do not significantly change financial incentives, offer a promising way forward. These interventions are often referred to as nudges. Objective: The current systematic literature review characterizes published studies describing nudge interventions to optimize medication prescribing by the behavioral determinants they intend to influence and the techniques they apply. Methods: Four databases

were searched (MEDLINE, Embase, PsychINFO, and CINAHL) to identify studies with nudge-type interventions aiming to optimize prescribing decisions. To describe the behavioral determinants that interventionists aimed to influence, data were extracted according to the Theoretical Domains Framework (TDF). To describe intervention techniques applied, data were extracted according to the Behavior Change Techniques (BCT) Taxonomy version 1 and MINDSPACE. Next, the recommended TDF-BCT mappings were used to appraise whether each intervention applied a sufficient array of techniques to influence all identified behavioral determinants. Results: The current review located 15 studies comprised of 20 interventions. Of the 20 interventions, 16 interventions (80%) were effective. The behavior change techniques most often applied involved prompts (n = 13). The MINDSPACE contextual influencer most often applied involved defaults (n = 10). According to the recommended TDF-BCT mappings, only two interventions applied a sufficient array of behavior change techniques to address the behavioral determinants the interventionists aimed to influence. Conclusion: The fact that so many interventions successfully changed prescriber behavior encourages the development of future behavior change interventions to optimize prescribing without mandates or financial incentives. The current review encourages interventionists to understand the behavioral determinants they are trying to affect, before the selection and application of techniques to change prescribing behaviors. Article Number: 12521

Accession Number: WOS:000867931900001

Abstract: COVID-19 has had profound effects on physical activity behaviours of older adults, and understanding this impact is essential to driving public health policies to promote healthy ageing. The present study aimed to determine; (1) intended physical activity behaviours of older adults following the easing of UK COVID-19 restrictions; (2) the relationship between self-reported physical activity and intended physical activity behaviour; (3) perceived barriers to achieving the intended physical activity goal. Ninety-six participants (74.8 +/- 4.4 years; 52 female) from a longitudinal study examining the impact of COVID-19 on physical activity were recruited. Participants outlined their future physical activity intentions and completed the COM-B Self Evaluation Questionnaire. Participants were split into groups based on their intention to 'Maintain' (n = 29), 'Increase' (n = 38) or 'Return' (n = 29) to pre-COVID-19 physical activity. Self-reported physical activity undulated over the pandemic but was mostly equivalent between groups. Intended physical activity behaviour was independent of self-report physical activity. Capability and motivation factors were the most frequently cited barriers to the intended physical activity behaviour, with a greater number of capability barriers in the 'Return' group. Such barriers should be considered in the COVID-19 recovery public health physical activity strategy for promoting healthy ageing.

ISSN: 1555-9041

DOI: 10.2215/cjn.04510416

Accession Number: WOS:000386864300015

Abstract: Background and objectives Conservative management of adults with stage 5 CKD (eGFR<15 ml/min per 1.73 m²) is increasingly being provided in the primary care setting. We aimed to examine perceived barriers and facilitators for conservative management of older adults by primary care physicians. Design,

setting, participants, & measurements In 2015, we conducted a cross sectional, population based survey of all primary care physicians in Alberta, Canada. Eligible participants had experience caring for adults ages years old with stage 5 CKD not planning on initiating dialysis. Questionnaire items were on the basis of a qualitative descriptive study informed by the Behavior Change Wheel and tested for face and content validity. Physicians were contacted via postal mail and/or fax on the basis of a modified Dillman method. Results Four hundred nine eligible primary care physicians completed the questionnaire (9.6% response rate). The majority of respondents were men (61.6%), were ages 40–60 years old (62.6%), and practiced in a large/medium population center (68.0%). The most common barrier to providing conservative care in the primary care setting was the inability to access support to maintain patients in the home setting (39.1% of respondents; 95% confidence interval, 34.6% to 43.6%). The second most common barrier was working with nonphysician providers with limited kidney specific clinical expertise (32.3%; 95% confidence interval, 28.0% to 36.7%). Primary care physicians indicated that the two most common strategies that would enhance their ability to provide conservative management would be the ability to use the telephone to contact a nephrologist or clinical staff from the conservative care clinic (86.9%; 95% confidence interval, 83.7% to 90.0% and 85.6%; 95% confidence interval, 82.4% to 88.9%, respectively). Conclusions We identified important areas to inform clinical programs to reduce barriers and enhance facilitators to improve primary care physicians' provision of conservative kidney care. In particular, primary care physicians require additional resources for maintaining patients in their home and telephone access to nephrologists and conservative care specialists.

Short Title: Effects of a serious game on knowledge, attitude and practice in vector control and dengue prevention among adults in primary care: A randomised controlled trial

ISSN: 2055–2076

DOI: 10.1177/20552076221129099

Article Number: 20552076221129099

Accession Number: WOS:000861960500001

Abstract: Objective Dengue is endemic but vaccination against it is optional in tropical Singapore. Despite vector control measures to curb mosquito breeding, dengue infection continues to be prevalent. A serious game has been developed to raise the community awareness of dengue vector control programme among residents in Singapore. The study aimed to evaluate the effectiveness of this serious game on the knowledge, attitude and practice (KAP) in dengue prevention among adults. It also determined their willingness to be vaccinated against dengue. **Methods** A randomised controlled trial was conducted among volunteer adults who were visiting a regional primary care clinic in Sengkang, Singapore. 400 participants were randomly allocated to receive information regarding dengue prevention from either playing a serious game (intervention) or visiting a dengue prevention website (control). Before and after receiving information on dengue prevention, participants completed a self-administered online questionnaire within a two-week interval to assess the KAP score and their interest to vaccinate against dengue. Participants, who played serious game, evaluated the game with the System Usability Scale (SUS). **Results** A total of 374 participants, comprising of 178 participants (89%) from intervention group and 196 participants (98%) from control group, completed both questionnaires. 157 (78.5%) participants in the intervention group completed playing the serious game. Participants in both groups had increased KAP score from baseline, but the mean difference in score (SD) was greater when assessing participants' daily practice towards dengue prevention in the serious game group compared to the control group (1.0 (2.8) vs 0.3 (1.9), $p = .009$). There was a positive correlation ($\rho = 0.275$) between mean change in KAP score and highest achievement attained within serious game ($p = .001$). The mean SUS (SD) was 61.8 (19.2) among participants who played the serious game. 84.2% of the study population was willing to undertake the dengue vaccination at baseline. Participants in both groups had increased proportion of participants who showed interest in dengue vaccination from baseline but the difference between serious game group and control group were not significant (5.6% vs 2.6%, $p = .131$). **Conclusions** Serious game is at least equally effective compared to conventional web-based learning in promoting dengue prevention measures and vaccination intention among adults, and may be considered as a feasible alternative to digitally engage local residents.

Title: Monitoring and Improving Adherence to Tyrosine Kinase Inhibitors in Patients with Chronic Myeloid Leukemia: A Systematic Review

Journal: Patient Preference and Adherence

Volume: 15

Pages: 2563–2575

Short Title: Monitoring and Improving Adherence to Tyrosine Kinase Inhibitors in Patients with Chronic Myeloid Leukemia: A Systematic Review

ISSN: 1177–889X

DOI: 10.2147/ppa.S269355

Accession Number: WOS:000720914300001

Abstract: Purpose: Suboptimal adherence to tyrosine kinase inhibitors (TKIs) is a widely recognized issue compromising the disease control and survival of patients with chronic myeloid leukemia (CML). A recently published review by Heiney et al reported inconclusive findings on the effects of a broad range of adherence enhancing interventions. The current systematic review aimed to identify studies that evaluated adherence-enhancing interventions implemented by healthcare professionals and determine their effect on CML patients' medication adherence and clinical outcomes.

Methods: A systematic literature search was performed in 5 databases for articles published between 2002 and 2021. Studies that compared adherence enhancing interventions implemented by healthcare professionals with a comparison group were included. Relevant data on study characteristics were extracted. Medication adherence and clinical outcomes between intervention and control arms were compared. Results: Nine studies were included in two randomised controlled trials, four cohort studies, and three before-and-after comparison studies. All the included studies incorporated complex interventions, including intensive education or consultation with pharmacists, nurses or multidisciplinary team, in combination with one or more other strategies such as structured follow-up, written materials or video, psychotherapy, medication reminder or treatment diary, with the overall goal of monitoring and improving TKI adherence. Most (7 out of 9) studies demonstrated significantly better adherence to TKIs in the intervention group than the comparison group. The relative proportion of participants who adhered to TKIs ranged from 1.22 to 2.42. The improvement in the rate of TKI doses taken/received ranged from 1.5% to 7.1%. Only one study showed a significant association between intervention and clinical outcomes, with a 22.6% higher major molecular response rate and improvement in 6 out of 20 subscales of health-related quality-of-life. Conclusion: Complex interventions delivered by healthcare professionals showed improvement in adherence to TKIs in CML patients. Further studies are required to clarify the costeffectiveness of adherence-enhancing interventions.

Short Title: Acceptability of pharmacist-led interventions to resolve drug-related problems in patients with chronic myeloid leukaemia

ISSN: 1078-1552

DOI: 10.1177/1078155220964539

Article Number: 1078155220964539

Accession Number: WOS:000578596800001

Abstract: Purpose Chronic myeloid leukaemia (CML) patients on long-term tyrosine kinase inhibitor (TKI) therapy are susceptible to drug-related problems (DRPs). This study aimed to evaluate the acceptability and outcomes of pharmacist-led interventions on DRPs encountered by CML patients. Methods This study included participants from the intervention arm of a randomised controlled trial which was conducted to evaluate the effects of pharmacist-led interventions on CML patients treated with TKIs. Participants were recruited and followed up in the haematology clinics of two hospitals in Malaysia from March 2017 to January 2019. A pharmacist identified DRPs and helped to resolve them. Patients were followed-up for six months, and their DRPs were assessed based on the Pharmaceutical Care Network Europe Classification for DRP v7.0. The identified DRPs, the pharmacist's interventions, and the acceptance and outcomes of the interventions were recorded. A Poisson multivariable regression model was used to analyse factors associated with the number of identified DRPs per participant. Results A total of 198 DRPs were identified from 65 CML patients. The median number of DRPs per participants was 3 (interquartile range: 2, 4). Most participants (97%) had at least one DRP, which included adverse drug events (45.5%), treatment ineffectiveness (31.5%) and patients' treatment concerns or dissatisfaction (23%). The 228 causes of DRPs identified comprised the following: lack of disease or treatment information, or outcome monitoring (47.8%), inappropriate drug use processes (23.2%), inappropriate patient behaviour (19.9%), suboptimal drug selection (6.1%), suboptimal dose selection (2.6%) and logistic issues in dispensing (0.4%). The number of concomitant medications was significantly associated with the number of DRPs (adjusted Odds Ratio: 1.100; 95% CI: 1.005, 1.205; $p = 0.040$). Overall, 233 interventions were made. These included providing patient education on disease states or TKI-related side effects (75.1%) and recommending appropriate instructions for taking medications (7.7%). Of the 233 interventions, 94.4% were accepted and 83.7% were implemented by the prescriber or patient. A total of 154 DRPs (77.3%) were resolved. Conclusions The pharmacist-led interventions among CML patients managed to identify various DRPs, were well accepted by both TKI prescribers and patients, and had a high success rate of resolving the DRPs.

Title: A systematic review of behavioural and exercise interventions for the prevention and management of chemotherapy-induced peripheral neuropathy symptoms

Journal: Journal of Cancer Survivorship

Volume: 17

Issue: 1

Pages: 254-277

Date: Feb

Short Title: A systematic review of behavioural and exercise interventions for the prevention and management of chemotherapy-induced peripheral neuropathy symptoms

ISSN: 1932-2259

DOI: 10.1007/s11764-021-00997-w

Accession Number: WOS:000628090700001

Abstract: Background Chemotherapy-induced peripheral neuropathy (CIPN) can result in functional difficulties. Pharmacological interventions used to prevent CIPN either show low efficacy or lack evidence to support their use and to date, duloxetine remains the only recommended treatment for painful CIPN. Non-pharmacological interventions such as exercise and behavioural interventions for CIPN exist. Purpose The aims were to (1) identify and appraise evidence on existing behavioural and exercise interventions focussed on preventing or managing CIPN symptoms, (2) describe psychological mechanisms of action by which interventions influenced CIPN symptoms, (3) determine the underpinning conceptual models that describe how an intervention may create behaviour change, (4) identify treatment components of each intervention and contextual factors, (5) determine the nature and extent of patient and clinician involvement in developing existing interventions and (6) summarise the relative efficacy or effectiveness of interventions to lessen CIPN symptoms and to improve quality of life, balance and muscle strength. Methods A systematic search of Ovid Medline, Cochrane Library, EMBASE, PsycINFO, Health Management Information Consortium, Global Health and CINAHL was performed to identify articles published between January 2000 to May 2020, followed by OpenGrey search and hand-searching of relevant journals. Studies that explored behavioural and/or exercise interventions designed to prevent or improve symptoms of CIPN in adults who had received or were receiving neurotoxic chemotherapy for any type of cancer, irrespective of when delivered within the cancer pathway were included. Results Nineteen randomised controlled trials and quasi-

experimental studies which explored behavioural (n=6) and exercise (n=13) interventions were included. Four studies were rated as methodologically strong, ten were moderate and five were weak. Ten exercise and two behavioural interventions, including those that improved CIPN knowledge and self-management resources and facilitated symptom self-reporting, led to reduced CIPN symptoms during and/or after chemotherapy treatment. Conclusions The extent of potential benefits from the interventions was difficult to judge, due to study limitations. Future interventions should incorporate a clear theoretical framework and involve patients and clinicians in the development process. Implications for Cancer Survivors Our findings show exercise interventions have beneficial effects on CIPN symptoms although higher quality research is warranted. Behavioural interventions that increase patient's CIPN knowledge, improve self-management capacity and enable timely access to symptom management led to reduced CIPN symptoms.

Accession Number: WOS:000868164600027

Abstract: Introduction People with age-related macular degeneration (AMD) are more likely to experience loneliness, have poorer diets and be less physically active than people without AMD. The online Movement, Interaction and Nutrition for Greater Lifestyles in the Elderly (MINGLE) program is a holistic evidence-based intervention aiming to support people with AMD by incorporating physical activity, social interaction and nutrition education components all delivered via a COVID-19-safe Zoom platform. This study will involve

two phases: 1) a formative qualitative study with AMD patients to identify the barriers and facilitators to participating in the proposed MINGLE program; and 2) a 10-week pilot study to evaluate the feasibility, acceptability and preliminary efficacy of MINGLE. Methods and analysis Phase 1 involves AMD patients who will be recruited from an eye clinic in Western Sydney, Australia to participate in audio-recorded semi-structured interviews. Verbatim interview transcripts will be coded using the Capability, Opportunity, Motivation and Behaviour (COM-B) model and themes established. These themes will be used as a guide to specifically tailor the proposed MINGLE program to people with AMD. Phase 2 involves 52 AMD patients who will then be recruited from the same clinic to participate in the MINGLE program. Pre-post questionnaires will be administered to intervention participants to collect information on the following variables: demographics, socioeconomic status, vision function, loneliness, quality of life (including depression), falls risk, physical activity (level), and dietary intake. The acceptability and feasibility of the MINGLE program will also be evaluated using descriptive statistics.

Title: Perceived Participation in Decision-Making on Primary Surgery and Associated Factors Among Early Breast Cancer Patients A Cross-sectional Study

Journal: Cancer Nursing

Volume: 46

Issue: 2

Pages: 111-119

Date: Mar-Apr

Short Title: Perceived Participation in Decision-Making on Primary Surgery and Associated Factors Among Early Breast Cancer Patients A Cross-sectional Study

ISSN: 0162-220X

DOI: 10.1097/ncc.0000000000001071

Accession Number: WOS:000933411300009

Abstract: BackgroundBreast cancer patients wish to participate in the treatment decision-making, but the perceived participation was inconsistent with the willingness, leading to poor patient outcomes.ObjectiveThe aims of this study were to explore the perceived participation in the primary surgery decision-making among Chinese patients with early-stage breast cancer (BCa) and to analyze the relationships of demographic and clinical factors, participation competence, self-efficacy, social support, and doctors' promotion of participation with the guidance of the capability, opportunity,

motivation-behavior system (the COM-B system). Methods Paper surveys were used to collect data from 218 participants. The participation competence, self-efficacy, social support, and the doctor facilitation of involvement were evaluated to measure factors related to perceived participation among early-stage BCa. Results Perceived participation was low, and participants with a high level of participation competence, self-efficacy, and social support and who were employed and had a higher education level and higher family income perceived higher participation in primary surgery decision-making. Conclusions Perceived participation was low and may be facilitated by patients' internal and external factors during the decision-making process. Health professionals should be aware that patient participation in decision-making is a type of self-care health behavior, and targeted decision support interventions should be provided to facilitate participation. Implications for Practice Patient-perceived participation may be evaluated from the perspective of self-care management behaviors among BCa patients. Nurse practitioners should emphasize their important roles in providing information, patient education, and psychological support to better contribute to the course of the treatment decision-making process for BCa patients who faced primary surgery.

Short Title: Perspectives of solid organ transplant recipients on medicine-taking: Systematic review of qualitative studies

ISSN: 1600-6135

DOI: 10.1111/ajt.16613

Accession Number: WOS:000661520300001

Abstract: Medicine-taking among transplant recipients is a complex and ubiquitous task with significant impacts on outcomes. This study aimed to describe the perspectives and experiences of medicine-taking in adult solid organ transplant recipients. Electronic databases were searched to July 2020, and thematic synthesis was used to analyze the data. From 119 studies (n = 2901), we identified six themes: threats to identity and ambitions (impaired self-image,

restricting goals and roles, loss of financial independence); navigating through uncertainty and distrust (lacking tangible/perceptible benefits, unprepared for side effects, isolation in decision-making); alleviating treatment burdens (establishing and mastering routines, counteracting side effects, preparing for the unexpected); gaining and seeking confidence (clarity with knowledge, reassurance through collective experiences, focusing on the future outlook); recalibrating to a new normal posttransplant (adjusting to ongoing dependence on medications, in both states of illness and health, unfulfilled expectations); and preserving graft survival (maintaining the ability to participate in life, avoiding rejection, enacting a social responsibility of giving back). Transplant recipients take medications to preserve graft function, but dependence on medications jeopardizes their sense of normality. Interventions supporting the adaptation to medicine-taking and addressing treatment burdens may improve patient satisfaction and capacities to take medications for improved outcomes.

Title: Intervention elements and behavior change techniques to improve prescribing for older adults with multimorbidity in Singapore: a modified Delphi study

Journal: European Geriatric Medicine

Volume: 13

Issue: 3

Pages: 531-539

Date: Jun

Short Title: Intervention elements and behavior change techniques to improve prescribing for older adults with multimorbidity in Singapore: a modified Delphi study

ISSN: 1878-7649

DOI: 10.1007/s41999-021-00566-5

Accession Number: WOS:000706907900001

Abstract: Key Summary pointsAims A modified Delphi study was conducted to (1) identify intervention elements that are considered by geriatricians to be important in optimizing prescribing for older adults with multimorbidity, and (2) to select the accompanying behavior change techniques to be incorporated into a context-relevant intervention to support prescribing. Findings Intervention elements such as medication review identified by the Delphi panel

mirrored results from a previous scoping review. Statements involving roles of pharmacists selected by the panel validated findings in the literature that pharmacists play important collaborative roles to help reduce potentially inappropriate prescribing among older adults with multimorbidity. Message We identified relevant intervention elements and their accompanying behavior change techniques to aid in the development of a context-specific intervention. Purpose Potentially inappropriate prescribing among older adults is a rising concern, attributed mainly by polypharmacy and multimorbidity. We aimed to identify key components and strategies for construction of a context-relevant intervention to facilitate appropriate prescribing in outpatient clinics in Singapore. Methods The modified Delphi study was conducted in two rounds with 20 geriatricians from seven public hospitals in Singapore. Round one survey presented 69 statements formulated from a scoping review, while round two presented 23 statements with some modifications based on round one comments. The statements were rated against a 7-point Likert scale on their importance and impact on prescribing for older adults with multimorbidity. Results Consensus were achieved for 90% of the statements. Seven intervention elements were identified as being important: medication review, training, medication therapy management, shared decision making, patient interview, medication reconciliation, comprehensive geriatric assessment. In addition, some commonly identified behavior change techniques included goal setting (behavior), goal setting (outcome) and problem solving. Conclusions This study identified important intervention elements and their potential strategies that could be adopted in an intervention to optimize appropriate prescribing for older adults with multimorbidity.

Short Title: Effects of automated speed control on speeding intention and behavior on mixed-traffic urban arterial roads

ISSN: 0386-1112

DOI: 10.1016/j.iatssr.2022.08.002

Accession Number: WOS:000907572800006

Abstract: Although the effectiveness of automated speed control (ASC) has been proven, the mechanism of behavioral change in developing countries remains unclear. The objective of this study was to elucidate the effect of ASC on drivers' speeding intention and behavior on mixed-traffic urban arterial roads. Before and during the implementation of ASC, questionnaires based on the theory of planned behavior (TPB) were administered to local passenger-vehicle drivers. A total of 200 participants with an average age of 38.4 years completed both survey waves. To explain the mechanism of behavioral change, the multiple indicators multiple causes (MIMIC) structural equation modeling (SEM) time-invariant was used simultaneously for both waves. The model explained 49% and 55% of the variance in intention, and 40% and 56% of the variance in self-reported speeding behavior, respectively, before and during the ASC implementation period. The findings reveal that ASC altered the cognitive factors of speeding behavior. Speeding became less favorable, had lower approval, and was more difficult to control. Drivers reported lower speeding tendency and diminished speeding behavior. Furthermore, the ASC changed the relative impact of the factors, boosted the influence of family members and close friends on drivers' speeding motivation, and increased the influence of intention and perceived control on speeding behavior. This paper provides recommendations for the implementation of ASCs on mixed-traffic urban arterial roads in developing countries. (c) 2022 International Association of Traffic and Safety Sciences. Short Title: Interventions to improve vitamin D status in at-risk ethnic groups during pregnancy and early childhood: a systematic review

ISSN: 1368-9800

DOI: 10.1017/s1368980021000756

Article Number: Pii s1368980021000756

Accession Number: WOS:000679049000036

Abstract: Objective: To systematically review the literature with

the primary aim of identifying behavioural interventions to improve vitamin D stores in children from at-risk ethnic groups. Design: Review based on Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines. PROSPERO registration number: CRD42017080932. Health Behaviour Model and Behaviour Change Wheel framework constructs used to underpin evaluation of interventions. Methodological quality evaluated using Cochrane Risk of Bias, Cochrane ROBINS-I and NHLBI tools. Setting: Databases Cochrane Library, MEDLINE, EMBASE, CINAHL with secondary search of Google Scholar. No country limits set. Papers between January 1990 and February 2018, published in English included. Anticipating study heterogeneity, outcome measures not pre-specified and identified from individual full papers. Updated literature search November 2020. Participants: Patient or population including pregnant women, newborns and children aged under 18 years, from Asian or African ethnic groups. Results: Of 10 690 articles screened, 298 underwent full-text review, with 24 ultimately included for data extraction. All identified studies conducted a vitamin D pharmacological supplementation intervention, with two also incorporating a behavioural intervention strategy. No study explicitly defined a primary aim of evaluating a behavioural intervention, undertaken to study its effect on vitamin D supplement uptake. Conclusions: There is a need to address the paucity of data in ethnic at-risk children on how behavioural interventions ideally developed and co-produced with the community under study, affect and help improve vitamin D uptake, within the antenatal and pregnancy phase as well as during childhood.

Abstract: Polypharmacy is growing in Canada, along with adverse drug events and drug-related costs. Part of the solution may be deprescribing, the planned and supervised process of dose reduction or stopping of medications that may be causing harm or are no longer providing benefit. Deprescribing can be a complex process, involving the intersection of patients, health care providers, and organizational and policy factors serving as enablers or barriers. This article describes the justification, theoretical foundation, and process for developing a Canadian Deprescribing Network (CaDeN), a network of individuals, organizations, and decision-makers committed to promoting the appropriate use of medications and non-pharmacological approaches to care, especially among older people in Canada. CaDeN will deploy multiple levels of action across multiple stakeholder groups simultaneously in an ecological approach to health system change. CaDeN proposes a unique model that might be applied both in national settings and for different transformational challenges in health care.

DOI: 10.1016/j.psicod.2021.05.002

Accession Number: WOS:000742136700007

Abstract: Multiple health-risk behaviors such as physical inactivity, sedentary behaviors or unhealthy diet represent a public health problem among adolescents. The aim of this study is to examine the effects of a school-based intervention on 24-hour movement behaviors (i.e., physical activity, screen-based behaviors, and sleep), Mediterranean diet, and self-rated health status. A quasi-experimental design has been carried out for two months and a half in a sample of 121 children, aged 8-9 years ($M = 9.01 \pm .09$ years old; 47.11% girls), from two elementary schools. Sixty-six students from one of the schools has been assigned to the control group and 55 students from the other school has been included in the experimental group. In the experimental group, ten one-hour weekly sessions about knowledge, awareness, and practices of health-related behaviors have been implemented by a research group member through the tutorial action plan. 24-hour movement behaviors, Mediterranean diet, and self-rated health status has been measured before and after the school-based intervention using self-reported questionnaires. Experimental group children show a significant increase in adherence to the Mediterranean diet and being physically active during the weekdays compared to their baseline values. Moreover, the greater baseline values in the adherence to the Mediterranean diet, as well as being physically active during weekend days in the control group, disappear between both groups after the intervention. Ten one-hour sessions of a school-based intervention conducted through the tutorial action plan seem effective in improving children's adherence to the Mediterranean diet and the proportion of active children, but not other health-related behaviors. Short Title: Effects of calorie labelling and contextual factors on hypothetical coffee shop menu choices

ISSN: 0195-6663

DOI: 10.1016/j.appet.2022.105963

Article Number: 105963

Accession Number: WOS:000821882300016

Abstract: This study examined the effects of calorie labelling and two key contextual factors (reflective motivation and habits) on the calorie content of hypothetical coffee-shop menu choices. In one exploratory (n = 70) and one preregistered (n = 300) laboratory study (Studies 1 and 2 respectively), participants viewed a hypothetical calorie-labelled or non calorie-labelled menuboard and selected their preferred item(s). Coffee shop drinking habits were measured using the Self-Report Habit Index, and reflective motivation (relating to calorie intake) was assessed with three items asking about watching weight, eating healthily, and reading calorie labels. In Study 2, participants also estimated calories contained in a subset of the menuboard drinks. Results of both studies showed that labelling did not significantly affect the total calorie content of items selected. However, in Study 2, as predicted, there was a trend toward moderation by reflective motivation (p = .056) with less motivated participants showing relatively greater calorie selection when exposed to labelling. Participants with weaker habits took longer to select items (p = .002) but, contrary to predictions, were not more influenced by labelling. Higher reflective motivation was associated with selecting fewer calories (p = .002), correctly recalling the presence/ absence of labelling (p = .016) and better estimating calorie content (p < .001). Overall, participants significantly underestimated calories in higher calorie drinks but overestimated calories in lower calorie drinks. The results highlight the importance of contextual factors such as habits and reflective motivation for obesity interventions and are relevant for the UK's introduction of selective mandatory calorie labelling. In some instances, labelling may actually increase intake among those less motivated by health and weight concerns, but further research is needed to substantiate this concern.

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2021-050890

Article Number: e050890

Accession Number: WOS:000787543100021

Abstract: Objectives Assess the feasibility and impact of a continuous professional development (CPD) course on type 2 diabetes and depression on health professionals' intention to include sex and gender considerations in patient care. Design and setting In collaboration with CPD organisations and patient-partners, we conducted a mixed-methods feasibility controlled trial with postintervention measures in three Canadian provinces. Participants Of 178 eligible health professionals, 127 completed questionnaires and 67 participated in semistructured group discussions.

Intervention and comparator An interactive 1 hour CPD course, codesigned with patient-partners, on diabetes and depression that included sex and gender considerations (innovation) was compared with a similar course that did not include them (comparator).

Outcomes Feasibility of recruitment and retention of CPD organisations and patient-partners throughout the study; adherence to planned activities; health professionals' intention to include sex and gender considerations in patient care as measured by the CPD-Reaction questionnaire; and barriers and facilitators using the Theoretical Domains Framework. Results All recruited CPD organisations and patient-partners remained engaged throughout the study. All planned CPD courses occurred. Overall, 71% of eligible health professionals participated (63% under 44 years old; 79.5% women; 67.7% practising in French; 66.9% practising in Quebec; 78.8% in urban practice). After training, mean intention scores for the innovation (n=49) and control groups (n=78) were 5.65 +/- 0.19 and 5.19 +/- 0.15, respectively. Mean difference was -0.47 (CI -0.95 to 0.01; p=0.06). Adjusted for age, gender and practice settings, mean difference was -0.57 (CI -1.09 to -0.05; p=0.03). We identified eight theoretical domains related to barriers and six related to facilitators for providing sex-adapted and gender-adapted diabetes and depression care. Conclusions CPD training on diabetes and depression that includes sex and gender considerations is feasible and, compared with CPD training that does not, may prompt health professionals to modify their care. Addressing identified barriers and facilitators could increase intention.

Abstract: Intimate partner violence (IPV) is a pervasive social issue. Younger women tend to experience the highest rates of violence, associated with a range of negative health outcomes. Although interventions in health settings have shown promise, younger women may be reluctant to access services or discuss relationships with a health professional. Delivering an IPV intervention online or via a smartphone has the potential to overcome some of these barriers. Little is known, however, about how young women might perceive such an intervention, or what factors might influence its uptake. Drawing on focus groups interviews, we explore the views of young Australian women on using a website or application to address IPV. Azjen's Theory of Planned Behavior is used to help understand the beliefs and norms around technology and help-seeking for IPV. Findings highlight the potential for technological interventions to become a valuable addition to the resources available to young women.

Abstract: Background: Despite the availability of evidence-based guidelines for the management of mild traumatic brain injury in the emergency department (ED), variations in practice exist. Interventions designed to implement recommended behaviours can reduce this variation. Using theory to inform intervention development is advocated; however, there is no consensus on how to select or apply theory. Integrative theoretical frameworks, based on syntheses of theories and theoretical constructs relevant to implementation, have the potential to assist in the intervention development process. This paper describes the process of applying two theoretical frameworks to investigate the factors influencing recommended behaviours and the choice of behaviour change techniques and modes of delivery for an implementation intervention. Methods: A stepped approach was followed: (i) identification of locally applicable and actionable evidence-based recommendations as targets for change, (ii) selection and use of two theoretical frameworks for identifying barriers to and enablers of change (Theoretical Domains Framework and Model of Diffusion of Innovations in Service Organisations) and (iii) identification and operationalisation of intervention components (behaviour change techniques and modes of delivery) to address the barriers and enhance the enablers, informed by theory, evidence and feasibility/acceptability considerations. We illustrate this process in relation to one recommendation, prospective assessment of post-traumatic amnesia (PTA) by ED staff using a validated tool. Results: Four recommendations for managing mild traumatic brain injury were targeted with the intervention. The intervention targeting the PTA recommendation consisted of 14 behaviour change techniques and addressed 6 theoretical domains and 5 organisational domains. The mode of delivery was informed by six Cochrane reviews. It was delivered via five intervention components : (i) local stakeholder meetings, (ii) identification of local opinion leader teams, (iii) a train-the-trainer workshop for appointed local opinion leaders, (iv) local training workshops for delivery by trained local opinion leaders and (v) provision of tools and materials to prompt recommended behaviours. Conclusions: Two theoretical frameworks were used in a complementary manner to inform intervention development in managing mild traumatic brain injury in the ED. The effectiveness and cost-effectiveness of the developed intervention is being evaluated in a cluster randomised trial, part of the Neurotrauma Evidence Translation (NET) program.

Short Title: Qualitative study of emergency clinicians to inform a national guideline on the management of children with mild-to-moderate head injuries

ISSN: 1472-0205

DOI: 10.1136/emered-2021-212198

Accession Number: WOS:000844720500001

Abstract: Background Head injury is a common reason children present to EDs. Guideline development to improve care for paediatric head injuries should target the information needs of ED clinicians and factors influencing its uptake. Methods We conducted semi-structured qualitative interviews (November 2017-November 2018) with a stratified purposive sample of ED clinicians from across Australia and New Zealand. We identified clinician information needs, used the Theoretical Domains Framework (TDF) to explore factors influencing the use of head CT and clinical decision rules/guidelines in CT decision-making, and explored ways to improve guideline uptake. Two researchers coded the interview transcripts using thematic content analysis. Results A total of 43 clinicians (28 doctors, 15 nurses), from 19 hospitals (5 tertiary, 8 suburban, 6 regional/rural) were interviewed. Clinicians sought guidance for scenarios including ED management of infants, children with underlying medical issues, delayed or representations and potential non-accidental injuries. Improvements to the quality and content of discharge communication and parental discussion materials were suggested. Known risks of radiation from head CTs has led to a culture of observation over use of CT in Australasia (TDF domain: beliefs about consequences). Formal and informal policies have resulted in senior clinicians making most head CT decisions in children (TDF domain: behavioural regulation). Senior clinicians consider their gestalt to be more

accurate and outperform existing guidance (TDF domain: beliefs about capabilities), although they perceive guidelines as useful for training and supporting junior staff. Summaries, flow charts, publication in ED-specific journals and scripted training materials were suggestions to improve uptake. Conclusion Information needs of ED clinicians, factors influencing use of head CT in children with head injuries and the role of guidelines were identified. These findings informed the scope and implementation strategies for an Australasian guideline for mild-to-moderate head injuries in children.

Abstract: Objectives To understand the barriers and facilitators to uptake and retention of postnatal women randomised to a commercial group weight management intervention using the COM-B (capability, opportunity, motivation and behaviour) behaviour change model. Design Concurrent mixed-methods (qualitative dominant) process evaluation nested within a feasibility randomised controlled trial, comprising questionnaires and interviews at 6 and 12 months postbirth. Setting One National Health Service maternity unit in an inner city area in the south of England. Participants 98 postnatal women with body mass indices >25 kg/m² (overweight/obese) at pregnancy commencement. Intervention Twelve-week Slimming World (SW) commercial group weight management programme, commencing anytime from 8 to 16 weeks postnatally. Primary and secondary outcome measures Data regarding uptake and retention from questionnaires and

interviews conducted 6 and 12 months postbirth analysed thematically and mapped to the COM-B model. Results Barriers to SW uptake mostly concerned opportunity issues (eg, lack of time or childcare support) though some women also lacked motivation, not feeling that weight reduction was a priority, and a few cited capability issues such as lacking confidence. Weight loss aspirations were also a key factor explaining retention, as were social opportunity issues, particularly in relation to factors such as the extent of group identity and relationship with the group consultant; and physical opportunity such as perceived support from and fit with family lifestyle. In addition, barriers relating to beliefs and expectations about the SW programme were identified, including concerns regarding compatibility with breastfeeding and importance of exercise. Women's understanding of the SW approach, and capability to implement into their lifestyles, appeared related to level of attendance (dose-response effect). Conclusions Uptake and retention in commercial weight management programmes may be enhanced by applying behaviour change techniques to address the barriers impacting on women's perceived capability, motivation and opportunity to participate.

Short Title: Views about integrating smoking cessation treatment within psychological services for patients with common mental illness: A multi-perspective qualitative study

ISSN: 1369-6513

DOI: 10.1111/hex.13182

Accession Number: WOS:000602712700001

Abstract: Background Tobacco smoking rates are significantly higher in people with common mental illness compared to those without.

Smoking cessation treatment could be offered as part of usual outpatient psychological care, but currently is not. Objective To understand patient and health care professionals' views about integrating smoking cessation treatment into outpatient

psychological services for common mental illness. Design Qualitative in-depth interviews, with thematic analysis. Participants Eleven Improving Access to Psychological Therapies (IAPT) psychological wellbeing practitioners (PWPs), six IAPT patients, and six stop smoking advisors were recruited from English smoking cessation, and IAPT services. Results Patients reported psychological benefits from smoking, and also described smoking as a form of self-harm. Stop smoking advisors displayed therapeutic pessimism and stigmatizing attitudes towards helping people with mental illness to quit smoking. PWPs have positive attitudes towards smoking cessation treatment for people with common mental illness. PWPs and patients accept evidence that smoking tobacco may harm mental health, and quitting might benefit mental health. PWPs report expertise in helping people with common mental illness to make behavioural changes in the face of mood disturbances and low motivation. PWPs felt confident in offering smoking cessation treatments to patients, but suggested a caseload reduction may be required to deliver smoking cessation support in IAPT. Conclusions IAPT appears to be a natural environment for smoking cessation treatment. PWPs may need additional training, and a caseload reduction. Integration of smoking cessation treatment into IAPT services should be tested in a pilot and feasibility study. Patient or public contribution Service users and members of the public were involved in study design and interpretation of data.

Short Title: Patterns of energy availability of free-living athletes display day-to-day variability that is not reflected in laboratory-based protocols: Insights from elite male road cyclists

ISSN: 0264-0414

DOI: 10.1080/02640414.2022.2115676

Accession Number: WOS:000850127800001

Abstract: The physiological effects of low energy availability (EA) have been studied using a homogenous daily EA pattern in laboratory

settings. However, whether this daily EA pattern represents those of free-living athletes and is therefore ecologically valid is unknown. To investigate this, we assessed daily exercise energy expenditure, energy intake and EA in 10 free-living elite male road cyclists (20 min Mean Maximal Power: 5.27 +/- 0.25 W center dot kg(-1)) during 7 consecutive days of late pre-season training. Energy intake was measured using the remote-food photography method and exercise energy expenditure estimated from cycling crank-based power-metres. Seven-day mean +/- SD energy intake and exercise energy expenditure was 57.9 +/- 10.4 and 38.4 +/- 8.6 kcal center dot kg FFM-1 center dot day(-1), respectively. EA was 19.5 +/- 9.1 kcal center dot kg FFM-1 center dot day(-1). Within-participants correlation between daily energy intake and exercise energy expenditure was .62 (95% CI: .43 - .75; P < .001), and .60 (95% CI: .41 - .74; P < .001) between carbohydrate intake and exercise energy expenditure. However, energy intake only partially compensated for exercise energy expenditure, increasing 210 kcal center dot day(-1) per 1000 kcal center dot day(-1) increase in expenditure. EA patterns displayed marked day-to-day fluctuation (range: -22 to 76 kcal center dot kg FFM-1 center dot day(-1)). The validity of research using homogenous low EA patterns therefore requires further investigation.

Short Title: Nature-positive goals for an organization's food consumption

DOI: 10.1038/s43016-022-00660-2

Accession Number: WOS:000913344100001

Abstract: Organizations are increasingly committing to biodiversity protection targets with focus on 'nature-positive' outcomes, yet examples of how to feasibly achieve these targets are needed. Here we propose an approach to achieve nature-positive targets with respect to the embodied biodiversity impacts of an organization's food consumption. We quantify these impacts using a comprehensive database of life-cycle environmental impacts from food, and map exploratory strategies to meet defined targets structured according to a mitigation and conservation hierarchy. By considering the

varying needs and values across the organization's internal community, we identify a range of targeted approaches towards mitigating impacts, which balance top-down and bottom-up actions to different degrees. Delivering ambitious nature-positive targets within current constraints will be challenging, particularly given the need to mitigate cumulative impacts. Our results evidence that however committed an organization is to being nature positive in its food provision, this is unachievable in the absence of systems change.

Title: Feasibility and acceptability of remote smartphone cognitive testing in frontotemporal dementia research

Journal: Alzheimer's & Dementia: Diagnosis, Assessment & Disease Monitoring

Volume: 15

Issue: 2

Date: Apr

Short Title: Feasibility and acceptability of remote smartphone cognitive testing in frontotemporal dementia research

DOI: 10.1002/dad2.12423

Article Number: e12423

Accession Number: WOS:000985064500001

Abstract: Introduction Remote smartphone assessments of cognition, speech/language, and motor functioning in frontotemporal dementia (FTD) could enable decentralized clinical trials and improve access to research. We studied the feasibility and acceptability of remote smartphone data collection in FTD research using the ALLFTD Mobile App (ALLFTD-mApp). Methods A diagnostically mixed sample of 214 participants with FTD or from familial FTD kindreds (asymptomatic: CDR (R)+NACC-FTLD = 0 [N = 101]; prodromal: 0.5 [N = 49]; symptomatic ≥ 1 [N = 51]; not measured [N = 13]) were asked to complete ALLFTD-mApp tests on their smartphone three times within 12 days. They completed smartphone familiarity and participation experience surveys. Results It was feasible for participants to complete the ALLFTD-mApp on their own smartphones. Participants reported high smartphone familiarity, completed similar to 70% of tasks, and considered the time commitment acceptable (98% of respondents). Greater disease severity was associated with poorer performance across several tests. Discussion These findings suggest that the ALLFTD-mApp study protocol is feasible and acceptable for remote FTD research. **HIGHLIGHTS** The ALLFTD Mobile App is a smartphone-based platform for remote, self-administered data collection. The ALLFTD Mobile App consists of a comprehensive battery of surveys and tests of executive functioning, memory, speech and language, and motor abilities. Remote digital data collection using the ALLFTD Mobile App was feasible in a multicenter research consortium that studies FTD. Data was collected in healthy controls and participants with a range of diagnoses, particularly FTD spectrum disorders. Remote digital data collection was well accepted by participants with a variety of diagnoses.

Title: Measuring perceived exercise capability and investigating its relationship with childhood obesity: a feasibility study

Journal: International Journal of Obesity

Volume: 40

Issue: 1

Pages: 34-38

Date: Jan

Short Title: Measuring perceived exercise capability and investigating its relationship with childhood obesity: a feasibility study

ISSN: 0307-0565

DOI: 10.1038/ijo.2015.210

Accession Number: WOS:000367628700006

Abstract: BACKGROUND/OBJECTIVES: According to the COM-B ('Capability', 'Opportunity', 'Motivation' and 'Behaviour') model of behaviour, three factors are essential for behaviour to occur: capability, opportunity and motivation. Obese children are less likely to feel capable of exercising. The implementation of a new methodological approach to investigate the relationship between perceived exercise capability (PEC) and childhood obesity was conducted, which involved creating a new instrument, and demonstrating how it can be used to measure obesity intervention outcomes. SUBJECTS/METHODS: A questionnaire aiming to measure perceived exercise capability, opportunity and motivation was systematically constructed using the COM-B model and administered to 71 obese children (aged 9-17 years (12.24 +/- 0.2.01), body mass index (BMI) standard deviation scores (SDS) 2.80 +/- 0.660) at a weight-management camp in northern England. Scale validity and reliability was assessed. Relationships between PEC, as measured by the questionnaire, and BMI SDS were investigated for the children at the weight-management camp, and for 45 Spanish schoolchildren (aged 9-13 years, (10.52 +/- 1.23), BMI SDS 0.80 +/- 0.99). A pilot study, demonstrating how the questionnaire can be used to measure the effectiveness of an intervention aiming to bring about improved PEC for weight-management camp attendees, was conducted. No participants withdrew from these studies. RESULTS: The questionnaire domain (exercise capability, opportunity and motivation) composite scales were found to have adequate internal consistency ($\alpha = 0.712-0.796$) and construct validity ($\chi^2/\text{degrees of freedom} = 1.55$, root mean square error of approximation = 0.072, comparative fit index = 0.92). Linear regression revealed that low PEC was associated with higher baseline BMI SDS for both UK ($b = -0.289$, $P = 0.010$) and Spanish ($b = -0.446$, $P = 0.047$) participants. Pilot study findings provide preliminary evidence for PEC improvements through intervention being achievable, and measurable using the questionnaire. CONCLUSIONS: Evidence is presented for reliability and validity of the questionnaire, and for feasibility of its use in the context of a childhood obesity intervention. Future research could investigate the link between PEC and childhood obesity further.

Title: Evaluation of a Type 2 diabetes risk reduction online program
for women with recent gestational diabetes: a randomised trial

Journal: International Journal of Behavioral Nutrition and Physical
Activity

Volume: 19

Issue: 1

Date: Mar

Short Title: Evaluation of a Type 2 diabetes risk reduction online
program for women with recent gestational diabetes: a randomised
trial

DOI: 10.1186/s12966-022-01275-3

Article Number: 35

Accession Number: WOS:000773933700003

Abstract: Background: To evaluate the preliminary efficacy,
feasibility and acceptability of the 3-month Body Balance Beyond
(BBB) online program among Australian women with overweight/obesity
and recent gestational diabetes mellitus. Methods: Women were
randomised into either: 1) High Personalisation (HP) (access
to 'BBB' website, video coaching sessions, text message support); 2)
Medium Personalisation (MP) (website and text message support); or
3) Low Personalisation (LP) (website only). Generalised linear mixed
models were used to evaluate preliminary efficacy, weight, diet
quality, physical activity levels, self-efficacy and quality of life
(QoL) at baseline and 3-months. Feasibility was assessed by
recruitment and retention metrics and acceptability determined via
online process evaluation survey at 3-months. Results: Eighty three
women were randomised, with 76 completing the study. Self-efficacy
scores showed significant improvements in confidence to resist
eating in a variety of situations from baseline to 3-months in HP
compared to MP and LP groups ($P=.03$). The difference in mean QoL
scores favoured the HP compared to MP and LP groups ($P=.03$). Half of
the women (HP $n=17$ [81%], MP $n=12$ [75%], LP $n=9$ [56%]) lost weight at
3-months. No significant group-by-time effect were reported for
other outcomes. Two-thirds of women in the HP group were satisfied
with the program overall and 86% would recommend it to others,
compared with 25% and 44% in the MP group, and 14% and 36% in the LP
group, respectively. Conclusions: Video coaching sessions were
associated with improvements in QoL scores and self-efficacy,
however further refinement of the BBB website and text messages
support could improve program acceptability.

Short Title: Group-based nutrition interventions to promote healthy eating and mobility in community-dwelling older adults: a systematic review

ISSN: 1368-9800

DOI: 10.1017/s136898002200115x

Article Number: Pii s136898002200115x

Accession Number: WOS:000804452500001

Abstract: Objective: To identify the efficacy of group-based nutrition interventions to increase healthy eating, reduce nutrition risk, improve nutritional status and improve physical mobility among community-dwelling older adults. Design: Systematic review.

Electronic databases MEDLINE, CINAHL, EMBASE, PsycINFO and Sociological Abstracts were searched on July 15, 2020 for studies published in English since January 2010. Study selection, critical appraisal (using the Joanna Briggs Institute's tools) and data extraction were performed in duplicate by two independent reviewers.

Setting: Nutrition interventions delivered to groups in community-based settings were eligible. Studies delivered in acute or long-term care settings were excluded. Participants: Community-dwelling older adults aged 55+ years. Studies targeting specific disease populations or promoting weight loss were excluded. Results: Thirty-one experimental and quasi-experimental studies with generally unclear to high risk of bias were included. Interventions included nutrition education with behaviour change techniques (BCT) (e.g. goal setting, interactive cooking demonstrations) (n 21), didactic nutrition education (n 4), interactive nutrition education (n 2), food access (n 2) and nutrition education with BCT and food access (n 2). Group-based nutrition education with BCT demonstrated the most promise in improving food and fluid intake, nutritional status and healthy eating knowledge compared with baseline or control. The impact on mobility outcomes was unclear. Conclusions: Group-based nutrition education with BCT demonstrated the most promise for improving healthy eating among community-dwelling older adults. Our findings should be interpreted with caution related to generally low

certainty, unclear to high risk of bias and high heterogeneity across interventions and outcomes. Higher quality research in group-based nutrition education for older adults is needed.

Abstract: Health behavior change is central in obesity management. Due to its complexity, there has been a growing body of research on: i) the factors that predict the adoption and maintenance of health behaviors, ii) the development and testing of theories that conceptualize relationships among these factors and with health behaviors, and iii) how these factors can be implemented in effective behavior change interventions, considering characteristics of the content (techniques) and delivery. This short review provides an overview of advances in behavior change science theories and methods, focusing on obesity management, and includes a discussion of the main challenges imposed by this research field. Short Title: Health Care Worker Burnout and Perceived Capacity to Address Social Needs

ISSN: 1942-7891

DOI: 10.1089/pop.2021.0175

Accession Number: WOS:000706452800001

Abstract: Health care organizations are increasingly incorporating social care programs into medical care delivery models. Recent studies have identified burnout as a potential unintended consequence of this expansion. Successful implementation of these programs requires investment in the health care team, although understanding the impact of this expansion on nonphysician team members remains limited. Utilizing a theory-informed model for organizational behavior change, the authors aim to characterize the perceived elements of capacity to address patients' social needs within a heterogeneous group of health care workers, and to examine the association of these behavioral conditions with burnout. A cross-sectional analysis was conducted of a survey of similar to 1900 health care staff from 46 organizations in a large delivery system. Exploratory factor analysis identified factors contributing to the "Perceived Capacity to Address Social Needs" domain; Motivation, Organizational Reinforcement, and 3 task-specific capacities (Identification of social needs, Providing care for patients with social needs, and Linkage to social needs resources). Logistic regression found both a lower sense of motivation (OR 0.71, 95% CI 0.59-0.86), and organizational reinforcement (OR 0.51, 95% CI 0.42-0.62) associated with a higher rate of burnout. These associations with burnout differed by organizational role, suggesting role-specific relationships between these behavioral conditions. As health care has evolved into team-based interventions, staff across the care spectrum are now tasked with addressing larger social issues that affect their patients. A systems approach, aligning organizational priorities and staff motivations, in addition to task-specific skill sets is likely necessary to prevent burnout in this setting.

Article Number: 5

Accession Number: WOS:000368142200002

Abstract: Background: Dental caries is the most common chronic disease of adult and childhood, a largely preventable yet widespread, costly public health problem. This study identified patient-, organization-, and system-level factors influencing routine delivery of recommended care for prevention and management of caries in primary dental care. Methods: A convergent mixed-methods design assessed six guidance-recommended behaviours to prevent and manage caries (recording risk, risk-based recall intervals, applying fluoride varnish, placing preventive fissure sealants, demonstrating oral health maintenance, taking dental x-rays). A diagnostic questionnaire assessing current practice, beliefs, and practice characteristics was sent to a random sample of 651 dentists in National Health Service (NHS) Scotland. Eight in-depth case studies comprising observation of routine dental visits and dental team member interviews were conducted. Patient feedback was collected from adult patients with recent checkups at case study practices. Key informant interviews were conducted with decision makers in policy, funding, education, and regulation. The Theoretical Domains Framework within the Behaviour Change Wheel was used to identify and describe patient-, organization-, and system-level barriers and facilitators to care. Findings were merged into a matrix describing theoretical domains salient to each behaviour. The matrix and Behaviour Change Wheel were used to prioritize behaviours for change and plan relevant intervention strategies. Results: Theoretical domains associated with best practice were identified from the questionnaire (N=196), case studies (N = 8 practices, 29 interviews), and patient feedback (N = 19). Using the study matrix, key stakeholders identified priority behaviours (use of preventive fissure sealants among 6-12-year-olds) and strategies (audit and feedback, patient informational campaign) to improve guidance implementation. Proposed strategies were assessed as appropriate for immediate implementation and suitable for development with remaining behaviours. Conclusions: Specific, theoretically based, testable interventions to improve caries prevention and management were coproduced by patient-, practice-, and policy-level stakeholders. Findings emphasize duality of behavioural determinants as barriers and facilitators, patient influence on preventive care delivery, and benefits of integrating multi-level interests when planning interventions in a dynamic, resource-constrained environment. Interventions identified in this study are actively being used to support ongoing implementation initiatives including guidance, professional development, and oral health promotion.

Title: Identifying the factors affecting 'patient engagement' in
exercise rehabilitation

Journal: BMC Sports Science Medicine and Rehabilitation

Volume: 14

Issue: 1

Date: Feb

Short Title: Identifying the factors affecting 'patient engagement'
in exercise rehabilitation

ISSN: 2052-1847

DOI: 10.1186/s13102-022-00407-3

Article Number: 18

Accession Number: WOS:000752345600002

Abstract: Background Despite the proven benefits of exercise
rehabilitation for numerous health conditions, musculoskeletal
injuries and recovery from surgery, patient adherence to such
programs is reported to often be less than 35%. Increasing patient
engagement therefore has the potential to improve patient health
outcomes, benefiting the patient, their carers and the services that
support them. The aims of this review were to identify the factors
that contribute to 'patient' engagement in prescribed exercise
rehabilitation using the COM-B (capability, opportunity, motivation-
behaviour) framework of behavioural analysis. Methods Five
electronic databases (PubMed, Embase, Cochrane, Web of Science, and
ClinicalTrials.gov) were searched. 'COM-B' was the key word searched
for specifically within titles and abstracts, combined with either
'physical activity' OR 'exercise' included using the 'AND'
operation. Records were then filtered and excluded following full-
text screening based on the predetermined eligibility criteria.
Results Twenty studies were included in the review. The main COM-B
themes highlighted for improving patient engagement were:
capability-improving patient knowledge and cognitive skills for
behavioural regulation, such as 'action planning' and 'action
control', which could also benefit time-management; opportunity-a
balanced life situation that enabled time to be devoted to the
exercise program, social support, easily accessible and affordable
resources and services; and motivation-increasing patient levels of
self-efficacy and autonomous motivation, which were noted to be
influenced by levels of perceived 'capability', additionally
'motivation' was noted to be influenced by patients perceiving the
benefits of the exercise, and adherence to the program was promoted
by 'goal-setting'. Other issues in the 'capability' domain included

a fear and/or dislike of exercise. Conclusion Patient engagement behavior has been shown to be influenced by both external (opportunity) and intrapersonal variables (capability and motivation). Those prescribing exercises within a rehabilitation program need to discuss these factors with their patients and co-design the exercise rehabilitation program in partnership with the patient, since this is likely to improve patient engagement, and thereby result in superior health outcomes. Furthermore, these factors need to be a consideration in clinical trials, if the findings from such trials are to translate into mainstream healthcare settings.

Title: Knowledge, attitude, and practice toward pre-diabetes among the public, patients with pre-diabetes and healthcare professionals: a systematic review

Journal: Bmj Open Diabetes Research & Care

Volume: 11

Issue: 1

Date: Feb

Short Title: Knowledge, attitude, and practice toward pre-diabetes among the public, patients with pre-diabetes and healthcare professionals: a systematic review

DOI: 10.1136/bmjdr-2022-003203

Article Number: e003203

Accession Number: WOS:000939400300002

Abstract: The prevalence of pre-diabetes is increasing globally, affecting an estimated 552 million people by 2030. While lifestyle interventions are the first line of defense against progression toward diabetes, information on barriers toward pre-diabetes management and how to overcome these barriers are scarce. This systematic review describes the publics' and healthcare professionals' knowledge, attitude and practice (KAP) toward pre-diabetes and determines the barriers toward pre-diabetes management. A systematic search for studies examining KAP towards pre-diabetes was conducted in six databases from inception to September 2022. Studies that quantitatively assessed at least two KAP elements using questionnaires were included. The quality of studies was assessed using the NIH Quality Assessment Tool for Observational Cohort and Cross-Sectional Studies. Barriers and enablers were identified and mapped onto the Capability, Motivation, and Behaviour model to identify factors that influence behavior change. Twenty-one articles that surveyed 8876 participants were included in this review. Most of the reviews (n=13) were directed to healthcare professionals. Overall, positive attitudes toward diabetes prevention efforts were

observed, although there were still knowledge deficits and poor behavior toward pre-diabetes management. Barriers and enablers were detected at patients (eg, goals and intention), healthcare professionals (eg, clinical judgement) and system (eg, access and resources) levels. The use of different survey instruments to assess KAP prevented a head-to-head comparison between studies. Most studies conducted among patients were from middle-income countries, while among healthcare professionals (HCPs) were from high-income countries, which may produce some biasness. Nevertheless, the development of pre-diabetes intervention should focus on: (1) increasing knowledge on pre-diabetes and its management; (2) imparting practical skills to manage pre-diabetes; (3) providing resources for lifestyle management; (4) improving the accessibility of lifestyle management programs; and (5) other HCPs and human support to pre-diabetes management.

Article Number: 950107

Accession Number: WOS:000861754500001

Abstract: The purpose of the present two studies was to investigate whether in framing messages that target salient beliefs of youth, the type of goal framed matter to promote physical activity (PA) participation among low-active adolescents (i.e., participating in less than 1 h/day of moderate-to-vigorous PA). More specifically, the main trial (study 2) compared the effect of intrinsic and extrinsic-goal framing messages alongside planning (IMC + P and EMC + P) to a control condition (CC) on low-active adolescents' physical activity (PA), intention, attitude, and exercise goals, and examined the potential mediational effect of these variables between condition and PA. Low-active students (n = 193; M age = 16.89) from fifteen classes were assigned to one of these three conditions. PA

was assessed using an accelerometer, and the socio-cognitive mediators were measured at baseline (i.e., 2 weeks before the intervention) and post-test, and the intention was measured again at follow-up (i.e., 2 weeks after the intervention). Results showed that compared to adolescents in the CC group, those in the experimental conditions did not do more moderate PA, but carried out more light PA, and yielded an increase in attitude and intention. Mediation analysis revealed no significant effect of the potential mediators.

Short Title: Challenges around Child-Feeding Practices with 'Comida Chatarra': A Qualitative Study to Understand the Role of Sociocultural Factors in Caregiver Feeding Decisions

DOI: 10.3390/nu15061317

Article Number: 1317

Accession Number: WOS:000958554800001

Abstract: A massive incorporation of ultra-processed products into young children's diets worldwide and in Mexico has been documented. The aim of this study is to understand the role of sociocultural factors in principal caregivers' decisions to give a type of ultra-processed food to children under age five, called 'comida chatarra' ('junk food' in English), usually includes sugar-sweetened beverages, sweet and salty snacks, and sweet breakfast cereals. We conducted a descriptive, observational qualitative study. The research was conducted in urban and rural communities in two Mexican states. Twenty-four principal caregivers were equally distributed between the two states and types of communities. They were interviewed in person. Phenomenology underpinned this study. Results highlight the preponderant role of culture in food choices and feeding practices with junk food. Local culture influences child-feeding with ultra-processed products through social norms, knowledge, or socially constructed attitudes. These social norms, built in the context of abundant ultra-processed products and omnipresent marketing, 'justify' children's consumption of junk food. They acquire these products from the principal caregivers, family members, and neighbors, among others, who reward and pamper them. These actors also define what amount (small amounts) and when

(after meals as snacks) children are given these products. Cultural factors must be considered in the development of effective public policies and programs that aim to change the culture around ultra-processed products among children and avoid their consumption.

Short Title: Is a female physical empowerment campaign effective in improving positive body image, motivation for physical activity, and physical activity behavior in young female adults? A two-study experimental test of 'This Girl Can?'

ISSN: 1740-1445

DOI: 10.1016/j.bodyim.2022.06.001

Accession Number: WOS:000822678500013

Abstract: This Girl Can is a campaign designed to empower women to increase physical activity. The campaign uses images/videos of women of diverse body weights/shapes, ages and ethnicities being physically active, emphasizing body functionality. First, we examined the effects of multi-session (N = 3) exposures to This Girl Can on body functionality, body appreciation and self-compassion (Study 1). Second, we explored if autonomous motivation for physical activity mediated effects of This Girl Can on physical activity (Study 2). Women (Study 1: N = 186, M (SD) age = 27.55 (14.01); Study 2: N = 153, M (SD) age = 28.31 (11.70)) were randomized to This Girl Can, or control videos/images depicting idealized women of thin/athletic body types being physically active (Study 1), or control videos highlighting physical activity benefits (Study 2). Outcomes were measured at baseline, post-test and 1-week follow-up. Study 1 results showed significant group by time interactions for body functionality (decreasing in the control group), body appreciation and self-compassion (both increased only in the experimental conditions). In Study 2, path analysis revealed no statistically significant mediation effect (ab = 13.18, 95 % CI [-107.92, 152.59]) of autonomous motivation. Future interventions

designed to promote positive body image and self-compassion should incorporate media focusing on diverse women engaging in self-chosen physical activity.(c) 2022 The Author(s). Published by Elsevier Ltd. CC_BY_4.0

Short Title: Lifestyle Interventions through Participatory Research: A Mixed-Methods Systematic Review of Alcohol and Other Breast Cancer Behavioural Risk Factors

DOI: 10.3390/ijerph19020980

Article Number: 980

Accession Number: WOS:000760291000001

Abstract: Breast cancer is one of the most frequently diagnosed cancers in women globally. Sex and advancing age represent the dominant risk factors, with strong evidence of alcohol as a modifiable risk factor. The carcinogenic nature of alcohol has been known for over twenty years; however, this has failed to translate into significant behavioural, practice, or policy change. As a result, women have not benefitted from this research and, by extension, have been exposed to unnecessary breast cancer risk. Participatory research presents a solution to research translation in public health through the collaboration of impacted populations with academics in research. This systematic review examines peer-reviewed research studies where participants were involved in the research process and the outcomes related to breast cancer prevention (either alcohol or broader lifestyle modification). Seven of the eight studies reported positive effects, and the collaboration between academic researchers and impacted populations may have supported positive outcomes. Women were receptive and responsive to participatory approaches, and their participation is important to address socially entrenched behaviours such as alcohol consumption. Participatory research presents opportunities for future interventions to improve (or address) modifiable risk factors for breast cancer.

Abstract: Objectives: To explore and theorize how patients perceive, interpret, and react in healthy lifestyle promotion situations in primary care and to investigate patients' role in implementation of lifestyle promotion illustrated by typologies. Methods: Grounded theory was used to assess qualitative interview data from 22 patients with varied experience of healthy lifestyle promotion. Data were analyzed by constant comparative analysis. Results: A substantive theory of being healthy emerged from the data. The theory highlights the processes that are important for implementation before, during, and after lifestyle promotion. Three interconnected categories emerged from the data: conditions for being healthy, managing being healthy, and interactions about being healthy; these formed the core category: being healthy. A typology proposed four patient trajectories on being healthy: resigned, receivers, coworkers, and leaders. Conclusion: Patients coproduced the implementation of lifestyle promotion through the degree of transparency, which was a result of patients' expectations and situation appraisals. Practice implications: Different approaches are needed during lifestyle promotion depending on a variety of patient-related factors. The typology could guide practitioners in their lifestyle promotion practice. (C) 2014 Elsevier Ireland Ltd. All rights reserved.

ISSN: 1478-2189

DOI: 10.1002/msc.1745

Accession Number: WOS:000945817000001

Abstract: Introduction Managing symptoms, resisting functional decline and maintaining health and independence are key motivators for people with Rheumatoid Arthritis (RA) who successfully engage with physical activity (PA). To inform PA support for people with RA the aim was to determine whether the broader RA population share similar beliefs and strategies regarding PA to those who report successful engagement. Methods A modified two-stage Delphi approach. 200 patients from four National Health Service rheumatology departments received a postal questionnaire containing statements relating to engagement with PA derived from prior interview data from physically active individuals with RA. Statements rated as agree or strongly agree by > 50% of respondents were retained and the same respondents asked to rate and prioritize potential PA intervention components. Ethical approval: Oxford C Research Ethics Committee (ref 13/SC/0418). Results Questionnaire one received 49 responses (11 males, 37 females, 1 unknown), mean age 65 years (range 29-82). Low levels of PA were reported by 60% of respondents. Questionnaire two responses (n = 36) indicated that a PA intervention should include information about prevention of RA symptoms worsening and benefits of PA for joints; help participants to achieve improved pain management and a feeling of being in control of their RA. For PA maintenance it was important that medication controlled symptoms, and PA instructors understood RA to ensure safety. Conclusions A key factor to consider when designing a PA intervention for people with RA is that education from a knowledgeable instructor should underpin programme delivery alongside effective medication. Programmes may need tailoring based on demographics; this should be explored in future studies.

Title: Use of the Theoretical Domains Framework to Develop an Intervention to Improve Physical Therapist Management of the Risk of Falls After Discharge

Journal: Physical Therapy

Volume: 94

Issue: 11

Pages: 1660-1675

Date: Nov

Short Title: Use of the Theoretical Domains Framework to Develop an Intervention to Improve Physical Therapist Management of the Risk of Falls After Discharge

ISSN: 0031-9023

DOI: 10.2522/ptj.20130412

Accession Number: WOS:000343794800012

Abstract: Background and Purpose. Older adults have an increased risk of falls after discharge from the hospital. Guidelines to manage this risk of falls are well documented but are not commonly implemented. The aim of this case report is to describe the novel approach of using the Theoretical Domains Framework (TDF) to develop an intervention to change the clinical behavior of physical therapists. Case Description. This project had 4 phases: identifying the evidence-practice gap, identifying barriers and enablers that needed to be addressed, identifying behavior change techniques to overcome the barriers, and determining outcome measures for evaluating behavior change. Outcomes. The evidence-practice gap was represented by the outcome that few patients who had undergone surgery for hip fracture were recognized as having a risk of falls or had a documented referral to a community agency for follow-up regarding the prevention of falls. Project aims aligned with best practice guidelines were established; 12 of the 14 TDF domains were considered to be relevant to behaviors in the project, and 6 behavior change strategies were implemented. Primary outcome measures included the proportion of patients who had documentation of the risk of falls and were referred for a comprehensive assessment of the risk of falls after discharge from the hospital. Discussion. A systematic approach involving the TDF was useful for designing a multifaceted intervention to improve physical therapist management of the risk of falls after discharge of patients from an acute care setting in South Australia, Australia. This framework enabled the identification of targeted intervention strategies that were likely to influence health care professional behavior. Early case note audit results indicated that positive changes were being made to reduce the evidence-practice gap.

Short Title: Motivations for the use and consumption of wildlife products

ISSN: 0888-8892

DOI: 10.1111/cobi.13578

Accession Number: WOS:000562562400001

Abstract: The dominant approach to combating the illegal wildlife trade has traditionally been to restrict the supply of wildlife products. Yet conservationists increasingly recognize the importance of implementing demand-side interventions that target the end consumers in the trade chain. Their aim is to curb the consumption of wildlife or shift consumption to more sustainable alternatives. However, there are still considerable knowledge gaps in understanding of the diversity of consumer motivations in the context of illegal wildlife trade, which includes hundreds of thousands of species, different uses, and diverse contexts. Based on consultation with multiple experts from a diversity of backgrounds, nationalities, and focal taxa, we developed a typology of common motivations held by wildlife consumers that can be used to inform conservation interventions. We identified 5 main motivational categories for wildlife use: experiential, social, functional, financial, and spiritual, each containing subcategories. This framework is intended to facilitate the segmentation of consumers based on psychographics and allow the tailoring of interventions—whether behavior change campaigns, enforcement efforts, or incentive programs—to the specific context in which they will be used.

Underlining the importance of consumer research and collaborating with local actors is an important step toward promoting a more systematic approach to the design of demand reduction interventions.

Short Title: Mobile app use to support therapeutic exercise for musculoskeletal pain conditions may help improve pain intensity and self-reported physical function: a systematic review

ISSN: 1836-9553

DOI: 10.1016/j.jphys.2022.11.012

Accession Number: WOS:000923613200001

Abstract: Question: What is the effect of therapeutic exercise or tailored physical activity programs supported by a mobile app (compared with exercise or physical activity programs delivered using other modes) for people with musculoskeletal pain conditions? Design: Systematic review of published randomised controlled trials with meta-analysis. Participants: People of all ages with musculoskeletal pain conditions. Intervention: Therapeutic exercise or tailored physical activity programs supported by a mobile app. Outcome measures: Pain intensity, pain interference, self-reported physical function, physical performance, adherence, psychosocial outcomes, health-related quality of life, work participation, physical activity, goal attainment and satisfaction. Results: Eleven studies were eligible for inclusion, with a total of 845 participants. There was low certainty evidence that using mobile apps to deliver exercise programs helps to reduce pain intensity to a worthwhile extent (SMD -0.60, 95% CI -0.93 to -0.27). There was low certainty evidence that using mobile apps to deliver exercise programs helps to improve self-reported physical function to a worthwhile extent (SMD -0.92, 95% CI -1.57 to -0.27). Although the effect of using mobile apps to deliver exercise programs on pain interference was also estimated to be a worthwhile benefit (SMD -0.66), this estimate came with marked uncertainty (95% CI -1.52 to 0.19) so the effect remains unclear. The remainder of the outcomes were unclear due to sparse evidence. The most common behaviour change intervention functions in the mobile app interventions were: training, enablement and environmental restructuring. Conclusion: Mobile apps supporting therapeutic exercise or tailored physical activity programs for musculoskeletal pain conditions may help in reducing pain intensity and improving physical function. The mobile apps utilised a limited range of behaviour change intervention functions. Article Number: 100572
Accession Number: WOS:000705398800005
Abstract: Cambodia has made significant efforts to improve nutritional outcomes while demonstrating increasing interest in ensuring that food safety challenges do not negate these efforts. This integrative review examines food safety in Cambodia to identify areas where efforts, both existing and recommended, could focus to best limit Cambodians' exposure to foodborne disease. The review considers: 1) documented foodborne disease outbreaks in Cambodia; 2) aggregated food safety research taking place in Cambodia; 3) current food safety regulatory structures in the country; and 4) gaps in food safety knowledge or practices. Lastly, the review proposes an framework to bridge food safety gaps through the integration of improved surveillance, targeted intervention research informed, and a comprehensive understanding of Cambodians motivations, opportunities, and capabilities to adopt food safety practices.

Title: Co-Developing an Antibiotic Stewardship Tool for Dentistry: Shared Decision-Making for Adults with Toothache or Infection
Journal: Antibiotics–Basel
Volume: 10
Issue: 11
Date: Nov
Short Title: Co-Developing an Antibiotic Stewardship Tool for Dentistry: Shared Decision-Making for Adults with Toothache or Infection
ISSN: 2079-6382
DOI: 10.3390/antibiotics10111345
Article Number: 1345
Accession Number: WOS:000807203200001
Abstract: Dentistry is responsible for around 10% of antibiotic prescribing across global healthcare, with up to 80% representing inappropriate use. Facilitating shared decision-making has been shown to optimise antibiotic prescribing (antibiotic stewardship) in primary medical care. Our aim was to co-develop a shared decision-making antibiotic stewardship tool for dentistry. Dentists, patients

and other stakeholders prioritised factors to include in the new tool, based on previous research (a systematic review and ethnographic study) about dentists' decision-making during urgent appointments. Candidate behaviour-change techniques were identified using the Behaviour Change Wheel and selected based on suitability for a shared decision-making approach. A 'think aloud' study helped fine-tune the tool design and Crystal Marking ensured clarity of messaging. The resulting paper-based worksheet for use at point-of-care incorporated various behaviour change techniques, such as: 'information about (and salience of) health consequences', 'prompts and cues', 'restructuring the physical (and social) environment' and 'credible sources'. The think aloud study confirmed the tool's acceptability to dentists and patients, and resulted in the title: 'Step-by-step guide to fixing your toothache.' Further testing will be necessary to evaluate its efficacy at safely reducing dental antibiotic prescribing during urgent dental appointments in England and, with translation, to other dental contexts globally.

Short Title: Does food store access modify associations between intrapersonal factors and fruit and vegetable consumption?

ISSN: 0954-3007

DOI: 10.1038/ejcn.2014.287

Accession Number: WOS:000359264100007

Abstract: BACKGROUND/OBJECTIVES: Existing theoretical frameworks suggest that healthy eating is facilitated by an individual's ability, motivation and environmental opportunities. It is plausible, although largely untested, that the importance of factors related to ability and motivation differ under varied environmental conditions. This study aimed to determine whether the magnitude of associations between fruit and vegetable consumption and intrapersonal factors (ability and motivation) were modified by differences in access to stores selling these items (environmental opportunities). SUBJECTS/METHODS: Cross-sectional analysis of 4335 women from socioeconomically disadvantaged neighbourhoods in the state of Victoria, Australia. Self-reported fruit and vegetable

consumption was assessed against a number of ability- and motivation-related factors. To examine whether associations were modified by store access, interactions with access to supermarkets and greengrocers within 2 km of participants' households were tested. RESULTS: Of the two factors related to ability and seven factors related to motivation, almost all were associated with fruit and vegetable consumption. In general, associations were not modified by store access suggesting that these factors were not tempered by environmental opportunities. CONCLUSIONS: This study provides little support for the hypothesis that the importance of intra-personal factors to fruit and vegetable consumption is modified by food store access. Further research on this topic is required to inform behaviour change interventions.

Pages: 141-163

Date: Feb

Short Title: Understanding Behaviour Change in Theory-Based Evaluation of Market Systems Development Programmes

ISSN: 0265-5012

DOI: 10.19088/1968-2022.109

Accession Number: WOS:000752278300008

Abstract: Market systems development (MSD) programmes aim to influence private actor behaviour to promote markets that work better for the poor. This article aims to inform theory-based evaluation (TBE) of such programmes, arguing that a stronger analysis of market actor behaviour change is needed. It proposes a 'behaviour change framework' (BCF), building on recent advances in the TBE literature. These focus attention on behaviour change as contingent on the alignment of actor capability, motivation, and opportunity, influenced by the meso and macro contexts. The article applies the BCF to three theory-based MSD evaluations to illustrate its applicability and draw lessons on its use. The BCF can be used to identify evidence gaps and support more compelling explanations of what worked and under what conditions. Such evidence can inform

future MSD programmes, and enable them to better stimulate systemic change in line with poverty reduction.

Abstract: Although the use of theories and evidence is often stressed in the development of health promotion interventions, this does not guarantee the success of an intervention. Thus, we need to reflect on intervention development processes that use different types of theories and evidence. In this paper, we provide a reflective discussion on how we identified evidence-based behavior change techniques and counseling themes for a health promotion intervention. In addition, we discuss the challenges that we encountered and what we learned during the process: a) a lack of previous research and meta-analyses, b) inconsistencies in evidence, c) integrating evidence and theories that have different starting points, and d) collaborating with researchers who represent different evidence and theories. During the process, we benefitted from having the clear goal of conducting evidence- and theory-based work. We solved the challenges by, for example, utilizing different types of evidence and being reflective about the reasons behind any inconsistencies in the evidence. In retrospect, we would have benefitted from closer collaboration between the teams that worked separately with different evidence. These kinds of reflective descriptions of development processes and the challenges encountered during them may help other researchers and professionals avoid encountering the same challenges. Title: Promoting physical therapists' use of research evidence to inform clinical practice: part 3—long term feasibility assessment of the PEAK program

Journal: BMC Medical Education

Volume: 16

Date: May

Short Title: Promoting physical therapists' use of research evidence to inform clinical practice: part 3—long term feasibility assessment of the PEAK program

DOI: 10.1186/s12909-016-0654-9

Article Number: 144

Accession Number: WOS:000375685500002

Abstract: Background: Evidence is needed to develop effective educational programs for promoting evidence based practice (EBP) and knowledge translation (KT) in physical therapy. This study reports long-term outcomes from a feasibility assessment of an educational program designed to promote the integration of research evidence into physical therapist practice. Methods: Eighteen physical therapists participated in the 6-month Physical therapist-driven Education for Actionable Knowledge translation (PEAK) program. The participant-driven active learning program consisted of four consecutive, interdependent components: 1) acquiring managerial leadership support and electronic resources in three clinical practices, 2) a 2-day learner-centered EBP training workshop, 3) 5 months of guided small group work synthesizing research evidence into a locally relevant list of, actionable, evidence-based clinical behaviors for therapists treating persons with musculoskeletal lumbar conditions—the Best Practices List, and 4) review and revision of the Best Practices List, culminating in participant agreement to implement the behaviors in practice. Therapists' EBP learning was assessed with standardized measures of EBP-related attitudes, self-efficacy, knowledge and skills, and self-reported behavior at baseline, immediately-post, and 6 months following conclusion of the program (long-term follow-up). Therapist adherence to the Best Practice List before and after the PEAK program was assessed through chart review. Results: Sixteen therapists completed the long-term follow-up assessment. EBP self-efficacy and self-reported behaviors increased from baseline to long-term follow-up ($p < 0.001$ and $p = 0.002$, respectively). EBP-related knowledge and skills showed a trend for improvement from baseline to long-term follow-up ($p = 0.05$) and a significant increase from immediate-post to long-term follow-up ($p = 0.02$). Positive attitudes at baseline were sustained throughout ($p = 0.208$). Eighty-nine charts were analyzed for therapist adherence to the Best Practices List. Six clinical behaviors had sufficient pre- and post-PEAK charts to justify analysis. Of those, one behavior showed a statistically significant increase in adherence, one had high pre-and post-PEAK

adherence, and four were change resistant, starting with low adherence and showing no meaningful improvement. Conclusions: This study supports the feasibility of the PEAK program to produce long-term improvements in physical therapists' EBP-related self-efficacy and self-reported behavior. EBP knowledge and skills showed improvement from post-intervention to long-term follow-up and a trend toward long-term improvements. However, chart review of therapists' adherence to the participant generated Best Practices List in day-to-day patient care indicates a need for additional support to facilitate behavior change. Future versions of the PEAK program and comparable multi-faceted EBP and KT educational programs should provide ongoing monitoring, feedback, and problem-solving to successfully promote behavior change for knowledge translation. Title: Interorganizational Networks in Physical Activity Promotion: A Systematic Review

Journal: International Journal of Environmental Research and Public Health

Volume: 18

Issue: 14

Date: Jul

Short Title: Interorganizational Networks in Physical Activity

Promotion: A Systematic Review

DOI: 10.3390/ijerph18147306

Article Number: 7306

Accession Number: WOS:000676834500001

Abstract: Public health challenges such as physical inactivity are multiplex and cannot be effectively addressed by single organizations or sectors. For this reason, public health policies have to involve various sectors and foster partnerships among organizations. Social network analysis (SNA) provides a methodological toolkit that enables the investigation of relationships between organizations to reveal information about the structure and cooperation within networks. This systematic review provides an overview of studies utilizing SNA to analyze the structure of networks that promote physical activity, including the structural set-up, types, and conditions of cooperation, the existence or absence of key actors, the characteristics of organizations working together, and potential barriers limiting collaboration. In total, eight eligible studies were identified. To evaluate the quality of these studies, a quality assessment tool for

SNA was created. Relevant aspects from each study were systematically outlined using a data extraction template developed for network studies. The studies reported low to moderate density scores with many ties not being realized. Organizations tend to work side by side than as real partners, whereas organizations of the same type are more strongly connected. Most of the studies identified governmental health organizations as key players in their networks. Network maturity influences network outcomes. Shared goals and geographic proximity are potential facilitators for network development. For future research, more sophisticated methods and longitudinal studies are required to describe how networks, with the aim of promoting physical activity, develop and change to identify predicting factors for an effective network structure.

Title: Ready, Set, Change! Development and usability testing of an online readiness for change decision support tool for healthcare organizations

Journal: BMC Medical Informatics and Decision Making

Volume: 16

Date: Feb

Short Title: Ready, Set, Change! Development and usability testing of an online readiness for change decision support tool for healthcare organizations

DOI: 10.1186/s12911-016-0262-y

Article Number: 24

Accession Number: WOS:000370693700001

Abstract: Background: To address challenges related to selecting a valid, reliable, and appropriate readiness assessment measure in practice, we developed an online decision support tool to aid frontline implementers in healthcare settings in this process. The focus of this paper is to describe a multi-step, end-user driven approach to developing this tool for use during the planning stages of implementation. Methods: A multi-phase, end-user driven approach was used to develop and test the usability of a readiness decision support tool. First, readiness assessment measures that are valid, reliable, and appropriate for healthcare settings were identified from a systematic review. Second, a mapping exercise was performed to categorize individual items of included measures according to key readiness constructs from an existing framework. Third, a modified Delphi process was used to collect stakeholder ratings of the included measures on domains of feasibility, relevance, and likelihood to recommend. Fourth, two versions of a decision support

tool prototype were developed and evaluated for usability. Results: Nine valid and reliable readiness assessment measures were included in the decision support tool. The mapping exercise revealed that of the nine measures, most measures (78 %) focused on assessing readiness for change at the organizational versus the individual level, and that four measures (44 %) represented all constructs of organizational readiness. During the modified Delphi process, stakeholders rated most measures as feasible and relevant for use in practice, and reported that they would be likely to recommend use of most measures. Using data from the mapping exercise and stakeholder panel, an algorithm was developed to link users to a measure based on characteristics of their organizational setting and their readiness for change assessment priorities. Usability testing yielded recommendations that were used to refine the Ready, Set, Change! decision support tool. Conclusions: Ready, Set, Change! decision support tool is an implementation support that is designed to facilitate the routine incorporation of a readiness assessment as an early step in implementation. Use of this tool in practice may offer time and resource-saving implications for implementation. Notes: Timmings, Caitlyn Khan, Sobia Moore, Julia E. Title: Feasibility, Usability, and Effectiveness of a Machine Learning-Based Physical Activity Chatbot: Quasi-Experimental Study

Journal: Jmir Mhealth and Uhealth

Volume: 9

Issue: 11

Date: Nov

Short Title: Feasibility, Usability, and Effectiveness of a Machine Learning-Based Physical Activity Chatbot: Quasi-Experimental Study

ISSN: 2291-5222

DOI: 10.2196/28577

Article Number: e28577

Accession Number: WOS:000726402500014

Abstract: Background: Behavioral eHealth and mobile health interventions have been moderately successful in increasing physical activity, although opportunities for further improvement remain to be discussed. Chatbots equipped with natural language processing can interact and engage with users and help continuously monitor physical activity by using data from wearable sensors and smartphones. However, a limited number of studies have evaluated the effectiveness of chatbot interventions on physical activity.

Objective: This study aims to investigate the feasibility, usability, and effectiveness of a machine learning-based physical activity chatbot. Methods: A quasi-experimental design without a control group was conducted with outcomes evaluated at baseline and 6 weeks. Participants wore a Fitbit Flex 1 (Fitbit LLC) and

connected to the chatbot via the Messenger app. The chatbot provided daily updates on the physical activity level for self-monitoring, sent out daily motivational messages in relation to goal achievement, and automatically adjusted the daily goals based on physical activity levels in the last 7 days. When requested by the participants, the chatbot also provided sources of information on the benefits of physical activity, sent general motivational messages, and checked participants' activity history (ie, the step counts/min that were achieved on any day). Information about usability and acceptability was self-reported. The main outcomes were daily step counts recorded by the Fitbit and self-reported physical activity. Results: Among 116 participants, 95 (81.9%) were female, 85 (73.3%) were in a relationship, 101 (87.1%) were White, and 82 (70.7%) were full-time workers. Their average age was 49.1 (SD 9.3) years with an average BMI of 32.5 (SD 8.0) kg/m². Most experienced technical issues were due to an unexpected change in Facebook policy (93/113, 82.3%). Most of the participants scored the usability of the chatbot (101/113, 89.4%) and the Fitbit (99/113, 87.6%) as at least "OK." About one-third (40/113, 35.4%) would continue to use the chatbot in the future, and 53.1% (60/113) agreed that the chatbot helped them become more active. On average, 6.7 (SD 7.0) messages/week were sent to the chatbot and 5.1 (SD 7.4) min/day were spent using the chatbot. At follow-up, participants recorded more steps (increase of 627, 95% CI 219–1035 steps/day) and total physical activity (increase of 154.2 min/week; 3.58 times higher at follow-up; 95% CI 2.28–5.63). Participants were also more likely to meet the physical activity guidelines (odds ratio 6.37, 95% CI 3.31–12.27) at follow-up. Conclusions: The machine learning-based physical activity chatbot was able to significantly increase participants' physical activity and was moderately accepted by the participants. However, the Facebook policy change undermined the chatbot functionality and indicated the need to use independent platforms for chatbot deployment to ensure successful delivery of this type of intervention.

Journal: International Journal of Behavioral Nutrition and Physical Activity

Volume: 20

Issue: 1

Date: Apr

Short Title: Using photovoice to explore young women's experiences of behaviour change techniques in physical activity mobile apps

DOI: 10.1186/s12966-023-01447-9

Article Number: 43

Accession Number: WOS:000968206200001

Abstract: Background Research shows that inactive young women are attracted to using mobile phone applications (apps) to increase physical activity. Apps can promote physical activity by delivering a range of behaviour change techniques to influence determinants of user behaviour. Previous qualitative research has examined user experiences with techniques in physical activity apps, however there is little research specifically among young women. This study aimed to explore young women's experiences using commercial physical activity apps to change their behaviour. Methods Young women were recruited online to use a randomly assigned app for two weeks to achieve a personal goal. Using photovoice, a qualitative participatory research method, participants generated insights about their experiences through photographs and semi-structured interviews. Thematic analysis was conducted on photograph and interview data. Results Thirty-two female participants, aged 18-24 years, completed the study. Behaviour change techniques tended to cluster around four key themes: logging and monitoring physical activity; reminders and prompts; workout videos and written instructions; and social features. Social support also strongly influenced participants' experiences. Conclusions Results suggest that behaviour change techniques influenced physical activity in line with social cognitive models, and these models are useful to understand how apps can target user behaviour for young women. The findings identified factors important for young women that seemed to moderate their experiences, such as social norms about women's appearance, which should be further explored within the context of behaviour change models and app design.

Title: Impact of continuing medical education in cancer diagnosis on GP knowledge, attitude and readiness to investigate - a before-after study

Journal: BMC Family Practice

Volume: 17

Date: Jul

Short Title: Impact of continuing medical education in cancer diagnosis on GP knowledge, attitude and readiness to investigate - a before-after study

DOI: 10.1186/s12875-016-0496-x

Article Number: 95

Accession Number: WOS:000380281900002

Abstract: Background: Continuing medical education (CME) in earlier cancer diagnosis was launched in Denmark in 2012 as part of the

Danish National Cancer Plan. The CME programme was introduced to improve the recognition among general practitioners (GPs) of symptoms suggestive of cancer and improve the selection of patients requiring urgent investigation. This study aims to explore the effect of CME on GP knowledge about cancer diagnosis, attitude towards own role in cancer detection, self-assessed readiness to investigate and cancer risk assessment of urgently referred patients. Methods: We conducted a before-after study in the Central Denmark Region including 831 GPs assigned to one of eight geographical clusters. All GPs were invited to participate in the CME at three-week intervals between clusters. A questionnaire focusing on knowledge, attitude and clinical vignettes was sent to each GP one month before and seven months after the CME. The GPs were also asked to assess the risk of cancer in patients urgently referred to a fast-track cancer pathway during an eight-month period. CME-participating GPs were compared with reference (non participating) GPs by analysing before-after differences. Results: One quarter of all GPs participated in the CME. 202 GPs (24.3 %) completed both the baseline and the follow-up questionnaires. 532 GPs (64.0 %) assessed the risk of cancer before the CME and 524 GPs (63.1 %) assessed the risk of cancer after the CME in urgently referred consecutive patients. Compared to the reference group, CME-participating GPs statistically significantly improved their understanding of a rational probability of diagnosing cancer among patients urgently referred for suspected cancer, increased their knowledge of cancer likelihood in a 50 year old referred patient and lowered the assessed risk of cancer in urgently referred patients. Conclusions: The standardised CME lowered the GP-assessed cancer risk of urgently referred patients, whereas the effect on knowledge about cancer diagnosis and attitude towards own role in cancer detection was limited. No effect was found on the GPs' readiness to investigate. CME may be effective for optimising the interpretation of cancer symptoms and thereby improve the selection of patients for urgent cancer referral.

Article Number: 159

Accession Number: WOS:000347431100001

Abstract: Background: Denmark has inferior cancer survival rates compared with many European countries. The main reason for this is suggested to be late diagnosis at advanced cancer stages. Cancer diagnostic work-up begins in general practice in 85% of all cancer cases. Thus, general practitioners (GPs) play a key role in the diagnostic process. The latest Danish Cancer Plan included continuing medical education (CME) on early cancer diagnosis in general practice to improve early diagnosis. This dual aims of this protocol are, first, to describe the conceptualisation, operationalisation and implementation of the CME and, second, to describe the study design and outcomes chosen to evaluate the effects of the CME. **Methods/Design:** The intervention is a CME in early cancer diagnosis targeting individual GPs. It was developed by a step-wise approach. Barriers for early cancer diagnosis at GP level were identified systematically and analysed using the behaviour system involving capability, opportunity and motivation described by Michie et al. The study will be designed as a geographical cluster randomised stepped wedge study. The study population counts 836 GPs from 417 general practices in the Central Denmark Region, geographically divided into eight clusters. GPs from each cluster will be invited to a CME meeting at a certain date three weeks apart. The primary outcomes will be primary care interval and GP referral rate on cancer suspicion. Data will be obtained from national registries, GP-completed forms on patients referred to cancer fast-track pathways and GP-completed online questionnaires before and after the intervention. **Discussion:** To our knowledge, this will be the first study to measure the effect of a theory-based CME in early cancer diagnosis at three levels: GP knowledge and attitude, GP activity and patient outcomes. The achieved knowledge will contribute to the understanding of whether and how general practice's ability to perform cancer diagnosis may be improved.

DOI: 10.1007/s10803-022-05766-x

Accession Number: WOS:000861184800002

Abstract: For autistic young adults, deciding whether to disclose their autism at work is complex. Minimal research explores what they need to support disclosure and what influences decisions. To understand disclosure needs and influencers, we explored (i) disclosure decision-making experiences and (ii) perceptions of the disclosure process among autistic young adults. We conducted focus groups using the Capability, Opportunity, Motivation, Behaviour Model and Theoretical Domains Framework (TDF). We analyzed data from 23 participants and mapped onto the TDF to develop five themes: (1) workplace environment, (2) perceptions of disclosure outcomes, (3) personal factors and identity, (4) disclosure-related ambitions and determination, and (5) know-hows of disclosure. Future work should prioritize developing disclosure decision-making supports and investigate employer roles in fostering inclusive workplaces.

Short Title: Development of SmokeFree Baby: a smoking cessation smartphone app for pregnant smokers

ISSN: 1869-6716

DOI: 10.1007/s13142-016-0438-0

Accession Number: WOS:000393296000005

Abstract: Pregnant smokers may benefit from digital smoking cessation interventions, but few have been designed for this population. The aim was to transparently report the development of a smartphone app designed to aid smoking cessation during pregnancy. The development of a smartphone app ('SmokeFree Baby') to help pregnant women stop smoking was guided by frameworks for developing complex interventions, including the Medical Research Council (MRC), Multiphase Optimization Strategy (MOST) and Behaviour Change Wheel

(BCW). Two integrative behaviour change theories provided the theoretical base. Evidence from the scientific literature and behaviour change techniques (BCTs) from the BCT Taxonomy v1 informed the intervention content. The app was developed around five core modules, each with a distinct intervention target (identity change, stress management, health information, promoting use of face-to-face support and behavioural substitution) and available in a 'control' or 'full' version. SmokeFree Baby has been developed as part of a multiphase intervention optimization to identify the optimum combination of intervention components to include in smartphone apps to help pregnant smokers stop smoking.

Title: Determinants of orthopedic physicians' self-reported compliance with surgical site infection prevention: results of the WACH-trial's pilot survey on COM-B factors in a German university hospital

Journal: Antimicrobial Resistance and Infection Control

Volume: 10

Issue: 1

Date: Apr

Short Title: Determinants of orthopedic physicians' self-reported compliance with surgical site infection prevention: results of the WACH-trial's pilot survey on COM-B factors in a German university hospital

ISSN: 2047-2994

DOI: 10.1186/s13756-021-00932-9

Article Number: 67

Accession Number: WOS:000637760700001

Abstract: Background: Prevention of surgical site infections (SSIs), which due to their long-term consequences are especially critical in orthopedic surgery, entails compliance with over 20 individual measures. However, little is known about the psychosocial determinants of such compliance among orthopedic physicians, which impedes efforts to tailor implementation interventions to improve compliance. Thus, for this professional group, this pilot survey examined psychosocial determinants of self-reported compliance, which have been theoretically derived from the COM-B (Capability, Opportunity, Motivation and Behavior) model. Methods: In 2019, a cross-sectional survey was conducted in a tertiary care university orthopedic clinic in Hannover, Germany, as a pilot for the WACH-

trial ("Wundinfektionen und Antibiotikaverbrauch in der Chirurgie" [Wound Infections and Antibiotics Consumption in Surgery]). Fifty-two physicians participated (38 surgeons, 14 anesthesiologists; response rate: 73.2%). The questionnaire assessed self-reported compliance with 26 SSI preventive measures, and its psychosocial determinants (COM-B). Statistical analyses included descriptive, correlational, and linear multiple regression modeling. Results: Self-reported compliance rates for individual measures varied from 53.8 to 100%, with overall compliance (defined for every participant as the mean of his or her self-reported rates for each individual measure) averaging at 88.9% (surgeons: 90%, anesthesiologists: 85.9%; $p = 0.097$). Of the components identified in factor analyses of the COM-B items, planning, i.e., self-formulated conditional plans to comply, was the least pronounced (mean = 4.3 on the 7-point Likert scale), while motivation was reported to be the strongest (mean = 6.3). Bi-variately, the overall compliance index co-varied with all four COM-B-components, i.e., capabilities ($r = 0.512$, $p < 0.001$), opportunities ($r = 0.421$, $p = 0.002$), planning ($r = 0.378$, $p = 0.007$), and motivation ($r = 0.272$, $p = 0.051$). After mutual adjustment and adjustment for type of physician and the number of measures respondents felt responsible for, the final backward regression model included capabilities (beta = 0.35, $p = 0.015$) and planning (beta = 0.29, $p = 0.041$) as COM-B-correlates. Conclusion: Though based on a small sample of orthopedic physicians in a single hospital (albeit in conjunction with a high survey response rate), this study found initial evidence for positive correlations between capabilities and planning skills with self-reported SSI preventive compliance in German orthopedic physicians. Analyses of the WACH-trial will further address the role of these factors in promoting SSI preventive compliance in orthopedic surgery.

Short Title: Factors influencing caring behaviour among registered

nurses during the COVID-19 pandemic in China: A qualitative study using the COM-B framework

ISSN: 0966-0429

DOI: 10.1111/jonm.13855

Accession Number: WOS:000868570100001

Abstract: Aim The aim of this work is to explore the influencing factors of nurses' caring behaviour during the COVID-19 pandemic based on the Capability, Opportunity, Motivation as determinants of Behaviour (COM-B) theoretical framework. Background Nurse caring behaviour is vital to reduce and speed up the healing process of COVID-19 patients. It is important to understand the factors that influence caring behaviour among nurses during the COVID-19 pandemic. Research suggests that when it comes to understanding behaviour, using a theoretical framework is likely to be most effective, and the COM-B framework is a recommended approach. Methods Semistructured interviews with 42 nurses working in 11 Chinese cities were conducted, and their verbatim statements were transcribed and analysed using thematic analysis. The results were mapped to COM-B framework. Results Ten key themes emerged: Capability (professional knowledge and skills, emotional intelligence, cross-cultural care competence); opportunity (resources, organizational culture, social culture); motivation (past experience, character, role, beliefs). Conclusions Ten factors were found to influence nurses' caring behaviour. This study added two new influencing factors, social culture and past experiences, that further contributed to the understanding of nurses' care behaviours. Implications for Nursing Management Nurses' caring behaviour is influenced not only by themselves but also by institutions and society, so interventions aiming to improve their caring behaviour should consider these elements. The negative impact of the pandemic on capability factors that influence nurses' caring behaviour should be counteracted as soon as possible.

Title: Rheumatology Clinic Staff Needs Barriers and Strategies to Addressing High Blood Pressure and Smoking Risk

Journal: Jcr-Journal of Clinical Rheumatology

Volume: 28

Issue: 7

Pages: 354-361

Date: Oct

Short Title: Rheumatology Clinic Staff Needs Barriers and Strategies to Addressing High Blood Pressure and Smoking Risk

ISSN: 1076-1608

DOI: 10.1097/rhu.0000000000001868

Accession Number: WOS:000862006800005

Abstract: Objective Patients with rheumatologic conditions are at elevated risk of cardiovascular disease (CVD) due to inflammatory and traditional risk factors, such as high blood pressure (BP) and smoking. However, rheumatology clinics rarely address traditional risk factors, although they are routinely assessed and modifiable in primary care. The present study sought to (1) characterize rheumatology clinic staff's work process for addressing high BP and smoking and (2) identify barriers and strategies for effective management of these risk factors. **Methods** We conducted 7 focus groups with medical assistants, nurses, and scheduling staff from 4 adult rheumatology clinics across 2 health systems (BP focus groups, n = 23; smoking, n = 20). Transcripts were analyzed using thematic analysis to elucidate barriers and strategies. **Results** We found 3 clinic work processes for the management of high BP and smoking risk: (1) risk identification, (2) follow-up within the clinic, and (3) follow-up with primary care and community resources. Within these processes, we identified barriers and strategies grouped into themes: (1) time, (2) clinic workflows, (3) technology and resources, (4) staff's attitudes and knowledge, and (5) staff's perceptions of patients. The most pervasive barriers were (1) no structured system for follow-up and (2) staff confidence and skill in initiating conversations about health-related behavior change. **Conclusions** Our study identified generalizable gaps in rheumatology staff's work processes and competencies for addressing high BP and smoking in patients. Future efforts to support staff needs should target (1) systems for follow-up within and outside the clinic and (2) conversation support tools.

Short Title: Characteristics of Smartphone Applications for Nutrition Improvement in Community Settings: A Scoping Review

ISSN: 2161-8313

DOI: 10.3945/an.116.013748

Accession Number: WOS:000398109500009

Abstract: Smartphone applications are increasingly being used to support nutrition improvement in community settings. However, there is a scarcity of practical literature to support researchers and

practitioners in choosing or developing health applications. This work maps the features, key content, theoretical approaches, and methods of consumer testing of applications intended for nutrition improvement in community settings. A systematic, scoping review methodology was used to map published, peer-reviewed literature reporting on applications with a specific nutrition-improvement focus intended for use in the community setting. After screening, articles were grouped into 4 categories: dietary selfmonitoring trials, nutrition improvement trials, application description articles, and qualitative application development studies. For mapping, studies were also grouped into categories based on the target population and aim of the application or program. Of the 4818 titles identified from the database search, 64 articles were included. The broad categories of features found to be included in applications generally corresponded to different behavior change support strategies common to many classic behavioral change models. Key content of applications generally focused on food composition, with tailored feedback most commonly used to deliver educational content. Consumer testing before application deployment was reported in just over half of the studies. Collaboration between practitioners and application developers promotes an appropriate balance of evidence-based content and functionality. This work provides a unique resource for program development teams and practitioners seeking to use an application for nutrition improvement in community settings.

Abstract: A gap exists between best evidence and actual clinical care provided to patients. The advent of evidence-based practice was meant to address this gap by providing practitioners with a method to search, evaluate and incorporate evidence into practice. However, the gap continues to exist. The health research fields of knowledge translation and implementation science have evolved over the last few decades to assist practitioners in embedding research findings

and best evidence into routine practice. Knowledge translation seeks to improve public health outcomes by facilitating the movement of best evidence from the bench to clinical practice. Implementation science is the study of methods to integrate research findings and evidence-based practice into routine practice. This literature review aims to revisit the concepts of evidence-based practice and to introduce knowledge translation and implementation science by exploring their roles and influences in the delivery of appropriate glaucoma care by optometrists.

DOI: 10.1186/s13012-022-01196-6

Article Number: 23

Accession Number: WOS:000767925600001

Abstract: Background: There is limited research on prevention of mental ill-health of school personnel and the systematic management of school work environments. The aim of this study was to assess the effectiveness of implementing the guideline recommendations for the prevention of mental ill-health in schools, in particular, whether there was a difference in adherence to guideline recommendations between a multifaceted (group 1) and single implementation strategy (group 2) from baseline to 6 and to 12 months. Method: We conducted a cluster-randomized controlled trial with a 6- and 12-month follow-up. Data was collected from nearly 700 participants in 19 Swedish schools. Participants were school personnel working under the management of a school principal. The single implementation strategy consisted of one educational meeting, while the multifaceted implementation strategy comprised an educational meeting, an ongoing training in the form of workshops, implementation teams and Plan-Do-Study-Act cycles. Adherence was measured with a self-reported questionnaire. Generalized Linear Mixed Models were used to assess

the difference between groups in adherence to the guideline between baseline, 6-, and 12-months follow-up. Results: There were no statistically significant differences between the groups in improvements in adherence to the guideline between baseline, 6-, and 12-months follow-up. However, among those schools that did not undergo any organizational changes during the 12 months of the study significant differences between groups were observed at 12 months for one of the indicators. Conclusions: The multifaceted strategy was no more effective than the single strategy in improving guideline adherence. There are some limitations to the study, such as the measurement of the implementation outcome measure of adherence. The outcome measure was developed in a systematic manner by the research team, assessing specific target behaviors relevant to the guideline recommendations, however not psychometrically tested, which warrants a careful interpretation of the results. Short Title: Behaviour change interventions for the control and elimination of schistosomiasis: A systematic review of evidence from low- and middle-income countries

ISSN: 1935-2735

DOI: 10.1371/journal.pntd.0011315

Article Number: e0011315

Accession Number: WOS:000984078500002

Abstract: Author summary Modifying people's risk practices through behaviour change (BC) interventions can strengthen schistosomiasis control. Disease transmission can be interrupted by controlling peoples' exposure to infected water, open defaecation practices, and by fostering treatment acceptance. We reviewed peer-reviewed publications released before June 2021 to assess the effectiveness of BC projects in decreasing risk practices and disease prevalence. 32 publications reporting on 31 projects based in Low- and Middle-Income countries were fully examined. Projects used four approaches: health education (HEIs), social-environmental (SEIs), physical-environmental (PEIs), and incentives-centred interventions (ICIs). Available data could not assert which approach was most effective in reducing risk behaviour. Structural barriers limited HEIs' effects, whilst community social and material conditions affected those of

SEIs. Both demanded comprehensive infrastructure investments. The cost-effectiveness of ICIs, in turn, remain unclear. Limited evidence of independent epidemiological impacts from BC was found. Indicative evidence, however, shows that BC projects could sustain gains attained through treatment activities. Overall, investment in integrated interventions appear needed to address exposure and transmission behaviour, whilst a context-driven strategic use of HEIs or SEIs appears useful to prompt treatment uptake. Despite BC's potential, treatment activities appear essential for epidemiological effects. BackgroundFor the last two decades, schistosomiasis control efforts have focussed on preventive treatment. The disease, however, still affects over 200 million people worldwide. Behaviour change (BC) interventions can strengthen control by interrupting transmission through modifying exposure behaviour (water contact) or transmission practices (open urination/defaecation); or through fostering treatment seeking or acceptance. This review examines these interventions to assess their effectiveness in modifying risk practices and affecting epidemiological trends. Methodology/ Principal findingsA systematic multi-database literature search (PROSPERO CRD42021252368) was conducted for peer-reviewed publications released at any time before June 2021 assessing BC interventions for schistosomiasis control in low- and middle-income countries. 2,593 unique abstracts were identified, 66 were assigned to full text review, and 32 met all inclusion criteria. A typology of intervention models was outlined according to their use of behaviour change techniques and overarching rationale: health education (HEIs), social-environmental (SEIs), physical-environmental (PEIs), and incentives-centred interventions (ICIs). Available evidence does not allow to identify which BC approach is most effective in controlling risk behaviour to prevent schistosomiasis transmission. HEIs' impacts were observed to be limited by structural considerations, like infrastructure underdevelopment, economic obligations, socio-cultural traditions, and the natural environment. SEIs may address those challenges through participatory planning and implementation activities, which enable social structures, like governance and norms, to support BC. Their effects, however, appear context-sensitive. The importance of infrastructure investments was highlighted by intervention models. To adequately support BC, however, they require users' inputs and complementary services. Whilst ICIs reported positive impacts on treatment uptake, there are cost-effectiveness and sustainability concerns. Evaluation studies yielded limited evidence of independent epidemiological impacts from BC, due to limited use of suitable indicators and comparators. There was indicative evidence, however, that BC projects could sustain gains through treatment campaigns. Conclusions/SignificanceThere is a need for integrated interventions combining information provision, community-based planning, and infrastructure investments to support BC for schistosomiasis control. Programmes should carefully assess local conditions before implementation and consider that long-term support is likely needed. Available evidence indicates that BC interventions may contribute towards schistosomiasis control when accompanied by treatment activities. Further methodologically robust evidence is needed to ascertain the direct epidemiological benefits of BC.

Title: Self-management, self-care, and self-help in adolescents with emotional problems: a scoping review

Journal: European Child & Adolescent Psychiatry

Date: 2023 Jan

Short Title: Self-management, self-care, and self-help in adolescents with emotional problems: a scoping review

ISSN: 1018-8827

DOI: 10.1007/s00787-022-02134-z

Accession Number: WOS:000914037200001

Abstract: This study aimed to review the existing published and grey literature describing the concepts of self-management, self-care, and self-help, and to capture strategies or techniques related to these concepts, for adolescents with emotional problems. Emotional problems are rising amongst adolescents, yet timely access to specialist mental health treatment is limited to those with greater severity of mental health difficulties. Self-management, self-care, and self-help strategies may be used by adolescents with emotional problems both in terms of those waiting for treatment and to prevent relapse. Given the overlap in existing definitions and the lack of clarity around these concepts in an adolescent mental health context, a scoping review of the literature is warranted to provide clarity. Eligible studies were those involving adolescents aged 10 to 19 years with symptoms of emotional problems. Studies referenced self-management, self-care, or self-help, not involving a professional, in this population. Quantitative, qualitative, economic, and mixed methods studies, as well as systematic, scoping, and literature reviews, from 2000 onwards and in the English language, were eligible for inclusion. A systematic search was conducted of both published and grey literature. Databases searched included PsycINFO, Medline, Embase, Web of Science, and CINAHL Plus. Mednar was also searched for unpublished studies and grey literature. Tables of themes, terms, and associated strategies are presented alongside a thematic analysis of the results. 62 articles were included. These were 20 quantitative studies, 14 systematic reviews, 10 qualitative studies, five review papers, four book chapters, four mixed methods studies, two dissertations, two meta-analyses and one scoping review and systematic review. Most of the included articles referenced self-help (n = 51), followed by self-management (n = 17) and self-care (n = 6). A total of 12 themes were identified from a reflexive thematic analysis of descriptions (and associated strategies) of self-management, self-help, or self-care in included texts. This scoping review provides clarity on the similarities and differences between how these concepts are discussed, and the strategies which are associated with each of these concepts in the relevant literature. Implications for policy

and intervention development for adolescents' self-management, self-help, and self-care of their mental health are discussed. There is considerable overlap in both the ways in which these concepts are described, and the strategies or approaches proposed in relation to them, supporting previous research suggesting these strategies should be grouped under a single term, such as "self or community approaches." More research is needed for self-management, self-help, and self-care amongst marginalized groups as these adolescents may have the highest unmet need for mental health support.

Short Title: Can a community of practice enhance a palliative approach for people drawing close to death with dementia?

ISSN: 1357-6321

DOI: 10.12968/ijpn.2015.21.11.548

Accession Number: WOS:000389315500006

Abstract: This action research study was conducted to trial a strategy intended to support a consistent, high-quality, palliative approach for people with dementia drawing close to death—the implementation of a community of practice. Professionals from community/residential care and hospitals formed this community of practice, which took on the role of an action research group. The group was supported to identify and address practice problems. Four action plans were implemented; outcomes from two are reported. When actioning the plan 'providing education and information for the staff', the staff's ratings of sessions and resources were positive but impacts upon knowledge, views, or confidence were small. When actioning 'supporting families', families providing care in non-hospital settings received information about severe dementia from suitably prepared staff, plus contact details to access support. Family feedback was primarily positive. Reference to additional practice change frameworks and inclusion of specialist palliative care professionals are recommendations for future initiatives; also focusing on targeted, achievable goals over longer timeframes.

DOI: 10.1080/14739879.2023.2176264

Accession Number: WOS:000941874700001

Abstract: Purpose To evaluate Australian early-career general practitioners' perceptions of the utility of their prior vocational training in preparing them for independent specialist practice. We hypothesised that in-practice teaching would be perceived as more useful than formal education delivered by Regional Training Organisations (RTOs). Methods and materials A cross-sectional questionnaire-based study of early-career general practitioners (RTO 'alumni'). The outcomes were Likert scale ratings of alumni's perceived impact of RTO education versus in-practice training on their preparedness for independent practice. Ratings were compared using Wilcoxon signed-rank tests. Multivariable linear regression was used to establish alumni characteristics associated with perceptions of utility of in-practice versus RTO-delivered education. Results Three hundred and fifty-four alumni responded (response rate 28%). In-practice training was rated statistically significantly higher than RTO education for minor procedural skills, teaching skills, professional responsibilities, tolerating clinical uncertainty, and preparing for managing child and adolescent health, aged care, chronic disease, multi-morbidity and mental health. RTO education rated higher than in-practice training for practising evidence-based medicine and Aboriginal and Torres Strait Islander health. For a number of further areas, there was no statistically significant difference in alumni ratings of utility. Conclusions In-practice or RTO-led teaching was perceived as more useful for some components of independent practice, whilst for others there was no significant difference. The findings support recognition of the individual educational components of a blended education/training structure.

Short Title: Sustaining youth physical activity in times of
challenge and change: lessons from COVID-19

ISSN: 0957-4824

DOI: 10.1093/heapro/daad038

Article Number: daad038

Accession Number: WOS:000981149600001

Abstract: Physical activity (PA) is recognized as essential for positive physical and mental well-being in young people. However, participation in PA is known to decline as adolescents emerge into adulthood under the influence of complex social and structural factors. Globally, COVID-19 restrictions resulted in changes to PA and PA participation levels in youth populations, providing a unique opportunity for gaining insight into PA barriers and enablers in circumstances of challenge, limitation and change. This article details young people's self-reported PA behaviours during the 4-week 2020 COVID-19 lockdown in New Zealand. Taking a strengths-based view and drawing on the COM-B (capabilities, opportunity and motivation behaviour) model for behaviour change, the study explores factors enabling young people to sustain or increase PA during lockdown. Findings are drawn from qualitative-dominant mixed-methods analyses of responses to an online questionnaire: New Zealand Youth Voices Matter (16-24 years; N = 2014). Key insights included the importance of habit and routine, time and flexibility, social connections, incidental exercise and awareness of links between PA and well-being. Of note were the positive attitudes, creativity and resiliency demonstrated as young people substituted or invented alternatives to their usual PA. PA needs to change to adapt to new circumstances over the life course, and youth understanding and knowledge of modifiable factors may provide support for this. Thus these findings have implications for sustaining PA during late

adolescence and emerging adulthood, a life phase that can be associated with significant challenge and change.

Title: Pilot trial of the online implementation intervention Aphasia

Nexus: Connecting Evidence to Practice

Journal: International Journal of Speech-Language Pathology

Date: 2022 Dec

Short Title: Pilot trial of the online implementation intervention

Aphasia Nexus: Connecting Evidence to Practice

ISSN: 1754-9507

DOI: 10.1080/17549507.2022.2153918

Accession Number: WOS:000901901100001

Abstract: Purpose Aphasia Nexus: Connecting Evidence to Practice is a theoretically-based online implementation intervention designed to overcome the barriers related to the implementation of intensive and comprehensive aphasia services. The objective was to establish the feasibility of incorporating Aphasia Nexus within routine clinical practice through an evaluation of: (1) its potential to positively influence the intensity and/or comprehensiveness of aphasia services; (2) the ability of selected outcome measures to capture changes to factors influencing implementation; and (3) the acceptability of the website to on-site speech-language pathologists (SLPs). Method A single arm pre-post pilot trial was conducted within an Australian health service. The design collected qualitative and quantitative pre-post data in the form of therapy logs, behaviour change questionnaires, and a post-intervention focus group. Data were collected one week prior to, and one week following, a 12 week implementation period where participating SLPs (n = 5) were provided access to the Aphasia Nexus website. Result Quantitative data revealed improvements in the median time per patient with aphasia from 65 to 115 minutes per week (intensity/dose), an additional 50 minutes per week. SLPs trialled at least one new therapy approach (Attentive Reading and Constrained Summarisation) and service delivery model (group therapy) representing an increase in the comprehensiveness of their services to patients. SLPs perceived a reduction in the barriers associated with the promotion of new aphasia services. Qualitative analysis of focus group discussion revealed that participants considered Aphasia Nexus in the overarching theme of practice efficiency (obtaining the best outcome from the least amount of effort) and the sub-themes of accessible therapy resources

and the prioritisation of time. Conclusion Overall, Aphasia Nexus was considered a useful clinical tool with the potential to positively influence clinical aphasia practice. These results will inform further implementation intervention refinements and will inform the methodology of future research.

Abstract: Purpose To describe the process and outcome of a user and theory informed online intervention for speech pathologists targeting the implementation of intensive and comprehensive aphasia services. Methods The design process followed the eight steps outlined by the Behaviour Change Wheel and incorporated the principles of Integrated Knowledge Translation (IKT). Eight speech pathology researchers and clinicians from four countries (Australia, Canada, the United Kingdom and Ireland) contributed to three focus groups via videoconference. Results The online platform, Aphasia Nexus: Connecting Evidence to Practice, provides resources, guidance and support for speech pathologists seeking to improve the intensity and comprehensiveness of their aphasia service. A collaborative and iterative design process facilitated the creation of an intervention envisioned by participants. Conclusions The website contains both interactive elements and resource links which have been arranged under the three headings of resources, action and support. The inclusion of multi-national researchers and clinicians benefitted a design process to make implementation more likely.

DOI: 10.1111/1460-6984.12796

Accession Number: WOS:000888482300001

Abstract: BackgroundOnline knowledge translation (KT) approaches are becoming increasingly prevalent within healthcare due to their accessibility and facilitation of international support networks. Online platforms enable timely and far-reaching dissemination of current evidence and best-practice recommendations. Although there is potential to improve the uptake of rehabilitation guidelines, it is essential to consider the acceptability of online approaches to healthcare professionals to ensure their successful integration within everyday clinical settings. AimsTo establish the prospective acceptability of a theoretically informed online intervention for speech pathologists, Aphasia Nexus: Connecting Evidence to Practice, that aims to facilitate the implementation of aphasia best practice. Methods & ProceduresA mixed-methods multinational electronic survey based on the Theoretical Framework of Acceptability (TFA) completed by aphasia researchers and clinicians. Outcomes & ResultsA total of 43 participants completed the survey with 91% (n = 39) indicating that they would use Aphasia Nexus. Understanding the intervention and how it works (intervention coherence as per the TFA) was the key factor influencing the likelihood of integration within everyday clinical practice. Participants identified potential areas where the intervention could influence service change and also recommended further design and content changes to improve the intervention. Conclusions & ImplicationsAphasia Nexus is an acceptable platform for further feasibility testing in the form of a pilot trial within an Australian-based health service. The study progresses the theory of TFA as it was a valuable framework facilitating the identification of prominent factors influencing acceptability. The study also informs further intervention refinements in preparation for the next stage of research. WHAT THIS PAPER ADDSWhat is already known on the subjectOnline strategies have the potential to enhance

KT and promote the uptake of rehabilitation guidelines. An online intervention, however, can only be effective if implemented well. For this reason, it is essential to establish the acceptability of online interventions to the intended recipients and therefore increase the likelihood of successful implementation. What this paper adds to existing knowledgeThis study used a theoretically based framework to establish the acceptability of an online implementation intervention, Aphasia Nexus, to multinational aphasia clinicians and researchers. It demonstrated the value in identifying the prominent factors influencing acceptability to inform further intervention refinements and warrant continuing research. What are the potential or actual clinical implications of this work?Speech pathologists should use online platforms to drive the implementation of best practice on an international scale. It is important for clinicians to have an in-depth understanding of online interventions and how they work to enhance their successful uptake into routine clinical practice. Aphasia Nexus is an acceptable online platform for implementing best practice in aphasia.

Short Title: The Rapid Adaptation and Optimisation of a Digital Behaviour-Change Intervention to Reduce the Spread of COVID-19 in Schools

DOI: 10.3390/ijerph19116731

Article Number: 6731

Accession Number: WOS:000809039400001

Abstract: The rapid transmission of COVID-19 in school communities has been a major concern. To ensure that mitigation systems were in place and support was available, a digital intervention to encourage and facilitate infection-control behaviours was rapidly adapted and optimised for implementation as a whole-school intervention. Using the person-based approach, 'Germ Defence' was iteratively adapted, guided by relevant literature, co-production with Patient and Public Involvement representatives, and think-aloud interviews with forty-five school students, staff, and parents. Suggested infection-

control behaviours deemed feasible and acceptable by the majority of participants included handwashing/hand-sanitising and wearing a face covering in certain contexts, such as crowded public spaces. Promoting a sense of collective responsibility was reported to increase motivation for the adoption of these behaviours. However, acceptability and willingness to implement recommended behaviours seemed to be influenced by participants' perceptions of risk. Barriers to the implementation of recommended behaviours in school and at home primarily related to childcare needs and physical space. We conclude that it was possible to rapidly adapt Germ Defence to provide an acceptable resource to help mitigate against infection transmission within and from school settings. Adapted content was considered acceptable, persuasive, and accessible.

Title: Protocol for a cluster-randomised trial to determine the effects of advocacy actions on the salt content of processed foods

Journal: BMC Public Health

Volume: 16

Date: Jan

Short Title: Protocol for a cluster-randomised trial to determine the effects of advocacy actions on the salt content of processed foods

DOI: 10.1186/s12889-016-2743-4

Article Number: 75

Accession Number: WOS:000368585000001

Abstract: Background: Corporate decisions affecting the composition of processed foods are a potent factor shaping the nutritional quality of the food supply. The addition of large quantities of salt to foods is incompatible with Australian Dietary Guidelines and the reformulation of processed foods to have less salt is a focus of non-governmental organisations (NGOs). There is evidence that advocacy can influence corporate behaviour but there are few data to define the effects of NGOs working in the food space. The aim of this study is to quantify the effects of advocacy delivered by a local NGO on the salt content of food products produced or marketed by companies in Australia. Methods/Design: This is a cluster-randomised controlled trial that will be done in Australia from 2013 to 2015 which includes 45 food companies. The 23 companies in the control group will receive no specific intervention whilst the 22 companies in the intervention group will receive an advocacy program based upon an established theory of change model. The primary outcome will be the mean change in sodium content (mg/100 g) of

processed foods produced or marketed by intervention compared to control companies assessed at 24 months. Interim outcomes (statements of support, published nutrition policies, level of engagement, knowledge and use of technology to reduce salt, salt reduction plans, and support for national initiatives) will also be assessed and a qualitative evaluation will provide more detailed insight. Discussion: This novel study will provide robust randomised evidence about the effects of advocacy on food company behaviour and the quality of the processed food supply. A finding of improved food company behaviour will highlight the potential for greater investment in advocacy whilst the opposite result will reinforce the importance of government-led initiatives for the improvement of the food supply.

Article Number: 105933

Accession Number: WOS:000821760900014

Abstract: Facilitating the adoption of more sustainable food behaviors is key in order to reduce pressure on nature and improve public health. Food businesses that interact directly with consumers are well placed to enable a positive change in food behaviors. The present study evaluates the effectiveness of a 9-week multi-component behavioral intervention implemented by a large UK food retailer. Three food behaviors were explored: meat consumption, food waste and scratch cooking. Evaluation methods comprise of surveys issued pre-intervention, at intervention end and at delayed follow-up (3 months after intervention end), and focus groups where participants were divided according to life-stage (pre-family, family, retired). Results show the intervention mitigated individual barriers to change and had a positive impact on awareness, intention and behavior which lasted beyond intervention-end. Participants reported reducing their meat consumption and food waste and cooking more frequently from scratch. Findings indicate that the online

community, 'ask the expert' videos and product samples were the most impactful intervention components, while recipes and cook-alongs were less effective. This study provides an effective and feasible intervention which could be implemented and scaled by food companies. While behavioral interventions offer a positive opportunity for companies to drive consumer behavior change, structural and cultural changes to the food environment will be needed to facilitate long-term change at scale.

DOI: 10.1111/mcn.12559

Article Number: e12559

Accession Number: WOS:000418336700053

Abstract: The World Health Organisation guidance recommends breastfeeding peer support (BFPS) as part of a strategy to improve breastfeeding rates. In the UK, BFPS is supported by National Institute for Health and Care Excellence guidance and a variety of models are in use. The experimental evidence for BFPS in developed countries is mixed and traditional methods of systematic review are ill-equipped to explore heterogeneity, complexity, and context influences on effectiveness. This review aimed to enhance learning from the experimental evidence base for one-to-one BFPS intervention. Principles of realist review were applied to intervention case studies associated with published experimental studies. The review aimed (a) to explore heterogeneity in theoretical underpinnings and intervention design for one-to-one BFPS intervention; (b) inform design decisions by identifying transferable lessons developed from cross-case comparison of context-mechanism-outcome relationships; and (c) inform evaluation design by identifying context-mechanism-outcome relationships associated with experimental conditions. Findings highlighted poor attention to intervention theory and considerable heterogeneity in BFPS intervention design. Transferable mid-range theories to inform design emerged, which could be grouped into seven categories: (a) congruence with local infant feeding norms, (b) integration with the

existing system of health care, (c) overcoming practical and emotional barriers to access, (d) ensuring friendly, competent, and proactive peers, (e) facilitating authentic peer-mother interactions, (f) motivating peers to ensure positive within-intervention amplification, and (g) ensuring positive legacy and maintenance of gains. There is a need to integrate realist principles into evaluation design to improve our understanding of what forms of BFPS work, for whom and under what circumstances.

Short Title: Use of interactive voice response technology to address barriers to fistula care in Nigeria and Uganda

DOI: 10.21037/mhealth.2019.12.04

Article Number: 12

Accession Number: WOS:000850463700002

Abstract: Background: The use of digital health technologies has expanded across low-resource settings, including in programs seeking to improve maternal health care seeking and service usage. However, there has been limited use of these technologies for screening and referral within maternal health, and many interventions have relied on SMS tools, which may have limited impact in settings with low female literacy. Digital health technologies have the potential to increase access to care for chronic maternal morbidities, such as obstetric fistula, and for women facing stigma, geographic isolation, and other sociocultural barriers to care seeking. This study documented the process of developing and implementing an innovative fistula screening and referral hotline using interactive voice response (IVR) technology, and described the service usage results and stakeholder perspectives associated with the hotline. Methods: The IVR hotline was introduced within the context of a broader Fistula Treatment Barriers Reduction Intervention implemented by the USAID-funded Fistula Care Plus project in Ebonyi and Katsina states in Nigeria and Kalungu district in Uganda. The intervention used three communication pathways to disseminate fistula information and conduct fistula screening: trained community agents, trained primary health care providers, and the IVR hotline

paired with mass media messaging. All positively-screened women were eligible to receive vouchers for free transportation to an accredited fistula treatment center. Quantitative and qualitative data on intervention implementation and use across all three communication pathways were gathered during intervention implementation, at baseline, midline, and endline; as well as through ongoing program monitoring. This study presents findings specifically on service usage and stakeholder perspectives related to the IVR hotline. Results: Over a period of ten to twelve months of implementation, depending on the intervention area, a total of 566 women completed the IVR hotline screening process. Across the areas, 415 (73%) hotline callers screened positive for fistula symptoms. Hotline users and implementation partners reported positive impressions of the hotline, particularly the ability to preserve anonymity in seeking information and referral for fistula symptoms. Challenges to hotline use included limited mobile phone ownership and poor cellular network connectivity, affecting operability by women and community agents. Conclusions: Implementation of the fistula screening hotline suggests that IVR-based interventions may be useful in expanding access to health services for stigmatized conditions, particularly in settings where literacy is limited. In the current context, such IVR tools require pairing with community and health system partners to complete referral and support clients. Further program experience and evaluation research is required to understand the options for integrating the IVR hotline or other interventions similarly using mobile technologies for screening and referral into broader digital health platforms that are sustained by national health systems or commercial business models.

Date: Jul

Short Title: Examining Theoretical Factors That Influence Teachers'

Intentions to Implement Inclusive Physical Education

ISSN: 0270-1367

DOI: 10.1080/02701367.2021.1877605

Accession Number: WOS:000709165300001

Abstract: Purpose: The purpose of the current study was to apply the

Theoretical Domains Framework (TDF) and Capability, Opportunity, Motivation, and Behavior model (COM-B) to examine theoretical predictors of teachers' intentions to implement inclusive physical education. Methods: Ontario primary and secondary teachers (n = 383) completed an online questionnaire which assessed potential factors associated with intentions toward implementation of inclusive physical education. Results: The final statistical model explained 72% of variance in intentions to implement inclusive physical education with the following theoretical domains identified as significant (p<.05) predictors: knowledge (beta .09), professional role and identity (beta .22), memory, attention, and decision making (beta .14), social influence (beta .37), and emotion (beta -.20). Regarding the COM-B, the component Motivation explained the greatest amount of variance in intentions to implement inclusive physical education. Conclusions: The application of the TDF and COM-B model in this study work to extend current literature through advancing understanding regarding cognitive, affective, and social factors related to teachers' intentions to implement inclusive physical education. Teacher training strategies should take into consideration multidimensional approaches to support teachers' motivations to implement inclusive physical education. Future research and intervention should seek to target and foster factors such as social influences, social/professional role and identity, and knowledge. These factors, in turn, may improve teachers' intentions to implement inclusive physical education.

Title: Barriers and facilitators influencing parental adherence to prevention strategies for deformational plagiocephaly: Results from a scoping review

Journal: Child Care Health and Development

Date: 2023 Jan

Short Title: Barriers and facilitators influencing parental adherence to prevention strategies for deformational plagiocephaly: Results from a scoping review

ISSN: 0305-1862

DOI: 10.1111/cch.13095

Accession Number: WOS:000913013200001

Abstract: BackgroundDeformational plagiocephaly can be prevented in many healthy infants if strategies are implemented early after birth. However, despite efforts to disseminate accurate information, parental adherence to evidence-based prevention strategies is a challenge. To date, factors – barriers and facilitators – influencing parental adherence to strategies have yet to be identified in a comprehensive manner. ObjectivesThis scoping review

aims to identify and synthesize current evidence on barriers and facilitators impacting adherence of parents of newborns to deformational plagiocephaly prevention strategies. Methods This review followed the Joanna Briggs Institute (JBI) process guidelines. Seven electronic (Cumulative Index to Nursing and Allied Health Literature (CINAHL), MEDLINE, SPORTDiscus, Academic Search Complete, AMED, PsychINFO and Scopus) and two grey literature (Health Systems Evidence and Grey Literature Report) databases were searched. Studies published between 2001 and 2022 were included. The deductive thematic data analysis used was guided by the Capability, Opportunity, Motivation Behavioral Model (COM-B) of health behaviour change. Results From a total of 1172 articles, 15 met the eligibility criteria. All components of the COM-B framework were identified. Capability-psychological and opportunity-environmental factors dominated the literature, whereas capability-physical, motivation and, in particular, opportunity-social factors were understudied. The most often reported barriers were a lack of knowledge of deformational plagiocephaly and the associated prevention strategies, ambiguous or inconsistent messaging, intolerance of babies to prone positioning and a lack of time. The most frequently reported facilitators were an awareness of deformational plagiocephaly, postural asymmetry and prevention strategies, skill acquisition with practice, accurate convincing information, scheduled time and environmental organization to position the baby at home. Discussion Recommendations focused on diffusing accurate and detailed information for parents. Our review also suggests a gap regarding the comprehensive identification of factors influencing parental adherence to deformational plagiocephaly prevention strategies. Further studies exploring comprehensive opportunity-social and motivation factors influencing parental adherence to deformational plagiocephaly prevention strategies are warranted to inform prevention programmes and foster better infant outcomes. Short Title: A 12-month weight loss intervention in adults with obstructive sleep apnoea: is timing important? A step wedge randomised trial

ISSN: 0954-3007

DOI: 10.1038/s41430-022-01184-5

Accession Number: WOS:000836066400003

Abstract: Background/Objectives Continuous positive airway pressure (CPAP) concomitant with weight loss is a recommended treatment approach for adults with moderate-severe obstructive sleep apnoea (OSA) and obesity. This requires multiple synchronous behaviour changes. The aim of this study was to examine the effectiveness of a 6-month lifestyle intervention and to determine whether the timing of starting a weight loss attempt affects weight change and trajectory after 12 months in adults newly diagnosed with moderate-severe OSA and treated at home with overnight CPAP. Methods Using a stepped-wedge design, participants were randomised to commence a six-month lifestyle intervention between one and six-months post-enrolment, with a 12-month overall follow-up. Adults (n = 60, 75% males, mean age 49.4 SD 10.74 years) newly diagnosed with moderate-severe OSA and above a healthy weight (mean BMI 34.1 SD 4.8) were recruited. Results After 12 months, exposure to the intervention (CPAP and lifestyle) resulted in a 3.7 (95% CI: 2.6 to 4.8, p < 0.001) kg loss of weight compared to the control condition (CPAP alone). Timing of the weight loss attempt made no difference to outcomes at 12 months. When exposed to CPAP only (control period) there was no change in body weight (Coef, [95% CI] 0.03, [-0.3 to 0.36], p = 0.86). Conclusions The lifestyle intervention resulted in a modest reduction in body weight, while timing of commencement did not impact the degree of weight loss at 12 months. These findings support the recommendation of adjunctive weight-loss interventions within six-months of starting CPAP.

Article Number: 101224

Accession Number: WOS:000645566100053

Abstract: The purpose of this study was to provide a detailed and systematic outline of how a theoretical behaviour change framework was applied in the development of ParticipACTION's app to support a more active Canada. The app development process was guided by the Behaviour Change Wheel (BCW) framework, a theoretically-based approach for intervention development, in collaboration with the commercial app industry. Specifically, a behavioural diagnosis was used to understand what needs to change for the targeted behaviour to occur. Current literature, along with a series of surveys, and market research informed app development. Additionally, a validated app behaviour change scale, was consulted throughout development to help ensure app features maximized behaviour change potential. The behavioural diagnosis revealed that the app needed to target individuals' physical and psychological capabilities, physical and social opportunities, and reflective and automatic motivations in order to increase physical activity levels. To accomplish this, 6 of a possible 9 intervention functions and 2 of 7 policy categories were selected from the BCW to be included in the app. Goals and planning, feedback and monitoring, behaviour identification, action planning and knowledge shaping were selected as the main behaviour change techniques for the app. Collaboration with a mobile app development firm helped to embed the selected behaviour change techniques, policy categories, intervention functions, and sources of behaviour within the app. Using a systematic approach, this study used the BCW to ensure the health promotion app was theoretically informed. Future research will evaluate its effectiveness in increasing the physical activity of Canadians.

Title: Boundaries of solidarity: a meta-ethnography of mask use during past epidemics to inform SARS-CoV-2 suppression

Journal: Bmj Global Health

Volume: 6

Issue: 1

Short Title: Boundaries of solidarity: a meta-ethnography of mask use during past epidemics to inform SARS-CoV-2 suppression

ISSN: 2059-7908

DOI: 10.1136/bmjgh-2020-004068

Article Number: e004068

Accession Number: WOS:000610064900003

Abstract: Background Many countries aiming to suppress SARS-CoV-2 recommend the use of face masks by the general public. The social meanings attached to masks may influence their use, but remain

underinvestigated. Methods We systematically searched eight databases for studies containing qualitative data on public mask use during past epidemics, and used meta-ethnography to explore their social meanings. We compared key concepts within and across studies, then jointly wrote a critical synthesis. Results We found nine studies from China (n=5), Japan (n=1), Mexico (n=1), South Africa (n=1) and the USA (n=1). All studies describing routine mask use during epidemics were from East Asia. Participants identified masks as symbols of solidarity, civic responsibility and an allegiance to science. This effect was amplified by heightened risk perception (eg, during SARS in 2003), and by seeing masks on political leaders and in outdoor public spaces. Masks also acted as containment devices to manage threats to identity at personal and collective levels. In China and Japan, public and corporate campaigns framed routine mask use as individual responsibility for disease prevention in return for state- or corporate-sponsored healthcare access. In most studies, mask use waned as risk perception fell. In contexts where masks were mostly worn by patients with specific diseases (eg, for patients with tuberculosis in South Africa), or when trust in government was low (eg, during H1N1 in Mexico), participants described masks as stigmatising, uncomfortable or oppressive. Conclusion Face masks can take on positive social meanings linked to solidarity and altruism during epidemics. Unfortunately, these positive meanings can fail to take hold when risk perception falls, rules are seen as complex or unfair, and trust in government is low. At such times, ensuring continued use is likely to require additional efforts to promote locally appropriate positive social meanings, simplifying rules for use and ensuring fair enforcement. ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-060922

Article Number: e060922

Accession Number: WOS:000810036900018

Abstract: Introduction Use of home dialysis by centres in the UK

varies considerably and is decreasing despite attempts to encourage greater use. Knowing what drives this unwarranted variation requires in-depth understanding of centre cultural and organisational factors and how these relate to quantifiable centre performance, accounting for competing treatment options. This knowledge will be used to identify components of a practical and feasible intervention bundle ensuring this is realistic and cost-effective. Methods and analysis Underpinned by the non-adoption, abandonment, scale-up, spread and sustainability framework, our research will use an exploratory sequential mixed-methods approach. Insights from multisited focused team ethnographic and qualitative research at four case study sites will inform development of a national survey of 52 centres. Survey results, linked to patient-level data from the UK Renal Registry, will populate a causal graph describing patient and centre-level factors, leading to uptake of home dialysis and multistate models incorporating patient-level treatment modality history and mortality. This will inform a contemporary economic evaluation of modality cost-effectiveness that will quantify how modification of factors facilitating home dialysis, identified from the ethnography and survey, might yield the greatest improvements in costs, quality of life and numbers on home therapies. Selected from these factors, using the capability, opportunity and motivation for behaviour change framework (COM-B) for intervention design, the optimal intervention bundle will be developed through workshops with patients and healthcare professionals to ensure acceptability and feasibility. Patient and public engagement and involvement is embedded throughout the project. Ethics and dissemination Ethics approval has been granted by the Health Research Authority reference 20-WA-0249. The intervention bundle will comprise components for all stakeholder groups: commissioners, provider units, recipients of dialysis, their caregivers and families. To reach all these groups, a variety of knowledge exchange methods will be used: short guides, infographics, case studies, National Institute for Health and Care Excellence guidelines, patient conferences, 'Getting it Right First Time' initiative, Clinical Reference Group (dialysis).

Accession Number: WOS:000561823400001
Abstract: Purpose To understand the perceptions of falls risk and falls prevention, and the perceived enablers and barriers to engaging in falls prevention strategies/activities among people with doctor–diagnosed hip and/or knee osteoarthritis. Methods A qualitative study utilising semi–structured telephone interviews. Researchers independently analysed qualitative data using an inductive method guided by the COM–B framework. Interviews were analysed thematically using open, axial, and selective coding. Recruitment ceased at 20 interviews, once data saturation was evident. Results Participants were 18 women and two men aged 52–84 years and half had fallen in the last 12 months. Main themes were the absence of recommendations to access activities after having a fall, inconsistencies between perceptions of the relationship between OA and falls, and individual beliefs of not being at risk of falling because of taking precautions. Knowledge about falls prevention programs was limited, the term "falls prevention" was considered stigmatising and only applicable to older frail people. Home modifications were perceived as broadcasting negativity; participants felt falls terminology should be changed from a negative to a positive focus. Conclusions Falls were often seen as inevitable consequence of keeping active. Re–framing the language used to discuss falls is recommended to promote uptake of falls prevention activities.

DOI: 10.1016/j.vaccine.2020.10.020

Accession Number: WOS:000588128100014

Abstract: Background: Understanding the influenza vaccination practices of general practitioners (GP) and paediatric hospital specialists caring for children with special risk medical conditions (SRMC) is imperative for designing interventions to improve uptake. This study aimed to identify the vaccination decision making, provider practices and perceived barriers and facilitators to recommending or delivering influenza vaccine for children with SRMCs at the tertiary and primary care levels. Methods: Nominated GPs and hospital specialists from a single tertiary hospital were interviewed to explore influenza vaccination practices and challenges for children with confirmed SRMCs. Interviews were digitally recorded, transcribed verbatim and thematic analysis was used to inductively code these data. Resulting themes were mapped across the COM-B ('capability', 'opportunity', 'motivation' and 'behaviour') theoretical framework to understanding barriers and potential interventions. Results: Twenty-six medical practitioners (21 GPs and 5 hospital specialists) completed semi-structured interviews. Barriers, and facilitators for influenza vaccine recommendation (the intended behaviour) were thematically grouped. Opportunity themes included structural barriers (e.g. limited use of systems and processes to support the identification of children with SRMCs); recommendation as standard practice; vaccination inconvenience; lack of communication and educational resources; social acceptance and normalisation; and media messaging. Capability themes included provider communication with parents; knowledge of influenza vaccine recommendations; and professional boundaries to implement the recommendation. Themes in the Motivation category included provider clinical prioritisation and responsibility towards providing a recommendation. Conclusions: The main barriers to influenza recommendation raised by our study participants were structural. These included lack of processes to identify children with SRMCs, limited use of reminder systems and unclear delineation of role responsibility between hospital specialists and GPs. An important driver that emerged was GPs' responsibility for providing a recommendation. To increase influenza vaccine coverage for children with SRMCs, consideration should be given to addressing practice level structural barriers and improving collaboration. Short Title: Unblinded and Blinded N-of-1 Trials Versus Usual Care: A Randomized Controlled Trial to Increase Statin Uptake in Primary Care

ISSN: 1941-7705

DOI: 10.1161/circoutcomes.120.007793

Article Number: e007793

Accession Number: WOS:000812359000007

Abstract: BACKGROUND: The aim was to assess whether an intervention incorporating a practicable open-label n-of-1 trial would lead to greater uptake of statin than usual care and comparable uptake to a closed-label gold-standard n-of-1 trial. METHODS: We enrolled patients who had stopped or declined statins into a 3-arm trial (usual care, unblinded, and blinded n-of-1 intervention arms). Physicians advised participants randomized to usual care to take statin therapy to prevent cardiovascular disease. In both intervention arms, physicians delivered a theoretically informed informed intervention endorsing the value of experimenting with medication in n-of-1 trials to assess whether it caused side-effects. In these trials, participants alternated between 4 weeks of medication and no medication (unblinded arm) or randomly sorted active and placebo (blinded arm) and recorded symptoms and symptom attributions for 6 months. Thereafter, physicians discussed participants' symptom reports during active/inactive treatment periods and asked participants to resume statins if appropriate. RESULTS: Seventy-three were randomized to the intervention arms and 20 to the control group. Fifty-six of 73 (77%) attempted the n-of-1 experiment; 28/36 (78%) in the unblinded arm; and 28/37 (76%) in the blinded arm. Forty-three of 56 (77%) completed the 6-month experiment and received feedback from the physician; 20/28 (71%) in the unblinded arm and 23/28 (82%) in the blinded arm. Thirty-three of 76 (45%) people restarted statins in the n-of-1 arms compared with 4/20 (20%) in the control arm, difference 24% (95% CI, 5%-43%; P=0.041). There was no evidence this differed between blinded and unblinded arms, difference 2% (95% CI, -20% to 24%; P3.86). Adverse events occurred at a similar rate on and off statin. CONCLUSIONS: In patients refusing or intolerant of statin, supporting experimentation with n-of-1 trials increases medication uptake compared with usual care. Alternating on-off medication in unblinded n-of-1 experiments appears as effective as a blinded experiment. Notes: Tudor, Kate Brooks, Jenny Howick, Jeremy Fox, Robin Aveyard, Paul

Article Number: 61

Accession Number: WOS:000806740300001

Abstract: Background Long-term treatment adherence is a worldwide concern, with nonadherence resulting from a complex interplay of behaviors and health beliefs. Determining an individual's risk of nonadherence and identifying the drivers of that risk are crucial for the development of successful interventions for improving adherence. Here, we describe the development of a new tool assessing a comprehensive set of characteristics predictive of patients' treatment adherence based on the Social, Psychological, Usage and Rational (SPUR) adherence framework. Concepts from existing self-reporting tools of adherence-related behaviors were identified following a targeted MEDLINE literature review and a subset of these concepts were then selected for inclusion in the new tool. SPUR tool items, simultaneously generated in US English and in French, were tested iteratively through two rounds of cognitive interviews with US and French patients taking long-term treatments for chronic diseases. The pilot SPUR tool, resulting from the qualitative analysis of patients' responses, was then adapted to other cultural settings (China and the UK) and subjected to further rounds of cognitive testing. Results The literature review identified 27 relevant instruments, from which 49 concepts were included in the SPUR tool (Social: 6, Psychological: 13, Usage: 11, Rational: 19). Feedback from US and French patients suffering from diabetes, multiple sclerosis, or breast cancer (n = 14 for the first round; n = 16 for the second round) indicated that the SPUR tool was well accepted and consistently understood. Minor modifications were implemented, resulting in the retention of 45 items (Social: 5, Psychological: 14, Usage: 10, Rational: 16). Results from the cognitive interviews conducted in China (15 patients per round suffering from diabetes, breast cancer or chronic obstructive pulmonary disease) and the UK (15 patients suffering from diabetes) confirmed the validity of the tool content, with no notable differences being identified across countries or chronic conditions. Conclusion Our qualitative analyses indicated that the pilot SPUR tool is a promising model that may help clinicians and health systems to predict patient treatment behavior. Further steps using

quantitative methods are needed to confirm its predictive validity and other psychometric properties.

Abstract: Global food supply has substantial impacts on nature including environmental degradation from chemicals, greenhouse gas emissions and biodiversity loss through agricultural land conversion. Over the past decade, public demand for information on sustainable consumption choices has increased. Meanwhile, development and expansion of the life cycle assessment literature has improved scientific evidence on supply chain impacts on the environment. However, data gaps and biases lead to uncertainty and undermine development of effective impact mitigation actions or behavior change policies. This study evaluates whether scientific research into the nature-related impacts of agri-food systems aligns with the needs of the public, as indicated by patterns of information seeking. We compare the relative volume of public Google queries to scientific articles related to agri-food systems and three major impacts: chemical pollution, greenhouse gas emissions or biodiversity loss. We discover that biodiversity is systematically overlooked in scientific studies on agri-food system impacts in favor of research on emissions and to a lesser extent chemical impacts. In contrast, total relative volumes of public queries on agri-food systems and biodiversity equal those for emissions impacts at global and Australian scales. Public interest in biodiversity impacts of agri-food systems increased significantly between 2009 and 2019, despite no significant change in the relative volume of biodiversity-focused scientific articles. Global public attention on chemical impacts declined significantly over this time period, with no significant change in the relative representation of this topic in scientific outputs. We recommend strategic investment into the biodiversity impacts of agri-food systems to build a knowledge base

that allows the public to learn about the impacts of their choices and be inspired to change to more sustainable behaviors.

Accession Number: WOS:000877096300001

Abstract: Obesity is a chronic disease that compromises the physical and mental health of an increasing proportion of children globally.

In high-income countries, prevalence of paediatric obesity is increasing faster in those from marginalised populations such as low-income households, suggesting the disease as one that is largely systemic. Appropriate treatment should be prioritised in these settings to prevent the development of complications and co-morbidities and manage those that already exist. An array of clinical practice guidelines are available for managing overweight and obesity in children and adolescents, but no systematic review has yet compared their quality or synthesised their recommendations.

We aimed to narratively review clinical practice guidelines published in English for treating child and adolescent obesity, to identify the highest quality guidelines, and assess similarities, conflicts, and gaps in recommendations. We systematically searched academic databases and grey literature for guidelines published. We used the AGREE II tool to assess the quality, and identified nine high quality guidelines for inclusion in a narrative review of recommendations. Guidelines predominantly recommended the delivery of multi-component behaviour-change interventions aimed at improving nutrition and physical activity. Treatment outcomes were generally focussed on weight, with less emphasis on managing complications or improving quality-of-life. There was no evidence-based consensus on the best mode of delivery, setting, or treatment format. The guidelines rarely included recommendations for addressing the practical or social barriers to behaviour change, such as cooking

skills or supervised physical activity. There is insufficient evidence to evaluate pharmaceutical and surgical interventions in children, and these were generally not recommended. It should be noted that this review addressed documents published in English only, and therefore the included guidelines were applicable predominantly to high-resource settings.

Accession Number: WOS:000767615400001

Abstract: Wearable Health Technology (WHT) is considered to be fast, feasible, and effective in workplace health promotion programs. This study aims to analyze behavior change strategies applied to WHT products used by employees in health promotion programs. A systematic literature review of WHT in workplace health promotion between 2006 and 2020 was conducted. The Behavior Change Wheel (BCW) was used to undertake the content analysis. We identified 14 articles of WHT in the workplace. First, physical activity and weight management were the most common health issue. Second, using the BCW, we found guidelines, regulation and communication were the most frequently applied policy categories. Third, education, enablement and training were the most common intervention functions. For example, the promoter could provide health education information by WHT. Moreover, encouraging online would motivate employees to improve health behavior. There has been a growing interest in WHT with increasing complexity in research designs and specifications. While using WHT can be an appropriate strategy to adopt as employee health projects, other interventions should be considered, for incentivization and modeling, etc. The results of this study suggest using WHT should take related health behavior theories or variables into consideration to form a comprehensive health promotion programs.

Title: Weight concerns as a predictor of smoking cessation according to nicotine dependence A population-based study

Journal: Nordic Studies on Alcohol and Drugs

Volume: 35

Issue: 5

Pages: 344-356

Date: Oct

Short Title: Weight concerns as a predictor of smoking cessation according to nicotine dependence A population-based study

ISSN: 1455-0725

DOI: 10.1177/1455072518800217

Accession Number: WOS:000453327900003

Abstract: Background: Nicotine-dependent smokers find it difficult to quit smoking. Additionally, smoking-specific weight concerns may affect smoking cessation although the evidence is controversial. We investigated whether smoking-specific weight concerns predict the probability of cessation and, if so, whether the effect varies according to the level of nicotine dependence. Methods: The study was conducted with a population-based sample of 355 adult daily smokers who participated in the baseline examination in 2007 and in the 2014 follow-up. Baseline nicotine dependence was classified as low or high (Fagerstrom Test for Nicotine Dependence; 0-3 vs. 4-10 points). Within these groups, we examined whether baseline weight concerns predict smoking status (daily, occasional, ex-smoker) at follow-up by using multinomial logistic regression with adjustment for multiple covariates. Results: Among low-dependent participants at baseline, 28.5% had quit smoking, while among highly dependent participants 26.1% had quit smoking. The interaction between weight concerns and nicotine dependence on follow-up smoking status was significant. Among participants with low nicotine dependence per the fully adjusted model, greater weight concerns predicted a lower likelihood of both smoking cessation (relative risk ratio 0.93 [95% CI 0.87-1.00]) and smoking reduction to occasional occurrence (0.89 [95% CI 0.81-0.98]). Weight concerns were not associated with follow-up smoking status among participants with high nicotine dependence. Conclusions: Weight concerns are associated with a smaller likelihood of quitting among smokers with low nicotine dependence. Weight concerns should be addressed in smoking cessation interventions, especially with smokers who have low nicotine dependence.

Title: Factors influencing follow-up care post-TIA and minor stroke:
a qualitative study using the theoretical domains framework

Journal: BMC Health Services Research

Volume: 22

Issue: 1

Date: Feb

Short Title: Factors influencing follow-up care post-TIA and minor
stroke: a qualitative study using the theoretical domains framework

DOI: 10.1186/s12913-022-07607-0

Article Number: 235

Accession Number: WOS:000758788900003

Abstract: Background Follow-up care after transient ischaemic attack
(TIA) and minor stroke has been found to be sub-optimal, with
individuals often feeling abandoned. We aimed to explore factors
influencing holistic follow-up care after TIA and minor stroke.

Methods Qualitative semi-structured interviews with 24 healthcare
providers (HCPs): 5 stroke doctors, 4 nurses, 9 allied health
professionals and 6 general practitioners. Participants were
recruited from three TIA clinics, seven general practices and one
community care trust in the West Midlands, England. Interview
transcripts were deductively coded using the Theoretical Domains
Framework and themes were generated from coded data. Results There
was no clear pathway for supporting people with TIA or minor stroke
after rapid specialist review in hospital; consequently, these
patients had limited access to HCPs from all settings

('Environmental context and resources'). There was lack of
understanding of potential needs post-TIA/minor stroke, in
particular residual problems such as anxiety/fatigue ('Knowledge').
Identification and management of needs was largely influenced by
HCPs' perceived role, professional training ('Social professional
role and identity') and time constraints ('Environmental context and
resources'). Follow-up was often passive - with onerous on patients
to seek support - and predominantly focused on acute medical
management ('Intentions'/'Goal'). Conclusions Follow-up care post-
TIA/minor stroke is currently sub-optimal. Through identifying
factors which influence follow-up, we can inform guidelines and

practical strategies to improve holistic healthcare.

Short Title: Stroke and TIA Survivors' Perceptions of the COVID-19 Vaccine and Influences on Its Uptake: Cross Sectional Survey

DOI: 10.3390/ijerph192113861

Article Number: 13861

Accession Number: WOS:000882256500001

Abstract: Background: People who have experienced a stroke or transient ischaemic attack (TIA) have greater risks of complications from COVID-19. Therefore, vaccine uptake in this vulnerable population is important. To prevent vaccine hesitancy and maximise compliance, we need to better understand individuals' views on the vaccine. Objectives: We aimed to explore perspectives of the COVID-19 vaccine and influences on its uptake from people who have experienced a stroke or TIA. Method: A cross-sectional, electronic survey comprising multiple choice and free text questions.

Convenience sampling was used to recruit people who have experienced a stroke/TIA in the UK/Ireland. Results: The survey was completed by 377 stroke/TIA survivors. 87% (328/377) had either received the first vaccine dose or were booked to have it. The vaccine was declined by 2% (7/377) and 3% (11/377) had been offered the vaccine but not yet taken it up. 8% (30/377) had not been offered the vaccine despite being eligible. Some people expressed concerns around the safety of the vaccine (particularly risk of blood clots and stroke) and some were hesitant to have the second vaccine.

Societal and personal benefits were motivations for vaccine uptake. There was uncertainty and lack of information about risk of COVID-19 related complications specifically for people who have experienced a stroke or TIA. Conclusion: Despite high uptake of the first vaccine, some people with stroke and TIA have legitimate concerns and information needs that should be addressed. Our findings can be used to identify targets for behaviour change to improve vaccine uptake

specific to stroke/TIA patients.

Title: Telehealth interventions for physical activity and exercise participation in postpartum women: A quantitative systematic review

Journal: Preventive Medicine

Volume: 167

Date: Feb

Short Title: Telehealth interventions for physical activity and exercise participation in postpartum women: A quantitative systematic review

ISSN: 0091-7435

DOI: 10.1016/j.ypmed.2022.107413

Article Number: 107413

Accession Number: WOS:000917304400001

Abstract: Postpartum women are one of the least physically active vulnerable populations globally and telehealth has been proposed as a potential method of delivering effective exercise interventions for this population. However, clinical practice guidelines are based upon the recommendations for the general population and therefore, the most efficacious exercise dose and the delivery method for this population is unclear. This quantitative systematic review will examine the implementation and outcomes of telehealth exercise interventions in the postpartum population to synthesise the degree to which these outcomes have been assessed and evaluated. Five databases were searched from January 2001 to March 2022. Studies implementing synchronous telehealth exercise interventions for postpartum women were included. Interventions were examined against the Template for Intervention Description and Replication (TIDieR) checklist that assesses intervention reporting completeness and replicability. Of the 1036 records identified, 16 studies progressed to data extraction. Six interventions provided individualised exercise prescription, and only four were delivered by university-level exercise practitioners. Physical activity participation was well reported, however health-related outcomes (i.e., muscular strength and aerobic capacity) were very minimally assessed. Only one intervention utilised modern video conferencing as the primary telehealth communication method. With the minimal assessment of health-related outcomes, there is limited scope to assess the effectiveness of these interventions for postpartum women. Future research interventions need to be reported according to a validated trial reporting system and focus on relevant health related outcomes

including postpartum depressive symptoms, quality of life, cardiovascular fitness, muscular strength and body composition.

Title: Role and response of primary healthcare services in community end-of-life care during COVID-19: Qualitative study and recommendations for primary palliative care delivery

Journal: Palliative Medicine

Volume: 37

Issue: 2

Pages: 235-243

Date: Feb

Short Title: Role and response of primary healthcare services in community end-of-life care during COVID-19: Qualitative study and recommendations for primary palliative care delivery

ISSN: 0269-2163

DOI: 10.1177/02692163221140435

Accession Number: WOS:000893311200001

Abstract: Background: The need for end-of-life care in the community increased significantly during the COVID-19 pandemic. Primary care services, including general practitioners and community nurses, had a critical role in providing such care, rapidly changing their working practices to meet demand. Little is known about primary care responses to a major change in place of care towards the end of life, or the implications for future end-of-life care services. Aim: To gather general practitioner and community nurse perspectives on factors that facilitated community end-of-life care during the COVID-19 pandemic, and to use this to develop recommendations to improve future delivery of end-of-life care. Design: Qualitative interview study with thematic analysis, followed by refinement of themes and recommendations in consultation with an expert advisory group. Participants: General practitioners (n = 8) and community nurses (n = 17) working in primary care in the UK. Results: General practitioner and community nurse perspectives on factors critical to sustaining community end-of-life care were identified under three themes: (1) partnership working is key, (2) care planning for end-of-life needs improvement, and (3) importance of the physical presence of primary care professionals. Drawing on participants' experiences and behaviour change theory, recommendations are proposed to improve end-of-life care in primary care. Conclusions: To sustain and embed positive change, an increased policy focus on primary care in end-of-life care is required. Targeted interventions developed during COVID-19, including online team meetings and education, new prescribing systems and unified guidance, could

increase capacity and capability of the primary care workforce to deliver community end-of-life care.

Title: Community pharmacy COPD services: what do researchers and policy makers need to know?

Journal: Integrated Pharmacy Research and Practice

Volume: 6

Pages: 53-59

Short Title: Community pharmacy COPD services: what do researchers and policy makers need to know?

ISSN: 2230-5254

DOI: 10.2147/iprp.S105279

Accession Number: WOS:000393852400001

Abstract: COPD is a leading cause of morbidity and mortality across the world and is responsible for a disproportionate use of health care resources. It is a progressive condition that is largely caused by smoking. Identification of early stage COPD provides an opportunity for interventions, such as smoking cessation, which prevent its progression. Once diagnosed, ongoing support services potentially provide an opportunity to assist the patient in managing their condition and working more closely with the rest of the primary care team. While there are a number of robust studies which have demonstrated the role which pharmacists could undertake to identify and prevent disease progression, adoption of such services is currently limited. As a service that would seem to be appropriate for adoption in all societies where smoking is prevalent, we have performed a review of reported approaches that have been used when setting up and evaluating such services, and therefore aim to inform researchers and policy makers in other countries on how best to proceed. Implementation science has been used to further contextualize the findings of the review in terms of components that are likely to enhance the likelihood of implementation. With reference to screening services, we have made clear recommendations as to the identification of patients, structure and smoking cessation elements of the program. Further work needs to be undertaken by policy makers to determine the approaches that can be used to motivate pharmacists to provide this service. In terms of ongoing support services, there is some evidence to suggest that these would be effective and cost-effective to the health service in which they are implemented. However, the capability, opportunity and motivation of pharmacists to provide these, more complex, services

need to be the focus for researchers before implementation by policy makers.

Title: Aphasia outcome measurement in clinical practice: An international survey

Journal: Aphasiology

Date: 2022 Aug

Short Title: Aphasia outcome measurement in clinical practice: An international survey

ISSN: 0268-7038

DOI: 10.1080/02687038.2022.2112143

Accession Number: WOS:000841834500001

Abstract: Background Outcome measurement is recommended in stroke clinical practice guidelines, however there is considerable variability in how this activity is performed in clinical practice. Factors driving clinician behaviour have been explored in English-speaking countries, but little is known about the factors influencing clinical practice in non-English-speaking populations. Aims (1) To explore barriers and facilitators to aphasia outcome measurement from the perspective of international aphasia clinicians. (2) To determine whether barriers and facilitators to outcome measurement differ in English- and non-English- speaking countries. The primary hypothesis was that clinicians working with people with aphasia in non-English-speaking countries would experience more barriers to outcome measurement than those in English-speaking countries. Methods and Procedures An international sample of aphasia clinicians completed an online survey informed by the Theoretical Domains Framework. Quantitative data were analysed using descriptive statistics and a Mann-Whitney U Test to compare English- and non-English- speaking groups. TDF domains identified as influencing clinician behaviour were mapped to the Behaviour Change Wheel, producing theory-informed strategies to improve practice. Outcomes and Results A total of 208 clinicians from 25 countries completed the survey. Almost all (93.7%) reported measuring outcomes to some extent, most commonly to measure client progress. Facilitators to outcome measurement included "social/professional role and identity" (understanding that measuring outcomes is part of the clinicians' role), "optimism" (feeling positive about measuring outcomes), and "emotion" (enjoying, and feeling comfortable measuring outcomes). Barriers were "environmental context and resources" (time and resource limitations, and competing caseload priorities), "behavioural regulation" (a lack of personal and workplace systems to measure outcomes) and "skills" (having insufficient training and experience in outcome measurement). There was no significant difference between the barriers and facilitators

experienced by clinicians in English- and non-English- speaking countries. Implementation strategies, informed by Behaviour Change Techniques, were created to improve clinical practice. Conclusions Internationally, clinicians working with people with aphasia measure outcomes and believe that this is part of their role, and a positive aspect of their work. Common barriers to outcome measurement included insufficient time and access to resources, inadequate personal and workplace systems, and insufficient skills necessary for performing outcome measurement. Preliminary, theory-informed strategies (e.g., improving access to culturally and linguistically appropriate measurement instruments; developing protocols, templates or checklists guided by recommended practice; and providing training in outcome measurement) would assist with uptake of clinical practice guidelines in this area.

Short Title: Effects of the first COVID-19 lockdown on quality and safety in mental healthcare transitions in England

ISSN: 2056-4724

DOI: 10.1192/bjo.2021.996

Article Number: e156

Accession Number: WOS:000691354900001

Abstract: Background The COVID-19 pandemic forced the rapid implementation of changes to practice in mental health services, in particular transitions of care. Care transitions pose a particular threat to patient safety. Aims This study aimed to understand the perspectives of different stakeholders about the impact of temporary changes in practice and policy of mental health transitions as a result of coronavirus disease 2019 (COVID-19) on perceived healthcare quality and safety. Method Thirty-four participants were interviewed about quality and safety in mental health transitions during May and June 2020 (the end of the first UK national lockdown). Semi-structured remote interviews were conducted to generate in-depth information pertaining to various stakeholders

(patients, carers, healthcare professionals and key informants). Results were analysed thematically. Results The qualitative data highlighted six overarching themes in relation to practice changes: (a) technology-enabled communication; (b) discharge planning and readiness; (c) community support and follow-up; (d) admissions; (e) adapting to new policy and guidelines; (f) health worker safety and well-being. The COVID-19 pandemic exacerbated some quality and safety concerns such as tensions between teams, reduced support in the community and increased threshold for admissions. Also, several improvement interventions previously recommended in the literature, were implemented locally. Discussion The practice of mental health transitions has transformed during the COVID-19 pandemic, affecting quality and safety. National policies concerning mental health transitions should concentrate on converting the mostly local and temporary positive changes into sustainable service quality improvements and applying systematic corrective policies to prevent exacerbations of previous quality and safety concerns.

Short Title: Implementing best practice occupational therapist-led environmental assessment and modification to prevent falls: A qualitative study of two regional and rural public health services in Australia

ISSN: 0045-0766

DOI: 10.1111/1440-1630.12849

Accession Number: WOS:000881736600001

Abstract: Background Occupational therapist-led environmental assessment and modification (EAM) is effective in reducing falls for populations at high risk. Two regional and rural public health services in Queensland devised an implementation strategy to embed best practice occupational therapist-led EAM. Methods A qualitative study was conducted to compare the determinants of implementation success across the different health services, using the COM-B model

of behaviour change. Six semi-structured interviews were completed with occupational therapists involved at each site, following 12 months of implementation. Interview data were triangulated with minutes from three combined site steering committee meetings, eight local steering committee meetings, and field notes. Thematic analysis was completed to compare barriers and facilitators to best practice uptake of EAM and differences in outcomes between the two sites. Results Both sites commenced implementation with similar states of capability and motivation. After 12 months, one site considered that practice change had been embedded as noted in steering committee minutes and comments; however, the other site observed limited progress. According to the COM-B analysis, opportunity (the factors that lie outside the individual's control) had a significant influence on how both sites were able to respond to the practice change and navigate some of the unexpected challenges that emerged, including the COVID-19 pandemic. Existing team structure, multiple responsibilities of key stakeholders, differences in access to resources, and lack of connection between complementary services meant that COVID-19 disruptions were only a catalyst for unveiling other systemic issues. Conclusion This study highlights the power of external factors on influencing behaviour change for best practice implementation. Learnings from the study will provide deeper understanding of completing implementation projects in regional and rural contexts and support the future implementation of EAM in occupational therapy clinical settings.

DOI: 10.1177/13591053211012766

Article Number: 13591053211012766

Accession Number: WOS:000652319400001

Abstract: This study aimed to explore how social distancing and self-isolation measures, aimed at protecting vulnerable groups from

COVID-19, affected the wellbeing and physical activity levels among adults diagnosed with asthma. Twenty-seven participants took part across four online focus groups. Transcripts were analysed using thematic analysis. Participants reported becoming more health conscious due to being labelled as vulnerable. Their relationship with the severity of their asthma was altered and they reported making positive changes to increase their physical activity levels. Findings suggest there is a window of opportunity to engage with people diagnosed with asthma to promote beneficial lifestyle changes and self-management.

Title: Exploring a New Theoretical Model to Explain the Behavior of Medication Adherence

Journal: Pharmacy

Volume: 10

Issue: 2

Date: Apr

Short Title: Exploring a New Theoretical Model to Explain the Behavior of Medication Adherence

DOI: 10.3390/pharmacy10020043

Article Number: 43

Accession Number: WOS:000787423800001

Abstract: Medication adherence is essential for optimal therapeutic outcomes. However, non-adherence with long-term therapy is at 50%. Several theoretical models have identified several key factors that could explain medication adherence. Though numerous interventions have been developed based on these theoretical models, the success rates with interventions are not the best. This paper proposes a new Hierarchical Model for Medication Adherence. In this model, we propose medication adherence as a five-tier model with medication adherence as the desirable behavior on the top of the pyramid. From the bottom of the hierarchy upwards, the skills/beliefs/behaviors to be achieved are: health literacy, belief in illness (impacted by perceived susceptibility and severity of illness), belief in medicines (impacted by treatment satisfaction), and self-efficacy (impacted by social support). The model further proposes that each individual will achieve or already have these skills/beliefs/behaviors at various levels. Screening patients for these benchmarks will enable providers to decide where to target interventions.

Short Title: Stakeholders' Views on Mobile Applications to Deliver Infant and Toddler Feeding Education to Latina Mothers of Low Socioeconomic Status
DOI: 10.3390/nu13082569
Article Number: 2569
Accession Number: WOS:000689893200001
Abstract: Infant- and toddler-feeding (ITF) practices are critical to long-term health and chronic disease prevention. Using mobile applications (apps) to promote desirable ITF practices shows promise for overcoming challenges of in-person education. However, the viability of ITF apps for Latina mothers of low-socioeconomic status (SES) remains unclear. The objective of this study was to characterize stakeholders' views on Latina mothers' capability, motivation, and barriers to using ITF apps. New York City-based health professionals who frequently engage with Latina mothers of low SES completed in-depth interviews. Directed content analysis was used to identify themes through theoretical and inductive codes. Participants included dietitians, nutrition educators, and physicians (n = 17). The following themes were identified: (1) Most Latina mothers of low-SES are tech-savvy (i.e., high capability and experience using smartphones and apps); (2) Apps are an appealing way to deliver ITF education; (3) There are challenges to using apps that must be carefully considered for ITF education development. Overall, ITF apps are a viable option as skills and use appear high among Latina mothers. Key considerations for app development include targeted app promotion; detailed instructions for obtaining and using app; more visuals, less text for low literacy and multiple dialects; making key features available offline.

Title: Challenges and Strategies for Improving COPD Primary Care Services in Quebec: Results of the Experience of the COMPAS plus Quality Improvement Collaborative

Journal: International Journal of Chronic Obstructive Pulmonary Disease

Volume: 17

Pages: 259-272

Short Title: Challenges and Strategies for Improving COPD Primary Care Services in Quebec: Results of the Experience of the COMPAS plus Quality Improvement Collaborative

ISSN: 1178-2005

DOI: 10.2147/copd.S341905

Accession Number: WOS:000753042800001

Abstract: Introduction: Management of chronic obstructive pulmonary disease (COPD) remains a challenge in primary care and multiple barriers can limit implementation of COPD guidelines. Since 2016, a quality improvement (QI) collaborative, called COMPAS+, has been implemented across the province of Quebec (Canada) to support improvement of chronic disease management in primary care. The aim of this study was to describe the main COPD quality problems reported by participating teams and the strategies they proposed and implemented to improve COPD primary care services in Quebec.

Methods: Sixteen sites in four different regions of Quebec were engaged in the COMPAS+ intervention to improve primary care services delivered to people living with COPD. A total of 14 workshop reports, 31 QI action plans and 4 regional final reports underwent content analysis. Key COPD quality problems were first identified and, for each of them, root causes were classified according to the domains and constructs of the Consolidated Framework for Implementation Research. Proposed strategies were organized according to the intervention function types described in the Behavior Change Wheel. Results: Four key COPD quality problems were identified: 1) lack of organization/coordination of COPD services, 2) lack of screening services coordination, 3) lack of interprofessional communication and collaboration and 4) lack of treatment adherence. Main root causes explaining these quality gaps were 1) lack of awareness of COPD, 2) lack of professional knowledge, 3) lack of definition of professional roles, 4) lack of resources and tools for COPD prevention, diagnosis, and follow-up, 5) lack of communication tools, 6) lack of integration of the patient-as-partner approach, and 7) lack of adaptation of patient education to their specific needs. Multiple strategies were proposed to improve healthcare professionals' education and interprofessional collaboration and communication. Conclusion: QI collaborative activities can support achieving understanding of QI challenges healthcare organizations face to improve COPD services.

Short Title: Behaviour Change to Promote Diabetes Outcomes: Getting More From What We Have Through Dissemination and Scalability

ISSN: 1499-2671

DOI: 10.1016/j.jcjd.2022.08.008

Accession Number: WOS:000924826400001

Abstract: The potential benefits of advanced medical treatments (pharmacotherapies) and technologies (diagnostics, devices and apps) are unrealized due to lack of sustained behaviour change in individuals living with type 2 diabetes. The lack of scale-up of effective health behaviour change interventions limits health improvement. Identification of mediators of behaviour change (adherence, self-efficacy, intrinsic motivation) can address this limitation by shifting the focus of behaviour change from input (which behaviour change strategy to choose) to output (what can the person adhere to and sustain). Technology and accessing the workplace environment to promote change offer scalable opportunities for facilitating health behaviour change in populations.(c) 2022 Canadian Diabetes Association.

Short Title: User-driven open-source artificial pancreas systems and patient-reported outcomes: A missed opportunity?

ISSN: 0742-3071

DOI: 10.1111/dme.14797

Article Number: e14797

Accession Number: WOS:000751779500001

Abstract: Aim: This paper aims to highlight the attributes of engagement and urgency to act to control diabetes demonstrated by

open-source artificial pancreas system users with the view that increased user involvement in research and practice can capitalize on these self-management traits; and to outline the challenges of researching outcomes in the context of unlicensed therapies. Methods: A group of technically minded people with type 1 diabetes have reverse-engineered commercially available diabetes devices to help them achieve the diabetes outcomes they desire. Although studies have reported improved biomedical outcomes with these artificial pancreas systems, there are only a few studies examining patient-reported outcomes. Results: The investigation of patient-reported outcomes for open-source artificial pancreas system users has been hampered by the rapid advances in the technology, the lack of randomized controlled trials and the ethical challenges of researching unregulated technologies. There is an on-going debate about the most appropriate types of measures to evaluate patient-related outcomes. Conclusions: The early adopters of open-source artificial pancreas systems exhibit many of the characteristics that predict optimal diabetes outcomes through engagement and urgency regarding self-management. These qualities should be harnessed to improve research in this and other areas of diabetes management. Notes: Vallis, Michael Holt, Richard I. G. Short Title: Equipping providers with principles, knowledge and skills to successfully integrate behaviour change counselling into practice: a primary healthcare framework

ISSN: 0033-3506

DOI: 10.1016/j.puhe.2017.10.022

Accession Number: WOS:000418563900011

Abstract: Objectives: There is an urgent need for healthcare providers and healthcare systems to support productive interactions with patients that promote sustained health behaviour change in order to improve patient and population health outcomes. Behaviour change theories and interventions have been developed and evaluated in experimental contexts; however, most healthcare providers have little training, and therefore low confidence in, behaviour change counselling. Particularly important is how to integrate theory and method to support healthcare providers to engage in behaviour change counselling competently. In this article, we describe a general

training model developed from theory, evidence, experience and stakeholder engagement. This model will set the stage for future evaluation research on training needed to achieve competency, sustainability of competency, as well as effectiveness/cost-effectiveness of training in supporting behaviour change. Design and Methods: A framework to support competency based training in behaviour change counselling is described in this article. This framework is designed to be integrative, sustainable, scalable and capable of being evaluated in follow-up studies. Results and Discussion: Effective training in behaviour change counselling is critical to meet the current and future healthcare needs of patients living with, or at risk of, chronic diseases. Increasing competency in establishing change-based relationships, assessing and promoting readiness to change, implementing behaviour modification and addressing psychosocial issues will be value added to the healthcare system. Article Number: 20552076211057667

Accession Number: WOS:000724517800001

Abstract: Background Impulsive processes driving eating behaviour can often undermine peoples' attempts to change their behaviour, lose weight and maintain weight loss. Aim To develop an impulse management intervention to support weight loss in adults. Methods Intervention Mapping (IM) was used to systematically develop the "ImpulsePal" intervention. The development involved: (1) a needs assessment including a qualitative study, Patient and Public advisory group and expert group consultations, and a systematic review of impulse management techniques; (2) specification of performance objectives, determinants, and change objectives; (3) selection of intervention strategies (mapping of change techniques to the determinants of change); (4) creation of programme materials; (5) specification of adoption and implementation plans; (6) devising

an evaluation plan. Results Application of the IM Protocol resulted in a smartphone app that could support reductions in unhealthy (energy dense) food consumption, overeating, and alcoholic and sugary drink consumption. ImpulsePal includes inhibition training, mindfulness techniques, implementation intentions (if-then planning), visuospatial loading, use of physical activity for craving management, and context-specific reminders. An "Emergency Button" was also included to provide access to in-the-moment support when temptation is strong. Conclusions ImpulsePal is a novel, theory- and evidence-informed, person-centred app that aims to support impulse management for healthier eating. Intervention Mapping facilitated the incorporation of app components that are practical operationalisations of change techniques targeting our specific change objectives and their associated theoretical determinants. Using IM enabled transparency and provided a clear framework for evaluation, and enhances replicability and the potential of the intervention to accomplish the desired outcome of facilitating weight loss through dietary change.

Title: Barriers and facilitators to implementation of cognitive adaptation training in long-term inpatient facilities for people diagnosed with severe mental illness: A nursing perspective

Journal: Journal of Psychiatric and Mental Health Nursing

Volume: 29

Issue: 4

Pages: 568-577

Date: Aug

Short Title: Barriers and facilitators to implementation of cognitive adaptation training in long-term inpatient facilities for people diagnosed with severe mental illness: A nursing perspective

ISSN: 1351-0126

DOI: 10.1111/jpm.12821

Accession Number: WOS:000757458400001

Abstract: Accessible Summary What is known on the subject? To date, the majority of the research regarding innovative psychosocial interventions in psychiatry focuses upon the development and effectiveness of the interventions. Despite the fact that these are important clinical and scientific contributions, only a small percentage of the evidence-based interventions reach clinical practice. Cognitive Adaptation Training (CAT) is an effective psychosocial intervention to increase daily functioning and

cognitive functioning in people diagnosed with severe mental illness (SMI) in inpatient and outpatient psychiatric care. Despite knowledge on the intervention's effectiveness, systematic use of CAT in the daily routine of mental health nurses is insufficient. What the paper adds to existing knowledge? To date, no research is available that describes the factors associated to the implementation of CAT from a nursing perspective. This research also adds to the literature on rehabilitation in people diagnosed with SMI in an inpatient setting. The results contribute to the science of implementing interventions in long-term psychiatric care and may help future interventions in their implementation process. What are the implications for practice? This study highlights that multiple factors need to be considered when implementing an intervention in routine care and that it is a complicated process. Future implementation initiatives require ongoing training and supervision of CAT specialists, appointment of local champions to increase commitment among nursing staff and inclusion and commitment of management to overcome organizational barriers. Without acknowledging the presence of barriers to implementation and considering strategies to overcome these barriers, sustainable implementation is likely to be unsuccessful. Introduction Evidence-based interventions in psychiatry often fail to reach clinical practice. Cognitive Adaptation Training (CAT) is an evidence-based psychosocial intervention that aims to improve daily functioning of people diagnosed with a severe mental illness. Implementation of CAT remains challenging, despite demonstrated effectiveness. Aim Identifying facilitators and barriers of CAT on the intervention, nursing, and organizational levels, and investigating relationships between capability, opportunity, motivation, and appraisal using the COM-B model. Method The Measurement Instrument for Determinants of Innovations and CAT-specific questions were administered to 46 nurses. The relationship among capability, opportunity, motivation and appraisal was calculated using the Pearson's r correlation coefficient. Results Nine barriers (mostly organizational level) and 13 facilitators (mostly intervention and nursing level) were identified. Significant moderate correlations were found between capability and opportunity, capability and motivation, capability and appraisal and a strong correlation between motivation and appraisal. Discussion The results suggest that barriers at the organizational level should be removed and facilitators at intervention and nursing levels may be exploited to improve implementation. Implications for practice Future implementation initiatives require ongoing training and supervision of CAT specialists, appointment of local champions to increase commitment among nursing staff and inclusion and commitment of management to overcome organizational barriers.

Title: Detecting inappropriate total duration of antimicrobial therapy using semi-automated surveillance

Journal: Antimicrobial Resistance and Infection Control

Volume: 11

Issue: 1

Date: Aug

Short Title: Detecting inappropriate total duration of antimicrobial therapy using semi-automated surveillance

ISSN: 2047-2994

DOI: 10.1186/s13756-022-01147-2

Article Number: 110

Accession Number: WOS:000847332000003

Abstract: Objectives: Evaluation of the appropriateness of the duration of antimicrobial treatment is a cornerstone of antibiotic stewardship programs, but it is time-consuming. Furthermore, it is often restricted to antibiotics prescribed during hospital admission. This study aimed to determine whether mandatory prescription-indication registration at the moment of prescribing antibiotics enables reliable automated assessment of the duration of antibiotic therapy, including post-discharge duration, limiting the need for manual chart review to data validation. **Methods:** Antibiotic prescription and admission data, from 1-6-2020 to 31-12-2021, were electronically extracted from the Electronic Medical Record of two hospitals using mandatory indication registration. All consecutively prescribed antibiotics of adult patients who received empiric therapy in the first 24 h of admission were merged to calculate the total length of therapy (LOT) per patient, broken down per registered indication. Endpoints were the accuracy of the data, evaluated by comparing the extracted LOT and registered indication with the clinical notes in 400 randomly selected records, and guideline adherence of treatment duration. Data were analysed using a reproducible syntax, allowing semi-automated surveillance.

Results: A total of 3,466 antibiotic courses were analysed. LOT was accurately retrieved in 96% of the 400 evaluated antibiotic courses. The registered indication did not match chart review in 17% of antibiotic courses, of which only half affected the assessment of guideline adherence. On average, in 44% of patients treatment was continued post-discharge, accounting for 60% (+/- 19%) of their total LOT. Guideline adherence ranged from 26 to 75% across indications. **Conclusions:** Mandatory prescription-indication registration data can be used to reliably assess total treatment course duration, including post-discharge antibiotic duration, allowing semi-automated surveillance.

Title: Impact of the First SARS-CoV-2 Lockdown on Adherence to Biological Treatment in Patients with Immune-Mediated Inflammatory Diseases in the Netherlands

Journal: Patient Preference and Adherence

Volume: 17

Pages: 167-174

Short Title: Impact of the First SARS-CoV-2 Lockdown on Adherence to Biological Treatment in Patients with Immune-Mediated Inflammatory Diseases in the Netherlands

ISSN: 1177-889X

DOI: 10.2147/ppa.S392290

Accession Number: WOS:000922345700001

Abstract: Purpose: During the SARS-CoV-2 pandemic, national and international societies have recommended continuing biological agents in patients with immune-mediated inflammatory diseases (IMID) in the absence of SARS-CoV-2 symptoms. However, adherence to biological treatment might decrease, because these recommendations contradict patients' beliefs. Especially an increased concern about side effects could have influenced the adherence to biological treatment during the first lockdown. The primary objective was to investigate the impact of the first SARS-CoV-2 lockdown on adherence to biological treatment in IMID patients. Patients and Methods: In this prospective cohort study, IMID patients who received a biological agent before and during the first SARS-CoV-2 lockdown (March 2020-June 2020) were included. Patients were excluded if they did not complete the medication adherence report scale-5 (MARS-5) questionnaire at ≥ 1 visit before the lockdown and ≥ 1 visit during the lockdown. Adherence to biological treatment was measured with the MARS-5 and Medication Possession Ratio (MPR). Results: We included 157 IMID patients. The percentage of adherent patients, defined as MARS-5 score >21 , was significantly lower during the lockdown compared to the period before the lockdown (88.5% vs 84.1%, $p < 0.001$). Additionally, the overall percentage of adherent patients during the lockdown based on the MPR $\geq 90\%$ was significantly lower compared to adherence based upon the MARS-5 (65.1% vs 84.1%, $p < 0.001$). Conclusion: This study showed that the first SARS-CoV-2 lockdown negatively impacts adherence to biological treatment in IMID patients. Therefore, treating physicians should be aware of this problem to minimize the potential harmful effects of non-adherence.

Abstract: is widely agreed that technology alone cannot prevent
cyber incidents. Organizations often need to rely the cooperation of
employees, for instance to report cyber incidents and to follow
security policies. This research article presents a model of how the
psychological constructs capability, opportunity and motivation
interact to produce employee security behaviours that are assumed to
help prevent data leakage incidents. To validate this model we
surveyed 384 bank employees about their data leakage prevention
behaviour. Results generally show that capability (i.e., knowledge)
is uniquely related to data leakage prevention behaviour, and that
motivation and opportunity are uniquely related to capability. Our
findings suggest that although knowledge is pivotal for achieving
desired behaviour, increasing motivation and opportunity may be key
to influence knowledge acquiring and consequently data leakage
prevention behaviour. Implications for information security practice

Short Title: Barriers and facilitators for the usage of a personal health record for medication reconciliation: A qualitative study among patients

ISSN: 0306-5251

DOI: 10.1111/bcp.15409

Accession Number: WOS:000802920800001

Abstract: Aims Personal health records (PHRs) are more often used for medication reconciliation (MR). However, patients' adoption rate is low. We aimed to provide insight into patients' barriers and facilitators for the usage of a PHR for MR prior to an in- or outpatient visit. Methods A qualitative study was conducted among PHR users and non-users who had a planned visit at the outpatient rheumatology department or the inpatient cardiology or neurology department. About 1 week after the hospital visit, patients were interviewed about barriers and facilitators for the usage of a PHR for MR using a semi-structured interview guide based on the theoretical domains framework. Afterwards, data were analysed following thematic analysis. Results Ten PHR users and non-users were interviewed. Barriers and facilitators were classified in four domains: patient, application, process and context. We identified 14 barriers including limited (health) literacy and/or computer skills, practical and technical issues, ambiguity about who is responsible (the patient or the healthcare provider) and lack of data exchange and connectivity between applications. Besides that, ten facilitators were identified including being place and time independent, improve usability, target patients who benefit most and/or have sufficient skills, and integration of different applications. Conclusion Barriers and facilitators identified at the patient, application, process and context level, need to be addressed to effectively develop and implement PHRs for MR.

Title: Facilitators and barriers of intersectoral co-operation to promote healthier and more environmentally friendly behaviour: a qualitative evaluation through focus groups for the INHERIT project

Journal: BMC Public Health

Volume: 22

Issue: 1

Date: Mar

Short Title: Facilitators and barriers of intersectoral co-operation

to promote healthier and more environmentally friendly behaviour: a qualitative evaluation through focus groups for the INHERIT project
DOI: 10.1186/s12889-022-12974-8

Article Number: 617

Accession Number: WOS:000774960500018

Abstract: Background Tackling challenges related to health, environmental sustainability and equity requires many sectors to work together. This "intersectoral co-operation" can pose a challenge on its own. Research commonly focuses on one field or is conducted within one region or country. The aim of this study was to investigate facilitators and barriers regarding intersectoral co-operative behaviour as experienced in twelve distinct case studies in ten European countries. The COM-B behavioural system was applied to investigate which capabilities, opportunities and motivational elements appear necessary for co-operative behaviour. Method Twelve focus groups were conducted between October 2018 and March 2019, with a total of 76 participants (policymakers, case study coordinators, governmental institutes and/or non-governmental organisations representing citizens or citizens). Focus groups were organised locally and held in the native language using a common protocol and handbook. One central organisation coordinated the focus groups and analysed the results. Translated data were analysed using deductive thematic analysis, applying previous intersectoral co-operation frameworks and the COM-B behavioural system. Results Amongst the main facilitators experienced were having highly motivated partners who find common goals and see mutual benefits, with good personal relationships and trust (Motivation). In addition, having supportive environments that provide opportunities to co-operate in terms of support and resources facilitated co-operation (Opportunity), along with motivated co-operation partners who have long-term visions, create good external visibility and who have clear agreements and clarity on roles from early on (Capability). Barriers included not having necessary and/or structural resources or enough time, and negative attitudes from specific stakeholders. Conclusions This study on facilitators and barriers to intersectoral co-operation in ten European countries confirms findings of earlier studies. This study also demonstrates that the COM-B model can serve as a relatively simple tool to understand co-operative behaviour in terms of the capability, opportunity and motivation required amongst co-operation partners from different sectors. Results can support co-operators' and policymakers' understanding of necessary elements of intersectoral co-operation. It can help them in developing more successful intersectoral co-operation when dealing with challenges of health, environmental sustainability and equity.

Title: Developing a questionnaire to identify perceived barriers for implementing the Dutch physical therapy COPD clinical practice guideline

Journal: BMC Health Services Research

Volume: 13

Date: May

Short Title: Developing a questionnaire to identify perceived barriers for implementing the Dutch physical therapy COPD clinical practice guideline

DOI: 10.1186/1472-6963-13-159

Article Number: 159

Accession Number: WOS:000318527800001

Abstract: Background: Clinical practice guidelines have been developed to assist healthcare practitioners in clinical decision making. Publication of clinical practice guidelines does not automatically lead to their uptake and barrier identification has been recognized as an important step in implementation planning. This study aimed at developing a questionnaire to identify perceived barriers for implementing the Dutch COPD guideline for physical therapists and its recommended measurement instruments. Methods: An overall questionnaire, based on two existing questionnaires, was constructed to identify barriers and facilitators for implementing the COPD guideline. The construct of the questionnaire was assessed in a cross-sectional study among 246 chest physical therapists. Factor analysis was conducted to explore underlying dimensions. Psychometric properties were analyzed using Cronbach's alpha. Barriers and facilitators were assessed using descriptive statistics. Results: Some 139 physical therapists (57%) responded. Factor analysis revealed 4-factor and 5-factor solutions with an explained variance of 36% and 39% respectively. Cronbach's alpha of the overall questionnaire was 0.90, and varied from 0.66 to 0.92 for the different factors. Underlying domains of the 5-factor solution were characterized as: attitude towards using measurement instruments, knowledge and skills of the physical therapist, applicability of the COPD guideline, required investment of time & money, and patient characteristics. Physical therapists showed a positive attitude toward using the COPD guideline. Main barriers for implementation were required time investment and financial constraints. Conclusions: The construct of the questionnaire revealed relevant underlying domains for the identification of barriers and facilitators for implementing the COPD guideline. The questionnaire allowed for tailoring to the target group and may be used across health care professionals as basis for in-depth analysis of barriers to specific recommendations in guidelines. The results of the questionnaire alone do not provide sufficient information to inform the development of an implementation strategy. The infrastructure for developing the guideline can be used for addressing key barriers by the guideline development group, using

the questionnaire as well as in-depth analysis such as focus group interviews. Further development of methods for prospective identification of barriers and consequent tailoring of implementation interventions is required.

Title: Can using the functional resonance analysis method, as an intervention, improve patient safety in hospitals?: a stepped wedge design protocol

Journal: BMC Health Services Research

Volume: 21

Issue: 1

Date: Nov

Short Title: Can using the functional resonance analysis method, as an intervention, improve patient safety in hospitals?: a stepped wedge design protocol

DOI: 10.1186/s12913-021-07244-z

Article Number: 1228

Accession Number: WOS:000718096600005

Abstract: Background: Healthcare professionals are sometimes forced to adjust their work to varying conditions leading to discrepancies between hospital protocols and daily practice. We will examine the discrepancies between protocols, 'Work As Imagined' (WAI), and daily practice 'Work As Done' (WAD) to determine whether these adjustments are deliberate or accidental. The discrepancies between WAI and WAD can be visualised using the Functional Resonance Analysis Method (FRAM). FRAM will be applied to three patient safety themes: risk screening of the frail older patients; the administration of high-risk medication; and performing medication reconciliation at discharge. Methods: A stepped wedge design will be used to collect data over 16 months. The FRAM intervention consists of constructing WAI and WAD models by analysing hospital protocols and interviewing healthcare professionals, and a meeting with healthcare professionals in each ward to discuss the discrepancies between WAI and WAD. Safety indicators will be collected to monitor compliance rates. Additionally, the potential differences in resilience levels among nurses before and after the FRAM intervention will be measured using the Employee Resilience Scale (EmpRes) questionnaire. Lastly, we will monitor whether gaining insight into differences between WAI and WAD has led to behavioural and organisational change.

Discussion: This article will assess whether using FRAM to reveal

possible discrepancies between hospital protocols (WAI) and daily practice (WAD) will improve compliance with safety indicators and employee resilience, and whether these insights will lead to behavioural and organisational change.

Short Title: LOFIT (Lifestyle front Office For Integrating lifestyle medicine in the Treatment of patients): a novel care model towards community-based options for lifestyle change-study protocol

DOI: 10.1186/s13063-022-06960-z

Article Number: 114

Accession Number: WOS:000936877900001

Abstract: BackgroundA healthy lifestyle is indispensable for the prevention of noncommunicable diseases. However, lifestyle medicine is hampered by time constraints and competing priorities of treating physicians. A dedicated lifestyle front office (LFO) in secondary/tertiary care may provide an important contribution to optimize patient-centred lifestyle care and connect to lifestyle initiatives from the community. The LOFIT study aims to gain insight into the (cost-)effectiveness of the LFO. MethodsTwo parallel pragmatic randomized controlled trials will be conducted for (cardio)vascular disorders (i.e. (at risk of) (cardio)vascular disease, diabetes) and musculoskeletal disorders (i.e. osteoarthritis, hip or knee prosthesis). Patients from three outpatient clinics in the Netherlands will be invited to participate in the study. Inclusion criteria are body mass index (BMI) ≥ 25 (kg/m²) and/or smoking.

Participants will be randomly allocated to either the intervention group or a usual care control group. In total, we aim to include 552 patients, 276 in each trial divided over both treatment arms. Patients allocated to the intervention group will participate in a face-to-face motivational interviewing (MI) coaching session with a so-called lifestyle broker. The patient will be supported and guided towards suitable community-based lifestyle initiatives. A network communication platform will be used to communicate between the lifestyle broker, patient, referred community-based lifestyle initiative and/or other relevant stakeholders (e.g. general practitioner). The primary outcome measure is the adapted Fuster-BEWAT, a composite health risk and lifestyle score consisting of resting systolic and diastolic blood pressure, objectively measured physical activity and sitting time, BMI, fruit and vegetable consumption and smoking behaviour. Secondary outcomes include cardiometabolic markers, anthropometrics, health behaviours, psychological factors, patient-reported outcome measures (PROMs), cost-effectiveness measures and a mixed-method process evaluation. Data collection will be conducted at baseline, 3, 6, 9 and 12 months follow-up. Discussion This study will gain insight into the (cost-)effectiveness of a novel care model in which patients under treatment in secondary or tertiary care are referred to community-based lifestyle initiatives to change their lifestyle.

Title: Background and evaluation design of a community-based health-promoting school intervention: Fit Lifestyle at School and at Home (FLASH)

Journal: BMC Public Health

Volume: 19

Date: Jun

Short Title: Background and evaluation design of a community-based health-promoting school intervention: Fit Lifestyle at School and at Home (FLASH)

DOI: 10.1186/s12889-019-7088-3

Article Number: 784

Accession Number: WOS:000472845800004

Abstract: Background A community-based approach can be a promising strategy for implementing school-based health promotion aimed at stimulating healthy physical activity and dietary behaviour. Such an approach builds on the community capacity of multiple stakeholders, empowering them to design and implement tailored activities, supported by the whole school community. This paper describes the background and evaluation design of the community-based school intervention 'Fit Lifestyle at School and at Home' (FLASH) in four pre-vocational schools. FLASH includes four strategies for building the community capacity of students, school personnel and parents: 1) identifying leaders in each stakeholder group, 2) stimulating a school culture of participation, 3) having stakeholders design and implement tailored activities and 4) creating a network of local partners for structural embedding. The objective is to monitor the capacity-building processes of the FLASH intervention and to explore if these processes contribute to changes in community capacity. In addition, we will explore if the FLASH intervention is related to changes in PA, dietary behaviours and BMI of students. **Methods:** This study has a mixed methods design and uses a participatory action-oriented approach to monitor and evaluate changes in community capacity, tailored health-promotion activities and implementation processes. Methods include semi-structured interviews, focus groups, journals, document analysis and observational scans of the physical environment. In addition, changes in BMI, physical activity and dietary behaviours of pre-vocational students will be explored by comparing the four intervention schools to four control schools. Data are collected by questionnaires and anthropometric measurements. **Discussion:** The main strength of this study is its use of mixed methods to evaluate real-life processes of creating a healthy-school community. This will provide valuable information on capacity-building strategies for the structural embedding of health-promotion activities within school settings. The results could help schools become more empowered to adapt and adopt integral health-promotion interventions in daily practice that suit the needs of their communities, that are expected to be sustainable and that could lead to favourable changes in the PA and dietary behaviour of students. **Trial registration:** ISRCTN67201841; date registered: 09-05-2019, retrospectively registered.

Title: The leashing behavior of dog owners in different types of natural areas

Journal: Human Dimensions of Wildlife

Date: 2022 May

Short Title: The leashing behavior of dog owners in different types of natural areas

ISSN: 1087-1209

DOI: 10.1080/10871209.2022.2077482

Accession Number: WOS:000800213900001

Abstract: Encouraging compliance with dog leashing regulations in natural areas is a priority for land managers seeking to protect wildlife. We surveyed residents of Victoria, Australia, to document self-reported leashing behavior by dog owners in different habitat types, exploring demographic, attitudinal, and belief variables as predictors of compliance. We found support for leashing regulations among dog owners (n = 313) and those without dogs (n = 711), but generally low reported compliance by owners. Social norms about leashing predicted leashing at all areas, and habits (i.e., leashing where leashing was not regulated) predicted compliance with regulations. Older age and beliefs about wildlife protection predicted compliance in water-based areas (e.g., beaches, wetlands) and beliefs that off-leash roaming is beneficial to dogs predicted compliance in other natural areas (e.g., hiking trails). Exploring these context-based differences allows managers to identify and understand target groups to design tailored messaging and other behavior change interventions.

Title: Experiences of tobacco smoking and quitting in smokers with and without chronic obstructive pulmonary disease—a qualitative analysis

Journal: BMC Family Practice

Volume: 16

Date: Nov

Short Title: Experiences of tobacco smoking and quitting in smokers with and without chronic obstructive pulmonary disease—a qualitative analysis

DOI: 10.1186/s12875-015-0382-y

Article Number: 164

Accession Number: WOS:000364184400001

Abstract: Background: Smokers with chronic obstructive pulmonary disease (COPD) seem to be a special subgroup of smokers that have a more urgent need to quit smoking but might find it more difficult to do so. This study aimed to explore which justifications for tobacco smoking and experiences of quitting were commonly shared in smokers with and without COPD, and which, if any, were specific to smokers with COPD. Methods: In ten primary healthcare centres in the Netherlands, we conducted semi-structured, in-depth interviews in 10 smokers with and 10 smokers without COPD. Results: Three themes were generated: 'balancing the impact on health of smoking', 'challenging of autonomy by social interference', 'prerequisites for quitting'. All participants trivialized health consequences of smoking; those with COPD seemed to be less knowledgeable about smoking and health. Both groups of smokers found autonomy very important. Smokers with COPD were indignant about a perceived lack of empathy in their communication with doctors. Furthermore, smokers with COPD in particular had little faith in the efficacy of smoking cessation aids. Lastly, motivation for quitting was dominated by fluctuation and smokers with COPD specifically maintained that their vision of life was linked with quitting. Conclusions: The participants showed many similarities in their reasoning about smoking and quitting. The corresponding themes argue for a less paternalistic regime in the communication with smokers with attention required for the motivational stage and room made for smokers' own views, and with clear information and education. Furthermore, addressing social interactions, health perceptions and moral agendas in the communication with smokers with COPD may help to make smoking cessation interventions more suitable for them.

Title: Exploring barriers and facilitators of behavioural changes in dietary intake and physical activity: a qualitative study in older adults undergoing transcatheter aortic valve implantation

Journal: European Geriatric Medicine

Date: 2023 Apr

Short Title: Exploring barriers and facilitators of behavioural changes in dietary intake and physical activity: a qualitative study in older adults undergoing transcatheter aortic valve implantation

ISSN: 1878-7649

DOI: 10.1007/s41999-023-00774-1

Accession Number: WOS:000961733700001

Abstract: Key summary points **Aim** To explore barriers and facilitators regarding dietary intake and physical activity behaviour change in older patients undergoing transcatheter aortic valve implantation. **Findings** Three following themes were identified as barriers: (1) low physical capability, (2) healthy dietary intake and physical activity are not a priority at an older age and (3) ingrained habits and preferences. Three themes were identified as facilitators: (1) knowledge that dietary intake and physical activity are important for maintaining health, (2) norms set by family, friends and caregivers and (3) support from the social environment. **Message** Given the prevalent ambivalence among older cardiac patients towards behaviour change, healthcare professionals should address this mindset before implementing interventions to promote behaviour modification. **Purpose** The majority of older patients, scheduled for a cardiac procedure, do not adhere to international dietary intake and physical activity guidelines. The purpose of this study was to explore barriers and facilitators regarding dietary intake and physical activity behaviour change in older patients undergoing transcatheter aortic valve implantation (TAVI). **Methods** We conducted a qualitative study using semi-structured interviews with patients undergoing TAVI. Interviews were analysed by two independent researchers using thematic analysis, the capability, opportunity and motivation behaviour model was used as a framework. **Results** The study included 13 patients (82 +/- 6 years old, 6 females) until data saturation was reached. Six themes were identified, which were all applicable to both dietary intake and physical activity. Three following themes were identified as barriers: (1) low physical capability, (2) healthy dietary intake and physical activity are not a priority at an older age and (3) ingrained habits and preferences. Three following themes were identified as facilitators: (1) knowledge that dietary intake and physical activity are important for maintaining health, (2) norms set by family, friends and caregivers and (3) support from the social environment. **Conclusion** Our study found that older patients had mixed feelings about changing their behaviour. The majority initially stated that dietary intake and physical activity were not a priority at older age. However, with knowledge that behaviour could improve health, patients also stated willingness to change, leading to a state of ambivalence. Healthcare professionals may consider motivational interviewing techniques to address this ambivalence.

Short Title: The Trajectory of Nutritional Status and Physical Activity before and after Transcatheter Aortic Valve Implantation

DOI: 10.3390/nu14235137

Article Number: 5137

Accession Number: WOS:000896484000001

Abstract: It is suggested that older patients waiting for an elective surgical procedure have a poor nutritional status and low physical activity level. It is unknown if this hypothesis is true and if these conditions improve after a medical procedure. We aimed to determine the trajectory of both conditions before and after transcatheter aortic valve implantation (TAVI). Included patients (n = 112, age 81 +/- 5 years, 58% male) received three home visits (preprocedural, one and six months postprocedural). Nutritional status was determined with the mini nutritional assessment-short form (MNA-SF) and physical activity using an ankle-worn monitor (Stepwatch). The median MNA-SF score was 13 (11-14), and 27% of the patients were at risk of malnutrition before the procedure. Physical activity was 6273 +/- 3007 steps/day, and 69% of the patients did not meet the physical activity guidelines (>7100 steps/day). We observed that nutritional status and physical activity did not significantly change after the procedure (beta 0.02 [95% CI -0.03, 0.07] points/months on the MNA-SF and beta 16 [95% CI -47, 79] steps/month, respectively). To conclude, many preprocedural TAVI patients should improve their nutritional status or activity level. Both conditions do not improve naturally after a cardiac procedure.

Short Title: Who accepts nudges? nudge acceptability from a self-regulation perspective

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0260531

Article Number: e0260531

Accession Number: WOS:000754686900005

Abstract: Background Public acceptability of nudging is receiving increasingly more attention, but studies remain limited to evaluations of aspects of the nudge itself or (inferred intentions) of the nudger. Yet, it is important to investigate which individuals are likely to accept nudges, as those who are supposed to benefit from the implementation should not oppose it. The main objective of this study was to integrate research on self-regulation and nudging, and to examine acceptability of nudges as a function of self-regulation capacity and motivation. **Method** Participants (N = 301) filled in questionnaires about several components of self-regulation capacity (self-control, proactive coping competence, self-efficacy, perceived control and perceived difficulty) and motivation (autonomous motivation and controlled motivation). To evaluate nudge acceptability, we used three vignettes describing three types of nudges (default, portion size, and rearrangement) that stimulated either a pro-self behavior (healthy eating) or pro-social behavior (sustainable eating) and asked participants to rate the nudges on (aspects of) acceptability. **Results** Results revealed that there were substantial differences in acceptability between the three types of nudges, such that the default nudge was seen as less acceptable and the rearrangement nudge as most acceptable. The behavior that was stimulated did not affect acceptability, even though the nudges that targeted healthy eating were seen as more pro-self than the nudges targeting sustainable eating. From all self-regulation components, autonomous motivation was the only measure that was consistently associated with nudge acceptability across the three nudges. For self-regulatory capacity, only some elements were occasionally related to acceptability for some nudges. **Conclusion** The current study thus shows that people are more inclined to accept nudges that target behaviors that they are autonomously motivated for, while people do not meaningfully base their judgments of acceptability on self-regulatory capacity.

Short Title: Whole person HIV services: a social science approach
ISSN: 1746-630X

DOI: 10.1097/coh.0000000000000773

Accession Number: WOS:000897624700006

Abstract: Purpose of review Globally, approximately 38.4 million people who are navigating complex lives, are also living with HIV, while HIV incident cases remain high. To improve the effectiveness of HIV prevention and treatment service implementation, we need to understand what drives human behaviour and decision-making around HIV service use. This review highlights current thinking in the social sciences, emphasizing how understanding human behaviour can be leveraged to improve HIV service delivery. Recent findings The social sciences offer rich methodologies and theoretical frameworks for investigating how factors synergize to influence human behaviour and decision-making. Social-ecological models, such as the Behavioural Drivers Model (BDM), help us conceptualize and investigate the complexity of people's lives. Multistate and group-based trajectory modelling are useful tools for investigating the longitudinal nature of peoples HIV journeys. Successful HIV responses need to leverage social science approaches to design effective, efficient, and high-quality programmes. To improve our HIV response, implementation scientists, interventionists, and public health officials must respond to the context in which people make decisions about their health. Translating biomedical efficacy into real-world effectiveness is not simply finding a way around contextual barriers but rather engaging with the social context in which communities use HIV services.

Title: 'Don't forget the mouth!': a process evaluation of a public oral health project in community-dwelling frail older people

Journal: BMC Oral Health

Volume: 21

Issue: 1

Date: Oct

Short Title: 'Don't forget the mouth!': a process evaluation of a public oral health project in community-dwelling frail older people

ISSN: 1472-6831

DOI: 10.1186/s12903-021-01884-7

Article Number: 536

Accession Number: WOS:000708473500001

Abstract: Background: Older people are encouraged to remain community dwelling, even when they become care-dependent. Not every

dental practice is prepared or able to provide care to community-dwelling frail older people, while their ability to maintain oral health and to visit a dentist is decreasing, amongst others due to multiple chronic diseases and/or mobility problems. The public oral health project 'Don't forget the mouth! (DFTM!) aimed to improve the oral health of this population, by means of early recognition of decreased oral health as well as by establishing interprofessional care. A process evaluation was designed to scientifically evaluate the implementation of this project. Methods: The project was implemented in 14 towns in The Netherlands. In each town, health care professionals from a general practice, a dental practice, and a homecare organization participated. The process evaluation framework focused on fidelity, dose, adaptation, and reach. Each of the items were examined on levels of implementation: macro-level, meso-level, and micro-level. Mixed methods (i.e., quantitative and qualitative methods) were used for data collection. Results: The experiences of 50 health care professionals were evaluated with questionnaires, 22 semi-structured interviews were conducted, and the oral health of 407 community-dwelling frail older people was assessed. On each level of implementation, oral health care was integrated in the daily routine. On macro-level, education was planned (dose, adaptation), and dental practices organized home visits (adaptation). On meso-level, health care professionals attended meetings of the project (fidelity), worked interprofessionally, and used a screening-referral tool of the project DFTM! in daily practice (dose, adaptation, reach). On micro-level, the frail older people participated in the screening of oral health (fidelity, dose), had their daily oral hygiene care observed (adaptation) and supported if necessary, and some had themselves referred to a dental practice (reach). The semi-structured interviews also showed that the project increased the oral health awareness amongst health care professionals. Conclusions: The project DFTM! was, in general, implemented and delivered as planned. Factors that contributed positively to the implementation were identified. With large-scale implementation, attention is needed regarding the poor accessibility of the oral health care professional, financial issues, and increased work pressure.

Title: The health promoting sports club model: an intervention planning framework

Journal: Health Promotion International

Volume: 36

Issue: 3

Pages: 811-823

Date: Jun

Short Title: The health promoting sports club model: an intervention planning framework

ISSN: 0957-4824

DOI: 10.1093/heapro/daaa093

Accession Number: WOS:000693258500021

Abstract: Researchers and policymakers acknowledge sports clubs (SCs) as health promoting settings. Limited research links the health promoting sports club (HPSC) concept with evidence-driven strategies to provide SCs guidance to develop health promotion (HP) interventions. As implementation science insists on theoretically grounded interventions, the present work's objective was to provide SCs an evidence-driven intervention framework for planning, developing and implementing HP initiatives. Four iteratively sequenced steps were undertaken: (i) investigation of 'health promoting' indicators, (ii) adaptation of the HPSC concept to create the HPSC model, (iii) formulation of published evidence-driven guidelines into strategies and implementable intervention components (ICs) and (iv) merging the HPSC model with the ICs to create an intervention planning framework for SCs. First, researchers drafted five HPSC indicators. Second, they defined three SC levels (macro, meso and micro) and four health determinants (organizational, environmental, economic and social) to create an HPSC model. Third, researchers used published guidelines to develop 14 strategies with 55 ICs. Fourth, three workshops (one each with French master-level sport students, French sport and health professionals and Swedish sport and health professionals) had participants classify the ICs into the model. The HPSC model and intervention framework are starting points to plan, select and deliver interventions to increase SC HP. This planning framework is usable in several ways: (i) clubs can apply strategies to achieve specific goals, (ii) clubs can target specific levels with corresponding ICs and (iii) ICs can be used to address particular health determinants.

Pages: 35-56

Short Title: Keeping active for your health: A narrative review of theoretical models on the adoption and maintenance of physical activity behavior using a socio-ecological approach

ISSN: 0247-106X

DOI: 10.3917/sta.137.0035

Accession Number: WOS:000940221000003

Abstract: Despite growing evidence surrounding the benefits of physical activity, a high percentage of the population still do not achieve the recommended amount of physical activity, and interventions to counter this have been ineffective. To shed light on the engagement and maintenance factors of physical activity practice, we have conducted a review of existing theoretical models using a socio-ecological approach, considered in the present work as a meta-model, to describe their applications to physical activity, as well as their uses and limitations. Currently, the complexity of physical activity behavior has not been widely studied in the literature, as theoretical models are centered on the intra- and inter-individual levels and not on system approaches. Models mobilising a single level of the socio-ecological approach, which limits our understanding of its complexity, as it is supported by both implicit and explicit processes, as well as by individual-environment interactions. These are studied using linear statistical models and not dynamic, retroactive approaches, preventing the consideration of a whole system. Looking to the future, these gaps in our knowledge will have to be filled in order to advance our explanation of physical activity behavior change and maintenance.

Short Title: Recommendations and Improvements for the Evaluation of Integrated Community-Wide Interventions Approaches

ISSN: 2090-0708

DOI: 10.1155/2016/2385698

Article Number: 2385698

Accession Number: WOS:000392098500001

Abstract: Background. Integrated community-wide intervention approaches (ICIAs) are implemented to prevent childhood obesity. Programme evaluation improves these ICIAs, but professionals involved often struggle with performance. Evaluation tools have been developed to support Dutch professionals involved in ICIAs. It is unclear how useful these tools are to intended users. We therefore researched the facilitators of and barriers to ICIA programme evaluation as perceived by professionals and their experiences of the evaluation tools. Methods. Focus groups and interviews with 33 public health professionals. Data were analysed using a thematic

content approach. Findings. Evaluation is hampered by insufficient time, budget, and experience with ICIAs, lack of leadership, and limited advocacy for evaluation. Epidemiologists are regarded as responsible for evaluation but feel incompetent to perform evaluation or advocate its need in a political environment. Managers did not prioritise process evaluations, involvement of stakeholders, and capacity building. The evaluation tools are perceived as valuable but too comprehensive considering limited resources. Conclusion. Evaluating ICIAs is important but most professionals are unfamiliar with it and management does not prioritise process evaluation nor incentivize professionals to evaluate. To optimise programme evaluation, more resources and coaching are required to improve professionals' evaluation capabilities and specifically the use of evaluation.

Title: Ways to improve communication and support in healthcare centres according to people with aphasia and their relatives: a Dutch perspective

Journal: Aphasiology

Volume: 37

Issue: 1

Pages: 69-82

Date: Jan

Short Title: Ways to improve communication and support in healthcare centres according to people with aphasia and their relatives: a Dutch perspective

ISSN: 0268-7038

DOI: 10.1080/02687038.2021.1988505

Accession Number: WOS:000708245000001

Abstract: Background There is an increasing amount of research that investigates the needs and wishes of people with aphasia and their relatives with regards to improving the accessibility of communication with healthcare professionals (HCP). An important way to improve this is by training HCP to use supportive conversation techniques and tools. Objectives This study aimed to inform the development of such a training, by adding to previous findings in the literature regarding the experiences, needs and wishes of people with aphasia and their relatives. We were interested in their

experiences with the accessibility of communication and support from HCP and how they believed this can be improved. Methods An exploratory qualitative research design was chosen. Data was collected through qualitative semi-structured interviews with 20 people with aphasia and 12 relatives. The time post stroke ranged from 3 months to 41 years. Results Four themes described the data. According to people with aphasia and relatives (1) information transfer in healthcare settings and (2) the use of supported conversation techniques by HCP are inadequate, (3) there is a lack of shared decision-making in healthcare settings, and (4) support, guidance, counseling and education is mainly targeted at the person with aphasia. Conclusions People with aphasia and relatives reported a variety of positive and negative experiences in all themes. Even though guidelines and interventions have been developed to improve healthcare for people with aphasia and their relatives, we found that people still encounter substantial challenges in access to- and provision of information, shared decision-making, support and communication with HCP. The findings in this study provide some important recommendations for improvement, including the improvement of transfer of information, shared decision-making and individual support for the relatives.

Short Title: Evaluating communication partner training in healthcare centres: Understanding the mechanisms of behaviour change

ISSN: 1368-2822

DOI: 10.1111/1460-6984.12659

Accession Number: WOS:000683017800001

Abstract: Background Communication between people with aphasia and their healthcare professionals (HCPs) can be greatly improved when HCPs are trained in using supportive conversation techniques and tools. Communication partner training (CPT) is an umbrella term that covers a range of interventions that train the conversation partners of people with aphasia. Several CPT interventions for HCPs have been

developed and used to support HCPs to interact successfully with people with aphasia. Aims The objective of this study was to identify the mechanisms of change as a result of a Dutch CPT intervention, named CommuniCare, in order to evaluate and optimise the intervention. Methods & procedures A total of 254 HCPs from five different healthcare centres received CommuniCare. An explorative qualitative research design was chosen. Two interviews were conducted with 24 HCPs directly after and 4 months after receiving the training that was part of CommuniCare. Two conceptual frameworks were used to deductively code the interviews. HCPs' perspectives were coded into a four-part sequence following CIMO logic: the self-reported use of supportive conversation techniques or tools pre-intervention (Context), the intervention elements (Intervention) that evoked certain mechanisms (Mechanisms), resulting in the self-reported use of supportive conversation techniques and tools post-intervention (Outcomes). The Capabilities Opportunities Motivation-Behaviour (COM-B) model was used to fill in the Mechanisms component. Outcomes & results Three themes were identified to describe the mechanisms of change that led to an increase in the use of supportive conversation techniques and tools. According to HCPs, (i) information, videos, e-learning modules, role-play, feedback during training and coaching on the job increased their psychological capabilities; (ii) information and role-play increased their automatic motivations; and (iii) information, videos and role-play increased their reflective motivations. Remaining findings show HCPs' perspectives on various barriers to use supportive conversation techniques and tools. Conclusions & implications HCPs in this study identified elements in our CPT intervention that positively influenced their behaviour change. Of these, role-play and coaching on the job were particularly important. HCPs suggested this last element should be better implemented. Therefore, healthcare settings wishing to enhance HCPs' communication skills should first consider enhancing HCPs' opportunities for experiential learning. Second, healthcare settings should determine which HCPs are suitable to have a role as implementation support practitioners, to support their colleagues in the use of supportive conversation techniques and tools. What this paper adds What is already known on this subject? Several communication partner training (CPT) interventions for healthcare professionals (HCPs) have been developed and used to support HCPs to interact successfully with people with aphasia. To date, there is limited evidence of the mechanisms of change that explain exactly what changes in HCPs' behaviour after CPT and why these changes take place. What this paper adds to existing knowledge Evaluating our CPT intervention by identifying mechanisms of change from the perspectives of HCPs provided us with: (i) a better understanding of the elements that should be included in CPT interventions in different contexts; and (ii) an understanding of the important remaining barriers identified by HCPs to use supportive conversation techniques, even after CPT is implemented. What are the potential or actual clinical implications of this work? This study shows the different intervention elements in our CPT intervention that improve HCPs' capabilities, motivations or opportunities to use supportive conversation techniques and tools. Essential ingredients of CPT according to HCPs in this study

were role-play and coaching on the job by an expert and were linked to an increase in HCPs' motivations or beliefs about self-competency. Healthcare settings wishing to enhance HCPs' communication skills should therefore consider appointing implementation support practitioners to coach and support HCPs, and facilitate these practitioners to fulfil this role.

Title: Behavioural factors of Dutch pig producers related to control of toxoplasma gondii infections in pigs

Journal: Preventive Veterinary Medicine

Volume: 176

Date: Mar

Short Title: Behavioural factors of Dutch pig producers related to control of toxoplasma gondii infections in pigs

ISSN: 0167-5877

DOI: 10.1016/j.prevetmed.2020.104899

Article Number: 104899

Accession Number: WOS:000524340500007

Abstract: *Toxoplasma gondii* (*T. gondii*) is a food safety hazard which causes a substantial human disease burden. Infected pig meat is a common risk source of toxoplasmosis. Therefore, it is important to control *T. gondii* infections in pigs. Improving farm management to control the introduction risk likely contributes to that aim. A pig producer only implements control measures when he or she is aware of the underlying problem, wants to solve it, and is able to solve it. If a pig producer is not implementing appropriate control measures, behavioural change interventions can be introduced to overcome constraining behavioural factors. To aid in designing behaviour change interventions, this study analysed behavioural factors of Dutch pig producers in terms of capability, opportunity and motivation to control *T. gondii* infections in pigs. Key risk sources analysed focused on the life cycle of *T. gondii*, with cats as primary host, rodents as intermediate host, and uncovered feed as an important risk source. A survey was conducted among Dutch pig producers. Responses were analysed using descriptive and cluster analysis. Results showed that around 80% of the 67 responding pig producers was aware of key risk sources of *T. gondii* infections in pigs. Respondents also rated risk sources that are not known to increase the risk of *T. gondii* infections in pigs as somewhat important. Many respondents did not know about potential consequences of a *T. gondii* infection in pigs on human health. Two

third expected some impact on pig performance, which is incorrect because *T. gondii* generally does not make pigs ill. Most respondents indicated to have the motivation and opportunity to control the risk sources cats, rodents and uncovered feed. Three pig producer clusters were identified: one with higher capability to control rodents, one with lower motivation to control rodents and cats and to cover feed storages, and one with lower scores on the importance of rodent control for pigs, human health and farm profit. We conclude that, although many pig producers have knowledge about risk sources for and consequences of *T. gondii* infections in pigs, the public health impact and risks of *T. gondii* infections in pigs are not yet common knowledge among all Dutch pig producers. Furthermore, Dutch pig producers differ in opportunity and motivation to control *T. gondii* infections. Targeted interventions to address these specific constraining behavioural factors can help to improve the control of *T. gondii* infections in pigs.

Title: User characteristics associated with use of wrist-worn wearables and physical activity apps by adults with and without impaired speech-in-noise recognition: a cross-sectional analysis

Journal: International Journal of Audiology

Date: 2022 Nov

Short Title: User characteristics associated with use of wrist-worn wearables and physical activity apps by adults with and without impaired speech-in-noise recognition: a cross-sectional analysis

ISSN: 1499-2027

DOI: 10.1080/14992027.2022.2135031

Accession Number: WOS:000883315800001

Abstract: Objective: To study weekly use of smartwatches, fitness watches and physical activity apps among adults with and without impaired speech-in-noise (SIN) recognition, to identify subgroups of users. Design: Cross-sectional study. Study sample: Adults (aged 28-80 years) with impaired (n = 384) and normal SIN recognition (n = 341) as measured with a web-based digits-in-noise test, from the Netherlands Longitudinal Study on Hearing. Multiple logistic regression analyses were used to study differences and to build an association model. Results: Employed adults in both groups are more likely to use each type of fitness technology (all ORs >3.4, all p-values < 0.004). Specific to fitness watch use, adults living with others use it more (OR 2.5, 95%CI 1.1;5.8, p = 0.033) whereas those abstaining from alcohol (OR 0.3, 95%CI 0.1;0.6) or consuming >2 glasses/week (OR 0.4, 95%CI 0.2;0.81, overall p = 0.006) and hearing

aid users (OR 0.5, 95%CI 0.2;0.9, p = 0.024) make less use.
Conclusions: Subgroups of adults more and less likely to use fitness technology exist, but do not differ between adults with and without impaired SIN recognition. More research is needed to confirm these results and to develop interventions to increase physical activity levels among adults with hearing loss.

Title: Strategies to implement multifactorial falls prevention interventions in community-dwelling older persons: a systematic review

Journal: Implementation Science

Volume: 18

Issue: 1

Date: Feb

Short Title: Strategies to implement multifactorial falls prevention interventions in community-dwelling older persons: a systematic review

ISSN: 1748-5908

DOI: 10.1186/s13012-022-01257-w

Article Number: 4

Accession Number: WOS:000926697200001

Abstract: Background One-third of the community-dwelling older persons fall annually. Guidelines recommend the use of multifactorial falls prevention interventions. However, these interventions are difficult to implement into the community. This systematic review aimed to explore strategies used to implement multifactorial falls prevention interventions into the community. Methods A systematic search in PubMed (including MEDLINE), CINAHL (EBSCO), Embase, Web of Science (core collection), and Cochrane Library was performed and updated on the 25th of August, 2022. Studies reporting on the evaluation of implementation strategies for multifactorial falls prevention interventions in the community setting were included. Two reviewers independently performed the search, screening, data extraction, and synthesis process (PRISMA flow diagram). The quality of the included reports was appraised by means of a sensitivity analysis, assessing the relevance to the research question and the methodological quality (Mixed Method Appraisal Tool). Implementation strategies were reported according to Proctor et al.'s (2013) guideline for specifying and reporting implementation strategies and the Taxonomy of Behavioral Change Methods of Kok et al. (2016). Results Twenty-

three reports (eighteen studies) met the inclusion criteria, of which fourteen reports scored high and nine moderate on the sensitivity analysis. All studies combined implementation strategies, addressing different determinants. The most frequently used implementation strategies at individual level were "tailoring," "active learning," "personalize risk," "individualization," "consciousness raising," and "participation." At environmental level, the most often described strategies were "technical assistance," "use of lay health workers, peer education," "increasing stakeholder influence," and "forming coalitions." The included studies did not describe the implementation strategies in detail, and a variety of labels for implementation strategies were used. Twelve studies used implementation theories, models, and frameworks; no studies described neither the use of a determinant framework nor how the implementation strategy targeted influencing factors. Conclusions This review highlights gaps in the detailed description of implementation strategies and the effective use of implementation frameworks, models, and theories. The review found that studies mainly focused on implementation strategies at the level of the older person and healthcare professional, emphasizing the importance of "tailoring," "consciousness raising," and "participation" in the implementation process. Studies describing implementation strategies at the level of the organization, community, and policy/society show that "technical assistance," "actively involving stakeholders," and "forming coalitions" are important strategies.

Accession Number: WOS:000779919400009

Abstract: Background: Laboratory stewardship programs aim to improve the use of laboratory resources, including reducing inappropriate testing. These programs should engage all healthcare stakeholder

groups, including all levels of laboratory staff. Medical laboratory technologists (MLTs) are highly skilled professionals and are well positioned to play a supportive role in stewardship but may be overlooked. The aim of this study is to identify the barriers to MLT participation in stewardship activities. Methods: We developed and disseminated a self-administered survey to MLTs in Canada to assess their knowledge and attitudes toward inappropriate laboratory utilization and explore perceived barriers to taking on an active role in stewardship initiatives. Themes were identified in open-ended responses and mapped to the Theoretical Domains Framework (TDF). Results: MLTs feel accountable for helping ensure appropriate resource use and recognize that it is an important issue to address. However, they experience significant barriers and have low intention to act. The self-reported barrier most frequently described was lack of time arising from excessive workloads, but other constraints exist. Themes mapped to the TDF most strongly in the domain of environmental context and resources, supporting evidence that workplace structure and culture play key roles in impacting this group. Conclusions: To meaningfully engage MLTs in stewardship activities, these barriers should be addressed. Highlighting MLT expertise and creating communication structures and opportunities for their unique contributions may be fruitful.

Issue: 6

Pages: 471--

Date: Jun

Short Title: Development and implementation of a clinician report to reduce unnecessary urine drug screen testing in the ED: a quality improvement initiative

ISSN: 1472-0205

DOI: 10.1136/emered-2020-210009

Accession Number: WOS:000728295000001

Abstract: Background Unnecessary testing is a problem-facing healthcare systems around the world striving to achieve sustainable care. Despite knowing this problem exists, clinicians continue to order tests that do not contribute to patient care. Using behavioural and implementation science can help address this problem. Locally, audit and feedback are used to provide information to clinicians about their performance on relevant metrics. However, this is often done without evidence-based methods to optimise uptake. Our objective was to improve the appropriate use of laboratory tests in the ED using evidence-based audit and feedback and behaviour change techniques. Methods Using the behaviour change wheel, we implemented an audit and feedback tool that provided information to ED physicians about their use of laboratory tests; specifically, we focused on education and review of the appropriate use of urine drug screen tests. The report was designed in collaboration with end users to help maximise engagement. Following development of the report, audit and feedback sessions were delivered over an 18-month period. Results Data on urine drug screen testing were collected continually throughout the intervention period and showed a sustained decrease among ED physicians. Test use dropped from a monthly departmental average of 26 urine drug screen tests per 1000 patient visits to only eight tests per 1000 patient visits following the initiation of the audit and feedback intervention. Conclusion Audit and feedback reduced unnecessary urine drug screen testing in the ED. Regular feedback sessions continuously engaged physicians in the audit and feedback intervention and allowed the implementation team to react to changing priorities and feedback from the clinical group. It was important to include the end users in the design of audit and feedback tools to maximise physician engagement. Inclusion in this process can help ensure physicians adopt a sense of ownership regarding which metrics to review and provides a key component for the motivation aspect of behaviour change. Departmental leadership is also critical to the process of implementing a successful audit and feedback initiative and achieving sustained behaviour change.

Title: Applying the capability, opportunity, motivation, and
behavior model to identify opportunities to increase pharmacist
comfort dispensing naloxone in Texas: A structural equation modeling
approach

Journal: International Journal of Drug Policy

Volume: 83

Date: Sep

Short Title: Applying the capability, opportunity, motivation, and
behavior model to identify opportunities to increase pharmacist
comfort dispensing naloxone in Texas: A structural equation modeling
approach

ISSN: 0955-3959

DOI: 10.1016/j.drugpo.2020.102827

Article Number: 102827

Accession Number: WOS:000614426400016

Abstract: Background: The prevalence of opioid use and misuse in the
United States contributed to 48,000 opioid related deaths in 2018.
Naloxone, a potent opioid reversal agent, can be dispensed by
pharmacists without a prescription, however few do so. Previous
studies on naloxone dispensing have contributed to our understanding
of the determinants of naloxone in community pharmacy, however, none
have focused on comprehensive behavioral change. This study utilized
the Capability, Opportunity, Motivation, and Behavior (COM-B) model,
a behavioral change and intervention design framework, to examine
community pharmacists' comfort dispensing naloxone. Methods: A 48-
item questionnaire grounded in the COM-B and theoretical domains
framework was developed and mailed to 1,000 community pharmacists in
Texas, USA using a modified Dillman cross-sectional survey design.
Confirmatory factor analysis was used to refine and establish
dimensionality of the hypothesized scales and structural equation
modeling was used to estimate the fit of the COM-B in explaining
pharmacists' comfort dispensing naloxone. Results: The usable
response rate was 19.4%. Of surveyed pharmacists, 29.7% had ever had
a patient request naloxone and 35.1% had dispensed naloxone without
a prescription. Capability and opportunity explained 60% of the
variance in motivation. Opportunity and motivation were the most
salient predictors of comfort dispensing naloxone. Together,
capability, opportunity, and motivation explained 78.1% of variance
in pharmacists' comfort dispensing naloxone, indicating that the
COM-B model is useful in this setting. Conclusion: Despite previous
findings, policy interventions to increase naloxone dispensing
should go beyond providing additional education to the pharmacy
workforce. Rather, these results suggest that a complex intervention

designed with pharmacist input that enables them to act autonomously and evaluate whether patients need naloxone may increase their comfort dispensing. Without collaboration from pharmacy and managed care corporations, dissemination efforts will continue to be limited.

Title: 'All My Animals Are Equal, but None Can Survive without the Horse'. The Contribution of Working Equids to the Livelihoods of Women across Six Communities in the Chimaltenango Region of Guatemala

Journal: Animals

Volume: 11

Issue: 6

Date: Jun

Short Title: 'All My Animals Are Equal, but None Can Survive without the Horse'. The Contribution of Working Equids to the Livelihoods of Women across Six Communities in the Chimaltenango Region of Guatemala

ISSN: 2076-2615

DOI: 10.3390/ani11061509

Article Number: 1509

Accession Number: WOS:000665428000001

Abstract: Simple Summary Working equids are often absent from higher level policy interventions, and the global standard of their welfare is low. Understanding the social and cultural context of their contributions to human livelihoods generates evidence supporting the importance of their inclusion in livestock welfare programmes. Although there is increasing evidence globally that working equids contribute to women's livelihoods and that women facilitate equid welfare, there is a well recognised gender gap in access to extension services. This study aims to investigate how working equids contribute to women's livelihoods in six communities in Guatemala, using information from 34 face-to-face interviews. Results show that working equids support women's livelihoods by generating income, saving time, feeding livestock and reducing domestic drudgery. Thirty-two women played a major role in the daily husbandry of working equids, and 31 expressed an interest in gaining more knowledge in equid care. This study explores the relationship between working equids and women in a local context, using the concept of 'One Welfare', and investigates the knowledge gaps that exist in the daily husbandry of horses, donkeys and mules. It emphasises the need for equid welfare organisations to understand

women's roles in their target communities and recognise what prevents women from accessing educational resources. It is widely assumed that working equid husbandry is carried out by men, and women are often not recognised as facilitating equid welfare. The aim of this study is to investigate how working equids contribute to women's livelihoods in six of the World Horse Welfare programme target communities in Guatemala and determine what roles women have in their care. Thirty-four face-to-face interviews were carried out and data were analysed using both quantitative and qualitative methods. This study found that working equids support women by reducing domestic drudgery, generating income, feeding livestock and saving time. Thirty-two women played a major role in the care of one or more equids, and overall, women did not feel that they knew enough about equid husbandry. Thirty-one women said they would attend training opportunities if the advertising was clear and they felt that women were able to join. This study recognises the contribution of working equids to women's livelihoods, describes the roles women play in equid husbandry and addresses the discrepancies between women's roles and their capacity to undertake these tasks. This emphasises the need for extension services to include and cater for women, improving equid welfare and their ability to continue supporting women's livelihoods.

Accession Number: WOS:000369471600006

Abstract: In Australia, fruit and vegetable consumption is lower than recommended while discretionary foods (i.e., foods high in fat, sugar, and salt) are eaten in excess. Long-haul truck drivers are a group at risk of unhealthy eating but have received limited attention in the health literature. We aimed to examine long haul truck drivers eating decisions in order to develop theory-based and empirically-driven health messages to improve their healthy food choices. Drawing on the Theory of Planned Behavior, three phased formative research was conducted using self-report surveys. Phase 1 (N = 30, M-age = 39.53, SDage = 10.72) identified modal salient beliefs about fruit and vegetable (FV) intake and limiting

discretionary choices (DC). There were nine behavioral and seven normative beliefs elicited for both FV and DC; while nine and five control beliefs were elicited for FV and DC, respectively. Phase 2 (N = 148, M-age = 44.23, SDage = 12.08) adopted a prospective design with one week follow-up to examine the predictors of FV and DC intention and behavior. A variety of behavioral and control beliefs were predictive of FV and DC intention and behavior. Normative beliefs were predictive of FV intention and behavior and DC intention only. Phase 3 (N = 20, M-age = 46.9, SDage = 12.85) elicited the reasons why each belief is held/solutions to negative beliefs, that could be used as health messages. In total, 40 reasons/solutions were identified: 26 for FV and 14 for DC. In summary, we found that specific behavioral, normative and control beliefs influenced FV and DC eating decisions. These results have implications for truck driver's health and provide formative research to inform future interventions to improve the food choices of a unique group who are at risk of unhealthy eating behaviors. Short Title: Self-Regulations for Educators Questionnaire (SREQ) for implementation programming

ISSN: 1869-6716

DOI: 10.1093/tbm/ibaa092

Accession Number: WOS:000732777000004

Abstract: The adoption and dissemination of evidence-based programs is predicated on multiple factors, including the degree to which key stakeholders are motivated to implement program best practices. The present study focuses on the development of indicators that capture motivations of teachers to adopt school wellness programming since personal motivations are central to achieving sustainable impacts in these settings. The study specifically describes the measurement development and validation of the Self-Regulations for Educators Questionnaire (SREQ), designed to measure educators' autonomous and controlled motivation for adopting evidence-based programming in their schools. A naturalistic design to study motivation to adopt aspects of NFL PLAY60 programming through the NFL PLAY60 FitnessGram

Partnership Project was used. A total of 1,106 teachers completed the SREQ online. Internal validity was assessed through exploratory and confirmatory factor analysis, and predictive validity using structural equation modeling (SEM). The results supported the two factor solution with separate items capturing aspects of autonomous and controlled motivation. Both factors had good internal reliability and the item-total correlation coefficients were above 0.40 for both factors. The results also supported the predictive validity as autonomous motivation positively predicted the level of overall engagement, teaching effectiveness, fitness testing reports sent home, and completion of fitness testing with students ($p < .05$). Controlled motivation positively predicted whether the teachers conducted fitness testing and the engagement of Play 60 Challenge ($p < .05$). Findings suggest that the SREQ displays a number of psychometric characteristics that make the instrument useful for examining motivation of providers to implement evidence-based best practices.

Article Number: 113896

Accession Number: WOS:000668752500025

Abstract: Background: Florence Nightingale lamented that nurses were seen as merely obedient and devoted. Our two previous oncology studies demonstrated the continuum of strictly curative care and paternalistic care practices among healthcare professionals. At a time when France has just formalized the nursing sciences, this article seeks to shed light on the specifics of the nursing role in oncology and the evolution of standard nursing practices in a rapidly changing environment. Methods: We performed a secondary qualitative analysis, on the same dataset, focusing only on the nursing population (n = 20), to answer a question not excavated through the two previous studies. The COREQ guidelines were used to ensure the rigorous reporting of this study. Findings: The data analysis show that the inherent role and application of medical directives characterise the profession of nursing in oncology. The former is essentially an intermediary role, whereby the nurse directs the patient to a professional specialist for a problem identified through clinical nursing expertise. The latter is expressed through the application of various medical instructions. The results highlight a minor evolution in nursing practices, despite an evolving environment. Oncology nurses do not seem to authorise themselves to become agents of change. Conclusion: Various reforms and studies of the nursing profession, as well as public funding of programmes dedicated to nursing research were designed to facilitate the integration of Evidence Based Practice to encourage the autonomy of nurses in their practices. Education in research is fundamental to awakening critical thinking and considering scientific validity as vital. Continuing education and leadership by advanced practice nurses are two strong levers to acculturate registered nurses to gaining empowerment, improving their ability to question practices, helping them adapt to increasing the quality of care and making oncology nursing care more efficient. For cancer nurses in France, research education is the challenge to be met.

Abstract: The achievement of national pledges that are compatible with the Paris Agreements warming limit of 1.5C is a massive challenge, as it requires not only an acceleration of technological innovation, but also a socio-economic and cultural transformation. Reducing uncertainties demands a better integration of behavioural evolutions in models exploring future energy pathways, including non-monetary barriers and drivers to technology diffusion. This study provides suggestions on incorporating social mechanisms of change such as resistance to change and the diffusion of environmental values into a UK-focused probabilistic energy system model, with a focus on people's attitudes towards residential heating technologies. We also offer a comprehensive literature review on interdisciplinary energy transitions modelling and exploratory scenarios embedding climate risks perceptions. We argue that efficient policy-making to meeting netzero emissions targets must fully embrace whole-system approaches, support the more constrained segments of society, and account for interconnected socio-political factors.

Title: Can needle and syringe programmes and opiate substitution therapy achieve substantial reductions in hepatitis C virus prevalence? Model projections for different epidemic settings
Journal: Addiction
Volume: 107
Issue: 11
Pages: 1984–1995
Date: Nov
Short Title: Can needle and syringe programmes and opiate substitution therapy achieve substantial reductions in hepatitis C virus prevalence? Model projections for different epidemic settings
ISSN: 0965-2140
DOI: 10.1111/j.1360-0443.2012.03932.x
Accession Number: WOS:000309596900016
Abstract: Aims To investigate the impact of scaling-up opiate

substitution therapy (OST) and high coverage needle and syringe programmes (100%NSPobtaining more sterile syringes than you inject) on HCV prevalence among injecting drug users (IDUs). Design Hepatitis C virus HCV transmission modelling using UK estimates for effect of OST and 100%NSP on individual risk of HCV infection. Setting Range of chronic HCV prevalent (20/40/60%) settings with no OST/100%NSP, and UK setting with 50% coverage of both OST and 100%NSP. Participants Injecting drug users. Measurements Decrease in HCV prevalence after 520 years due to scale-up of OST and 100%NSP to 20/40/60% coverage in no OST/100%NSP settings, or from 50% to 60/70/80% coverage in the UK setting. Findings For 40% chronic HCV prevalence, scaling-up OST and 100%NSP from 0% to 20% coverage reduces HCV prevalence by 13% after 10 years. This increases to a 24/33% relative reduction at 40/60% coverage. Marginally less impact occurs in higher prevalence settings over 10 years, but this becomes more pronounced over time. In the United Kingdom, without current coverage levels of OST and 100%NSP the chronic HCV prevalence could be 65% instead of 40%. However, increasing OST and 100%NSP coverage further is unlikely to reduce chronic prevalence to less than 30% over 10 years unless coverage becomes =80%. Conclusions Scaling-up opiate substitution therapy and high coverage needle and syringe programmes can reduce hepatitis C prevalence among injecting drug users, but reductions can be modest and require long-term sustained intervention coverage. In high coverage settings, other interventions are needed to further decrease hepatitis C prevalence. In low coverage settings, sustained scale-up of both interventions is needed.

DOI: 10.7150/ijms.5800

Accession Number: WOS:000324409200013

Abstract: Background: To study the potentially avoidable decision-

making delay in acute myocardial infarction (AMI) adults male with different psychological characteristics a nationwide multicentre study was conducted in Italy by the 118 Coronary Care Units (CCUs). Method: 929 AMI patients consecutively presented to the CCU in a conscious condition less than two hours, 2–6 hours, 6–12 hours, and more than 12 hours after symptom onset and completing the Disease Distress Questionnaire (DDQ) were enrolled in a multicentre case-control study. The DDQ collects information regarding the decision time to seek help, and includes a set of items assessing psychological factors and pain-related symptoms. The relationship between the perceived threat and the delay due to decision-making was evaluated by means of a multivariate model using LISREL 8 structural equation modelling. Results: The delay significantly correlated with perceived threat, which was mainly related to somatic awareness. It was only slightly related to pain and was not associated with any of the other variables. Perceived threat was also related to psychological upset, fear and health worries, the first of which was considerably influenced by emotional instability. Conclusion: Somatic awareness is the main dimension affecting perceived threat, but subjective pain intensity affects the delay both directly and indirectly. The core of the model is the relationship between perceived threat and the delay due to decision-making. The importance of subjective pain intensity is well documented, but it is still not clear how subjective and objective pain interact.

Short Title: Relationships between Farmer Psychological Profiles and Farm Business Performance amongst Smallholder Beef and Poultry Farmers in South Africa

DOI: 10.3390/agriculture13030548

Article Number: 548

Accession Number: WOS:000983472400001

Abstract: Beef cattle and poultry are critically important livestock for improving household food security and alleviating poverty

amongst smallholder farmers in South Africa. In this paper, our goal is to examine the relationships between farmer psychological profiles and farm business performance of commercially oriented beef cattle and poultry smallholder farmers in South Africa. We employ a multipronged interdisciplinary approach to test the theory of planned behaviour and its relationship to farm business performance. First, a behavioural science-informed survey instrument was employed to collect data from randomly selected farmer participants in two major beef and poultry projects undertaken by the authors. Second, a latent profile analysis was used to identify the psychological profiles of those farmers. Third, traditional and estimated indicators of farm business performance were obtained using descriptive and econometric-based approaches, including logistic regression and stochastic frontier analyses. The estimated farm business performance indicators were correlated with the psychological profiles of farmers. Results from the latent profile analysis showed three distinct profiles of beef and poultry farmers clearly differentiated by their ability to control and succeed in their farm business enterprises; criteria included attitude, openness to ideas, personality, perceived capabilities, self-efficacy, time orientation, and farm- and personal-related concerns. Profile 1 ('Fatalists') scored themselves negatively on their ability to control and succeed in their business enterprises. The majority of farmers were generally neutral about their ability to control and succeed in their businesses (Profile 2, 'Traditionalists'), while a relatively small group of farmers were confident of their ability to succeed (Profile 3, 'Entrepreneurs'). We found evidence of significant differences in farm business performance amongst the different profiles of farmers. As far as we can determine, this is the only study to have assessed farm business performance based on a differentiation of farmers' psychological profiles. Our results provide a framework to further investigate whether particular types of on-farm interventions and training methods can be customised for different segments of farmers based on their preferred learning styles.

Accession Number: WOS:000734227900001

Abstract: Recent decades have seen increased efforts internationally to prevent the use of anabolic androgenic steroids (AAS) and other image and performance-enhancing drugs (IPEDs) in gyms and fitness environments. Yet, very little is known about effective prevention strategies. This study aimed to identify key risk factors for AAS use and assess the relevance of these risk factors as targets of intervention. Seventy four (n = 74) IPED experts participated in the Anabolic Steroid Prevention Survey (response rate: 62.4%). A total of 18 psychosocial and two behavioral risk factors identified in a literature review were rated by participants along two dimensions: importance and preventability. The results show that most IPED experts (91%) believe that preventing AAS use in gyms is important to public health, and that AAS use can be prevented to a certain degree (91%), but not eliminated altogether (85%). Based on participants' assessment, six risk factors were categorised as very promising (e.g. the descriptive norm and poor knowledge on AAS alternatives), 10 as promising (e.g. body dissatisfaction and drive for muscularity), and four as unpromising but worthy of consideration (e.g. AAS-using peers and perceived benefits of AAS use). To effectively prevent AAS use in gyms, interventions should attempt to reduce these risk factors.

Short Title: How Can We Better Prevent Obesity in Children?

ISSN: 2162-4968

DOI: 10.1007/s13679-015-0167-6

Accession Number: WOS:000214755200009

Abstract: The aim of this review is to discuss the state of the art regarding the field of health promotion in the context of childhood obesity prevention in order to learn how we can better prevent childhood obesity. Challenges have been identified that exist within the different steps of health promotion programme development and

implementation. Important steps forward include studying behaviours and determinants of behaviours as clusters, upgrading the importance of distal environmental factors in modelling determinants and understanding determinants as a dynamic system: a complex of interacting elements. An important note is that the process of implementation and the analysis thereof should more often come before the analysis of behaviours and the determinants of behaviour. In applied research, the expertise from the 'real world' practitioners should be used in an early stage to find out whether the answers on research questions really help us in preventing childhood obesity.

ISSN: 0033-3352
DOI: 10.1111/puar.12564
Accession Number: WOS:000379761300009
Abstract: Many of the most significant challenges in health care—such as smoking, overeating, and poor adherence to evidence-based guidelines—will only be resolved if we can influence behavior. The traditional policy tools used when thinking about influencing behavior include legislation, regulation, and information provision. Recently, policy analysts have shown interest in policies that "nudge" people in particular directions, drawing on advances in understanding that behavior is strongly influenced in largely automatic ways by the context within which it is placed. This article considers the theoretical basis for why nudges might work and reviews the evidence in health behavior change. The evidence is structured according to the Mindspace framework for behavior change. The conclusion is that insights from behavioral economics offer powerful policy tools for influencing behavior in health care. This article provides public administration practitioners with an accessible summary of this literature, putting these insights into practical use.

Abstract: Evidence from the behavioural sciences, notably economics

and psychology, has profoundly changed the way policymakers and practitioners view expert advice to consumers. In this article, we take stock of the behavioural science evidence on financial advice and explore its implications for the profession. We organise the evidence in a comprehensive theoretical framework that also serves a practical purpose: the design of behaviour change interventions. We suggest various ways in which financial advisers can use the insights from behavioural science to improve the take-up and effectiveness of their advice. Finally, we discuss ethical and practical considerations for the financial advisor wishing to put behavioural science knowledge to use.

Abstract: Background Health systems often fail to use evidence in clinical practice. In maternal and perinatal health, the majority of maternal, fetal and newborn mortality is preventable through implementing effective interventions. To meet this challenge, WHO's Department of Reproductive Health and Research partnered with the Knowledge Translation Program at St. Michael's Hospital (SMH), University of Toronto, Canada to establish a collaboration on knowledge translation (KT) in maternal and perinatal health, called the GREAT Network (Guideline-driven, Research priorities, Evidence synthesis, Application of evidence, and Transfer of knowledge). We applied a systematic approach incorporating evidence and theory to identifying barriers and facilitators to implementation of WHO maternal health recommendations in four lower-income countries and to identifying implementation strategies to address these. Methods We conducted a mixed-methods study in Myanmar, Uganda, Tanzania and Ethiopia. In each country, stakeholder surveys, focus group discussions and prioritization exercises were used, involving

multiple groups of health system stakeholders (including administrators, policymakers, NGOs, professional associations, frontline healthcare providers and researchers). Results Despite differences in guideline priorities and contexts, barriers identified across countries were often similar. Health system level factors, including health workforce shortages, and need for strengthened drug and equipment procurement, distribution and management systems, were consistently highlighted as limiting the capacity of providers to deliver high-quality care. Evidence-based health policies to support implementation, and improve the knowledge and skills of healthcare providers were also identified. Stakeholders identified a range of tailored strategies to address local barriers and leverage facilitators. Conclusion This approach to identifying barriers, facilitators and potential strategies for improving implementation proved feasible in these four lower-income country settings. Further evaluation of the impact of implementing these strategies is needed.

Title: Implementing the WHO Labour Care Guide to reduce the use of Caesarean section in four hospitals in India: protocol and statistical analysis plan for a pragmatic, stepped-wedge, cluster-randomized pilot trial

Journal: Reproductive Health

Volume: 20

Issue: 1

Date: Jan

Short Title: Implementing the WHO Labour Care Guide to reduce the use of Caesarean section in four hospitals in India: protocol and statistical analysis plan for a pragmatic, stepped-wedge, cluster-randomized pilot trial

DOI: 10.1186/s12978-022-01525-4

Article Number: 18

Accession Number: WOS:000916086800001

Abstract: BackgroundThe World Health Organization (WHO) Labour Care Guide (LCG) is a paper-based labour monitoring tool designed to facilitate the implementation of WHO's latest guidelines for effective, respectful care during labour and childbirth. Implementing the LCG into routine intrapartum care requires a strategy that improves healthcare provider practices during labour and childbirth. Such a strategy might optimize the use of Caesarean section (CS), along with potential benefits on the use of other obstetric interventions, maternal and perinatal health outcomes, and women's experience of care. However, the effects of a strategy to implement the LCG have not been evaluated in a randomised trial. This study aims to: (1) develop and optimise a strategy for implementing the LCG (formative phase); and (2) To evaluate the implementation of the LCG strategy compared with usual care (trial phase).

MethodsIn the formative phase, we will co-design the LCG strategy with key stakeholders informed by facility assessments and provider surveys, which will be field tested in one hospital. The LCG strategy includes a LCG training program, ongoing supportive supervision from senior clinical staff, and audit and feedback using the Robson Classification. We will then conduct a stepped-wedge, cluster-randomized pilot trial in four public hospitals in India, to evaluate the effect of the LCG strategy intervention compared to usual care (simplified WHO partograph). The primary outcome is the CS rate in nulliparous women with singleton, term, cephalic pregnancies in spontaneous labour (Robson Group 1). Secondary outcomes include clinical and process of care outcomes, as well as women's experience of care outcomes. We will also conduct a process evaluation during the trial, using standardized facility assessments, in-depth interviews and surveys with providers, audits of completed LCGs, labour ward observations and document reviews. An economic evaluation will consider implementation costs and cost-effectiveness.

DiscussionFindings of this trial will guide clinicians, administrators and policymakers on how to effectively implement the LCG, and what (if any) effects the LCG strategy has on process of care, health and experience outcomes. The trial findings will inform the rollout of LCG internationally.

Trial registration: CTRI/2021/01/030695 (Protocol version 1.4, 25 April 2022). Plain language summary

The new WHO Labour Care Guide (LCG) is an innovative partograph that emphasises women-centred, evidence-based care during labour and childbirth. Together with clinicians working at four hospitals in India, we will develop and test a strategy to implement the LCG into routine care in labour wards of these hospitals. We will use a randomised trial design where this LCG strategy is introduced sequentially in each of the four hospitals, in a random order. We will collect data on all women giving birth and their newborns during this period and analyse whether the LCG strategy has any effects on the use of Caesarean section, women's and newborn's health outcomes, and women's experiences during labour and childbirth. While the trial is being conducted, we will also collect qualitative and quantitative data from doctors, nurses and midwives working in these hospitals, to understand their perspectives and experiences of using the LCG in their day-to-day work. In addition, we will collect economic data to understand how much the LCG strategy costs, and how much money it might save if it is effective.

Through this study, our international collaboration will generate critical evidence and innovative tools to support implementation of the LCG in other countries.

Short Title: Using the Medical Research Council framework and public involvement in the development of a communication partner training intervention for people with primary progressive aphasia (PPA): Better Conversations with PPA

DOI: 10.1186/s12877-021-02561-8

Article Number: 642

Accession Number: WOS:000718836300001

Abstract: Background Primary progressive aphasia is a language-led dementia resulting in a gradual dissolution of language. Primary progressive aphasia has a significant psychosocial impact on both the person and their families. Speech and language therapy is one of the only available management options, and communication partner training interventions offer a practical approach to identify strategies to support conversation. The aim of this study was to define and refine a manual and an online training resource for speech and language therapists to deliver communication partner training to people with primary progressive aphasia and their communication partners called Better Conversations with primary progressive aphasia. Methods The Better Conversations with primary progressive aphasia manual and training program were developed using the Medical Research Council framework for developing complex interventions. The six-stage development process included 1.

Exploratory review of existing literature including principles of applied Conversation Analysis, behaviour change theory and frameworks for chronic disease self-management, 2. Consultation and co-production over 12 meetings with the project steering group comprising representatives from key stakeholder groups, 3. Development of an initial draft, 4. Survey feedback followed by a consensus meeting using the Nominal Group Techniques with a group of speech and language therapists, 5. Two focus groups to gather opinions from people with PPA and their families were recorded, transcribed and Thematic Analysis used to examine the data, 6. Refinement. Results Co-production of the Better Conversations with primary progressive aphasia resulted in seven online training modules, and a manual describing four communication partner training intervention sessions with accompanying handouts. Eight important components of communication partner training were identified in the aggregation process of the Nominal Group Technique undertaken with 36 speech and language therapists, including use of video feedback to focus on strengths as well as areas of conversation breakdown. Analysis of the focus groups held with six people with primary progressive aphasia and seven family members identified three themes 1) Timing of intervention, 2) Speech and language therapists' understanding of types of dementia, and 3) Knowing what helps. These data informed refinements to the manual including additional practice activities and useful strategies for the future. Conclusions Using the Medical Research Council framework to develop an intervention that is underpinned by a theoretical rationale of how communication partner training causes change allows for the key intervention components to be strengthened. Co-production of the manual and training materials ensures the intervention will meet the needs of people with primary progressive aphasia and their communication partners. Gathering further data from speech and language therapists and people living with primary progressive aphasia and their families to refine the manual and the training materials enhances the feasibility of delivering this in preparation for a phase II NHS-based randomised controlled pilot-feasibility study, currently underway.

Article Number: 101602

Accession Number: WOS:000958661700001

Abstract: Introduction: Encouraging older adults to active travel can lead to improved health outcomes in this population. Behavioural science theories, models, and frameworks can help us to understand the determinants of older adult active travel and to identify appropriate support strategies. This review paper uses behavioural science to: (i) understand the types of behavioural determinants being measured in the literature, (ii) identify the types of behavioural determinants found to significantly impact older adult active travel, (iii) map the most relevant behaviour change intervention strategies, and (iv) appraise current intervention strategies. Methods: We conducted a scoping review of the literature and a strategic behavioural analysis to address our research objectives. Studies were identified from PsychInfo, Web of Science, Scopus, AgeLine using search terms related active travel and older adults. Included studies had to evaluate determinants of older adult active travel or describe an intervention influencing older adult active travel. Two reviewers screened the studies for inclusion and completed the data extraction. A strategic behavioural analysis was conducted. Results: A total of 102 papers met the inclusion criteria. The most commonly measured determinants of older adult active travel were in the "environmental context and resource" domain. A wide range of determinants were found to significantly impact older adult active travel, especially in the domains of "environmental context and resource", "social influences and social-professional role", "emotions", "beliefs about capabilities" and "beliefs about consequences". A wide range of intervention strategies may be relevant to support older adult active travel, especially those related to social support, prompts and cues, and restructuring the built environment. Conclusions: Behavioural science offers an important lens to understand the determinants of older adult active travel and to plan evidence-based interventions. This paper contributes to the literature by reviewing the older adult active travel literature using a strategic behavioural analysis.

Accession Number: WOS:000934925700001

Abstract: This qualitative descriptive research explored barriers and facilitators of the intuitive eating (IE) implementation process, as experienced by six postmenopausal women classified as 'overweight' or 'obese'. The data was analysed using deductive and inductive thematic analysis and six themes were identified. IE implementation included developing scepticism about weight loss diets, dealing with hunger and satiety cues, making nutritious food choices for one's body, struggling with emotional eating, learning to accept one's body and challenging weight stigma and sociocultural norms of beauty and thinness. IE allowed women to develop a more peaceful relationship with their diet, and was accepted as a welcome alternative to dieting.

Short Title: Barriers and facilitators to disease-modifying antirheumatic drug use in patients with inflammatory rheumatic diseases: a qualitative theory-based study

DOI: 10.1186/s12891-016-1289-z

Article Number: 442

Accession Number: WOS:000395031500004

Abstract: Background: Although disease-modifying anti-rheumatic drugs (DMARDs) are the cornerstone of treatment for inflammatory rheumatic diseases, medication adherence to DMARDs is often suboptimal. Effective interventions to improve adherence to DMARDs are lacking, and new targets are needed to improve adherence. The aim of the present study was to explore patients' barriers and facilitators of optimal DMARD use. These factors might be used as targets for adherence interventions. Methods: In a mixed method study design, patients (n = 120) with inflammatory arthritis (IA) completed a questionnaire based on an existing adapted Theoretical

Domains Framework (TDF) to identify facilitators and barriers of DMARD use. A subgroup of these patients (n = 21) participated in focus groups to provide insights into their facilitators and barriers. The answers to the questionnaires and responses of the focus groups were thematically coded by three researchers independently and subsequently categorized. Results: The barriers and facilitators that were reported by IA patients presented large inter-individual variations. The identified barriers and facilitators could be captured in the following domains based on an adapted TDF: (i) knowledge, (ii) emotions, (iii) attention, memory, and decision processes, (iv) social influences, (v) beliefs about capability, (vi) beliefs about consequences, (vii) motivation and goals, (viii) goal conflict, (ix) environmental context and resources, and (x) skills. Conclusions: Patients with IA have a variety of barriers and facilitators with regard to their DMARD use. All of these barriers and facilitators could be categorized into adapted domains of the TDF. Interventions that address individual facilitators and barriers, based on capability, opportunity, and motivation, are needed to develop strategies for medication adherence that are tailored to individual patient needs.

Title: Healthcare professionals' perceptions on barriers and facilitators to DMARD use in rheumatoid arthritis

Journal: BMC Health Services Research

Volume: 22

Issue: 1

Date: Jan

Short Title: Healthcare professionals' perceptions on barriers and facilitators to DMARD use in rheumatoid arthritis

DOI: 10.1186/s12913-021-07459-0

Article Number: 62

Accession Number: WOS:000741998100002

Abstract: Background Disease-modifying anti-rheumatic drugs (DMARDs) are the cornerstone of rheumatoid arthritis (RA) treatment. However, the full benefits of DMARDs are often not realized because many patients are sub-optimally adherent to their medication. In order to optimize adherence, it is essential that healthcare professionals (HCPs) understand patients' barriers and facilitators for medication use. Insight in these barriers and facilitators may foster the dialogue about adequate medication use between HCPs and patients.

What HCPs perceive as barriers and facilitators has, so far, scarcely been investigated. This study aimed to identify the perceptions of HCPs on patients' barriers and facilitators that might influence their adherence. Methods This qualitative study was performed using semi structured in-depth interviews with HCPs. An interview guide was used, based on an adjusted version of the Theoretical Domains Framework (TDF). Thematic analysis was conducted to identify factors that influence barriers and facilitators to DMARD use according to HCPs. Results Fifteen HCPs (5 rheumatologists, 5 nurses and 5 pharmacists) were interviewed. They mentioned a variety of factors that, according to their perceptions, influence DMARD adherence in patients with RA. Besides therapy-related factors, such as (onset of) medication effectiveness and side-effects, most variation was found within patient-related factors and reflected patients' beliefs, ways of coping, and (self-management) skills toward medication and their condition. In addition, factors related to the condition (e.g., level of disease activity), healthcare team and system (e.g., trust in HCP), and social and economic context (e.g. support, work shifts) were reported. Conclusions This study provided insights in HCPs' perceptions of the barriers and facilitators to DMARD use patients with RA. Most factors that were mentioned were patient-related and potentially modifiable. When physicians understand patients' perceptions on medication use, adherence to DMARDs can probably be optimized in patients with RA leading to more effectiveness of treatment outcomes.

Title: Nutritional Knowledge, Confidence, Attitudes towards Nutritional Care and Nutrition Counselling Practice among General Practitioners

Journal: Healthcare

Volume: 10

Issue: 11

Date: Nov

Short Title: Nutritional Knowledge, Confidence, Attitudes towards Nutritional Care and Nutrition Counselling Practice among General Practitioners

DOI: 10.3390/healthcare10112222

Article Number: 2222

Accession Number: WOS:000881165300001

Abstract: Nutritional care represents any practice provided by a health professional, aimed to improve the patient's health outcomes

by influencing patient's dietary habits. Clearly, dietitians are the ones supposed to provide top-quality nutrition care, but their services are often inaccessible to many for various reasons. This obliges general practitioners (GPs) in primary health care to provide nutritional counselling to their patients to a certain extent. Preconditions to successful nutritional counselling are GPs with adequate nutritional knowledge, positive attitudes towards nutrition and nutritional care, self-confident and competent in nutritional counselling. Therefore, the aim of this review is to summarise currently available information on nutritional knowledge, confidence and attitudes towards nutritional care and nutrition counselling practice of GPs, as well as barriers towards provision of nutritional counselling. GPs do not consistently obtain satisfying results in nutrition knowledge assessments and their self-confidence in nutrition counselling skills varies. Studies suggest that nutritional counselling practice still has not met its full potential, and GPs frequently report various barriers that impair nutritional counselling practice. Thus, health policies that help overcome barriers and create stimulating environment for GPs to implement nutrition counselling strategies efficiently are the key to improving quality and quantity of nutritional counselling.

Title: The experiences of smoking cessation among patients with chronic obstructive pulmonary disease in Australian general practice: a qualitative descriptive study

Journal: Family Practice

Volume: 33

Issue: 6

Pages: 715-720

Date: Dec

Short Title: The experiences of smoking cessation among patients with chronic obstructive pulmonary disease in Australian general practice: a qualitative descriptive study

ISSN: 0263-2136

DOI: 10.1093/fampra/cmw083

Accession Number: WOS:000392738200023

Abstract: Background. It is important to understand the experiences surrounding smoking cessation among patients with chronic obstructive pulmonary disease (COPD) to improve the likely success of future smoking cessation programs. Objective. To explore the personal experiences surrounding smoking cessation among general practice patients with COPD. Methods. A purposive sample of 33 general practice patients with COPD, 28 ex-smokers and 5 smokers,

participated in the semi-structured telephone interviews. Thematic analysis was conducted using a predominantly deductive approach guided by the Behaviour Change Wheel framework. Results. Three inter-related themes were generated: the motivation, opportunities and capabilities among the participants to quit and maintain smoking cessation. Most quit attempts occurred without explanation or prior planning, though some attempts were motivated by the participants' family, peers or GP. Internet-based smoking cessation support programs led by general practices and involving the practice nurse were perceived as opportunities to engage in quit attempts. Most participants, both ex-smokers and smokers, demonstrated capacity to engage in multiple quit attempts. However, for many smokers, boredom, mood disturbances, the strong sense of identity as a smoker, peer reinforcement, irritability, cravings, hunger and weight gain limited capability to maintain smoking cessation. Conclusions. Patients with COPD have motivation to quit and have demonstrated capacity to engage in multiple quit attempts. GPs and other primary care practitioners need to recognize the patients' spontaneity around quit attempts and to meet the needs of the individual patient by being ready to offer support for each attempt once the patient has made their decision to quit.

Title: Barriers and facilitators to shared decision-making in hospitals from policy to practice: a systematic review

Journal: Implementation Science

Volume: 16

Issue: 1

Date: Jul

Short Title: Barriers and facilitators to shared decision-making in hospitals from policy to practice: a systematic review

ISSN: 1748-5908

DOI: 10.1186/s13012-021-01142-y

Article Number: 74

Accession Number: WOS:000679791000001

Abstract: Background: Involving patients in their healthcare using shared decision-making (SDM) is promoted through policy and research, yet its implementation in routine practice remains slow. Research into SDM has stemmed from primary and secondary care contexts, and research into the implementation of SDM in tertiary care settings has not been systematically reviewed. Furthermore, perspectives on SDM beyond those of patients and their treating

clinicians may add insights into the implementation of SDM. This systematic review aimed to review literature exploring barriers and facilitators to implementing SDM in hospital settings from multiple stakeholder perspectives. Methods: The search strategy focused on peer-reviewed qualitative studies with the primary aim of identifying barriers and facilitators to implementing SDM in hospital (tertiary care) settings. Studies from the perspective of patients, clinicians, health service administrators, and decision makers, government policy makers, and other stakeholders (for example researchers) were eligible for inclusion. Reported qualitative results were mapped to the Theoretical Domains Framework (TDF) to identify behavioural barriers and facilitators to SDM. Results: Titles and abstracts of 8724 articles were screened and 520 were reviewed in full text. Fourteen articles met inclusion criteria. Most studies (n = 12) were conducted in the last four years; only four reported perspectives in addition to the patient-clinician dyad. In mapping results to the TDF, the dominant themes were Environmental Context and Resources, Social/Professional Role and Identity, Knowledge and Skills, and Beliefs about Capabilities. A wide range of barriers and facilitators across individual, organisational, and system levels were reported. Barriers specific to the hospital setting included noisy and busy ward environments and a lack of private spaces in which to conduct SDM conversations. Conclusions: SDM implementation research in hospital settings appears to be a young field. Future research should build on studies examining perspectives beyond the clinician-patient dyad and further consider the role of organisational- and system-level factors. Organisations wishing to implement SDM in hospital settings should also consider factors specific to tertiary care settings in addition to addressing their organisational and individual SDM needs. DOI: 10.1186/s12961-023-00959-x

Article Number: 15

Accession Number: WOS:000940785900002

Abstract: Background Shared decision-making (SDM) has been shown to improve healthcare outcomes and is a recognized right of patients.

Policy requires health services to implement SDM. However, there is limited research into what interventions work and for what reasons. The aim of the study was to develop a series of interventions to increase the use of SDM in maternity care with stakeholders. Methods Interventions to increase the use of SDM in the setting of pregnancy care were developed using Behaviour Change Wheel and Theoretical Domains Framework and building on findings of an in-depth qualitative study which were inductively analysed. Intervention development workshops involved co-design, with patients, clinicians, health service administrators and decision-makers, and government policy makers. Workshops focused on identifying viable SDM opportunities and tailoring interventions to the local context (the Royal Women's Hospital) and salient qualitative themes. Results Pain management options during labour were identified by participants as a high priority for application of SDM, and three interventions were developed including patient and clinician access to the Victorian Government's maternity record via the patient portal and electronic medical records (EMR); a multi-layered persuasive communications campaign designed; and clinical champions and SDM simulation training. Factors identified by participants for successful implementation included having alignment with strategic direction of the service, support of leaders, using pre-standing resources and workflows, using clinical champions, and ensuring equity. Conclusion Three interventions co-designed to increase the use of SDM for pain management during labour address key barriers and facilitators to SDM in maternity care. This study exemplifies how health services can use behavioural science and co-design principles to increase the use of SDM. Insights into the co-design of interventions to implement SDM in routine practice provide a framework for other health services, policy makers and researchers.

Title: Caregiver perspectives on the everyday medical and social needs of long-term pediatric liver transplant patients

Journal: Liver Transplantation

Volume: 28

Issue: 11

Pages: 1735-1746

Date: Nov

Short Title: Caregiver perspectives on the everyday medical and social needs of long-term pediatric liver transplant patients

ISSN: 1527-6465

DOI: 10.1002/lt.26498

Accession Number: WOS:000805997300001

Abstract: Using in-depth interviews, we sought to characterize the everyday medical and social needs of pediatric liver transplant caregivers to inform the future design of solutions to improve care processes. Participants (parents/caregivers of pediatric liver transplant recipients) completed a survey (assessing socioeconomic status, economic hardship, health literacy, and social isolation). We then asked participants to undergo a 60-min virtual, semistructured qualitative interview to understand the everyday medical and social needs of the caregiver and their household. We intentionally oversampled caregivers who reported a social or economic hardship on the survey. Transcripts were analyzed using thematic analysis and organized around the Capability, Opportunity, Motivation-Behavior model. A total of 18 caregivers participated. Of the participants, 50% reported some form of financial strain, and about half had less than 4 years of college education. Caregivers had high motivation and capability in executing transplant-related tasks but identified several opportunities for improving care. Caregivers perceived the health system to lack capability in identifying and intervening on specific family social needs. Caregiver interviews revealed multiple areas in which family supports could be strengthened, including (1) managing indirect costs of prolonged hospitalizations (e.g., food, parking), (2) communicating with employers to support families' needs, (3) coordinating care across hospital departments, and (4) clarifying care team roles in helping families reduce both medical and social barriers. This study highlights the caregiver perspective on barriers and facilitators to posttransplant care. Future work should identify whether these themes are present across transplant centers. Caregiver perspectives should help inform future interventions aimed at improving long-term outcomes for children after liver transplantation.

Short Title: How and Why Do Smokers Start Using E-Cigarettes?

Qualitative Study of Vapers in London, UK

DOI: 10.3390/ijerph13070661

Article Number: 661

Accession Number: WOS:000380759800037

Abstract: The aims of the study were to (1) describe how and why smokers start to vape and what products they use; (2) relate findings to the COM-B theory of behaviour change (three conditions are necessary for behaviour change (B): capability (C), opportunity (O), and motivation (M)); and (3) to consider implications for e-cigarette policy research. Semi-structured interviews (n = 30) were conducted in London, UK, with smokers or ex-smokers who were currently using or had used e-cigarettes. E-cigarette initiation (behaviour) was facilitated by: capability (physical capability to use an e-cigarette and psychological capability to understand that using e-cigarettes was less harmful than smoking); opportunity (physical opportunity to access e-cigarettes in shops, at a lower cost than cigarettes, and to vape in "smoke-free" environments, as well as social opportunity to vape with friends and family); and motivation (automatic motivation including curiosity, and reflective motivation, including self-conscious decision-making processes related to perceived health benefits). The application of the COM-B model identified multiple factors that may lead to e-cigarette initiation, including those that could be influenced by policy, such as price relative to cigarettes and use in smoke-free environments. The effects of these policies on initiation should be further investigated along with the possible moderating/mediating effects of social support.

Title: An approach to involve municipal leaders into strategic decision-making for sustainability-A case study

Journal: Frontiers in Sustainable Cities

Volume: 4

Date: Aug

Short Title: An approach to involve municipal leaders into strategic decision-making for sustainability-A case study

DOI: 10.3389/frsc.2022.895962

Article Number: 895962

Accession Number: WOS:000911597800001

Abstract: In a previous study we tested a model for implementation of methodological support for cross-sectoral collaboration for strategic transition toward sustainability. To make the model viable long-term, practitioners emphasized the importance to recruit and engage leaders into the process upfront, however, this was also the key missing element according to the ten municipalities and regions

in the action research project. Nevertheless, if addressed sufficiently, active leadership could favor other needed support, such as capacity building and merging with ongoing work. Therefore, this study aimed to design, test and evaluate an approach to better involve leaders into strategic decision-making for sustainability early on in the collaboration processes. The approach evolved as an in-depth study in one of the municipalities. A pre-assessment based on semi-structured interviews and desktop review was compiled and presented back to municipal top management during a session that included a focus group discussion to capture the leaders' feedback on the assessment as well as advice on how to make the implementation model viable long-term. Results gave that the leaders reached a good understanding of the implementation model and how current practice in the municipality related or could be related to it. As an indicator of spurred engagement and hence, a successful result, one outcome from the session was a strategic decision to carry out a thorough sustainability analysis according to the methodology that the model is supposed to implement. This work is ongoing. In addition, support for alignment with existing management systems was asked for. An evaluation of the approach itself was positive, however, pointed at the extensive work needed for the assessment. Alternative ways, such as self-assessment or peer-assessment was discussed. Forthcoming research will test and further refine the applied approach of this study to enhance strategic decision-making for sustainability while also considering the role of academia in municipal practices for sustainability.

Article Number: 107322

Accession Number: WOS:000880088800003

Abstract: Over 20% of women aged 50-64 in Britain have not attended cervical screening within the recommended 5-year interval. The aim of the present study was to investigate the impact of five messages, informed using strategies from the Behaviour Change Wheel, on strength of intention to attend cervical screening in women aged 50-64 with weak positive intentions to be screened when next

invited. Women were randomised (2:2:1), into one of two intervention groups or a control group. The control group saw basic information about cervical screening. Intervention group 1 saw a social norms message and an outcome expectancy message. Intervention group 2 saw a risk reduction message and a response efficacy message. There was further randomisation within the two intervention groups (1:1) to test the effectiveness of message framing and age-targeted information. Lastly, both intervention groups were randomised (1:1) to see a message acknowledging the possible discomfort associated with screening and offering support, or the support message only. Data were included from 475 women, collected using an online survey in March 2022. Adjusting for baseline intention, social norms ($p = .84$), outcome expectancy ($p = .51$), risk reduction ($p = .19$), response efficacy ($p = .23$) and discomfort acknowledgement messages ($p = .71$) had no effect on intention strength. However, there was a significant increase in intention after reading multiple messages. These results suggest that although no single message has a significant impact on intentions, when combined, they may act together to increase intention strength. Further research will understand the impact of these messages when combined in information materials.

Short Title: Almost half of the Danish general practitioners have negative a priori attitudes towards a mandatory accreditation programme

Article Number: A5266

Accession Number: WOS:000389033300001

Abstract: INTRODUCTION: The objective of this study was to analyse Danish general practitioners' (GPs) a priori attitudes and expectations towards a nationwide mandatory accreditation programme. METHODS: This study is based on a nationwide electronic survey comprising all Danish GPs ($n = 3,403$). RESULTS: A total of 1,906 (56%) GPs completed the questionnaire. In all, 861 (45%) had a negative attitude towards accreditation, whereas 429 (21%) were very positive or positive. The negative attitudes towards accreditation were associated with being older, male and with working in a single-

handed practice. A regional difference was observed as well. GPs with negative expectations were more likely to agree that accreditation was a tool meant for external control (odds ratio (OR) = 1.87 (95% confidence interval (CI): 1.18–2.95)), less likely to agree that accreditation was a tool for quality improvement (OR = 0.018 (95% CI: 0.013–0.025)), more likely to agree that it would affect job satisfaction negatively (OR = 21.88 (95% CI: 16.10–29.72)), and they were generally less satisfied with their present job situation (OR = 2.51 (95% CI: 1.85–3.41)). CONCLUSION: Almost half of the GPs had negative attitudes towards accreditation. DOI: 10.1177/1747493017711815

Accession Number: WOS:000405516500005

Abstract: Recent reviews have demonstrated that the quality of stroke rehabilitation research has continued to improve over the last four decades but despite this progress, there are still many barriers in moving the field forward. Rigorous development, monitoring and complete reporting of interventions in stroke trials are essential in providing rehabilitation evidence that is robust, meaningful and implementable. An international partnership of stroke rehabilitation experts committed to develop consensus-based core recommendations with a remit of addressing the issues identified as limiting stroke rehabilitation research in the areas of developing, monitoring and reporting stroke rehabilitation interventions. Work exploring each of the three areas took place via multiple teleconferences and a two-day meeting in Philadelphia in May 2016. A total of 15 recommendations were made. To validate the need for the

recommendations, the group reviewed all stroke rehabilitation trials published in 2015 (n=182 papers). Our review highlighted that the majority of publications did not clearly describe how interventions were developed or monitored during the trial. In particular, under-reporting of the theoretical rationale for the intervention and the components of the intervention call into question many interventions that have been evaluated for efficacy. More trials were found to have addressed the reporting of interventions recommendations than those related to development or monitoring. Nonetheless, the majority of reporting recommendations were still not adequately described. To progress the field of stroke rehabilitation research and to ensure stroke patients receive optimal evidence-based clinical care, we urge the research community to endorse and adopt our recommendations.

Short Title: Empowerment for behaviour change through social connections: a qualitative exploration of women's preferences in preconception health promotion in the state of Victoria, Australia

DOI: 10.1186/s12889-022-14028-5

Article Number: 1642

Accession Number: WOS:000847690100010

Abstract: Background: Health behaviours in the preconception period have the potential to impact on fertility and pregnancy outcomes, and the health of all women regardless of pregnancy intention.

Public awareness of this is low and interventions that promote behaviour change have not been integrated into real-world settings. Aims were to explore women's understandings of health and health behaviours and what supports are important to promote behaviour change in the preconception period. Methods: This qualitative study is the first phase of a broader co-design project set in the state of Victoria, Australia. Over 3 months, a series of in-depth interviews were conducted with female participants who were intending to become pregnant in the next 2 years (n = 6) and participants who were not intending to become pregnant in the next 2 years (n = 6). Community advisors (n = 8) aged 18-45 years provided feedback throughout the process. Coding of transcripts from interviews and meetings was undertaken by two researchers before a deductive process identified themes mapped to the COM-B framework. Results: Nine themes and eight sub-themes were identified. Participants had a holistic view of health with nutrition, physical activity and sleep being most valued. Social connections were considered as being important for overall health and wellbeing and for promoting health behaviours. The only difference between groups was that pregnancy was an additional motivator for women who were planning to become pregnant in the next 2 years. A range of health information is available from health professionals and other sources. Unlimited access to information was empowering but sometimes overwhelming. Being listened to and shared experiences were aspects of social connections that validated participants and guided them in their decision-making. Conclusions: Women valued their health and had a holistic view that includes physical, mental and social dimensions. Women viewed social connections with others as an opportunity to be listened to and to gain support that empowers behaviour change. Future interventions to promote behaviour change in preconception women should consider the importance all women placed on social connections and leverage off existing resources to connect women.

Date: Oct

Short Title: The Development of the Psychological Determinants of

Exercise Questionnaire for Japanese Older Adults: A Questionnaire Based Upon the Theoretical Domains Framework

ISSN: 1063-8652

DOI: 10.1123/japa.2021-0218

Accession Number: WOS:000908424200014

Abstract: Japan has become a super-aged society. To overcome the negative implications of this, practitioners are increasingly using exercise-based interventions to reduce the requirement for long-term care among Japanese older adults. However, no comprehensive means of assessing the wide range of exercise behavioral determinants exists for this population. Thus, the principle aim of this study was to develop a questionnaire based upon the theoretical domains framework—a framework that has synthesized a wide range of behavior change theories. Completed responses were received from 1,000 Japanese older adults who resided in the Kansai area of Japan. Findings were suggestive of good reliability and validity for seven unique psychological determinants of exercise. This study was the first to provide a measurement tool related to a distinct range of psychological determinants of exercise among Japanese older adults.

Title: Identifying barriers and facilitators to recognition and response to patient clinical deterioration by clinicians using a behaviour change approach: A qualitative study

Journal: Journal of Clinical Nursing

Volume: 30

Issue: 5-6

Pages: 803-818

Date: Mar

Short Title: Identifying barriers and facilitators to recognition and response to patient clinical deterioration by clinicians using a behaviour change approach: A qualitative study

ISSN: 0962-1067

DOI: 10.1111/jocn.15620

Accession Number: WOS:000606965700001

Abstract: Background: Failure of clinicians to recognise and respond to patient clinical deterioration is associated with increased hospital mortality. Emergency response teams are implemented throughout hospitals to support direct-care clinicians in managing patient deterioration, but patient clinical deterioration is often not identified or acted upon by clinicians in ward settings. To date, no studies have used an integrative theoretical framework in multiple sites to examine why clinicians' delay identification and action on patients' clinical deterioration. Aim: To identify barriers and facilitators that influence clinicians' absent or

delayed response to patient clinical deterioration using the Theoretical Domains Framework. Methods: The Theoretical Domains Framework guided: (a) semi-structured interviews with clinicians, health consumers and family members undertaken at two sites; (b) deductive analyses of inductive themes to identify barriers and facilitators to optimal care. This study complied with the COREQ research guidelines. Findings: Seven themes identified: (a) information transfer; (b) ownership of patient care; (c) confidence to respond; (d) knowledge and skills; (e) culture; (f) emotion; and (g) environmental context and resources. Discussion: The Theoretical Domains Framework identified traditional social and professional hierarchies and limitations due to environmental contexts and resources as contributors to diminished interprofessional recognition and impediments to the development of effective relationships between professional groups. Communication processes were impacted by these restraints and further confounded by inadequate policy development and limited access to regular effective team-based training. As a result, patient safety was compromised, and clinicians frustrated. Conclusions: These results inform the development, implementation and evaluation of a behaviour change intervention and increase knowledge about barriers and facilitators to timely response to patient clinical deterioration. Relevance to clinical practice: Results contribute to understanding of why clinicians delay responding to patient clinical deterioration and suggest key recommendations to identify and challenge traditional hierarchies and practices that prevent interdisciplinary collaboration and decision-making.

Short Title: The effect of a novel, digital physical activity and emotional well-being intervention on health-related quality of life in people with chronic kidney disease: trial design and baseline data from a multicentre prospective, wait-list randomised controlled trial (kidney BEAM)

DOI: 10.1186/s12882-023-03173-7

Article Number: 122

Accession Number: WOS:000979511600001

Abstract: Background Physical activity and emotional self-management has the potential to enhance health-related quality of life (HRQoL), but few people with chronic kidney disease (CKD) have access to resources and support. The Kidney BEAM trial aims to evaluate whether an evidence-based physical activity and emotional wellbeing self-management programme (Kidney BEAM) leads to improvements in HRQoL in people with CKD. **Methods** This was a prospective, multicentre, randomised waitlist-controlled trial, with health economic analysis and nested qualitative studies. In total, three hundred and four adults with established CKD were recruited from 11 UK kidney units. Participants were randomly assigned to the intervention (Kidney BEAM) or a wait list control group (1:1). The primary outcome was the between-group difference in Kidney Disease Quality of Life (KDQoL) mental component summary score (MCS) at 12 weeks. Secondary outcomes included the KDQoL physical component summary score, kidney-specific scores, fatigue, life participation, depression and anxiety, physical function, clinical chemistry, healthcare utilisation and harms. All outcomes were measured at baseline and 12 weeks, with long-term HRQoL and adherence also collected at six months follow-up. A nested qualitative study explored experience and impact of using Kidney BEAM. **Results** 340 participants were randomised to Kidney BEAM (n = 173) and waiting list (n = 167) groups. There were 96 (55%) and 89 (53%) males in the intervention and waiting list groups respectively, and the mean (SD) age was 53 (14) years in both groups. Ethnicity, body mass, CKD stage, and history of diabetes and hypertension were comparable across groups. The mean (SD) of the MCS was similar in both groups, 44.7 (10.8) and 45.9 (10.6) in the intervention and waiting list groups respectively. **Conclusion** Results from this trial will establish whether the Kidney BEAM self management programme is a cost-effective method of enhancing mental and physical wellbeing of people with CKD.

Short Title: Tackling communication and analytical problems in environmental planning: Expert assessment of key definitions and their relationships

ISSN: 0301-4797

DOI: 10.1016/j.jenvman.2022.115352

Article Number: 115352

Accession Number: WOS:000811228100006

Abstract: Inadequate definition of key terms and their relationships generates significant communication and analytical problems in environmental planning. In this work, we evaluate an ontological framework for environmental planning designed to combat these problems. After outlining the framework and issues addressed, we describe its evaluation by a group of experts representing a range of expertise and institutions. Experts rated their level of agreement with 12 propositions concerning the definitions and models underpinning the framework. These propositions, in turn, were used to assess three assumptions regarding the expected effectiveness of the framework and its contribution to addressing the abovementioned planning problems. In addition to point-based best estimates of their agreement with propositions, expert ratings were also captured on a continuous interval-valued scale. The use of intervals addresses the challenge of measuring and modelling uncertainty associated with complex assessments such as those provided by experts. Combined with written anonymous expert comments, these data provide multiple perspectives on the level of support for the approach. We conclude that the framework can complement existing planning approaches and strengthen key definitions and related models, thus helping avoid communication and analytical problems in environmental planning. Finally, experts highlighted areas that require further development, and we provide recommendations for improving the framework.

Short Title: Designing physical activity interventions for women aged 50+: a qualitative study of participant perspectives

DOI: 10.1186/s12889-022-14237-y

Article Number: 1855

Accession Number: WOS:000863835900005

Abstract: Background The Active Women over 50 trial tested a scalable program for increasing physical activity among women aged 50+. The program included information, activity tracker and email support. This study sought to describe the participant perspectives of the Active Women over 50 program and considerations for designing physical activity interventions for this demographic. Methods Women who completed the Active Women over 50 trial were purposively recruited for maximum variation in age, employment, carer responsibility, medical conditions and physical activity. Individual semi-structured interviews explored their perspectives on physical activity, Active Women over 50 program components and suggestions for future iterations. Data were thematically analysed. Results Participants' capacity to be physically active was shaped by an interplay of factors. Our analysis generated four main themes relating to physical activity in general and to the program: Age and gender matters, Physical activity is social, Strategising for physical activity and the Self-responsibility discourse. At this midlife stage, physical activity participation was challenged by personal, life-stage and cultural factors, alongside a tension of the self-responsibility discourse which also impacted the program experience. Social factors and finding a suitable strategy for motivation were deemed integral aspects of being active. Future programs could consider facilitation of social networks and accountability, life-stage health information and positive framing to support self-responsibility. Conclusion A range of strategies is key to supporting women over 50 to be more physically active due to the variety of circumstances and levels of agency experienced. We offer suggestions that do not need to be resource intensive but could be incorporated into a scaled program.

Short Title: Acceptability and feasibility of an online physical activity program for women over 50: a pilot trial

ISSN: 1869-6716

DOI: 10.1093/tbm/ibab161

Accession Number: WOS:000755952100005

Abstract: Lay Summary Regular physical activity benefits health at all ages. Women in middle-age years often juggle carer and work responsibilities. We investigated the acceptability, feasibility, and effect of a scalable physical activity program targeting this group. Participants were randomly assigned to immediate access to the [Active Women over 50 Online] program or after a 3-month wait. [Active Women over 50 Online] program included: (1) study-specific website with information, case studies and links to physical activity opportunities, (2) email or SMS motivation-based messages, (3) telephone health-coaching session. We recruited 62 participants, who were on average aged 59 years, active, and had at least two medical conditions. At the 3-month follow-up, 83% of participants would recommend study participation. Participants who received the program immediately agreed to receive health coaching (81%) and messages (87%). They accessed an average of five web sessions each in a 3-month period and reported the program supported their physical activity. These participants were also more likely to take an average of 2000+ daily steps more than at baseline, and increased their physical activity at light, moderate, and vigorous intensities more than those who had not received the program. The high uptake, engagement, positive recommendation, and promising impact on physical activity warrants further program testing in a larger trial. Regular physical activity benefits health across the lifespan. Women in middle-age often juggle carer and work responsibilities, are often inactive, and may benefit from tailored support to increase physical activity. Establish the acceptability, feasibility, and impact on physical activity of a scalable program for women 50+ years. This pilot trial randomized participants to immediate program access, or to a wait-list control. [Active Women over 50 Online] program included: (1) study-specific website, (2) 8 emails or 24 SMS motivation-based messages, (3) one telephone health-coaching session. Outcomes, at 3 months, were acceptability (recommend study participation, intervention uptake), feasibility (recruitment, reach, completion), intervention impact (physical activity), intervention impressions. At baseline, 62 participants of mean (SD) age 59 (+/- 7) years took 7459 (+/- 2424) steps/day and most (92%) reported >= 2 medical conditions. At 3 months,

acceptability and impact data were available for 52 (84%) and 57 (92%) participants, respectively. Study participation was recommended by 83% of participants. Participants mostly agreed to receive health coaching (81%) and messages (87%: email = 56%, SMS = 44%), opened 82% of emails and accessed the website 4.8 times on average. Respondents reported the intervention supported their physical activity. Intervention participants were more likely to increase steps from baseline by 2000+/day (OR: 6.31, 95% CI: 1.22 to 32.70, $p = .028$) than controls, and trended toward more light-intensity ($p = .075$) and moderate-vigorous intensity physical activity ($p = .11$). The [Active Women over 50 Online] program demonstrated acceptability and feasibility among the target population, and effectiveness in some domains in the short term. Results warrant further testing in a full-scale RCT. Regular physical activity benefits health at all ages. Women in middle-age years often juggle carer and work responsibilities. We investigated the acceptability, feasibility, and effect of a scalable physical activity program targeting this group. Participants were randomly assigned to immediate access to the Active Women over 50 Online program or after a 3-month wait. Active Women over 50 Online program included: 1) study-specific website with information, case studies and links to physical activity opportunities, 2) email or SMS motivation-based messages, 3) telephone health-coaching session. We recruited 62 participants, who were on average aged 59 years, active, and had at least 2 medical conditions. At the 3-month follow-up, 83% of participants would recommend study participation. Participants who received the program immediately agreed to receive health coaching (81%) and messages (87%). They accessed an average of 5 web sessions each in a 3-month period and reported the program supported their physical activity. These participants were also more likely to take an average of 2000+ daily steps more than at baseline, and increased their physical activity at light, moderate, and vigorous intensities more than those who had not received the program. The high uptake, engagement, positive recommendation, and promising impact on physical activity warrants further program testing in a larger trial.

ISSN: 1036-1073

DOI: 10.1002/hpja.707

Accession Number: WOS:000945331400001

Abstract: Background Noncommunicable diseases can be prevented or delayed through health promotion programs. Little is known about programs delivered by partnership organisations that address lifestyle behaviours. The study's purpose was to review the literature on physical activity or healthy eating health promotion programs, delivered in partnership by the local government and local health services, to describe characteristics of programs and their impact on physical activity, healthy eating or related health outcomes among middle-aged adults. Methods This rapid review was conducted from November 2021 to June 2022, informed by the Cochrane Rapid Reviews Methods guidance for conducting rapid reviews.

Articles published in English since 2000 were identified in Medline, Embase, CINAHL, AgeLine and Scopus databases. A narrative synthesis was performed. Results Ten articles involving 19 802 participants were identified from a total of 4847 articles identified from the search. The primary role of the partnership was providing funds. Other roles were facilitating stakeholder involvement, program development, delivery and recruitment. Positive outcomes were likely if programs were developed by collaborative stakeholder partnerships, informed by previous research or a behaviour change framework. The heterogeneity of study designs and reported outcomes did not permit meta-analysis. Conclusion This review highlights the lack of evidence of local government-health service partnerships delivering physical activity or healthy eating health promotion programs for middle-aged adults. Programs designed collaboratively with an evidence base or a theory base are recommended and can guide future work investigating strategies for partnership development. So What? Physical activity or healthy eating health promotion programs need early stakeholder collaborative input designed with a theory/evidence base. This can guide future work for investigating strategies for partnership development.

Abstract: Efforts to challenge mental health-related stigma have been limited by an insufficient conceptualization of the problem space. As is common in health communication, practitioners have neglected the multiple tacit understandings the public embody in everyday life. Using the example of our recent research into the public's social representations of mental health and illness, in this paper, we will work through the theoretical-methodological considerations involved in how we approached expanding the problem space. Using social theory, we tailored thematic analysis and natural language processing techniques to examine the public's polyphasic sense-making processes. The approach is novel, as it diverges from standard methods in understanding health communication and the possibilities for behaviour change. Instead, we root our approach in a dynamic and relational epistemology to iteratively reveal in greater complexity some of the contents and processes that sustain mental health-related stigma.

Abstract: Background: Physical inactivity is a growing concern for society and is a risk factor for cardiovascular disease, obesity,

and other chronic diseases. Objective: This study aimed to determine the efficacy of the Accupedo-Pro Pedometer mobile phone app intervention, with the goal of increasing daily step counts in young adults. Methods: Mobile phone users (n=58) between 17–26 years of age were randomized to one of two conditions (experimental and control). Both groups downloaded an app that recorded their daily step counts. Baseline data were recorded and followed-up at 5 weeks. Both groups were given a daily walking goal of 30 minutes, but the experimental group participants were told the equivalent goal in steps taken, via feedback from the app. The primary outcome was daily step count between baseline and follow-up. Results: A significant time x group interaction effect was observed for daily step counts (P=.04). Both the experimental (P<.001) and control group (P=.03) demonstrated a significant increase in daily step counts, with the experimental group walking an additional 2000 steps per day. Conclusions: The results of this study demonstrate that a mobile phone app can significantly increase physical activity in a young adult sample by setting specific goals, using self-monitoring, and feedback.

Abstract: Background: Cancer survivorship in Ireland is increasing in both frequency and longevity. However, a significant proportion of cancer survivors do not reach the recommended physical activity levels and have overweight. This has implications for both physical and psychological health, including an increased risk of subsequent and secondary cancers. Mobile health (mHealth) interventions

demonstrate potential for positive health behavior change, but there is little evidence for the efficacy of mobile technology in improving health outcomes in cancer survivors with overweight or obesity. Objective: This study aims to investigate whether a personalized mHealth behavior change intervention improves physical and psychological health outcomes in cancer survivors with overweight or obesity. Methods: A sample of 123 cancer survivors (BMI \geq 25 kg/m²) was randomly assigned to the standard care control (n=61) or intervention (n=62) condition. Group allocation was unblinded. The intervention group attended a 4-hour tailored lifestyle education and information session with physiotherapists, a dietician, and a clinical psychologist to support self-management of health behavior. Over the following 12 weeks, participants engaged in personalized goal setting to incrementally increase physical activity (with feedback and review of goals through SMS text messaging contact with the research team). Direct measures of physical activity were collected using a Fitbit accelerometer. Data on anthropometric, functional exercise capacity, dietary behavior, and psychological measures were collected at face-to-face assessments in a single hospital site at baseline (T₀), 12 weeks (T₁; intervention end), and 24 weeks (T₂; follow-up). Results: The rate of attrition was 21% (13/61) for the control condition and 14% (9/62) for the intervention condition. Using intent-to-treat analysis, significant reductions in BMI (F=2, F=242=4.149; P=.02; η^2 (2)=0.033) and waist circumference (F=2, F=242=3.342; P=.04; η^2 (2)=0.027) were observed in the intervention group. Over the 24-week study, BMI was reduced by 0.52 in the intervention condition, relative to a nonsignificant reduction of 0.11 in the control arm. Waist circumference was reduced by 3.02 cm in the intervention condition relative to 1.82 cm in the control condition. Physical activity level was significantly higher in the intervention group on 8 of the 12 weeks of the intervention phase and on 5 of the 12 weeks of the follow-up period, accounting for up to 2500 additional steps per day (mean 2032, SD 270). Conclusions: The results demonstrate that for cancer survivors with a BMI \geq 25 kg/m², lifestyle education and personalized goal setting using mobile technology can yield significant changes in clinically relevant health indicators. Further research is needed to elucidate the mechanisms of behavior change and explore the capacity for mHealth interventions to improve broader health and well-being outcomes in the growing population of cancer survivors.

Short Title: Influences on Decision-Making Regarding Antipsychotic Prescribing in Nursing Home Residents With Dementia: A Systematic Review and Synthesis of Qualitative Evidence

ISSN: 1525-8610

DOI: 10.1016/j.jamda.2017.06.032

Article Number: 897.e1-897.e12

Accession Number: WOS:000411335700016

Abstract: Background: Antipsychotic prescribing is prevalent in nursing homes for the management of behavioral and psychological symptoms of dementia (BPSD), despite the known risks and limited effectiveness. Many studies have attempted to understand this continuing phenomenon, using qualitative research methods, and have generated varied and sometimes conflicting findings. To date, the totality of this qualitative evidence has not been systematically collated and synthesized. Aims: To synthesize the findings from individual qualitative studies on decision-making and prescribing behaviors for antipsychotics in nursing home residents with dementia, with a view to informing intervention development and quality improvement in this field. Methods: A systematic review and synthesis of qualitative evidence was conducted (PROSPERO protocol registration CRD42015029141). Six electronic databases were searched systematically from inception through July 2016 and supplemented by citation, reference, and gray literature searching. Studies were included if they used qualitative methods for both data collection and analysis, and explored antipsychotic prescribing in nursing homes for the purpose of managing BPSD. The Critical Appraisal Skills Program assessment tool was used for quality appraisal. A meta-ethnography was conducted to synthesize included studies. The Confidence in the Evidence from Reviews of Qualitative research approach was used to assess the confidence in individual review findings. All stages were conducted by at least 2 independent reviewers. Results: Of 1534 unique records identified, 18 met the inclusion criteria. Five key concepts emerged as influencing decision-making: organizational capacity; individual professional capability; communication and collaboration; attitudes; regulations and guidelines. A "line of argument" was synthesized and a conceptual model constructed, comparing this decision-making process to a dysfunctional negative feedback loop. Our synthesis indicates that when all stakeholders come together to communicate and collaborate as equal and empowered partners, this can result in a successful reduction in inappropriate antipsychotic prescribing. Conclusions: Antipsychotic prescribing in nursing home residents with dementia occurs in a complex environment involving the interplay of various stakeholders, the nursing home organization, and external influences. To improve the quality of antipsychotic prescribing in this cohort, a more holistic approach to BPSD

management is required. Although we have found the issue of antipsychotic prescribing has been extensively explored using qualitative methods, there remains a need for research focusing on how best to change the prescribing behaviors identified. Pages: 470-483

Date: Feb

Short Title: Identifying behavior change techniques for inclusion in a complex intervention targeting antipsychotic prescribing to nursing home residents with dementia

ISSN: 1869-6716

DOI: 10.1093/tbm/ibaa053

Accession Number: WOS:000649397000018

Abstract: Nursing home residents with dementia are commonly prescribed antipsychotics despite the associated increased risk of harms. Interventions to optimize prescribing practice have been found to be effective in the short term, but there is a lack of evidence to support sustainability of effects, along with a lack of theory, public involvement, and transparency in the intervention development process. Using theory has been advocated as a means of improving intervention sustainability. The aim of this study was, therefore, to identify behavior change techniques (BCTs) for inclusion in a complex intervention targeting antipsychotic prescribing to nursing home residents with dementia. A comprehensive approach to identifying a long list of all potential BCTs from three different sources was undertaken. The most appropriate BCTs were then selected through a two-round Delphi consensus survey with a broad range of experts (n = 18 panelists). Advisory groups of people with dementia, family carers, and professional stakeholders provided feedback on the final BCTs included. After two Delphi survey rounds, agreement was reached on 22 BCTs. Further refinement of the selected BCTs based on advisory group and panelists' feedback, along with use of the APEASE criteria (Affordability, Practicability, Effectiveness, Acceptability, Side effects/safety, and Equity)

resulted in a final list of 16 BCTs. The next step in intervention development will be to identify the most appropriate mode of delivery of the 16 BCTs identified for inclusion. The study provides a case example of a systematic approach to incorporating evidence with stakeholder views in the identification of appropriate BCTs.

Title: A qualitative study of perceived barriers and facilitators to sustainable parasite control on thoroughbred studs in Ireland

Journal: Veterinary Parasitology

Volume: 317

Date: May

Short Title: A qualitative study of perceived barriers and facilitators to sustainable parasite control on thoroughbred studs in Ireland

ISSN: 0304-4017

DOI: 10.1016/j.vetpar.2023.109904

Article Number: 109904

Accession Number: WOS:000951521900001

Abstract: In view of the rising threat of anthelmintic resistance in parasite populations and the planned change of classification of anthelmintics in Ireland for food animals to prescription-only medicines, there is a need for increased focus on parasite control strategies for horses. Effective parasite control programs (PCPs) are complex, necessitating the application of risk-assessment based on host immune status, infection pressure, type of parasite and seasonality to determine the requirement for anthelmintic administration and an understanding of parasite biology to employ effective, non-therapeutic, parasite control measures. The aim of this study was to explore horse breeders' attitudes and behaviours towards general parasite control practices and anthelmintic use on thoroughbred studs in Ireland using qualitative research methods, in order to help identify barriers to the implementation of sustainable equine PCPs supported by veterinary involvement. One-to-one, qualitative, semi-structured interviews were conducted with 16 breeders, using an interview topic guide that allowed for an open questioning style. The topic guide facilitated discussion around the following areas: (i) parasite control measures (general approach, (ii) veterinary involvement, (iii) use of anthelmintics, (iv) use of diagnostics, pasture management), (v) recording of anthelmintic use and (vi) anthelmintic resistance. Convenience, purposive (subjective selection) sampling was used to select a small group of participants that reflected the characteristics of current thoroughbred breeders in Ireland taking into account farm type, farm size, geographical

location. The interviews were transcribed, and a method of inductive thematic analysis (a data driven identification and analysis of themes) was performed. Assessment of current behaviours by these participants found that PCPs were primarily based on the prophylactic use of anthelmintics without a strategic rationale. A key driver of behaviour regarding parasite prevention practices was localised routine, dictated by tradition, that gave breeders a sense of confidence and protection regarding parasite control. The perceptions of the benefits of parasitology diagnostics were varied and their application to control was poorly understood. Anthelmintic resistance was recognised as an industry threat but not an issue for individual farms. By using a qualitative approach, this study offers insights into the possible barriers to the adoption of sustainable PCPs on Irish thoroughbred farms and highlights the need for end-user involvement in the preparation of future guidelines.

Short Title: Patients' experiences of, and engagement with, remote home monitoring services for COVID-19 patients: A rapid mixed-methods study

ISSN: 1369–6513

DOI: 10.1111/hex.13548

Accession Number: WOS:000821560000001

Abstract: Introduction Remote home monitoring models were implemented during the COVID-19 pandemic to shorten hospital length of stay, reduce unnecessary hospital admission, readmission and infection and appropriately escalate care. Within these models, patients are asked to take and record readings and escalate care if advised. There is limited evidence on how patients and carers experience these services. This study aimed to evaluate patient experiences of, and engagement with, remote home monitoring models for COVID-19. Methods A rapid mixed-methods study was carried out in England (conducted from March to June 2021). We remotely conducted a cross-sectional survey and semi-structured interviews with patients and carers. Interview findings were summarized using rapid assessment procedures sheets and data were grouped into themes (using thematic analysis). Survey data were analysed using descriptive statistics. Results We received 1069 surveys (18% response rate) and conducted interviews with patients (n = 59) or their carers (n = 3). 'Care' relied on support from staff members and family/friends. Patients and carers reported positive experiences and felt that the service and human contact reassured them and was easy to engage with. Yet, some patients and carers identified problems with engagement (e.g., hesitancy to self-escalate care). Engagement was influenced by patient factors such as health and knowledge, support from family/friends and staff, availability and ease of use of informational and material resources (e.g., equipment) and service factors. Conclusion Remote home monitoring models place responsibility on patients to self-manage symptoms in partnership with staff; yet, many patients required support and preferred human contact (especially for identifying problems). Caring burden and experiences of those living alone and barriers to engagement should be considered when designing and implementing remote home monitoring services. Patient or Public Contribution The study team met with service users and public members of the evaluation teams throughout the project in a series of workshops. Workshops informed study design, data collection tools and data interpretation and were conducted to also discuss study dissemination. Public patient involvement (PPI) members helped to pilot patient surveys and interview guides with the research team. Some members of the public also piloted the patient survey. Members of the PPI group were given the opportunity to comment on the manuscript, and the manuscript was amended accordingly.

Short Title: Development of a School-Based Intervention to Increase Physical Activity Levels Among Chinese Children: A Systematic Iterative Process Based on Behavior Change Wheel and Theoretical Domains Framework

DOI: 10.3389/fpubh.2021.610245

Article Number: 610245

Accession Number: WOS:000648896300001

Abstract: Regular physical activity has a range of benefits for children's health, academic achievement, and behavioral development, yet they face barriers to participation. The aim of the study was to systematically develop an intervention for improving Chinese children's physical activity participation, using the Behavior Change Wheel (BCW) and Theoretical Domains Framework (TDF). The BCW and TDF were used to (i) understand the behavior (through literature review), (ii) identify intervention options (through the TDF-intervention function mapping table), (iii) select content and implementation options [through behavior change technique (BCT) taxonomy and literature review], and (iv) finalize the intervention content (through expert consultation, patient and public involvement and engagement, and piloting). A systematic iterative process was followed to design the intervention by following the steps recommended by the BCW. This systematic process identified 10 relevant TDF domains to encourage engagement in physical activity among Chinese children: knowledge, memory, attention and decision processes, social influences, environmental context and resources, beliefs about capabilities, beliefs about consequences, social/professional role and identity, emotions, and physical skills. It resulted in the selection of seven intervention functions (education, persuasion, environmental restricting, modeling, enablement, training, and incentivization) and 21 BCTs in the program, delivered over a period of 16 weeks. The BCW and TDF allowed an in-depth consideration of the physical activity behavior among Chinese children and provided a systematic framework for developing the intervention. A feasibility study is now being undertaken to determine its acceptability and utility.

Article Number: 451

Accession Number: WOS:000871407900001

Abstract: Background While supervised toothbrushing programmes have been established in many countries of the world, little is known about different perspectives on their implementation. The aim of the study was to explore stakeholders' barriers and facilitators to implementation of a school-based toothbrushing programme in Taiwan. Methods Focus groups and interviews were used to explore the views of elementary school students, teachers, staff, and nurses in a piloted school-based toothbrushing programme. The topic guides were developed according to the Theoretical Domains Framework (TDF) to cover the behavioural factors systematically and comprehensively. Data were analysed with content analysis. Results Overall, 36 students, 29 teachers/staff, and five school nurses (N = 65) were included. The overarching theme was the importance of habit formation for both staff and children to ensure that toothbrushing as part of the programme was embedded into the school schedule and routine. While children did not necessarily appear to retain the dental knowledge which was taught in the programme, the provision of fluoride toothpaste and toothbrush for their use in schools allowing teachers and staff to choose the timing of the brushing and engaging classmates to supervise each other were found to be key factors. Conclusions Implementing a school-based toothbrushing programme with the support of staff and active engagement of children can help children to develop a toothbrushing habit. Classmate-supervised toothbrushing may reduce the burden on teachers and staff to implement the programme.

Article Number: 105

Accession Number: WOS:000861894800003

Abstract: Background As systematically developed statements regarding possible courses of action, health system guidance (HSG) can assist with making decisions about addressing problems or achieving goals in health systems. However, there are conceptual and methodological challenges in HSG implementation due to the complexity of health-system policy-making, the diversity of available evidence and vast differences in contexts. To address these gaps, we aim to develop a theoretical framework for supporting HSG implementation as part of a broader effort to promote evidence-informed policy-making in health systems. Methods To develop a theoretical framework about facilitators, barriers and strategies for HSG implementation, we will apply a critical interpretive synthesis (CIS) approach to synthesize the findings from a range of relevant literature. We will search 11 electronic databases and seven organizational websites to identify relevant published and grey literature. We will check the references of included studies and contact experts to identify additional eligible papers. Finally, we will conduct purposively sampling of the literature to fill any identified conceptual gaps. We will use relevance and five quality criteria to assess included papers. A standardized form will be developed for extracting information. We will use an interpretive analytic approach to synthesize the findings, including a constant comparative method throughout the analysis. Two independent reviewers will conduct the literature screening and relevance assessment, and disagreements will be resolved through discussion. The principal investigator will conduct data extraction and synthesis, and a second reviewer will check the sample of extracted data for consistency and accuracy. Discussion A new theoretical framework about facilitators, barriers and strategies for HSG implementation will be developed using a CIS approach. The HSG implementation framework could be widely used for supporting the implementation of HSG covering varied topics and in different contexts (including low-, middle- and high-income countries). In later work, we will develop a tool for supporting HSG implementation based on the theoretical framework. Registration PROSPERO CRD42020214072. Date of Registration: 14 December 2020.

Short Title: Reinforcement Learning to Send Reminders at Right Moments in Smartphone Exercise Application: A Feasibility Study

DOI: 10.3390/ijerph18116059

Article Number: 6059

Accession Number: WOS:000659979100001

Abstract: Just-in-time adaptive intervention (JITAI) has gained attention recently and previous studies have indicated that it is an effective strategy in the field of mobile healthcare intervention. Identifying the right moment for the intervention is a crucial component. In this paper the reinforcement learning (RL) technique has been used in a smartphone exercise application to promote physical activity. This RL model determines the 'right' time to deliver a restricted number of notifications adaptively, with respect to users' temporary context information (i.e., time and calendar). A four-week trial study was conducted to examine the feasibility of our model with real target users. JITAI reminders were sent by the RL model in the fourth week of the intervention, while the participants could only access the app's other functionalities during the first 3 weeks. Eleven target users registered for this study, and the data from 7 participants using the application for 4 weeks and receiving the intervening reminders were analyzed. Not only were the reaction behaviors of users after receiving the reminders analyzed from the application data, but the user experience with the reminders was also explored in a questionnaire and exit interviews. The results show that 83.3% reminders sent at adaptive moments were able to elicit user reaction within 50 min, and 66.7% of physical activities in the intervention week were performed within 5 h of the delivery of a reminder. Our findings indicated the usability of the RL model, while the timing of the moments to deliver reminders can be further improved based on lessons learned.

Short Title: Digital Patient Experience: Umbrella Systematic Review
ISSN: 1438-8871
DOI: 10.2196/37952
Article Number: e37952
Accession Number: WOS:000862701700010
Abstract: Background: The adoption and use of technology have significantly changed health care delivery. Patient experience has become a significant factor in the entire spectrum of patient-centered health care delivery. Digital health facilitates further improvement and empowerment of patient experiences. Therefore, the design of digital health is served by insights into the barriers to and facilitators of digital patient experience (PEX). Objective: This study aimed to systematically review the influencing factors and design considerations of PEX in digital health from the literature and generate design guidelines for further improvement of PEX in digital health. Methods: We performed an umbrella systematic review following the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) methodology. We searched Scopus, PubMed, and Web of Science databases. Two rounds of small random sampling (20%) were independently reviewed by 2 reviewers who evaluated the eligibility of the articles against the selection criteria. Two-round interrater reliability was assessed using the Fleiss-Cohen coefficient ($k_1 = 0.88$ and $k_2 = 0.80$). Thematic analysis was applied to analyze the extracted data based on a small set of a priori categories. Results: The search yielded 173 records, of which 45 (26%) were selected for data analysis. Findings and conclusions showed a great diversity; most studies presented a set of themes (19/45, 42%) or descriptive information only (16/45, 36%). The digital PEX-related influencing factors were classified into 9 categories: patient capability, patient opportunity, patient motivation, intervention technology, intervention functionality, intervention interaction design, organizational environment, physical environment, and social environment. These can have three types of impacts: positive, negative, or double edged. We captured 4 design constructs (personalization, information, navigation, and visualization) and 3 design methods (human-centered or user-centered design, co-design or participatory design, and inclusive design) as design considerations. Conclusions: We propose the following definition for digital PEX: "Digital patient experience is the sum of all interactions affected by a patient's behavioral determinants,

framed by digital technologies, and shaped by organizational culture, that influence patient perceptions across the continuum of care channeling digital health." In this study, we constructed a design and evaluation framework that contains 4 phases—define design, define evaluation, design ideation, and design evaluation—and 9 design guidelines to help digital health designers and developers address digital PEx throughout the entire design process. Finally, our review suggests 6 directions for future digital PEx-related research.

Title: Expert and Stakeholder Consensus on Priorities for Obesity Prevention Research in Early Care and Education Settings

Journal: Childhood Obesity

Volume: 9

Issue: 2

Pages: 116-124

Date: Apr

Short Title: Expert and Stakeholder Consensus on Priorities for Obesity Prevention Research in Early Care and Education Settings

ISSN: 2153-2168

DOI: 10.1089/chi.2012.0125

Accession Number: WOS:000336846200005

Abstract: Background: Early childhood is a formative period for many weight-related behaviors (diet and activity), but little obesity prevention research targeting this age group has been conducted. Early care and education settings are a useful avenue for interventions targeting young children, but the limited research provides insufficient evidence upon which to base policy decisions, practice guidelines, or mobilized efforts to improve healthy eating and physical activity, and ultimately healthy weight development in these settings. Methods: In September of 2011, prominent researchers, young investigators, and leaders in early care and education came together to examine past research and to explore challenges and priorities for future research on healthy weight development in children aged 2-5 years. During this meeting, experts presented and attendees discussed key issues around measurement of diet and physical activity, policy and environment measurement, intervention approaches, policy research, and capacity development. Following the meeting, attendees were invited to participate in an online voting exercise to select top research priorities. Results: A total of 64 research issues were identified, and voting narrowed this list to 24 issues. Highest-rated issues included: Assessment of the quality of children's meals and snacks, use of financial

incentives, interventions that include healthcare providers, the role of screen time, and need for multilevel interventions. Conclusions: The presentations within this meeting highlighted the importance of research to address the unique challenges for those working in early care and education settings. Expert and stakeholder consensus of priorities identified significant and innovative areas where future obesity prevention research efforts should be focused. Notes: Ward, Dianne S. Title: Evaluation of a web-based app to assist home-hazard modification in falls prevention
Journal: British Journal of Occupational Therapy
Volume: 80
Issue: 12
Pages: 735-744
Date: Dec
Short Title: Evaluation of a web-based app to assist home-hazard modification in falls prevention
ISSN: 0308-0226
DOI: 10.1177/0308022617726243
Accession Number: WOS:000416824700006
Abstract: Introduction: Given the impact falls can have on older people and their families, many health and social care services are focused on preventing falls and implementing interventions to reduce future falls. FallCheck is a web app that supports identification of home-hazards and directs users towards self-management strategies to reduce risk of falling. Method: A survey by clinical experts of a beta version of FallCheck was conducted, producing quantitative and qualitative data including issues and attributes identified by respondents. Thirty-six individuals signed up to take part in the study, and 27 respondents took part in the final evaluation survey. Findings: Testing by health and social care professionals found there is scope for using the app as a digital self-assessment tool by people at risk of falls. It has further potential as an effective tool to support environmental/behavioural change to reduce risk of falls. Conclusion: FallCheck was developed from a sound evidence-base to support home-hazard modification as an effective intervention component within a multifactorial intervention to prevent falls. Health and social care professionals found it had good acceptability for use in practice, justifying further testing of the usability and effectiveness of the app in supporting behavioural changes and environmental modifications with people at risk of falling and carers. Title: Formative Research on HPV Vaccine Acceptance among Health Workers, Teachers, Parents, and Social Influencers in Uzbekistan

Journal: Vaccines

Volume: 11

Issue: 4

Date: Apr

Short Title: Formative Research on HPV Vaccine Acceptance among Health Workers, Teachers, Parents, and Social Influencers in Uzbekistan

DOI: 10.3390/vaccines11040754

Article Number: 754

Accession Number: WOS:000977884600001

Abstract: Human papillomavirus (HPV) vaccines effectively prevent cervical cancer, most of which results from undetected long-term HPV infection. HPV vaccine introduction is particularly sensitive and complicated given widespread misinformation and vaccination of young girls before their sexual debut. Research has examined HPV vaccine introduction in lower- and middle-income countries (LMICs), but almost no studies attend to HPV vaccine attitudes in central Asian countries. This article describes the results of a qualitative formative research study to develop an HPV vaccine introduction communication plan in Uzbekistan. Data collection and analysis were designed using the Capability, Opportunity, and Motivation for Behaviour change (COM-B) mode for understanding health behaviours. This research was carried out with health workers, parents, grandparents, teachers, and other social influencers in urban, semi-urban, and rural sites. Information was collected using focus group discussions (FGDs) and semi-structured in-depth interviews (IDIs), and data in the form of participants' words, statements, and ideas were thematically analysed to identify COM-B barriers and drivers for each target group's HPV vaccine-related behaviour. Represented through exemplary quotations, findings were used to inform the development of the HPV vaccine introduction communication plan. Capability findings indicated that participants understood cervical cancer was a national health issue, but HPV and HPV vaccine knowledge was limited among non-health professionals, some nurses, and rural health workers. Results on an opportunity for accepting the HPV vaccine showed most participants would do so if they had access to credible information on vaccine safety and evidence. Regarding motivation, all participant groups voiced concern about the potential effects on young girls' future fertility. Echoing global research, the study results highlighted that trust in health workers and the government as health-related information sources and collaboration among schools, municipalities, and polyclinics could support potential vaccine acceptance and uptake. Resource

constraints precluded including vaccine target-aged girls in research and additional field sites. Participants represented diverse social and economic backgrounds reflective of the country context, and the communication plan developed using research insights contributed to the Ministry of Health (MoH) of the Republic of Uzbekistan HPV vaccine introduction efforts that saw high first dose uptake.

Title: Evaluation of attitudes towards telemedicine as a basis for successful implementation: A cross-sectional survey among postgraduate trainees in family medicine in Germany

Journal: Zeitschrift Fur Evidenz Fortbildung Und Qualitaet Im Gesundheitswesen

Volume: 156-157

Pages: 75-81

Date: Nov

Short Title: Evaluation of attitudes towards telemedicine as a basis for successful implementation: A cross-sectional survey among postgraduate trainees in family medicine in Germany

ISSN: 1865-9217

DOI: 10.1016/j.zefq.2020.07.001

Accession Number: WOS:000595301700010

Abstract: Background: By comparison with other countries of the European Union Germany is only middle-ranking in terms of telemedicine usage. There is a relevant gap between the legal framework and the actual state of implementation. Healthcare providers play an important role in this implementation process as they are increasingly confronted with the application of telemedical scenarios. Therefore, the aim of this survey was to determine attitudes towards telemedicine of postgraduate trainees in Family Medicine (FM) in Germany. Methods: A cross-sectional survey was conducted between July and October 2016 among postgraduate trainees in FM throughout Germany. The questionnaire covered four topics: attitudes towards telemedicine, barriers for the implementation of telemedicine, assessment of useful telemedical applications and telemedicine scenarios. A descriptive approach was used to analyze the data in order to derive determinants for the implementation of telemedicine. Results: In total, 388 postgraduate trainees from 13 of the 16 federal states in Germany answered the survey. Seventy-eight percent were female. Participants' mean age was 36 years. The majority of participants believed that only a fraction of the already existing technology in telemedicine is being used (70 %). The largest perceived barrier to telemedicine was data safety

concerns. More than half of the participants (54 %) believed that telemedicine would change the doctor-patient relationship. 51 % of the participants were interested in training in telemedicine. In this respect, it is important to note that 27 % of the postgraduate trainees said their willingness to practice in rural areas might be facilitated through the availability of telemedical backup for family physicians. Conclusions: Participating trainees in FM in Germany think that the potential for telemedicine is not yet fully exploited. Based on the results of this survey the next steps to be taken for the implementation of telemedicine applications can be addressed.

Title: Design for Circular Behaviour: Considering Users in a Circular Economy

Journal: Sustainability

Volume: 10

Issue: 6

Date: Jun

Short Title: Design for Circular Behaviour: Considering Users in a Circular Economy

DOI: 10.3390/su10061743

Article Number: 1743

Accession Number: WOS:000436570100055

Abstract: In a linear economy, a product is manufactured and sold to a customer. Then, little concern is given to what the user actually does with it when they have it. However, in a circular economy where the aim is to circulate products at their highest level of value, the customer's behaviour can become an important part of the system. Circular design strategies have tended to focus on the physical aspects of a product (e.g., disassembly, material selection), but the design of products and services can also have an influence on user behaviour and, to date, this aspect of circular design has not been fully explored. This project aims to define what key user behaviours are required for circular business models to work and to outline how design can enable these circular behaviours'. This research project consists of a literature review, case study analysis and expert interviews with practitioners. A theoretical framework for designing products and services to encourage circular behaviour is developed. This work provides an initial step towards a better understanding of the user's role in the transition to a circular economy as well as a preliminary model for how design for behaviour change strategies could be implemented in this context.

Title: Implementation barriers and considerations for recommending and administering the human papillomavirus (HPV) vaccination in oncology settings

Journal: Journal of Cancer Survivorship

Date: 2023 May

Short Title: Implementation barriers and considerations for recommending and administering the human papillomavirus (HPV) vaccination in oncology settings

ISSN: 1932-2259

DOI: 10.1007/s11764-023-01391-4

Accession Number: WOS:000982383900001

Abstract: BackgroundSurvivors of childhood and adolescent cancer experience low human papillomavirus (HPV) vaccination rates—a crucial form of cancer prevention. Oncology provider recommendations may increase young survivors HPV vaccine intent, but HPV vaccination is not typically provided in the oncology setting. Thus, we explored the implementation barriers of providing the HPV vaccine in oncology.MethodsWe interviewed oncology providers in a variety of specialty areas about their perceptions of the HPV vaccine and to explore barriers to recommending and administering the vaccine in their clinics. Interviews were audio recorded, quality checked, and thematically analyzed. Emergent themes were then mapped onto the Capability, Opportunity, Motivation, and Behavior (COM-B) Model and the Theoretical Domains Framework.ResultsA total of N=24 oncology providers were interviewed. Most provided direct clinical care (87.5%) and most commonly specialized in pediatric oncology (20.8%), medical oncology (16.7%), bone marrow transplant (16.7%), and nurse coordination (16.7%). Two themes emerged within each COM-B domain. Capability: 1) educational barriers to HPV vaccination and 2) complicated post treatment HPV vaccination guidelines. Motivation: 1) perceived importance of HPV vaccine and 2) concern about blurred scope of practice. Opportunity: 1) hospital administration and time concern barriers and 2) clinical workflow integration concerns.ConclusionImplementing HPV vaccination in the oncology setting has the potential to increase HPV vaccination rates among young survivors. Multi-level barriers to providing the HPV vaccine in the oncology setting were identified by participants. Leveraging existing implementation strategies may be an effective way to mitigate provider identified barriers and increase vaccination rates.

Title: Effectiveness of implementation strategies for clinical guidelines to community pharmacy: a systematic review

Journal: Implementation Science

Volume: 10

Date: Oct

Short Title: Effectiveness of implementation strategies for clinical guidelines to community pharmacy: a systematic review

ISSN: 1748-5908

DOI: 10.1186/s13012-015-0337-7

Article Number: 151

Accession Number: WOS:000364002200001

Abstract: Background: The clinical role of community pharmacists is expanding, as is the use of clinical guidelines in this setting. However, it is unclear which strategies are successful in implementing clinical guidelines and what outcomes can be achieved. The aim of this systematic review is to synthesise the literature on the implementation of clinical guidelines to community pharmacy. The objectives are to describe the implementation strategies used, describe the resulting outcomes and to assess the effectiveness of the strategies. Methods: A systematic search was performed in six electronic databases (Medline, EMBASE, CINAHL, Web of Science, Informit, Cochrane Library) for relevant articles. Studies were included if they reported on clinical guidelines implementation strategies in the community pharmacy setting. Two researchers completed the full-search strategy, data abstraction and quality assessments, independently. A third researcher acted as a moderator. Quality assessments were completed with three validated tools. A narrative synthesis was performed to analyse results. Results: A total of 1937 articles were retrieved and the titles and abstracts were screened. Full-text screening was completed for 36 articles resulting in 19 articles (reporting on 22 studies) included for review. Implementation strategies were categorised according to a modified version of the EPOC taxonomy. Educational interventions were the most commonly utilised strategy (n = 20), and computerised decision support systems demonstrated the greatest effect (n = 4). Most studies were multifaceted and used more than one implementation strategy (n = 18). Overall outcomes were moderately positive (n = 17) but focused on process (n = 22) rather than patient (n = 3) or economic outcomes (n = 3). Most studies (n = 20) were rated as being of low methodological quality and having low or very low quality of evidence for outcomes. Conclusions: Studies in this review did not generally have a well thought-out rationale for the choice of implementation strategy. Most utilised educational strategies, but the greatest effect on outcomes was demonstrated using computerised clinical decision support systems. Poor methodology, in the majority of the research, provided insufficient evidence to be conclusive about the best implementation strategies or the benefit of clinical guidelines in this setting. However, the generally positive outcomes across studies and strategies indicate that implementing clinical

guidelines to community pharmacy might be beneficial. Improved methodological rigour in future research is required to strengthen the evidence for this hypothesis.

Short Title: Household disposal of pharmaceuticals: attitudes and risk perception in a UK sample

ISSN: 1438-4957

DOI: 10.1007/s10163-022-01494-7

Accession Number: WOS:000854737900003

Abstract: Pharmaceuticals can enter the environment through disposal in toilets, sinks and general waste. In the UK, household medicines are correctly disposed of by returning them to a pharmacy. This study examined household patterns of medicine waste, storage and disposal practices via a cross-sectional survey with 663 UK adults. Multiple regression was used to explore the contribution of key variables on self-reported medicines disposal behaviour. Analysis demonstrated that age, information, awareness, probability, attitude and intention all predicted correct disposal behaviour. Results indicate that multiple factors influence different disposal destinations uniquely. Affect and age increase disposal in sink/toilet but reduce disposal in bin. Presence of children increase bin and sink/toilet disposal but decrease pharmacy returns. Awareness and received information on correct disposal reduce bin disposal and increase pharmacy returns. The results suggest people use different mental models for each destination with disposal in sink/toilets and bins considered quicker and safer in the presence of children or for those feeling anxious. It is important to understand the capability, opportunity and motivation people have to return medicines to the pharmacy in addition to raising awareness of correct medicine disposal.

Title: Effectiveness of behaviour change techniques used in hand hygiene interventions targeting older children-A systematic review

Journal: Social Science & Medicine

Volume: 281

Date: Jul

Short Title: Effectiveness of behaviour change techniques used in hand hygiene interventions targeting older children-A systematic review

ISSN: 0277-9536

DOI: 10.1016/j.socscimed.2021.114090

Article Number: 114090

Accession Number: WOS:000670372200014

Abstract: Background: Promoting good hand hygiene in older children is an important measure to reduce the burden of common diseases such as diarrhoea and acute respiratory infections. The evidence around what works to change this behaviour, however, is unclear.

Objectives: To aid future intervention design and effective use of resources, this review aims to identify the individual components used in hand hygiene interventions and assesses their contribution to intended behavioural change. Methods: We systematically searched seven databases for experimental studies evaluating hand hygiene

interventions targeting children (age 5–12) and quantitatively reporting hand hygiene behaviour. Interventions in each study were categorised as 'promising', or 'non-promising' according to whether they led to a positive change in the targeted behaviour. Behaviour change techniques (BCTs) were identified across interventions using a standard taxonomy and a novel promise ratio calculated for each (the ratio of promising to non-promising interventions featuring the BCT). 'Promising' BCTs were those with a promise ratio of >2. BCTs were ranked from most to least promising. Results: Our final analysis included 19 studies reporting 22 interventions across which 32 unique BCTs were identified. The most frequently used were 'demonstration of the behaviour', 'instruction on how to perform the behaviour' and 'adding objects to the environment'. Eight BCTs had a promise ratio of >2 and the five most promising were 'demonstration of the behaviour', 'information about social and environmental consequences', 'salience of consequences', 'adding objects to the environment', and 'instruction on how to perform the behaviour'. Conclusions: Our findings suggest that hand hygiene interventions targeting older children should employ a combination of promising BCTs that ensure children understand the behaviour and the consequences of their hand hygiene habits, appropriate hardware is available, and social support is provided. Researchers are encouraged to consistently and transparently describe evaluated interventions to allow promising components to be identified and replicated.

Short Title: Investigating primary healthcare practitioners' barriers and enablers to referral of patients with COPD to pulmonary rehabilitation: a mixed-methods study using the Theoretical Domains Framework

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2020-046875

Article Number: e046875

Accession Number: WOS:000745075200013

Abstract: Objectives Pulmonary rehabilitation (PR) is a highly effective, recommended intervention for patients with chronic obstructive pulmonary disease (COPD). Using behavioural theory within mixed-methods research to understand why referral remains low enables the development of targeted interventions in order to improve future PR referral. Design A multiphase sequential mixed-methods study. Setting United Kingdom (UK). Participants 252 multiprofessional primary healthcare practitioners (PHCPs). Measures Phase 1: semistructured interviews. Phase 2: a 54-item paper and online questionnaire, based on the Theoretical Domains Framework (TDF). Content and descriptive analysis utilised. Data mixed at two points: instrument design and interpretation. Results 19 PHCPs took part in interviews and 233 responded to the survey. Integrated results revealed that PHCPs with a post qualifying respiratory qualification (154/241; 63.9%) referred more frequently (91/154; 59.1%) than those without (28/87; 32.2%). There were more barriers than enablers for referral in all 13 TDF domains. Key barriers included: infrequent engagement from PR provider to referrer, concern around patient's physical ability and access to PR (particularly for those in work), assumed poor patient motivation, no clear practice referrer and few referral opportunities. These mapped to domains: belief about capabilities, social influences, environment, optimism, skills and social and professional role. Enablers to referral were observed in knowledge, social influences memory and environment domains. Many PHCPs believed in the physical and psychological value of PR. Helpful enablers were out-of-practice support from respiratory interested colleagues, dedicated referral time (annual review) and on-screen referral prompts. Conclusions Referral to PR is complex. Barriers outweighed enablers. Aligning these findings to behaviour change techniques will identify interventions to overcome barriers and strengthen enablers, thereby increasing referral of patients with COPD to PR.

DOI: 10.2196/29064

Article Number: e29064

Accession Number: WOS:000853674500010

Abstract: Background: Mind-body interventions have the potential to positively impact the symptom burden associated with primary biliary cholangitis (PBC). Interventions are more likely to be effective if they are informed by a theoretical framework. The Behaviour Change Wheel (BCW) and the behaviour change technique taxonomy version 1 (BCTv1) provide frameworks for intervention development. Objective: This study describes how theory has guided the development of a 12-week multicomponent mind-body wellness intervention for PBC.

Methods: The steps involved in developing the BCW intervention included specifying the target behavior; explaining barriers and facilitators using the Capability, Opportunity, Motivation, and Behaviour and the theoretical domains framework; identifying intervention functions to target explanatory domains; and selecting relevant behavior change techniques to address intervention functions. Qualitative data from patients with inflammatory bowel disease using an earlier version of the program and feedback from a PBC patient advisory team were used to guide intervention development. Results: Barriers and facilitators to intervention participation associated with capability, opportunity, and motivation were identified. Intervention functions and behavior change techniques were identified to target each barrier and facilitator. Conclusions: The Peace Power Pack PBC intervention was developed to help individuals with PBC manage their symptom burden. The theoretical frameworks employed in this intervention provide direction on targeting antecedents of behavior and allow standardized reporting of intervention components.

Abstract: Good nutrition in the early years of life is vitally important for a child's development, growth and health. Children's diets in the United Kingdom are known to be poor, particularly among socially disadvantaged groups, and there is a need for timely and appropriate interventions that support parents to improve the diets of young children. The Medical Research Council has highlighted the importance of conducting developmental and exploratory research prior to undertaking full-scale trials to evaluate complex interventions, but have provided very limited detailed guidance on the conduct of these initial phases of research. This paper describes the initial developmental stage and the conduct of an exploratory randomised controlled trial undertaken to determine the feasibility and acceptability of a family-centred early years' nutrition intervention. Choosing Healthy Eating when Really Young (CHERRY) is a programme for families with children aged 18 months to 5 years, delivered in children's centres in one urban (Islington) and one rural (Cornwall) location in the United Kingdom. In the development stage, a mixed-methods approach was used to investigate the nature of the problem and options for support. A detailed review of the evidence informed the theoretical basis of the study and the creation of a logic model. In the feasibility and pilot testing stage of the exploratory trial, 16 children's centres, with a sample of 394 families were recruited onto the study. We hope that the methodology, which we present in this paper, will inform and assist other researchers in conducting community-based, exploratory nutrition research in early years settings.

Short Title: Motivations and values associated with combining sex and illicit drugs ('chemsex') among gay men in South London:

findings from a qualitative study

ISSN: 1368-4973

DOI: 10.1136/sextrans-2016-052695

Accession Number: WOS:000401935600016

Abstract: Objectives There is considerable public health concern about the combining of sex and illicit drugs (chemsex) among gay men. With a view to inform supportive therapeutic and clinical interventions, we sought to examine the motivations for engaging in chemsex among gay men living in South London. Methods Community advertising recruited 30 gay men for qualitative semi-structured interview. Aged between 21 and 53 years, all lived in South London in the boroughs of Lambeth, Southwark and Lewisham and all had combined crystal methamphetamine, mephedrone and/or gamma-hydroxybutyric acid/gamma-butyrolactone with sex in the past 12 months. Transcripts were subjected to a thematic analysis. Results We broadly distinguished two groups of reasons for combining sex and drugs, within which we described eight distinct motivations. The first major group of motivations for combining drugs with sex was that drugs provide the means by which men can have the sex they desire by increasing libido, confidence, disinhibition and stamina. The second major group of motivations for chemsex was that drugs enhance the qualities of the sex that men value. Drugs made other men seem more attractive, increased physical sensations, intensified perceptions of intimacy and facilitated a sense of sexual adventure. Conclusion Analysis revealed that sexualised drug use provides both motivation and capability to engage in the kinds of sex that some gay men value: sex that explores and celebrates adventurism. Those services providing (talking) interventions to men engaging in chemsex should consider these benefits of sexualised drug use alongside the harms arising.

Title: Increasing the frequency of physical activity very brief advice for cancer patients. Development of an intervention using the behaviour change wheel

Journal: Public Health

Volume: 133

Pages: 45-56

Date: Apr

Short Title: Increasing the frequency of physical activity very brief advice for cancer patients. Development of an intervention using the behaviour change wheel

ISSN: 0033-3506

DOI: 10.1016/j.puhe.2015.12.009

Accession Number: WOS:000373734600006

Abstract: Background: Being physically active has multiple benefits for cancer patients. Despite this only 23% are active to the national recommendations and 31% are completely inactive. A cancer diagnosis offers a teachable moment in which patients might be more receptive to lifestyle changes. Nurses are well placed to offer physical activity advice, however, only 9% of UK nurses involved in cancer care talk to all cancer patients about physical activity. A change in the behaviour of nurses is needed to routinely deliver physical activity advice to cancer patients. As recommended by the Medical Research Council, behavioural change interventions should be evidenced-based and use a relevant and coherent theoretical framework to stand the best chance of success. Objective: This paper presents a case study on the development of an intervention to improve the frequency of delivery of very brief advice (VBA) on physical activity by nurses to cancer patients, using the Behaviour Change Wheel (BCW). Method: The eight composite steps outlined by the BCW guided the intervention development process. An iterative approach was taken involving key stakeholders (n = 45), with four iterations completed in total. This was not defined a priori but emerged during the development process. Results: A 60 min training intervention, delivered in either a face-to-face or online setting, with follow-up at eight weeks, was designed to improve the capability, opportunity and motivation of nurses to deliver VBA on physical activity to people living with cancer. This intervention incorporates seven behaviour change techniques of goal setting coupled with commitment; instructions on how to perform the behaviour; salience of the consequences of delivering VBA; a demonstration on how to give VBA, all delivered via a credible source with objects added to the environment to support behavioural change. Conclusion: The BCW is a time consuming process, however, it provides a useful and comprehensive framework for intervention development and greater control over intervention replication and evaluation. Accession Number: WOS:000386189500016

Abstract: Objectives: To examine the impact, acceptability, practicability and implementation of a training intervention, designed using the Behaviour Change Wheel, on the delivery of very brief advice on physical activity, by nurses to cancer patients. Study design: A mixed methods feasibility study. Method: A purposeful sample of nurses (n = 62) were recruited across two delivery arms, face-to-face (n = 55) and online (n = 7). Frequency of delivery of physical activity advice was collected at baseline with follow-up at 12 weeks. The 'capability, opportunity and motivation' of nurses to deliver very brief advice was measured via questionnaire. Semi structured phone interviews (n = 14) were completed and analyzed thematically. A cost consequence analysis was undertaken. Results: The intervention improved the 'capability, opportunity and motivation' of nurses resulting in a change in knowledge, attitudes and beliefs towards physical activity. The intervention was both acceptable and practical. Face-to-face was the preferred mode of delivery, however there was also value in the online option. The cost of delivery per participant was 33.87 for face-to-face delivery, and 103.83 for online delivery inflated due to low recruitment numbers. A significant improvement was seen in delivery of very brief advice at 12 weeks (Z = 4.39, P <= 0.01). Conclusion: The intervention is acceptable, practical and improves delivery of very brief advice on physical activity by nurses to cancer patients in the short-term. Both face-to-face and online delivery should be considered. (C) 2016 The Author(s). Published by Elsevier Ltd on behalf of The Royal Society for Public Health. Accession Number: WOS:000778217100001

Abstract: Aim: To evaluate a digital intervention to improve physical activity in people in the UK with a musculoskeletal condition delivered during movement restrictions brought about because of the COVID-19 pandemic. Method: Service evaluation data collected from 26,041 participants over 5 months was assessed against national datasets to understand the reach and representativeness of the digital physical activity intervention. Measures to restrict the movement and interaction of people were in place during these 5 months. Cross-sectional data from 2752 participants across different stages of the 12-week programme assessed levels of physical activity and the components of behaviour as defined by the COM-B model (Capability, Opportunity, Motivation = Behaviour). Regression analysis investigated the relationship between programme stage and physical activity and the components of behaviour. Results: In comparison to the UK population of people with a musculoskeletal condition, the intervention participants were over-represented by females, White, and inactive people. A cross-sectional analysis suggested that the number of participants regularly active increased by programme stage. Scores for the behavioural components of automatic and reflective motivation, physical and psychological capability, and physical opportunity were also improved by programme stage. Conclusion: The service evaluation suggests that the digital intervention, designed to improve physical activity in people with a musculoskeletal condition, could be beneficial during measures to restrict movement to slow the spread of infectious disease in those who are already motivated to become or stay active.

Accession Number: WOS:000954882900001

Abstract: Objective: This article presents a real-world evaluation of a digital intervention, 'Let's Move with Leon', designed to improve physical activity and health-related quality of life (HRQoL) in people with a musculoskeletal condition. Study design: A pragmatic randomised controlled trial. Methods: After randomisation and withdrawals were removed, 184 participants were assigned to receive the digital intervention with 185 assigned to a control group. Self-reported physical activity was the primary outcome. Health-related quality of life, the number of days completing strength-based exercises per week, the capability, opportunity, and motivation to be active, and step count were secondary outcomes. Outcomes were assessed over 4, 8 and 13 weeks. Results: Significant improvements were seen for self-reported physical activity at 13 weeks, reported strength days at 8 weeks, perceptions of physical capability and automatic motivation to be active at 4 and 8 weeks. No improvements were seen in step count or HRQoL over the control group. Conclusion: Digital interventions such as 'Let's Move with Leon' have the potential to increase physical activity in people with a musculoskeletal condition; however, improvements are likely to be small. Small improvements in physical activity may not be enough to improve HRQoL. (c) 2023 The Author(s). Published by Elsevier Ltd on behalf of The Royal Society for Public Health. Accession Number: WOS:000385261500010

Abstract: Increasing condom use to prevent sexually transmitted infections is a key public health goal. Interventions are more likely to be effective if they are theory- and evidence based. The Behaviour Change Wheel (BCW) provides a framework for intervention development. To provide an example of how the BCW was used to develop an intervention to increase condom use in heterosexual men

(the MenSS website), the steps of the BCW intervention development process were followed, incorporating evidence from the research literature and views of experts and the target population. Capability (e.g. knowledge) and motivation (e.g. beliefs about pleasure) were identified as important targets of the intervention. We devised ways to address each intervention target, including selecting interactive features and behaviour change techniques. The BCW provides a useful framework for integrating sources of evidence to inform intervention content and deciding which influences on behaviour to target.

Abstract: Background: Health promotion and risk reduction are essential components of sexual health care. However, it can be difficult to prioritize these within busy clinical services. Digital interventions may provide a new method for supporting these.

Objective: The MenSS (Men's Safer Sex) website is an interactive digital intervention developed by a multidisciplinary team, which aims to improve condom use in men who have sex with women (MSW). This paper describes the content of this intervention, and the rationale for it. Methods: Content was informed by a literature review regarding men's barriers to condom use, workshops with experts in sexual health and technology (N=16) and interviews with men in sexual health clinics (N=20). Data from these sources were analyzed thematically, and synthesized using the Behavior Change Wheel framework. Results: The MenSS intervention is a website optimized for delivery via tablet computer within a clinic waiting room setting. Key targets identified were condom use skills, beliefs about pleasure and knowledge about risk. Content was developed using behavior change techniques, and interactive website features provided feedback tailored for individual users. Conclusions: This paper provides a detailed description of an evidence-based

interactive digital intervention for sexual health, including how behavior change techniques were translated into practice within the design of the MenSS web site. Triangulation between a targeted literature review, expert workshops, and interviews with men ensured that a range of potential influences on condom use were captured. Short Title: An electronic decision support-based complex intervention to improve management of cardiovascular risk in primary health care: a cluster randomised trial (INTEGRATE)

ISSN: 0025-729X

DOI: 10.5694/mja2.51030

Accession Number: WOS:000643675500001

Abstract: Objectives To determine whether a multifaceted primary health care intervention better controlled cardiovascular disease (CVD) risk factors in patients with high risk of CVD than usual care. Design, setting Parallel arm, cluster randomised trial in 71 Australian general practices, 5 December 2016 - 13 September 2019. Participants General practices that predominantly used an electronic medical record system compatible with the HealthTracker electronic decision support tool, and willing to implement all components of the INTEGRATE intervention. Intervention Electronic point-of-care decision support for general practices; combination cardiovascular medications (polypills); and a pharmacy-based medication adherence program. Main outcome measures Proportion of patients with high CVD risk not on an optimal preventive medication regimen at baseline who had achieved both blood pressure and low-density lipoprotein (LDL) cholesterol goals at study end. Results After a median 15 months' follow-up, primary outcome data were available for 4477 of 7165 patients in the primary outcome cohort (62%). The proportion of

patients who achieved both treatment targets was similar in the intervention (423 of 2156; 19.6%) and control groups (466 of 2321; 20.1%; relative risk, 1.06; 95% CI, 0.85–1.32). Further, no statistically significant differences were found for a number of secondary outcomes, including risk factor screening, preventive medication prescribing, and risk factor levels. Use of intervention components was low; it was highest for HealthTracker, used at least once for 347 of 3236 undertreated patients with high CVD risk (10.7%). Conclusions Despite evidence for the efficacy of its individual components, the INTEGRATE intervention was not broadly implemented and did not improve CVD risk management in participating Australian general practices. Trial registration Australian New Zealand Clinical Trials Registry, ACTRN12616000233426 (prospective). Title: Environmental and socio-psychological drivers of building users' behaviours: a case study of tertiary institutional offices in Auckland

Journal: Journal of Facilities Management

Date: 2022 Oct

Short Title: Environmental and socio-psychological drivers of building users' behaviours: a case study of tertiary institutional offices in Auckland

ISSN: 1472-5967

DOI: 10.1108/jfm-01-2022-0011

Accession Number: WOS:000865116200001

Abstract: Purpose Better identification of comfort preferences and occupant behaviour drivers is expected to improve buildings' user-centred designs and energy operations. To understand the underline drivers of occupant behaviours in office buildings, this study aims to evaluate the inter-relationships among occupant energy behaviours, indoor environmental quality satisfaction, user control

and social-psychological factors influencing occupant behaviours in New Zealand offices. Design/methodology/approach Using an occupant perception survey, this study identifies the occupant behaviour patterns based on multi-domain comfort preferences. A case study was conducted in five office spaces of a university in Auckland, New Zealand. Data were collected from 52 occupants and analysed using descriptive and binary logistic regression analysis. Indoor environmental quality, user control, motivational, opportunity and ability factors were the independent variables considered. A model to predict the behaviours using environmental, building and social-psychological aspects was developed. Findings The results showed that the primary sources of indoor environmental quality discomfort were related to thermal and air quality, while occupants' indoor environmental quality satisfaction correlated with their comfort preferences. The outcomes emphasise how the connection between building systems and occupants' comfort preferences affect the choice of occupant behaviours in offices. Also, the primary occupant behaviours were drinking hot and cold beverages, opening/closing windows and internal doors and adjusting clothing. The binary logistic regression analysis showed that occupants' perceived user control satisfaction is the main driver for increasing window actions. No other independent variable showed a statistically significant association with other behaviours. Originality/value This study adopted a novel approach to assess the combined effects of comfort preferences, occupant energy behaviours and various environmental, building and socio-psychological factors for modelling energy-saving behaviours in office buildings.

Short Title: Gatekeeper training for vendors to reduce pesticide self-poisoning in rural South Asia: a study protocol for a stepped-

wedge cluster randomised controlled trial

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2021-054061

Article Number: e054061

Accession Number: WOS:000778983400028

Abstract: Introduction Pesticide self-poisoning kills an estimated 110 000–168 000 people worldwide annually. Data from South Asia indicate that in 15%–20% of attempted suicides and 30%–50% of completed suicides involving pesticides these are purchased shortly beforehand for this purpose. Individuals who are intoxicated with alcohol and/or non-farmers represent 72% of such customers. We have developed a 'gatekeeper' training programme for vendors to enable them to identify individuals at high risk of self-poisoning (gatekeeper function) and prevent such individuals from accessing pesticides (means restriction). The primary aim of the study is to evaluate the effectiveness of the gatekeeper intervention in preventing pesticide self-poisoning in Sri Lanka. Other aims are to identify method substitution and to assess the cost and cost-effectiveness of the intervention. Methods and analysis A stepped-wedge cluster randomised trial of a gatekeeper intervention is being conducted in rural Sri Lanka with a population of approximately 2.7 million. The gatekeeper intervention is being introduced into 70 administrative divisions in random order at each of 30 steps over a 40-month period. The primary outcome is the number of pesticide self-poisoning cases identified from surveillance of hospitals and police stations. Secondary outcomes include: number of self-poisoning cases using pesticides purchased within the previous 24 hours, total number of all forms of self-harm and suicides. Intervention effectiveness will be estimated by comparing outcome measures between the pretraining and post-training periods across the divisions in the study area. The original study protocol has been adapted as necessary in light of the impact of the COVID-19. Ethics and dissemination The Ethical Review Committee of the Faculty of Medicine and Allied Sciences, Rajarata University, Sri Lanka (ERC/2018/30), and the ACCORD Medical Research Ethics Committee, Edinburgh University (18-HV-053) approved the study. Results will be disseminated in scientific peer-reviewed journals.

Short Title: Nudging Autonomous Learning Behavior: Three Field Experiments

DOI: 10.3390/educsci13010049

Article Number: 49

Accession Number: WOS:000914552500001

Abstract: Autonomous learning behavior is an important skill for students, but they often do not master it sufficiently. We investigated the potential of nudging as a teaching strategy in tertiary education to support three important autonomous learning behaviors: planning, preparing for class, and asking questions. Nudging is a strategy originating from behavioral economics used to influence behavior by changing the environment, and consists of altering the choice environment to steer human behavior. In this study, three nudges were designed by researchers in co-creation with teachers. A video booth to support planning behavior (n = 95), a checklist to support class preparation (n = 148), and a goal-setting nudge to encourage students to ask questions during class (n = 162) were tested in three field experiments in teachers' classrooms with students in tertiary education in the Netherlands. A mixed-effects model approach revealed a positive effect of the goal-setting nudge on students' grades and a marginal positive effect on the number of questions asked by students. Additionally, evidence for increased self-reported planning behavior was found in the video booth group—but no increase in deadlines met. No significant effects were found for the checklist. We conclude that, for some autonomous learning behaviors, primarily asking questions, nudging has potential as an easy, effective teaching strategy.

Short Title: An Official American Thoracic Society Research
Statement: Implementation Science in Pulmonary, Critical Care, and
Sleep Medicine

ISSN: 1073-449X

DOI: 10.1164/rccm.201608-1690ST

Accession Number: WOS:000385338200017

Abstract: Background: Many advances in health care fail to reach
patients. Implementation science is the study of novel approaches to
mitigate this evidence-to-practice gap. Methods: The American
Thoracic Society (ATS) created a multidisciplinary ad hoc committee
to develop a research statement on implementation science in
pulmonary, critical care, and sleep medicine. The committee used an
iterative consensus process to define implementation science and
review the use of conceptual frameworks to guide implementation
science for the pulmonary, critical care, and sleep community and to
explore how professional medical societies such as the ATS can
promote implementation science. Results: The committee defined
implementation science as the study of the mechanisms by which

effective health care interventions are either adopted or not adopted in clinical and community settings. The committee also distinguished implementation science from the act of implementation. Ideally, implementation science should include early and continuous stakeholder involvement and the use of conceptual frameworks (i.e., models to systematize the conduct of studies and standardize the communication of findings). Multiple conceptual frameworks are available, and we suggest the selection of one or more frameworks on the basis of the specific research question and setting.

Professional medical societies such as the ATS can have an important role in promoting implementation science. Recommendations for professional societies to consider include: unifying implementation science activities through a single organizational structure, linking front-line clinicians with implementation scientists, seeking collaborations to prioritize and conduct implementation science studies, supporting implementation science projects through funding opportunities, working with research funding bodies to set the research agenda in the field, collaborating with external bodies responsible for health care delivery, disseminating results of implementation science through scientific journals and conferences, and teaching the next generation about implementation science through courses and other media. Conclusions: Implementation science plays an increasingly important role in health care. Through support of implementation science, the ATS and other professional medical societies can work with other stakeholders to lead this effort.

Article Number: 107170

Accession Number: WOS:000979540500001

Abstract: Background: Non-alcoholic fatty liver disease (NAFLD) is the leading liver disorder among U.S. children and is most prevalent among Hispanic children with obesity. Previous research has shown that reducing the consumption of free sugars (added sugars + naturally occurring sugars in fruit juice) can reverse liver steatosis in adolescents with NAFLD. This study aims to determine if a low-free sugar diet (LFSD) can prevent liver fat accumulation and NAFLD in high-risk children. Methods: In this randomized controlled trial, we will enroll 140 Hispanic children aged 6 to 9 years who are \geq 50th percentile BMI and without a previous diagnosis of NAFLD. Participants will be randomly assigned to either an experimental (LFSD) or a control (usual diet + educational materials) group. The one-year intervention includes removal of foods high in free sugars from the home at baseline, provision of LFSD household groceries for the entire family (weeks 1-4, 12, 24, and 36), dietitian-guided family grocery shopping sessions (weeks 12, 24, and 36), and ongoing education and motivational interviewing to promote LFSD. Both groups complete assessment measures at baseline, 6, 12, 18, and 24 months. Primary study outcomes are percent hepatic fat at 12 months and incidence of clinically significant hepatic steatosis ($>5\%$) + elevated liver enzymes at 24 months. Secondary outcomes include metabolic markers potentially mediating or moderating NAFLD pathogenesis. Discussion: This protocol describes the rationale, eligibility criteria, recruitment strategies, analysis plan as well as a novel dietary intervention design. Study results will inform future dietary guidelines for pediatric NAFLD prevention. Trial registration: ClinicalTrials.gov, NCT05292352.

Title: "How do I keep this live in my mind?" Allied Health Professionals' perspectives of barriers and enablers to implementing good clinical practice principles in research: a qualitative exploration

Journal: BMC Health Services Research

Volume: 23

Issue: 1

Date: Mar

Short Title: "How do I keep this live in my mind?" Allied Health Professionals' perspectives of barriers and enablers to implementing good clinical practice principles in research: a qualitative exploration

DOI: 10.1186/s12913-023-09238-5

Article Number: 309

Accession Number: WOS:000982965200001

Abstract: Background Allied health professionals (AHPs) engaged in research are expected to comply with Good Clinical Practice (GCP) principles to protect participant safety and wellbeing and enhance data integrity. Currently, few studies have explored health professionals' perceptions of implementing and adhering to GCP principles in research with none of these including AHPs. Such knowledge is vital to guide future interventions to increase adherence to GCP principles. This study aimed to identify the barriers and enablers AHPs experience when applying GCP principles to research conduct in a public hospital and health service, as well as their perceived support needs. **Methods** The study used a qualitative descriptive study approach guided by behaviour change theory. AHPs currently undertaking ethically approved research within a public health service in Queensland, Australia were interviewed to explore barriers and enablers to adherence to GCP principles and support needs, with interview questions guided by the Theoretical Domains Framework (TDF). The TDF was chosen as it allows for a systematic understanding of factors influencing implementation of a specific behaviour (i.e., GCP implementation) and can be used to inform tailored interventions. **Results** Ten AHPs across six professions were interviewed. Participants identified both enablers and barriers to implementing GCP across nine domains of the TDF and enablers across three additional domains. Examples of enablers included strong beliefs about the importance of GCP in increasing research rigour and participant safety (i.e. from TDF – beliefs about consequences); applying clinical skills and personal attributes when implementing GCP (i.e., skills), available training and support (i.e., environmental context and resources); and alignment with their moral sense to 'do the right thing' (i.e., professional identity). Barriers to GCP implementation were generally less commonly reported but included reduced time to implement GCP and a sense of 'red tape' (i.e., environmental context and resources), a lack of knowledge of GCP principles (i.e., knowledge) and a fear of making mistakes (i.e., emotions), and varying relevance to individual projects (i.e., knowledge). Suggestions for support were identified beyond training, such as physical resources (e.g., prescriptive checklists, templates and scripts), additional time, and regular one-on-one mentoring support. **Conclusion** Findings suggest that while clinicians recognise the importance of GCP and want to implement it, they report barriers to its practical implementation. GCP training alone is unlikely to address these barriers to implementing GCP in daily practice. Findings suggest that GCP training may be more useful to AHPs when it is tailored to the allied health context and supplemented with additional supports including check-ups from

experienced researchers and access to prescriptive resources. Future research however is needed to investigate the effectiveness of such strategies.

Article Number: e101981

Accession Number: WOS:000339242700095

Abstract: Background: When designing interventions and policies to implement evidence based healthcare, tailoring strategies to the targeted individuals and organizations has been recommended. We aimed to gather insights into the ideas of a variety of people for implementing evidence-based practice for patients with chronic diseases, which were generated in five European countries. Methods:

A qualitative study in five countries (Germany, Netherlands, Norway, Poland, United Kingdom) was done, involving overall 115 individuals. A purposeful sample of four categories of stakeholders (healthcare professionals, quality improvement officers, healthcare purchasers and authorities, and health researchers) was involved in group interviews in each of the countries to generate items for improving healthcare in different chronic conditions per country: chronic obstructive pulmonary disease, cardiovascular disease, depression in elderly people, multi-morbidity, obesity. A disease-specific standardized list of determinants of practice in these conditions provided the starting point for these groups. The content of the suggested items was categorized in a pre-defined framework of 7 domains and specific themes in the items were identified within each domain. Results: The 115 individuals involved in the study generated 812 items, of which 586 addressed determinants of practice. These largely mapped onto three domains: individual health professional factors, patient factors, and professional interactions. Few items addressed guideline factors, incentives and resources, capacity of organizational change, or social, political and legal factors. The relative numbers of items in the different domains were largely similar across stakeholder categories within each of the countries. The analysis identified 29 specific themes in the suggested items across countries. Conclusion: The type of suggestions for improving healthcare practice was largely similar across different stakeholder groups, mainly addressing healthcare professionals, patient factors and professional interactions. As this study is one of the first of its kind, it is important that more research is done on tailored implementation strategies.

ISSN: 0003-066X

DOI: 10.1037/a0040394

Accession Number: WOS:000385566500009

Abstract: The majority of individuals with Type 2 diabetes (T2D) are overweight or obese, and this excess adiposity negatively impacts cardiovascular risk and contributes to challenges in disease management. Treatment of obesity by behavioral lifestyle intervention, within the context of diabetes, produces broad and clinically meaningful health improvements, and recent studies demonstrate long-term sustained weight management success with behavioral lifestyle interventions. Details of the Look AHEAD intensive lifestyle intervention are provided as an exemplar approach to the secondary prevention of T2D and obesity. The presence of behavior change expertise in the development and delivery of evidence-based behavioral weight control is discussed, and issues of adaptation and dissemination are raised, with a model to guide these important steps provided.

DOI: 10.1007/s11096-016-0359-5

Accession Number: WOS:000384561800030

Abstract: Background The World Health Organization states that globally more than half of all medication is inappropriately prescribed, dispensed or sold with a need to implement wastage reduction strategies. Developing processes which include behaviour change theories, such as the Theoretical Domains Framework (TDF), significantly impacts the positive implementation of evidence into healthcare practice. Objective To describe and understand the beliefs and behaviours regarding medication wastage of the Maltese public and healthcare professionals (HCPs) and to explore potential solutions. Setting: Malta. Method Five 90 min audio recorded focus

groups (2 public and 3 HCPs) were conducted with a purposive sample who responded to a previous survey study and were willing to participate in focus groups in Malta. The guide was based upon the TDF with interview questions derived from findings of the questionnaire phase. Focus groups were audio recorded and transcribed verbatim. Analysis was carried using the framework approach. Main outcome measure Beliefs and behaviours regarding medication wastage and potential solutions to reduce medication wastage. Results A total of eleven pharmacists, six doctors and six members of the public consented to participate. Focus groups conducted with HCPs and the general public identified the following four key themes aligned with the TDF domains to address proposed solutions to minimise medication wastage: (1) practitioner effects; (2) patients effects; (3) political effects; (4) societal effects. Conclusion This study has employed a theoretical framework to obtain a better understanding of facilitators which require attention as part of strategic development.

Short Title: A SYNTHETIC THEORY OF MOTIVATION

ISBN: 978-0-470-67421-5

Accession Number: WOS:000341971500009

Abstract: This chapter sets out a second draft of a synthetic theory of motivation (PRIME Theory) to provide a basis for a theory of addiction. It sets this within a broader model of behaviour, the COM-B model, which recognises that capability, opportunity and motivation all interact with behaviour as a dynamic system. The motivational theory needs to be able to provide a common framework for conscious choice processes and non-conscious motivational systems. It also needs to describe common mechanisms underlying apparently diverse patterns of addictive behaviour. Finally, it needs to set out the principles underlying the developmental process by which addiction and recovery from addiction occur.

Title: The effectiveness of digital interventions for increasing physical activity in individuals of low socioeconomic status: a systematic review and meta-analysis

Journal: International Journal of Behavioral Nutrition and Physical Activity

Volume: 18

Issue: 1

Date: Nov

Short Title: The effectiveness of digital interventions for increasing physical activity in individuals of low socioeconomic status: a systematic review and meta-analysis

DOI: 10.1186/s12966-021-01218-4

Article Number: 148

Accession Number: WOS:000716441100002

Abstract: Background Digital technologies such as wearables, websites and mobile applications are increasingly used in interventions targeting physical activity (PA). Increasing access to such technologies makes an attractive prospect for helping individuals of low socioeconomic status (SES) in becoming more active and healthier. However, little is known about their effectiveness in such populations. The aim of this systematic review was to explore whether digital interventions were effective in promoting PA in low SES populations, whether interventions are of equal benefit to higher SES individuals and whether the number or type of behaviour change techniques (BCTs) used in digital PA interventions was associated with intervention effects. Methods A systematic search strategy was used to identify eligible studies

from MEDLINE, Embase, PsycINFO, Web of Science, Scopus and The Cochrane Library, published between January 1990 and March 2020. Randomised controlled trials, using digital technology as the primary intervention tool, and a control group that did not receive any digital technology-based intervention were included, provided they had a measure of PA as an outcome. Lastly, studies that did not have any measure of SES were excluded from the review. Risk of Bias was assessed using the Cochrane Risk of Bias tool version 2. Results Of the 14,589 records initially identified, 19 studies were included in the final meta-analysis. Using random-effects models, in low SES there was a standardised mean difference (SMD (95%CI)) in PA between intervention and control groups of 0.06 (- 0.08,0.20). In high SES the SMD was 0.34 (0.22,0.45). Heterogeneity was modest in both low ($I^2 = 0.18$) and high ($I^2 = 0$) SES groups. The studies used a range of digital technologies and BCTs in their interventions, but the main findings were consistent across all of the sub-group analyses (digital interventions with a PA only focus, country, chronic disease, and duration of intervention) and there was no association with the number or type of BCTs. Discussion Digital interventions targeting PA do not show equivalent efficacy for people of low and high SES. For people of low SES, there is no evidence that digital PA interventions are effective, irrespective of the behaviour change techniques used. In contrast, the same interventions in high SES participants do indicate effectiveness. To reduce inequalities and improve effectiveness, future development of digital interventions aimed at improving PA must make more effort to meet the needs of low SES people within the target population.

Article Number: 79

Accession Number: WOS:000396617500001

Abstract: Background: Self-management interventions are considered effective in patients with chronic disease, but trials have shown inconsistent results, and it is unknown which patients benefit most. Adequate self-management requires behaviour change in both patients and health care providers. Therefore, the Activate intervention was developed with a focus on behaviour change in both patients and nurses. The intervention aims for change in a single self-management behaviour, namely physical activity, in primary care patients at risk for cardiovascular disease. The aim of this study is to evaluate the effectiveness of the Activate intervention. **Methods/design:** A two-arm cluster randomised controlled trial will be conducted to compare the Activate intervention with care as usual at 31 general practices in the Netherlands. Approximately 279 patients at risk for cardiovascular disease will participate. The Activate intervention is developed using the Behaviour Change Wheel and consists of 4 nurse-led consultations in a 3-month period, integrating 17 behaviour change techniques. The Behaviour Change Wheel was also applied to analyse what behaviour change is needed in nurses to deliver the intervention adequately. This resulted in 1-day training and coaching sessions (including 21 behaviour change techniques). The primary outcome is physical activity, measured as the number of minutes of moderate to vigorous physical activity using an accelerometer. Potential effect modifiers are age, body mass index, level of education, social support, depression, patient-provider relationship and baseline number of minutes of physical activity. Data will be collected at baseline and at 3 months and 6 months of follow-up. A process evaluation will be conducted to evaluate the training of nurses, treatment fidelity, and to identify barriers to and facilitators of implementation as well as to assess participants' satisfaction. **Discussion:** To increase physical activity in patients and to support nurses in delivering the intervention, behaviour change techniques are applied to change behaviours of the patients and nurses. Evaluation of the effectiveness of the intervention, exploration of which patients benefit most, and evaluation of our theory-based training for primary care nurses will enhance understanding of what works and for whom, which is essential for further implementation of self-management in clinical practice.

Article Number: e0212169

Accession Number: WOS:000458395600050

Abstract: Objective To explore the experiences of patients at risk for cardiovascular disease in primary care with the Activate intervention in relation to their success in increasing their physical activity. Methods A convergent mixed methods study was conducted, parallel to a cluster-randomised controlled trial in primary care, using a questionnaire and semi-structured interviews. Questionnaires from 67 patients were analysed, and semi-structured interviews of 22 patients were thematically analysed. Experiences of patients who had objectively increased their physical activity (responders) were compared to those who had not (non-responders). Objective success was analysed in relation to self-perceived success. Results The questionnaire and interview data corresponded, and no substantial differences among responders and non-responders emerged. Participating in the intervention increased patients' awareness of their physical activity and their physical activity level. Key components of the intervention were the subsequent support of nurses with whom patients' have a trustful relationship and the use of self-monitoring tools. Patients highly valued jointly setting goals, planning actions, receiving feedback and review on their goal attainment and jointly solving problems. Nurses' support, the use of self-monitoring tools, and involving others incentivised patients to increase their physical activity. Internal circumstances and external circumstances challenged patients' engagement in increasing and maintaining their physical activity. Conclusion Patients experienced the Activate intervention as valuable to increase and maintain their physical activity, irrespective of their objective change in physical activity. The findings enable the understanding of the effectiveness of the intervention and implementation in primary care.

DOI: 10.1136/bmjopen-2020-046551

Article Number: e046551

Accession Number: WOS:000634886700024

Abstract: Objective To evaluate the fidelity of delivery of a nurse-led intervention to enhance physical activity in patients at risk for cardiovascular diseases, the Activate intervention, by assessing: (1) self-reported fidelity of delivery; (2) observed fidelity of delivery; (3) quality of delivery of the Activate intervention and (4) nurses' beliefs about their capability, motivation, confidence and effectiveness towards delivering the Activate intervention, including behavioural change techniques. Design An observational study. Setting General practices in the Netherlands. Participants Primary care nurses (n=20) from 16 general practices. Primary and secondary outcome measures Nurses' self-reported fidelity was evaluated using checklists (n=282), and the observed fidelity and quality of delivery were examined using audiorecordings of consultations of the delivery of the Activate intervention (n=42). Nurses' beliefs towards delivering the intervention were assessed using questionnaires (n=72). Results The self-reported fidelity was 88.1% and observed fidelity was 85.4%, representing high fidelity. The observed fidelity of applied behavioural change techniques was moderate (75.0%). The observed quality of delivery was sufficient and varied among nurses (mean 2.9; SD 4.4; range 0-4). Nurses' beliefs about their capability, motivation, confidence and effectiveness towards delivering the intervention increased over time. Conclusions Nurses delivered most intervention components as intended with sufficient quality. Nurses believed they were capable, motivated and confident to deliver the intervention. They believed the intervention was effective to increase patients' physical activity level. Despite the high fidelity and moderate fidelity of applied behavioural change techniques, the varying quality of delivery within and across nurses might have diluted the effectiveness of the Activate intervention.

Title: The relationship between patient enablement and help-seeking in the context of blood cancer symptoms

Journal: Psycho-Oncology

Date: 2023 May

Short Title: The relationship between patient enablement and help-seeking in the context of blood cancer symptoms

ISSN: 1057-9249

DOI: 10.1002/pon.6170

Accession Number: WOS:000989095700001

Abstract: Objective Approaches to improve earlier diagnosis of cancer often focus on symptom awareness as a key driver of help-seeking behaviour and other psychological influences are less well understood. This is the first study to explore the role of patient enablement on help-seeking for people experiencing potential blood cancer symptoms. Methods A cross-sectional, nationally representative survey was completed by 434 respondents (>18 years). Questions asked about symptom experiences, medical help-seeking and re-consultation. Existing patient enablement items were included in the newly developed Blood Cancer Awareness Measure. We collected data on patient socio-demographic characteristics. Results Of those responding to the survey 224/434 (51.6%) reported experiencing at least one potential blood cancer symptom. Half of those experiencing symptoms (112/224) had sought medical help. Results from logistic regression analysis showed that higher scores on patient enablement were associated with being less likely to seek help (Odds Ratio [OR] 0.89, Confidence Interval [CI] 0.81-0.98) after controlling for socio-demographics. Separate analyses showed that higher enablement was associated with being more comfortable to re-consult if symptoms didn't go away or got worse (OR 1.31, CI 1.16-1.48); after a test result suggested there was nothing to worry about, but symptoms persisted (OR 1.23, CI 1.12-1.34) or to request further tests, scans or investigations (OR 1.31, CI 1.19-1.44). Conclusions Contrary to our hypotheses, patient enablement was associated with lower likelihood of help-seeking for potential blood cancer symptoms. Yet enablement appears to play an important role in likelihood of re-consulting when symptoms persist, get worse or need further investigation.

DOI: 10.5334/ijic.5426

Article Number: 6

Accession Number: WOS:000674193800001

Abstract: Introduction: Integrated team-based primary healthcare is well positioned to support opioid tapering for patients experiencing chronic pain. This paper describes the development, implementation and acceptability of a primary healthcare opioid tapering intervention 'Assess Inform Manage Monitor' (AIMM) at two sites. Methods: AIMM involved GP advice; nurse monitoring and potential engagement with: community pharmacist; psychologist; dietitian and exercise physiologist. Individuals receiving 90 days or more of prescription opioids were eligible. Patient and provider surveys and qualitative interviews were completed. Results: Of 140 eligible patients, 37 attended during the study period and were invited to participate. Patient post-intervention surveys (n = 8) and interviews (n = 6) indicated the intervention was acceptable, although the perceived value of some of the integrated team was low. GP and practice nurse support was valued. Providers (n = 4) valued team integration. Low weaning readiness was a barrier to engagement by patients and providers. Key lessons and conclusions: The intervention, whilst conceptually acceptable, was not feasible in its current form. Future efforts to transition patients towards integrated care should retain the practice nurse and place more focus on understanding and reinforcing patients' readiness to wean. Greater inter-professional collaboration may also be needed. Such refinements may advance the cause of opioid reduction in primary care.

ISSN: 1560-2214

DOI: 10.46542/pe.2021.211.5664

Accession Number: WOS:000660484900001

Abstract: Description: Students in small groups designed, delivered and evaluated real-life health promotion campaigns in the local community. A peer assessed component was included from the fifth cohort onwards. Evaluation: Six successive cohorts of pharmacy students anonymously completed an evaluation questionnaire after finishing the assessment. Descriptive and inferential statistical analyses were undertaken on the data. The results showed that consistently more respondents reported the assessment as a positive experience than a negative experience. Significantly more respondents reported peer assessment as being useful and group members equally contributing to campaign planning in the cohorts with peer assessment compared to the pre-peer assessment cohorts, but peer assessment did not significantly affect enjoyment ratings. Respondents' reported enjoyment of the assessment was significantly associated with agreement that it prepared them for health promotion in practice. Conclusions: Pharmacy students perceived the health promotion campaign assessment as appropriately challenging and enjoyable preparation for health promotion in practice.

Short Title: Integrating genomics into the care of people with palliative needs: A global scoping review of policy recommendations

ISSN: 1662-4246

DOI: 10.1159/000527963

Accession Number: WOS:000886485600001

Abstract: BACKGROUND: Genomics has growing relevance to palliative care, where testing largely benefits relatives. Integration of genomics into the care of patients with palliative care needs has not received the critical attention it requires, and health professionals report a lack of policy guidance to support them to overcome practice barriers. SUMMARY: To identify policy recommendations related to: (1) integrating genomics into the care of patients with palliative care needs and their families, and (2) care of the family unit, we performed a scoping review of palliative care and genomic policies. Two of 78 policies recommended integrating genomics into palliative care. Six palliative care policies mentioned genomics in background information but were without relevant recommendations. No genomics policies mentioned palliative care in the background information. Across all policies,

guidance related to "Delivering Family-Centred Care" was the most frequent recommendation related to care of the family unit, (n=62/78, 79.5%). KEY MESSAGES: We identified a policy gap related to integrating genomics into palliative care. Without policy guidance, health services are less likely to commit funding towards supporting health professionals, reducing the personal and clinical benefits of genomics to patients and relatives. Framing genomic information as family-centred care enables policy makers to communicate the value of genomics to palliative care that will resonate with genomic and palliative care stakeholders. These findings increase awareness among policy makers of the benefits of genomic information to patients with palliative care needs and their families and call for incorporation of appropriate recommendations into palliative care and genomic policy.

Short Title: The Effectiveness of Self-Management Mobile Phone and Tablet Apps in Long-term Condition Management: A Systematic Review

ISSN: 1438-8871

DOI: 10.2196/jmir.4883

Article Number: e97

Accession Number: WOS:000405758500002

Abstract: Background: Long-term conditions and their concomitant management place considerable pressure on patients, communities, and health care systems worldwide. International clinical guidelines on the majority of long-term conditions recommend the inclusion of self-management programs in routine management. Self-management programs have been associated with improved health outcomes; however, the successful and sustainable transfer of research programs into clinical practice has been inconsistent. Recent developments in mobile technology, such as mobile phone and tablet computer apps, could help in developing a platform for the delivery of self-management interventions that are adaptable, of low cost, and easily accessible. Objective: We conducted a systematic review to assess the effectiveness of mobile phone and tablet apps in self-

management of key symptoms of long-term conditions. Methods: We searched PubMed, Embase, EBSCO databases, the Cochrane Library, and The Joanna Briggs Institute Library for randomized controlled trials that assessed the effectiveness of mobile phone and tablet apps in self-management of diabetes mellitus, cardiovascular disease, and chronic lung diseases from 2005–2016. We searched registers of current and ongoing trials, as well as the gray literature. We then checked the reference lists of all primary studies and review papers for additional references. The last search was run in February 2016. Results: Of the 9 papers we reviewed, 6 of the interventions demonstrated a statistically significant improvement in the primary measure of clinical outcome. Where the intervention comprised an app only, 3 studies demonstrated a statistically significant improvement. Interventions to address diabetes mellitus (5/9) were the most common, followed by chronic lung disease (3/9) and cardiovascular disease (1/9). A total of 3 studies included multiple intervention groups using permutations of an intervention involving an app. The duration of the intervention ranged from 6 weeks to 1 year, and final follow-up data ranged from 3 months to 1 year. Sample size ranged from 48 to 288 participants. Conclusions: The evidence indicates the potential of apps in improving symptom management through self-management interventions. The use of apps in mHealth has the potential to improve health outcomes among those living with chronic diseases through enhanced symptom control. Further innovation, optimization, and rigorous research around the potential of apps in mHealth technology will move the field toward the reality of improved health care delivery and outcomes.

behaviour change analysis

ISSN: 1352-0504

DOI: 10.1111/jvh.13443

Accession Number: WOS:000596155400001

Abstract: The ease of direct-acting antiviral (DAA) medications for

hepatitis C virus (HCV) has provided an opportunity to decentralize HCV treatment into community settings. However, the role of non-specialist clinicians in community-based pathways has received scant attention to date. This study examined barriers and enablers to expanding the role of general practitioners (GPs) in HCV treatment provision, using simple behaviour change theory as a conceptual framework. A maximum variation sample of 22 HCV treatment providers, GPs and HCV support workers participated in semi-structured interviews. Data were inductively coded, and the resulting codes deductively mapped into three principal components of behaviour change: capability, opportunity and motivation (COM-B). By this process, a number of provider- and systemic-level barriers and enablers were identified. Key barriers included the pre-treatment assessment of liver fibrosis, GP capacity and the 'speciality' of HCV care. Enablers included the simplicity of the drugs, existing GP/patient relationships and the provision of holistic care. In addition to these specific factors, the data also exposed an overarching provider understanding of 'HCV treatment' as triumvirate in nature, incorporating the assessment of liver fibrosis, the provision of holistic support and the treatment of disease. This understanding imposes a further fundamental barrier to GP-led treatment as each of these three components needs to be individually addressed. To enable sustainable models of HCV treatment provision by GPs, a pragmatic re-examination of the 'HCV treatment triumvirate' is required, and a paradigm shift from the 'refer and treat' status quo.

Short Title: Developing a primary care-initiated hepatitis C treatment pathway in Scotland: a qualitative study

ISSN: 0960-1643

DOI: 10.3399/bjgp.2022.0044

Accession Number: WOS:000802917400001

Abstract: Background The ease of contemporary hepatitis C virus (HCV) therapy has prompted a global drive towards simplified and decentralised treatment pathways. In some countries, primary care has become an integral component of community-based HCV treatment

provision. In the UK, however, the role of primary care providers remains largely focused on testing and diagnosis alone. Aim To develop a primary care-initiated HCV treatment pathway for people who use drugs, and recommend theory informed interventions to help embed that pathway into practice. Design and setting A qualitative study informed by behaviour change theory. Semi-structured interviews were undertaken with key stakeholders (n = 38) primarily from two large conurbations in Scotland. Method Analysis was three-stage. First, a broad pathway structure was outlined and then sequential pathway steps were specified; second, thematic data were aligned to pathway steps, and significant barriers and enablers were identified; and, third, the Theoretical Domains Framework and Behaviour Change Wheel were employed to systematically develop ideas to enhance pathway implementation, which stakeholders then appraised. Results The proposed pathway structure spans broad, overarching challenges to primary care-initiated HCV treatment. The theory-informed recommendations align with influences on different behaviours at key pathway steps, and focus on relationship building, routinisation, education, combating stigmas, publicising the pathway, and treatment protocol development. Conclusion This study provides the first practicable pathway for primary care-initiated HCV treatment in Scotland, and provides recommendations for wider implementation in the UK. It positions primary care providers as an integral part of community-based HCV treatment, providing workable solutions to ingrained barriers to care.

Abstract: Addressing climate change requires profound behaviour change, not only in consumer action, but also in action as members of communities and organisations, and as citizens who can influence policies. However, while many behavioural models exist to explain and predict mitigation and adaptation behaviours, we argue that their utility in establishing meaningful change is limited due to

their being too reductive, individualistic, linear, deliberative and blind to environmental impact. This has led to a focus on suboptimal intervention strategies, particularly informational approaches. Addressing the climate crisis requires a focus on high-impact behaviours and high-emitting groups; interdisciplinary interventions that address the multiple drivers, barriers and contexts of behaviour; and timing to ensure interventions are targeted to moments of change when habits are weaker.

DOI: 10.3390/ijerph19041980

Article Number: 1980

Accession Number: WOS:000769116800001

Abstract: This study explores healthcare professionals' experiences of using behavior change interventions in clinical practice. Semi-structured qualitative interviews were conducted with 11 healthcare professionals working in a cardiac and pulmonary rehabilitation National Health Service Trust in the United Kingdom. Interviews were transcribed and analyzed using inductive thematic analysis. Four overarching themes representing healthcare practitioners' perceptions of using behavior change interventions were identified: (1) reliance on experiential learning, (2) knowledge transition, (3) existing professional development programs, and (4) barriers and facilitators for continued professional development. The results are discussed in relation to the implications they may have for behavior change training in clinical healthcare practice. Healthcare professionals require bespoke and formalized training to optimize their delivery of behavior change interventions in cardiac and pulmonary rehabilitation. Doing so will enhance intervention fidelity and implementation that can potentially ameliorate patient rehabilitation outcomes.

Short Title: Efficacy of the SOAR knee health program: protocol for a two-arm stepped-wedge randomized delayed-controlled trial

DOI: 10.1186/s12891-022-05019-z

Article Number: 85

Accession Number: WOS:000749212300001

Abstract: Background: Knee trauma permanently elevates one's risk for knee osteoarthritis. Despite this, people at-risk of posttraumatic knee osteoarthritis rarely seek or receive care, and accessible and efficacious interventions to promote knee health after injury are lacking. Exercise can ameliorate some mechanisms and independent risk factors for osteoarthritis and, education and action-planning improve adherence to exercise and promote healthy behaviours. Methods: To assess the efficacy of a virtually-delivered, physiotherapist-guided exercise-based program (SOAR) to improve knee health in persons discharged from care after an activity-related knee injury, 70 people (16-35 years of age, 12-48 months post-injury) in Vancouver Canada will be recruited for a two-arm step-wedged assessor-blinded delayed-control randomized trial. Participants will be randomly allocated to receive the intervention immediately or after a 10-week delay. The program consists of 1) one-time Knee Camp (group education, 1:1 individualized exercise and activity goal-setting); 2) weekly individualized home-based exercise and activity program with tracking, and; 3) weekly 1:1 physiotherapy-guided action-planning with optional group exercise class. Outcomes will be measured at baseline, 9- (primary endpoint), and 18-weeks. The primary outcome is 9-week change in knee extension strength (normalized peak concentric torque; isokinetic dynamometer). Secondary outcomes include 9-week change in moderate-to-vigorous physical activity (accelerometer) and self-reported knee-related quality-of-life (Knee injury and OA Outcome Score subscale) and self-efficacy (Knee Self Efficacy Scale). Exploratory outcomes include 18-week change in primary and secondary outcomes, and 9- and 18- week change in other components of knee extensor and flexor muscle function, hop function, and self-reported symptoms,

function, physical activity, social support, perceived selfcare and kinesiophobia. Secondary study objectives will assess the feasibility of a future hybrid effectiveness–implementation trial protocol, determine the optimal intervention length, and explore stakeholder experiences. Discussion: This study will assess the efficacy of a novel, virtually-delivered, physiotherapist-guided exercise-based program to optimize knee health in persons at increased risk of osteoarthritis due to a past knee injury. Findings will provide valuable information to inform the management of osteoarthritis risk after knee trauma and the conduct of a future effectiveness–implementation trial.

Title: What the guide does not tell you: reflections on and lessons learned from applying the COM-B behavior model for designing real life interventions

Journal: Translational Behavioral Medicine

Volume: 11

Issue: 5

Pages: 1122-1126

Date: May

Short Title: What the guide does not tell you: reflections on and lessons learned from applying the COM-B behavior model for designing real life interventions

ISSN: 1869-6716

DOI: 10.1093/tbm/ibaa116

Accession Number: WOS:000732777000009

Abstract: Substantial inconsistency exists in the effectiveness of existing interventions to improve heart failure (HF) self-care, which can be partially explained by the fact that self-management interventions often lack theoretical models that underpin intervention development. The COM-B behavior model is a comprehensive theoretical framework that can be used to develop effective, theory-based interventions. The aim of this article is to highlight the challenges and practical solutions when applying the COM-B model to HF self-care, in order to provide useful support for researchers intending to use the model for designing behavior change interventions. "The Behaviour Change Wheel" handbook provides a step-by-step guide to understand and change behavior. When following the guide, some practical and methodological challenges were encountered. Lessons learnt to overcome these challenges are reported. Although the handbook is a comprehensive guide for

designing behavior change interventions, a number of challenges arose. For example, the descriptions provided in the guide were not always sufficient to make solid judgments on how to categorize determinants; narrowing down intervention possibilities to a manageable number and prioritizing potential behavior change techniques over others involved a certain amount of subjectivity in an otherwise highly systematic and structured approach. For the encountered challenges, solutions are provided to illustrate how the model was applied practically to design theory-based behavior change interventions. This article provides a useful reference for researchers' use of the COM-B behavior model, as it outlines challenges that may occur and potential solutions to overcome them.

Accession Number: WOS:000571602200001

Abstract: Background: Effective interventions to enhance adherence to self-care recommendations in patients with heart failure have immense potential to improve health and wellbeing. However, there is substantial inconsistency in the effectiveness of existing self-management interventions, partly because they lack theoretical models underpinning intervention development. Aim: To outline how the capability, opportunity and motivation behaviour model has been applied to guide the development of a theory-based intervention aiming to improve adherence to heart failure self-care recommendations. Methods: The application of the capability, opportunity and motivation behaviour model involved three steps: (a) identification of barriers and facilitators to heart failure self-care from two comprehensive meta-studies; (b) identification of appropriate behaviour change techniques to improve heart failure

self-care; and (c) involvement of experts to reduce and refine potential behaviour change techniques further. Results: A total of 119 barriers and facilitators were identified. Fifty-six behaviour change techniques remained after applying three steps of the behaviour model for designing interventions. Expert involvement (n=39, of which 31 were patients (67% men; 45% New York Heart Association II)) further reduced and refined potential behaviour change techniques. Experts disliked some behaviour change techniques such as 'anticipated regret' and 'salience of consequences'. This process resulted in a final comprehensive list consisting of 28 barriers and 49 appropriate behaviour change techniques potentially enhancing self-care that was put forward for further use. Conclusion: The application of the capability, opportunity and motivation behaviour model facilitated identifying important factors influencing adherence to heart failure self-care recommendations. The model served as a comprehensive guide for the selection and design of interventions for improving heart failure self-care adherence. The capability, opportunity and motivation behaviour model enabled the connection of heart failure self-care barriers to particular behaviour change techniques to be used in practice. Short Title: Applying the behavior change wheel to identify pandemic-related attitudes and feelings about physical activity as predictors of physical activity level among university students in Indonesia during the COVID-19 pandemic

DOI: 10.3389/educ.2022.958348

Article Number: 958348

Accession Number: WOS:000872898500001

Abstract: A recent systematic review found a significant drop in physical activity (PA) among university students during the coronavirus disease 2019 (COVID-19) pandemic. Identifying students' attitudes and feelings about PA and coronavirus, which could facilitate or hinder PA, is essential to guide intervention planning. Therefore, this study aimed to examine attitudes and feelings about PA and coronavirus as predictors of PA levels. We

conducted a cross-sectional study among undergraduate university students in Indonesia to collect their PA levels using the global PA questionnaire version 2 and their attitudes and feelings about PA in pandemic situations. A binomial logistic regression has been conducted to predict whether students will sufficiently engage in PA based on their attitudes and feelings related to PA, coronavirus, and demographic characteristics. Results from 588 undergraduate students (75% female) showed that students perceived the health benefits of PA, perceived feeling guilty about wanting to do PA during the pandemic, body mass index (BMI), and field of study were statistically significant predictors of PA levels. An increase of one unit of perceived health benefits of PA increases the odds of meeting the PA guidelines by 2.313 (95% confidence interval 1.708–3.132, $p < 0.001$). On the other hand, raising one point of feeling guilty about conducting PA was associated with 1.285 times lower odds (95% confidence interval 1.062–1.558, $p = 0.01$) of meeting the PA guidelines. Thus, intervention should increase students' awareness of the physical health benefits of PA during the pandemic and reduce their feeling of guilty about conducting the PA. Accession Number: WOS:000950323000001

Abstract: Environmental problems demand for innovative interdisciplinary research to tackle problem complexity and provide insights for problem-solving. Along these lines, behavioral insights have the potential to improve the effectiveness of policies by identifying which behaviors are best tackled and how. In this paper, we present a systematic review of the literature on small-scale farmers' pesticide use in the Global South to identify (a) pesticide use behaviors and (b) their behavioral determinants. We defined our body of literature by establishing inclusion criteria and screened studies in a two-step process involving multiple coders. From the selected studies ($k = 70$), we extracted data about farmers' pesticide use behaviors. We also extracted the determinants of these behaviors with an established framework of behavioral change, the behavior change wheel. Finally, we show how the behavioral insights

thus obtained can provide hypotheses on the suitability and ultimate effectiveness of policy instruments for agriculture and environmental protection. Overall, this systematic approach showcases how behavioral insights can be used to systematically gather new knowledge on what works and why in pesticide policy. Additionally, this paper illustrates that the current literature on pesticide use behavior in the Global South lacks standardized and consistent measures of behavior and determinants to provide valid and robust results. Overall, this hampers evidence synthesis and thus scientific progress in the field.

Article Number: 13623613211073020

Accession Number: WOS:000759726600001

Abstract: Accessing adult autism diagnostic pathways can be difficult. This study explored perspectives of UK autistic adults, relatives and clinicians regarding the characteristics of optimal adult autism assessment and diagnostic services. In stage 1, three key stakeholder groups were surveyed about experiences of adult autism diagnostic services (pre-assessment/assessment): 343 autistic adults, 45 relatives and 35 clinicians completed parallel surveys. Information from stage 1 surveys was used to devise statements for a modified Delphi process in stage 2 seeking consensus among clinicians on optimal diagnostic service characteristics. Data analyses were non-parametric and descriptive. Over half of adults were in contact with mental health services prior to autism diagnosis. Clinicians reported that multidisciplinary diagnostic teams lacked key professionals. Thirteen statements describing optimal autism diagnostic service provision were developed. There was consensus from clinicians on 11 statements relating to clear assessment pathways, updates for people while waiting, pre-assessment information gathering/provision, co-occurring condition identification and training/networking. Some autistic adults, relatives and clinicians were positive about services, all

stakeholders identified improvements were needed. The findings describing optimal service provision are relevant for UK clinicians, managers and commissioners to improve diagnostic assessments for autistic adults, and have international relevance for similar health systems. Lay abstract Living with undiagnosed autism can be distressing and may affect mental health. A diagnosis of autism can help self-awareness and self-understanding. However, it can be difficult for adults to access an autism assessment. Clinicians also sometimes find it hard to identify autism in adults. This may mean an autism diagnosis is delayed or missed. In this study, we asked autistic adults, relatives and clinicians how to improve this. The study was in two stages. In the first stage (stage 1), 343 autistic adults and 45 relatives completed a survey. In the survey, we asked questions about people's experiences of UK autism assessment services for adults. Thirty-five clinicians completed a similar survey. Clinicians reported that some autism assessment teams lacked key professionals, for example, psychologists and occupational therapists. We used the information from the three separate surveys to create 13 statements describing best autism assessment services for adults. In stage 2, we asked clinicians for their views on the 13 statements. Clinicians agreed with 11 of the statements. Some autistic adults, relatives and clinicians were positive about autism assessment services, and many also described areas that could be improved. The study findings can be used to improve UK adult autism assessment services and may be helpful for service developments worldwide.

Abstract: Purpose: To develop a culturally-sensitive intervention for the early prevention of gender-based violence (GBV) in Uganda.

Methods: Programme design followed the 6SQuID model of intervention

development and multi-sectorial advice. A formative evaluation was conducted in two communities with six groups and 138 participants. Findings: Four familial predictors of GBV were identified as potentially malleable: poor parent-child attachment, harsh parenting, inequitable gendered socialization and parental conflict. A community-based parenting programme was developed to address them. Its programme theory incorporates Attachment Theory, the concept that positive behavioural control develops emotional control, and Social Learning Theory. Its rationale, structure and content are presented using the TIDieR checklist. A formative evaluation showed the programme to be widely acceptable, culturally appropriate, and perceived to be effective, but also identified challenges. Conclusion: The careful development of this community-based parenting programme shows promise for the early prevention of GBV. Short Title: Self-management intervention to reduce pulmonary exacerbations by supporting treatment adherence in adults with cystic fibrosis: a randomised controlled trial

ISSN: 0040-6376

DOI: 10.1136/thoraxjnl-2021-217594

Accession Number: WOS:000727730500001

Abstract: Introduction Recurrent pulmonary exacerbations lead to progressive lung damage in cystic fibrosis (CF). Inhaled medications (mucoactive agents and antibiotics) help prevent exacerbations, but objectively measured adherence is low. We investigated whether a multi-component (complex) self-management intervention to support adherence would reduce exacerbation rates over 12 months. Methods Between October 2017 and May 2018, adults with CF (aged \geq 16 years; 19 UK centres) were randomised to the intervention (data-logging nebulisers, a digital platform and behavioural change sessions with trained clinical interventionists) or usual care (data-logging nebulisers). Outcomes included pulmonary exacerbations (primary

outcome), objectively measured adherence, body mass index (BMI), lung function (FEV1) and Cystic Fibrosis Questionnaire-Revised (CFQ-R). Analyses were by intent to treat over 12 months. Results Among intervention (n=304) and usual care (n=303) participants (51% female, median age 31 years), 88% completed 12-month follow-up. Mean exacerbation rate was 1.63/year with intervention and 1.77/year with usual care (adjusted ratio 0.96; 95% CI 0.83 to 1.12; p=0.64). Adjusted mean differences (95% CI) were in favour of the intervention versus usual care for objectively measured adherence (9.5% (8.6% to 10.4%)) and BMI (0.3 (0.1 to 0.6) kg/m²), with no difference for %FEV1 (1.4 (-0.2 to 3.0)). Seven CFQ-R subscales showed no between-group difference, but treatment burden reduced for the intervention (3.9 (1.2 to 6.7) points). No intervention-related serious adverse events occurred. Conclusions While pulmonary exacerbations and FEV1 did not show statistically significant differences, the intervention achieved higher objectively measured adherence versus usual care. The adherence difference might be inadequate to influence exacerbations, though higher BMI and lower perceived CF treatment burden were observed.

Short Title: Exercise training combined with psychological interventions for people with chronic obstructive pulmonary disease

ISSN: 1323-7799

DOI: 10.1111/resp.12419

Accession Number: WOS:000346467400010

Abstract: Previous systematic reviews have confirmed the benefits of both exercise training and psychological interventions in people

with chronic obstructive pulmonary disease (COPD). The objective of this systematic review was to examine the effect of interventions which combine exercise training and psychological interventions for a range of health outcomes in people with COPD. Database searches identified randomized controlled trials of people with COPD participating in interventions that combined exercise training with a psychological strategy compared with control (usual care, waiting list) or active comparators (education, exercise, psychological interventions alone). Health outcomes included dyspnoea, anxiety, depression, quality of life or functional exercise capacity. Standardized mean differences (SMD) were calculated for each intervention arm/control comparison. Across the 12 included studies (738 participants), compared with control conditions, SMD consistently favoured interventions which included both exercise+psychological components (SMD range dyspnoea -1.63 to -0.25; anxiety -0.50 to -0.20; depression -0.46 to -0.18; quality of life 0.09 to 1.16; functional exercise capacity 0.22 to 1.23). When compared with active comparators, SMD consistently favoured interventions that included exercise training+psychological component for dyspnoea (SMD range -0.35 to -0.97), anxiety (SMD range -0.13 to -1.00) and exercise capacity (SMD range 0.64 to 0.71) but were inconsistent for depression (-0.11 to 1.27) and quality of life (0.02 to -2.00). The magnitude of effect for most interventions was greater than the minimum required for clinical significance (i.e.>0.32) in behavioural medicine. While interventions, outcomes and effect sizes differed substantially between studies, combining exercise training with a psychological intervention may provide a means of optimizing rehabilitation in people with COPD.

Abstract: Evidence supports the positive influence of nature on

population health, which has led to increased interest in nature-based interventions (NBIs). This scoping review explored how NBIs were currently being implemented to change adult health-related behaviours and outcomes linked with international public health indicators. Fiftytwo of the 618 studies initially screened met the inclusion criteria. The review reinforced nature's potential to improve multiple health and wellbeing outcomes relevant to environment and public health disciplines. However, NBI effects were typically small, assessed short-term, and often based on comparisons between natural and highly urbanised settings. Vague NBI descriptions, an absence of theoretical frameworks guiding NBI design, and limited exploration of differences by socio-demographic or clinical group limited the conclusions. Based on the review findings, future NBIs should include clear, full descriptions of the settings and intervention techniques. The theoretical framework(s) utilised in the design and evaluation process should also be specified. NBIs duration should also be systematically investigated to establish if doseresponse relationships differ by health outcomes to inform public health guidance on the "minimum duration for maximum benefit" for nature users. Another recommendation is for health behaviour change frameworks to be considered along with environment-health theories in NBI design and evaluation. This complementary approach could establish the full range of environment and health benefits associated with NBIs and better evidence the environmental, health and social impact.

ISSN: 2691-3321

DOI: 10.1097/xeb.0000000000000333

Accession Number: WOS:000851324900006

Abstract: Introduction and aims: Room service is a hospital meal service model with demonstrated improved nutrition intake, reduced wastage and cost benefits in some settings compared with traditional models. However, uptake across public hospital settings appears low; the underlying reasons require exploration. In 2019, room service

was introduced in a Queensland Hospital and Health Service site. The aim of this article is to identify the barriers and enablers to implementing room service to provide recommendations for future implementation of this model. Methods: The current qualitative descriptive study utilized semistructured interviews with project members and key stakeholders involved in implementation of the room service meal delivery model at the Prince Charles Hospital (Queensland, Australia). A convenience sample of participants were recruited. Interviews explored project experiences from commencement to completion, barriers and enablers to implementation, strategies to overcome challenges and recommendations for implementation at other sites. Interviews were coded to identify themes and subthemes. Results: Nine participants were interviewed. Key themes with associated subthemes were (1) foundations of transformation, (2) navigating implementation and (3) embedding sustainable practices. Conclusion: The current study adds rich information to understand factors that support the implementation of a room service model in a large public hospital. Future implementation of room service should not only consider measuring quantifiable outcomes, but also the importance of qualitative descriptive studies surveying project members and key stakeholders to further explore experiences, barriers and enablers to implementation and develop strategies to overcome challenges to assist further sites implement this model. Abstract: Issue addressed Retention of weight gained during pregnancy contributes to overweight and obesity and consequent chronic disease risk. Early programs have been successful in improving diet quality, physical activity levels and reducing postnatal weight retention. However, barriers to program engagement remain. This study aimed to investigate women's healthy eating,

physical activity and weight experiences and explore their views regarding digital health interventions to assist meeting their lifestyle goals. Methods This qualitative descriptive study utilised semi-structured interviews with women who had recently become mothers who had gestational diabetes or a body mass index above 25 kg/m(2). Themes were then identified through thematic analysis of interview transcripts. Results Nine women were interviewed (average age 33.4 +/- 4.2 years). The two distinct areas of questioning resulted in two overarching topics: (i) Enablers and barriers to maintaining regular physical activity and a healthy dietary pattern; and (ii) characteristics of a postpartum program to enable meeting of diet, physical activity and weight loss goals. These topics each had their own descriptive themes and sub-themes. Conclusions Understanding women's needs and viewpoints for a postnatal diet, physical activity and weight program allows researchers to design a program to maximise engagement and outcomes. So what? Any further postnatal program must leverage off existing infrastructure, integrate learnings from published formative work and harnesses the impact of digital delivery. This will improve program accessibility and provide ongoing contact for sustained behaviour change through text messaging and providing digital resources in a dynamic format women can engage with in their own time.

Accession Number: WOS:000851324900005

Abstract: Introduction and aims: Clinicians understanding and applying the skills of knowledge translation is essential for the delivery of high value, effective health care. However, many clinicians lack confidence and capacity to undertake knowledge translation. Our team recently piloted a group telementoring

knowledge translation support service (KTSS) with allied health professionals (AHPs) undertaking knowledge translation in their practice. This article aims to investigate barriers and enablers to participants' participation and identify evidence-based strategies to improve future delivery of the initiative. Methods: The evaluation utilized semistructured interviews with participants who completed the first KTSS. Interview transcripts were analysed to identify key themes and subthemes. Subthemes were also mapped to an implementation science framework and model (theoretical domains framework and behaviour change wheel) to guide evidence-based identification of effective strategies to address, overcome, or enhance issues raised. Results: Six of the nine participants invited were interviewed. Five barriers and six enablers of KTSS participation, and five improvement ideas for a future KTSS program, were suggested. Barriers included knowledge gaps, competing time demands, and organizational expectations. Enablers included organizational support, motivation and preparation, and local champions. Additional strategies included additional preparation, an initial rapport building session, and strategies to meet the emotional needs of the participants. These were reinforced by the framework mapping results, with the further addition of a peer modelling strategy. Conclusion: Through a qualitative methodology we have examined and identified the experiences of AHPs who have participated in a knowledge translation telementoring program with clear strategies to enhance further programs offered.

Short Title: The incorporation of body composition assessments as part of routine clinical care in a tertiary hospital's dietetic department: a best practice implementation project

ISSN: 2691-3321

DOI: 10.1097/xeb.000000000000291

Accession Number: WOS:000783723400004

Abstract: Objectives: Our aim was to incorporate body composition assessment (BCA) into dietetic department procedures using interventions tailored to previously identified barriers and

enablers. Introduction: BCA is recommended as part of routine malnutrition assessment and follow-up but is not yet part of usual care. Methods: Evidence-informed strategies to overcome barriers and enablers were operationalized and delivered as three overarching interventions: upskilling (professional development strategy), modelling and reducing fear of change (Clinical Champion project), and embedding as usual practice (departmental integration). Process evaluation assessed intervention fidelity. A survey assessed utilization of BCA devices, (perceived) competency, and attitudes of clinical dietitians towards BCA before and after interventions. Results: Two of the three elements were incorporated as planned (upskilling and embedding as usual practice), with one element (modelling and reducing fear of change) modified through iterative processes. The Clinical Champion project ran for 12 rather than 6 months, and resulted in the majority of champions confident with their skills, completing BCA within their daily clinical workload and feeling BCA was useful. Pre-surveys and post-surveys within the department of 26 dietitians showed a marked reduction in most perceived barriers and improved recognition of enablers across all theoretical framework domains; with a large proportion of 'not applicable' responses given for many barriers at follow-up. Conclusion: This evidence-informed implementation strategy successfully integrated BCA into dietitians' practice and departmental processes highlighting direction for future service changes. Continual assessment of barriers and success of integration into routine workloads is required to facilitate this. Notes: Wilkinson, Shelley A. Jobber, Chloe J. D. Abstract: Aim Poorly controlled gestational diabetes mellitus can result in negative pregnancy and delivery outcomes. A reduced need for insulin was documented in the validation of American gestational diabetes Nutrition Practice Guidelines, which recommend at least

three dietitian visits. No Australian gestational diabetes mellitus nutrition guidelines exist. This paper evaluates the implementation of a dietetic model of care based on the American guidelines in an Australian hospital. MethodsThe implementation plan consisted of a nine-month pre (usual care)/post (new model of care) design with a month for integration' across 2012–2013. Primary outcomes were uptake of the new dietetic model of care and requirement for pharmacotherapy. ResultsBoth phases ran for seven months; integration required four months. Pre-intervention, only one woman received a review appointment. Significantly more women received best-practice care post-implementation ($P = 0.02$); of the 162 women seen, 50.6% received two review appointments. As a result of heavy clinical demand, only 31.5% of the women seen post-implementation received an individual dietitian assessment and education session, deviating from best practice. Clinically relevant changes were seen in medication requirements with a decrease in women requiring pharmacological treatment (31.1% (pre); 26.9% (post)). The difference was more pronounced in women who received best-practice care (27.2% (no) vs 25.0% (yes)). ConclusionsThis project successfully increased the proportion of women seen according to best practice. Service limitations impaired the delivery of optimal care. The present study illustrates the opportunities and challenges of conducting evidence-based implementation research in routine clinical care.

Abstract: Introduction and aims: Dissemination and local adaptation of best practice models of care are often poorly achieved in knowledge translation processes. Understanding and documenting the iterative cycles of improvement can elucidate barriers, enablers and benefits of the process for future adoption and service integration improvements. This project examined the process of local adaptation for a third stage translation of a gestational diabetes dietetic model of care through collaboration with two Queensland (Australia) hospitals. Methods: Using a hub (research team)-spoke (sites) model, two Queensland Hospital and Health Service Districts were supported to assess and address evidence-practice dietetic model of care gaps in their gestational diabetes mellitus (GDM) services. Sites selected demonstrated strong GDM team cohesiveness and project commitment. The project phases were: Consultation; Baseline; Transition; Implementation; and Evaluation. Results: Despite strong site buy-in and use of a previously successful model of care dissemination and adoption strategy, unexpected global, organisational, team and individual barriers prevented successful implementation of the model of care at both sites. Barriers included challenges with ethics and governance requirements for health service research, capacity to influence and engage multidisciplinary teams, staff turnover and coronavirus disease 2019's (COVID-19's) disruption to service delivery. Conclusion: This third iteration of the dissemination of a best practice model of nutrition care for GDM in two Queensland Hospital and Health Service Districts did not achieve successful clinical or process outcomes. However, valuable learnings and recommendations regarding future clinical and research health service redesign aligned with best practice are suggested. Notes: Wilkinson, Shelley A. DOI: 10.1111/ajo.12011

Accession Number: WOS:000312247600016

Abstract: Background: Statewide (Queensland) Clinical Guidelines

reflecting current best practice have recently become available for the management of pregnancy-related obesity. However, dissemination of guidelines alone do not change practice. Aim: To systematically assess evidence-practice gap in the multidisciplinary management of overweight and obesity (ow/ob) in pregnancy to inform an intervention to facilitate translating obesity guidelines into practice in a tertiary maternity service. Materials and Methods: An online survey, available over a three-week period (May-June 2011), was disseminated to obstetric, midwifery and allied health staff. Outcomes of interest included a 15-point guideline adherence score, knowledge of guideline content, advice given, knowledge of obesity-pregnancy-related complications, previous training and referral patterns. Results: Eighty-four staff completed surveys (57% response rate). Widespread discordance with the guideline was noted. The majority (88.1%) reported overweight/obesity (ow/ob) as an important/very important general obstetric issue, most correctly identified associated complications. However, only 32.1% were aware of existing guidelines, with only half correctly identifying BMI categories for ow/ob. Compliance with referral recommendations varied; 20% of staff considered referral 'was not their job'. Conclusions: Staff are aware of negative outcomes associated with maternal ow/ob, although few are fully compliant with referral guidelines or provide advice in line with recommendations. These findings will be categorised using implementation of science methodological frameworks, and effective behaviour change interventions will be constructed to facilitate translation of this important guideline into practice.

Abstract: There is limited evidence regarding the accuracy of inferences about intention. The research described in this article shows how perceptual control theory (PCT) can provide a "ground truth" for these judgments. In a series of 3 studies, participants were asked to identify a person's intention in a tracking task where the person's true intention was to control the position of a knot connecting a pair of rubber bands. Most participants failed to correctly infer the person's intention, instead inferring complex but nonexistent goals (such as "tracing out two kangaroos boxing") based on the actions taken to keep the knot under control. Therefore, most of our participants experienced what we call "control blindness." The effect persisted with many participants even when their awareness was successfully directed at the knot whose position was under control. Beyond exploring the control blindness phenomenon in the context of our studies, we discuss its implications for psychological research and public policy.

Article Number: e015833

Accession Number: WOS:000406391200189

Abstract: Introduction Osteoarthritis (OA) is a common degenerative articular disease, the highest cause of individual level disability and a significant socioeconomic burden to healthcare services. Patient education and physical activity (PA) prescription are recommended components of interventions in several healthcare guidelines and are commonly provided by physiotherapists. However, these interventions lack long-term clinical effectiveness. Patient adherence to PA prescription requires patients to modify their PA behaviour and appears critical in maintaining symptomatic improvements. This systematic review aims to evaluate the effectiveness of behavioural change techniques (BCTs) used in physiotherapy interventions to improve PA adherence. Methods and analysis Medline, Cochrane and PEDro registers of Controlled Trials, EMBASE, CINAHL and PsycInfo databases, and key grey literature sources will be rigorously searched for randomised controlled trials that compared a physiotherapy intervention incorporating BCTs with other therapies, placebo interventions, usual care or no-treatment. Two independent researchers will conduct literature searches, assess trial eligibility, extract data, conduct risk of bias assessment (using Cochrane risk of bias tool), classify BCTs and evaluate the quality of the body of literature following Grading of Recommendations, Assessment, Development and Evaluation (GRADE) guidelines. Narrative synthesis of key outcomes will be presented and meta-analysis will be performed if included trials are clinically homogenous, based on their intervention and comparator groups and outcome measures. This review will be reported in line with the Preferred Reporting Items for Systematic review and Meta-Analysis guidelines. Ethics and dissemination Research ethics approval is not required. This review will help inform clinicians and researchers on the most effective behavioural change techniques used in physiotherapy interventions to enhance adherence to PA prescription for patients with lower limb OA. The findings will be disseminated through publication in a peer-reviewed journal and conference presentations.

Abstract: When starting new and healthy habits or encouraging
vigilance against returning to poor habits, a simple text message
can be beneficial. Text messages also have the advantage of being
easily accessible for lower-income populations spread over a rural
area, who may not be able to afford smartphones with apps or data
plans. Users benefit the most from text messages that are customized
for them, but personalization requires time and effort on part of
the user and the counselor. However, personalization that focuses on
the cultural background of a pool of recipients, in addition to
general personal preferences, can be a low-cost method of ensuring
the best experience for patients interested in taking up new habits.
In this paper, we discuss the development of a system for motivating
users to quit smoking designed for Native American users in South
Dakota, using text messaging as a daily intervention method for
patients. Our results show that focusing on modular message
customization options and messages with a conversational tone best
helps our goal of providing users with customization options that
help motivate them to live happy and healthy lifestyles.

Short Title: Social Patterning and Stability of Intention to Accept a COVID-19 Vaccine in Scotland: Will Those Most at Risk Accept a Vaccine?

DOI: 10.3390/vaccines9010017

Article Number: 17

Accession Number: WOS:000611850700001

Abstract: Vaccination is central to controlling COVID-19. Its success relies on having safe and effective vaccines and also on high levels of uptake by the public over time. Addressing questions of population-level acceptability, stability of acceptance, and sub-population variation in acceptability are imperative. Using a prospective design, a repeated measures two-wave online survey was conducted to assess key sociodemographic variables and intention to accept a COVID-19 vaccine. The first survey (Time 1) was completed by 3436 people during the period of national lockdown in Scotland and the second survey (n = 2016) was completed two months later (Time 2) when restrictions had been eased. In the first survey, 74% reported being willing to receive a COVID-19 vaccine. Logistic regression analyses showed that there were clear sociodemographic differences in intention to accept a vaccine for COVID-19 with intention being higher in participants of white ethnicity as compared with Black, Asian, and minority ethnic (BAME) groups, and in those with higher income levels and higher education levels. Intention was also higher in those who had "shielding" status due to underlying medical conditions. Our results suggest that future interventions, such as mass media and social marketing, need to be targeted at a range of sub-populations and diverse communities.

Title: Counseling for health behavior change in people with COPD:

systematic review

Journal: International Journal of Chronic Obstructive Pulmonary Disease

Volume: 12

Pages: 2165–2178

Short Title: Counseling for health behavior change in people with COPD: systematic review

ISSN: 1178–2005

DOI: 10.2147/copd.S111135

Accession Number: WOS:000406779300002

Abstract: Counseling has been suggested as a promising approach for facilitating changes in health behavior. The aim of this systematic review of counseling interventions for people with COPD was to describe: 1) counseling definitions, 2) targeted health behaviors, 3) counseling techniques and 4) whether commonalities in counseling techniques were associated with improved health behaviors. Ten databases were searched for original randomized controlled trials which included adults with COPD, used the term "counseling" as a sole or component of a multifaceted intervention and were published in the previous 10 years. Data extraction, study appraisal and coding for behavior change techniques (BCTs) were completed by two independent reviewers. Data were synthesized descriptively, with meta-analysis conducted where possible. Of the 182 studies reviewed as full-text, 22 were included. A single study provided a definition for counseling. Two key behaviors were the main foci of counseling: physical activity (n=9) and smoking cessation (n=8). Six studies (27%) reported underlying models and/or theoretical frameworks. Counseling was the sole intervention in 10 studies and part of a multicomponent intervention in 12. Interventions targeting physical activity included a mean of 6.3 (+/- 3.1) BCTs, smoking cessation 4.9 (+/- 2.9) BCTs and other behaviors 6.5 (+/- 3.9) BCTs. The most frequent BCTs were social support unspecified (n=22; 100%), goal setting behavior (n=11), problem-solving (n=11) and instructions on how to perform the behavior (n=10). No studies shared identical BCT profiles. Counseling had a significant positive effect for smoking cessation and positive but not significant effect for physical activity. Counseling for health behavior change was rarely defined and effectiveness varied by target behavior. Provision of specific details when reporting studies of counseling interventions (definition, BCTs, dosage) would allow clarification of the effectiveness of counseling as an approach to health behavior change in people with COPD.

Abstract: A step toward the development of optimally effective, efficient, and feasible implementation strategies that increase evidence-based treatment integration in mental health services involves identification of the multilevel mechanisms through which these strategies influence implementation outcomes. This article (a) provides an orientation to, and rationale for, consideration of multilevel mediating mechanisms in implementation trials, and (b) systematically reviews randomized controlled trials that examined mediators of implementation strategies in mental health. Nine trials were located. Mediation-related methodological deficiencies were prevalent and no trials supported a hypothesized mediator. The most common reason was failure to engage the mediation target. Discussion focuses on directions to accelerate implementation strategy development in mental health.

Short Title: Assessing mental health clinicians' intentions to adopt evidence-based treatments: reliability and validity testing of the evidence-based treatment intentions scale

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0417-3

Article Number: 60

Accession Number: WOS:000376091100001

Abstract: Background: Intentions play a central role in numerous empirically supported theories of behavior and behavior change and have been identified as a potentially important antecedent to successful evidence-based treatment (EBT) implementation. Despite this, few measures of mental health clinicians' EBT intentions exist and available measures have not been subject to thorough psychometric evaluation or testing. This paper evaluates the psychometric properties of the evidence-based treatment intentions (EBTI) scale, a new measure of mental health clinicians' intentions to adopt EBTs. **Methods:** The study evaluates the reliability and validity of inferences made with the EBTI using multi-method, multi-informant criterion variables collected over 12 months from a sample of 197 mental health clinicians delivering services in 13 mental health agencies. Structural, predictive, and discriminant validity evidence is assessed. **Results:** Findings support the EBTI's factor structure ($\chi^2(2) = 3.96, df = 5, p = .556$) and internal consistency reliability ($\alpha = .80$). Predictive validity evidence was provided by robust and significant associations between EBTI scores and clinicians' observer-reported attendance at a voluntary EBT workshop at a 1-month follow-up ($OR = 1.92, p < .05$), self-reported EBT adoption at a 12-month follow-up ($R^2 = .17, p < .001$), and self-reported use of EBTs with clients at a 12-month follow-up ($R^2 = .25, p < .001$). Discriminant validity evidence was provided by small associations with clinicians' concurrently measured psychological work climate perceptions of functionality ($R^2 = .06, p < .05$), engagement ($R^2 = .06, p < .05$), and stress ($R^2 = .00, ns$). **Conclusions:** The EBTI is a practical and theoretically grounded measure of mental health clinicians' EBT intentions. Scores on the EBTI provide a basis for valid inferences regarding mental health clinicians' intentions to adopt EBTs. Discussion focuses on research and practice applications.

Title: Help-seeking behaviour in women diagnosed with gynaecological cancer: a systematic review

Journal: British Journal of General Practice

Volume: 72

Issue: 725

Pages: E849-E856

Date: Dec

Short Title: Help-seeking behaviour in women diagnosed with gynaecological cancer: a systematic review

ISSN: 0960-1643

DOI: 10.3399/bjgp.2022.0071

Accession Number: WOS:000886594000001

Abstract: Background Identifying what prompts or hinders womens help-seeking behaviour is essential to ensure timely diagnosis and management of gynaecological cancers. Aim To understand the factors that influence the help-seeking behaviour of women diagnosed with gynaecological cancer. Design and setting Systematic review and narrative synthesis of studies from high-income settings worldwide. Method Five databases were searched for studies, of any design, that presented factors related to the help-seeking behaviour of women diagnosed with a gynaecological cancer. Data from the articles were extracted and presented using narrative synthesis, which was both inductive and deductive. The COM-B (capability, opportunity, motivation, behaviour) model of behaviour change was used as a framework. Results In total, 21 studies were included in the review. Inductive synthesis presented three main themes of factors related to the help-seeking behaviour of women diagnosed with gynaecological cancer: patient factors, such as knowledge of symptoms; emotional factors, including previous healthcare experience, embarrassment, and trust; and practical factors, including time and resources. Deductive synthesis demonstrated that capability (namely, symptom knowledge), opportunity (having the required time and overcoming the cultural taboos surrounding gynaecological symptoms), and motivation (believing that seeking help is beneficial) are all required to initiate help-seeking behaviour. Conclusion Although it is a journey of defined steps, the help-seeking behaviour of women with symptoms diagnosed with gynaecological cancer is influenced by personal and societal factors. Interventions to improve help seeking will need to address the specific identified factors, as well as capability, opportunity, and motivation.

Short Title: Let's Focus on Solutions to Entrepreneurial Ill-Being!

Recovery Interventions to Enhance Entrepreneurial Well-Being

ISSN: 1042-2587

DOI: 10.1177/10422587211006431

Article Number: 10422587211006431

Accession Number: WOS:000646226500001

Abstract: Entrepreneurship is uniquely stressful. Entrepreneurs often cannot avoid entrepreneurial stressors (e.g., uncertainty, workload, resource constraints) and these stressors can deter natural recovery activities (e.g., detachment and sleep). Yet, entrepreneurs may be able to lessen the negative impact of stress on their well-being, health, and productivity by engaging in recovery. In this editorial, we outline how scholars can employ recovery interventions to ameliorate some of entrepreneurship's ill effects and support entrepreneurs' health, well-being, and productivity. We aim to move the focus of scholarly inquiry from documenting the health and well-being challenges of entrepreneurs, toward identifying and implementing solutions to support entrepreneurs.

Short Title: The Physical Activity Messaging Framework (PAMF) and Checklist (PAMC): International consensus statement and user guide

DOI: 10.1186/s12966-021-01230-8

Article Number: 164

Accession Number: WOS:000731479100002

Abstract: Effective physical activity messaging plays an important role in the pathway towards changing physical activity behaviour at a population level. The Physical Activity Messaging Framework (PAMF) and Checklist (PAMC) are outputs from a recent modified Delphi study. This sought consensus from an international expert panel on how to aid the creation and evaluation of physical activity messages. In this paper, we (1) present an overview of the various concepts within the PAMF and PAMC, (2) discuss in detail how the

PAMF and PAMC can be used to create physical activity messages, plan evaluation of messages, and aid understanding and categorisation of existing messages, and (3) highlight areas for future development and research. If adopted, we propose that the PAMF and PAMC could improve physical activity messaging practice by encouraging evidence-based and target population-focused messages with clearly stated aims and consideration of potential working pathways. They could also enhance the physical activity messaging research base by harmonising key messaging terminologies, improving quality of reporting, and aiding collation and synthesis of the evidence.

Article Number: 108

Accession Number: WOS:000686786700001

Abstract: Introduction Physical activity messaging is an important step in the pathway towards improving population physical activity

levels, but best practice is not yet understood. A gap in the literature exists for a physical activity messaging framework to help guide creation and evaluation of messages. This study aimed to further develop and improve, and gain international expert consensus on, a standardised Physical Activity Messaging Framework and Checklist. Methods A modified Delphi study consisting of three online survey rounds was conducted. Each survey gathered feedback from an international expert panel using quantitative and qualitative methods. The framework and checklist were amended between each round based on survey results until consensus (defined a priori as 80% agreement) was reached. Results The final expert panel (n = 40, 55% female) came from nine countries and comprised academics (55%), healthcare and other professionals (22.5%) and government officials or policymakers (22.5%). Consensus was reached in survey 3 with 85 and 87.5% agreement on the framework and checklist, respectively. Conclusion This study presents an expert- and evidence-informed framework and checklist for physical activity messaging. If used consistently, the Physical Activity Messaging Framework and Checklist may improve practice by encouraging evidence-based and target audience-focused messages, as well as enhance the research base on physical activity messaging by harmonising key terminologies and improving quality of reporting. Key next steps include further refining the Physical Activity Messaging Framework and Checklist based on their use in real-world settings.

Title: "Communicate to vaccinate": the development of a taxonomy of communication interventions to improve routine childhood vaccination

Journal: BMC International Health and Human Rights

Volume: 13

Date: May

Short Title: "Communicate to vaccinate": the development of a taxonomy of communication interventions to improve routine childhood vaccination

DOI: 10.1186/1472-698x-13-23

Article Number: 23

Accession Number: WOS:000319013900001

Abstract: Background: Vaccination is a cost-effective public health measure and is central to the Millennium Development Goal of reducing child mortality. However, childhood vaccination coverage remains sub-optimal in many settings. While communication is a key

feature of vaccination programmes, we are not aware of any comprehensive approach to organising the broad range of communication interventions that can be delivered to parents and communities to improve vaccination coverage. Developing a classification system (taxonomy) organised into conceptually similar categories will aid in: understanding the relationships between different types of communication interventions; facilitating conceptual mapping of these interventions; clarifying the key purposes and features of interventions to aid implementation and evaluation; and identifying areas where evidence is strong and where there are gaps. This paper reports on the development of the 'Communicate to vaccinate' taxonomy. Methods: The taxonomy was developed in two stages. Stage 1 included: 1) forming an advisory group; 2) searching for descriptions of interventions in trials (CENTRAL database) and general health literature (Medline); 3) developing a sampling strategy; 4) screening the search results; 5) developing a data extraction form; and 6) extracting intervention data. Stage 2 included: 1) grouping the interventions according to purpose; 2) holding deliberative forums in English and French with key vaccination stakeholders to gather feedback; 3) conducting a targeted search of grey literature to supplement the taxonomy; 4) finalising the taxonomy based on the input provided. Results: The taxonomy includes seven main categories of communication interventions: inform or educate, remind or recall, teach skills, provide support, facilitate decision making, enable communication and enhance community ownership. These categories are broken down into 43 intervention types across three target groups: parents or soon-to-be-parents; communities, community members or volunteers; and health care providers. Conclusions: Our taxonomy illuminates and organises this field and identifies the range of available communication interventions to increase routine childhood vaccination uptake. We have utilised a variety of data sources, capturing information from rigorous evaluations such as randomised trials as well as experiences and knowledge of practitioners and vaccination stakeholders. The taxonomy reflects current public health practice and can guide the future development of vaccination programmes.

Short Title: Improving theory use in social marketing: the TITE four-step theory application process

ISSN: 2042-6763

DOI: 10.1108/jsocm-05-2021-0117

Accession Number: WOS:000759567300001

Abstract: Purpose Theory remains underused in social marketing despite many potential benefits that may arise if theory is concretely and consistently applied. In response to ongoing calls for standardised frameworks and methods, this study aims to present a four-step theory application process with the aim of supporting improved theory use across the entire social marketing process.

Design/methodology/approach The role and importance of theory application in behaviour change is outlined alongside an integrative review and critical analysis of theory application in social marketing. To address key challenges impeding rigorous theory use, the theory selection, iterative schematisation, theory testing and explicit reporting of theory use (TITE) four-step theory application process is proposed. Evidence-based guidance, current best practice examples, and a worked example are provided to illustrate how the TITE process may be initially followed. Findings Low levels and poor quality of theory use suggest social marketing researchers and practitioners need further support in rigorously applying theories across the life of an intervention. The TITE process leverages the known benefits of theory use and capitalises on the reciprocal relationship that may be enacted between theory selection, iterative schematisation, theory testing and explicit reporting of theory use.

Research limitations/implications The TITE process delivers a standardised framework that aims to stimulate rigorous theory application and explicit reporting of theory use in social marketing. Clear theory application and reporting will permit a more fine-grained understanding of intervention effectiveness to be established by shifting away from a simple dichotomous view of effectiveness (success or failure) to unpacking the "active ingredients" contributing to observed outcomes. Practical implications The evidence-based guidance and best practice examples provided for each step of the TITE process will increase the accessibility and usability of theory among practitioners. With time the TITE process will support practitioners by delivering a robust theory base that can be reliably followed to further extend on social marketing's effectiveness. Originality/value This paper draws on interdisciplinary methods and resources to propose a standardised framework – the TITE process – designed to support rigorous theory application and explicit reporting of theory use in social marketing. Refinement, uptake and widespread implementation of the TITE process will improve theory use and support the creation of a shared language, thereby advancing social marketing's cumulative

knowledge base over time.

ISSN: 0957-4824

DOI: 10.1093/heapro/dau004

Accession Number: WOS:000361212400025

Abstract: Little is known about the views of obese people and how best to meet their needs. Amongst London boroughs Barking and Dagenham has the highest prevalence of adult obesity at 28.7%; the lowest level of healthy eating and of physical activity; and is the 22nd most deprived area of England. The study aimed to gain insight into the attitudes, motivations and priorities of people who are obese or overweight to inform the social marketing of an obesity strategy. Two hundred and ten obese or overweight adults were recruited through visual identification in public thoroughfares to attempt to recruit those seldom seen in primary care. One hundred and eighty-one street-intercept and 52 in-depth interviews were conducted. Thematic analysis was followed by psychographic segmentation. Eleven population segments were identified based on their readiness to change, the value accorded to tackling obesity, identified enabling factors and barriers to weight management and perceived self-efficacy. This population showed considerable variation in its readiness to change and perceived control over obesity but considerable similarity in the exchange value they attributed to tackling their obesity. Even within a relatively homogenous socio-demographic community, there needs to be a range of interventions and messages tailored for different population segments that vary in their readiness to change and confidence about tackling obesity. The dominant emphasis of policy and practice on the health consequences of obesity does not reflect the priorities of this obese population for whom the exchange value of addressing obesity was daily functioning especially in relation to family life.

DOI: 10.1108/ijes-09-2020-0057

Accession Number: WOS:000616987700001

Abstract: Purpose The primary aim of this systematic review is to identify, describe and synthesise the published literature on the types and effects of feedback received by emergency ambulance staff. The secondary aim will be to describe the mechanisms and moderators of the effects of prehospital feedback in an organisational context. Design/methodology/approach The application and effects of feedback for healthcare professionals, to support improved practice, is well researched within the wider healthcare domain. Within a prehospital context, research into feedback has been developing in specific areas such as automated feedback from defibrillators and debrief after simulation. However, to date there has been no systematic review published on the types and effects of feedback available to emergency ambulance staff. Findings This study will be a systematic mixed studies review including empirical primary research of qualitative, quantitative and mixed methods methodology published in peer-reviewed journals in English. Studies will be included if they explore the concept of feedback as defined in this review, i.e. the systematised provision of information to emergency ambulance staff regarding their performance within prehospital practice and/or patient outcomes. The search strategy will consist of three facets: ambulance staff synonyms, feedback synonyms and feedback content. The databases to be searched from inception are MEDLINE, Embase, AMED, PsycINFO, HMIC, CINAHL and Web of Science. Study quality will be appraised using the mixed methods appraisal tool (MMAT) developed by Hong et al. (2018). Data analysis will consist of narrative synthesis guided by Popay et al. (2006) following a parallel-results convergent synthesis design. Originality/value Registration: PROSPERO (CRD42020162600)

Accession Number: WOS:000381640400018

Abstract: Improving the design and implementation of interventions to encourage end-use energy efficiency has the potential to contribute a substantive reduction in carbon emissions. A plethora of behaviour change frameworks is available to guide policymakers and designers but none have been found to be comprehensive or well-used. A new framework – the Behaviour Change Wheel (BCW) – purports to be a useful aid for developing all types of behaviour change interventions. This paper assesses whether the BCW comprehensively describes programmes attempting to reduce energy consumption. To do this, components of behaviour change programmes as identified in four EU guidance documents were mapped onto the BCW. Most of the components discussed in the guidance could be readily coded to the BCW framework. The main energy policy under-represented in the BCW was energy price. Based on our work in this paper, we believe that the BCW offers a useful aid for the systematic design and development of behaviour change around end-use energy efficiency. We also propose that it may support development of a common lexicon for activities that can be rather vaguely described currently in energy efficiency guidance. (C) 2016 Elsevier Ltd. DOI: 10.1080/02602938.2021.1969536

Accession Number: WOS:000695053100001

Abstract: The higher education sector is under increasing pressure to deliver more and to evidence the fruits of its contribution to society. There is a particular focus on the enhanced engagement of students in order to maximise success, and for this engagement to be achieved equitably across the student body, regardless of demographic backgrounds. This calls for the sector to increase its capability to enhance student engagement in a targeted manner, and to be able to evidence success. The purpose of this article is to critically review, as a result of trialling, frameworks which offer guidance on the structuring of student engagement activity and/or encouraging behaviours associated with student engagement whether at student, teacher or institutional level. We assess the value of these frameworks in practice by identifying opportunities provided by them, reveal gaps in how they support effective student engagement activity, and identify further work for the sector in plugging the guidance gaps that lead to sub-optimal evaluation.

Abstract: Growing evidence suggests behavioral interventions that target a few key behaviors may be effective at improving population-level health outcomes; health status indicators; social, economic, and physical environments; personal capacity; and biological

outcomes. A theoretical framework that targets both social and cognitive mechanisms of behavioral interventions is outlined as critical for understanding "ripple effects" of behavioral interventions on influencing a broad range of outcomes associated with improved health and well-being. Evidence from randomized controlled trials is reviewed and demonstrates support for ripple effects—the effects that behavioral interventions have on multiple outcomes beyond the intended primary target of the interventions. These outcomes include physical, psychological, and social health domains across the lifespan. Cascading effects of behavioral interventions have important implications for policy that argue for a broader conceptualization of health that integrates physical, mental, and social well-being outcomes into future research to show the greater return on investment.

Title: Protocol for an intervention development and pilot implementation evaluation study of an e-health solution to improve newborn care quality and survival in two low-resource settings, Malawi and Zimbabwe: Neotree

Journal: Bmj Open

Volume: 12

Issue: 7

Date: Jul

Short Title: Protocol for an intervention development and pilot implementation evaluation study of an e-health solution to improve newborn care quality and survival in two low-resource settings, Malawi and Zimbabwe: Neotree

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2021-056605

Article Number: e056605

Accession Number: WOS:000823099300011

Abstract: Introduction Every year 2.4 million deaths occur worldwide in babies younger than 28 days. Approximately 70% of these deaths occur in low-resource settings because of failure to implement evidence-based interventions. Digital health technologies may offer an implementation solution. Since 2014, we have worked in Bangladesh, Malawi, Zimbabwe and the UK to develop and pilot Neotree: an android app with accompanying data visualisation, linkage and export. Its low-cost hardware and state-of-the-art software are used to improve bedside postnatal care and to provide insights into population health trends, to impact wider policy and practice. Methods and analysis This is a mixed methods (1)

intervention codevelopment and optimisation and (2) pilot implementation evaluation (including economic evaluation) study. Neotree will be implemented in two hospitals in Zimbabwe, and one in Malawi. Over the 2-year study period clinical and demographic newborn data will be collected via Neotree, in addition to behavioural science informed qualitative and quantitative implementation evaluation and measures of cost, newborn care quality and usability. Neotree clinical decision support algorithms will be optimised according to best available evidence and clinical validation studies. Ethics and dissemination This is a Wellcome Trust funded project (215742_Z_19_Z). Research ethics approvals have been obtained: Malawi College of Medicine Research and Ethics Committee (P.01/20/2909; P.02/19/2613); UCL (17123/001, 6681/001, 5019/004); Medical Research Council Zimbabwe (MRCZ/A/2570), BRTI and JREC institutional review boards (AP155/2020; JREC/327/19), Sally Mugabe Hospital Ethics Committee (071119/64; 250418/48). Results will be disseminated via academic publications and public and policy engagement activities. In this study, the care for an estimated 15 000 babies across three sites will be impacted.

Short Title: Brief Self-Efficacy Scales for Use in Weight-Loss Trials: Preliminary Evidence of Validity

ISSN: 1040-3590

DOI: 10.1037/pas0000249

Accession Number: WOS:000389307700012

Abstract: Self-efficacy is a commonly included cognitive variable in weight-loss trials, but there is little uniformity in its measurement. Weight-loss trials frequently focus on physical activity (PA) and eating behavior, as well as weight loss, but no survey is available that offers reliable measurement of self-efficacy as it relates to each of these targeted outcomes. The

purpose of this study was to test the psychometric properties of brief, pragmatic self-efficacy scales specific to PA, healthful eating and weight-loss (4 items each). An adult sample (n = 1,790) from 28 worksites enrolled in a worksite weight-loss program completed the self-efficacy scales, as well as measures of PA, dietary fat intake, and weight, at baseline, 6-, and 12-months. Confirmatory factor analysis supported the hypothesized factor structure indicating, 3 latent self-efficacy factors, specific to PA, healthful eating, and weight-loss. Measurement equivalence/invariance between relevant demographic groups, and over time was also supported. Parallel growth processes in self-efficacy factors and outcomes (PA, fat intake, and weight) support the predictive validity of score interpretations. Overall, this initial series of psychometric analyses supports the interpretation that scores on these scales reflect self-efficacy for PA, healthful eating, and weight-loss. The use of this instrument in large-scale weight-loss trials is encouraged.

Title: Testing times for dementia: a community survey identifying contemporary barriers to risk reduction and screening

Journal: Alzheimers Research & Therapy

Volume: 15

Issue: 1

Date: Apr

Short Title: Testing times for dementia: a community survey identifying contemporary barriers to risk reduction and screening

DOI: 10.1186/s13195-023-01219-4

Article Number: 76

Accession Number: WOS:000968911900001

Abstract: BackgroundAdvances in pharmacological and non-pharmacological dementia interventions may mean future dementia prevention incorporates a combination of targeted screening and lifestyle modifications. Elucidating potential barriers which may prevent community engagement with dementia prevention initiatives is important to maximise the accessibility and feasibility of these initiatives across the lifespan.MethodsSix hundred seven adults aged over 18 years completed a 54-item, multiple-choice survey exploring contemporary attitudes towards, and barriers to, dementia risk reduction and screening relative to other common health conditions. Participants were sourced from Australia's largest, paid, data

analytics service (ORIMA). Results Finances ($p = .009$), poor motivation ($p = .043$), and time ($p \leq .0001$) emerged as significant perceived barriers to dementia risk reduction behaviours. Lack of time was more likely to be reported by younger, relative to older, participants ($p \leq .0001$), while females were more likely than males to report financial ($p = .019$) and motivational ($p = .043$) factors. Binary logistic regression revealed willingness to undertake dementia testing modalities was significantly influenced by gender (genetic testing, $p = .012$; saliva, $p = .038$, modifiable risk factors $p = .003$), age (cognitive testing, $p \leq .0001$; blood, $p = .010$), and socio-economic group (retinal imaging, $p = .042$; modifiable risk-factor screening, $p = .019$). Over 65% of respondents felt adequately informed about risk reduction for at least one non-dementia health condition, compared to 30.5% for dementia. Conclusions This study found perceived barriers to dementia risk reduction behaviours, and the willingness to engage in various dementia testing modalities, was significantly associated with socio-demographic factors across the lifespan. These findings provide valuable insight regarding the accessibility and feasibility of potential methods for identifying those most at risk of developing dementia, as well as the need to better promote and support wide-scale engagement in dementia risk reduction behaviours across the lifespan.

Title: An investigation of barriers and enablers to community eye care for children in England: A qualitative descriptive study

Journal: Ophthalmic and Physiological Optics

Date: 2023 Mar

Short Title: An investigation of barriers and enablers to community eye care for children in England: A qualitative descriptive study

ISSN: 0275-5408

DOI: 10.1111/opo.13109

Accession Number: WOS:000945261200001

Abstract: Purpose Research suggests that there are challenges in the accessibility of eye care for children in England. This study explores the barriers and enablers to eye examinations for children under 5 years of age from the perspective of community optometrists in England. Methods Optometrists working in community settings were invited to participate in virtual focus group discussions using an online platform based on a topic guide. The discussions were audio-recorded, transcribed and thematically analysed. Themes were derived from the focus group data based on the study aim and research question. Results Thirty optometrists participated in the focus group

discussions. The overarching themes identified as barriers to eye examinations for young children in a community setting were as follows: 'Time and Money', 'Knowledge, Skills and Confidence', 'Awareness and Communication', 'Range of Attitudes' and 'Clinical Setting'. The key themes for enabling eye examinations for young children were as follows: 'Improving behaviour', 'Enhancing training and education', 'Enhancing eye care services', 'Raising awareness', 'Changes in professional bodies' and 'Balancing commercial pressures and health care'. Conclusion Time, money, training and equipment are perceived by optometrists as key factors in providing an eye examination for a young child. This study identified a need for improved training and robust governance related to eye examinations for young children. There is a need for change within eye care service delivery such that all children, regardless of age and ability, are examined regularly, and by conducting these examinations, optometrists remain confident.

Title: The Alberta Neonatal Abstinence Syndrome Mother-Baby Care ImprovEmeNT (NASCENT) program: protocol for a stepped wedge cluster randomized trial of a hospital-level Neonatal Abstinence Syndrome rooming-in intervention

Journal: BMC Health Services Research

Volume: 23

Issue: 1

Date: May

Short Title: The Alberta Neonatal Abstinence Syndrome Mother-Baby Care ImprovEmeNT (NASCENT) program: protocol for a stepped wedge cluster randomized trial of a hospital-level Neonatal Abstinence Syndrome rooming-in intervention

DOI: 10.1186/s12913-023-09440-5

Article Number: 448

Accession Number: WOS:000983214900001

Abstract: Background Neonatal Abstinence Syndrome (NAS), a problem common in newborns exposed to substances in-utero, is an emerging health concern. In traditional models of care, infants with NAS are routinely separated from their mothers and admitted to the Neonatal Intensive Care Unit (NICU) with long, expensive length of stay (LOS). Research shows a rooming-in approach (keeping mothers and infants together in hospital) with referral support is a safe and effective model of care in managing NAS. The model's key components

are facilitating 24-h care by mothers on post-partum or pediatric units with support for breastfeeding, transition home, and access to Opioid Dependency Programs (ODP). This study will implement the rooming-in approach at eight hospitals across one Canadian Province; support practice and culture shift; identify and test the essential elements for effective implementation; and assess the implementation's impact/outcomes. Methods A stepped wedge cluster randomized trial will be used to evaluate the implementation of an evidence-based rooming-in approach in the postpartum period for infants born to mothers who report opioid use during pregnancy. Baseline data will be collected and compared to post-implementation data. Six-month assessment of maternal and child health and an economic evaluation of cost savings will be conducted. Additionally, barriers and facilitators of the rooming-in model of care within the unique context of each site and across sites will be explored pre-, during, and post-implementation using theory-informed surveys, interviews, and focus groups with care teams and parents. A formative evaluation will examine the complex contextual factors and conditions that influence readiness and sustainability and inform the design of tailored interventions to facilitate capacity building for effective implementation. Discussion The primary expected outcome is reduced NICU LOS. Secondary expected outcomes include decreased rates of pharmacological management of NAS and child apprehension, increased maternal ODP participation, and improved 6-month outcomes for mothers and infants. Moreover, the NASCENT program will generate the detailed, multi-site evidence needed to accelerate the uptake, scale, and spread of this evidence-based intervention throughout Alberta, leading to more appropriate and effective care and use of healthcare resources.

Short Title: Supporting people with type 2 diabetes who need insulin

ISSN: 2047-2897

DOI: 10.1002/pdi.2424

Accession Number: WOS:000919776000004

Abstract: The year 2022 marks 100years since the first person with diabetes received an insulin injection and supporting people with insulin self-management is a core role for diabetes nurses. Janet Kinson was a diabetes nurse and author. She developed the first

diabetes education programme for nurses and the topic of insulin was central to the curriculum. This article will honour the contribution she made by focusing on diabetes education for people with type 2 diabetes who need insulin. It will start by tracing why and when people with type 2 diabetes should start insulin treatment followed by an exploration of the barriers to starting insulin at the level of the individual, the health care professional and the health system. We know that around 50% of people with type 2 diabetes delay starting insulin for seven years when it is clinically indicated. We also know that around a third of people with type 2 diabetes who are insulin treated remain hyperglycaemic or experience frequent hypoglycaemia. Therefore, there is a need for interventions that address delay, optimise starting insulin as well as consider how we best support people with type 2 diabetes to persist with and intensify their insulin over the diabetes journey. This article presents the current literature on interventions to support people with type 2 diabetes with insulin and identify gaps in support that may be addressed in future research. DOI: 10.3390/ijerph18136733

Article Number: 6733

Accession Number: WOS:000671198800001

Abstract: Prenatal nutrition is a key predictor of early-life development. However, despite mass campaigns to stimulate healthy nutrition during pregnancy, the diet of Dutch pregnant women is often suboptimal. Innovative technologies offer an opportunity to develop tailored tools, which resulted in the release of various apps on healthy nutrition during pregnancy. As midwives act as primary contact for Dutch pregnant women, the goal was to explore the experiences and perspectives of midwives on (1) nutritional counselling during pregnancy, and (2) nutritional mHealth apps to

support midwifery care. Analyses of eleven in-depth interviews indicated that nutritional counselling involved the referral to websites, a brochure, and an app developed by the Dutch Nutrition Centre. Midwives were aware of the existence of other nutritional mHealth apps but felt uncertain about their trustworthiness. Nevertheless, midwives were open towards the implementation of new tools providing that these are trustworthy, accessible, user-friendly, personalised, scientifically sound, and contain easy-digestible information. Midwives stressed the need for guidelines for professionals on the implementation of new tools. Involving midwives early-on in the development of future nutritional mHealth apps may facilitate better alignment with the needs and preferences of end-users and professionals, and thus increase the likelihood of successful implementation in midwifery practice.

Article Number: e0162713

Accession Number: WOS:000383255900153

Abstract: Introduction Innovative strategies, such as HIV self-testing (HIVST), could increase HIV testing rates and diagnosis. Evidence to inform the design of an HIVST intervention in the UK is scarce with very little European data on this topic. This study aims to understand values and preferences for HIVST interventions targeting MSM in the UK. We explore the acceptability of HIVST among MSM in the context of known barriers and facilitators to testing for HIV; assess preferences for, and the concerns about, HIVST. Methods Six focus group discussions (FGD) were conducted with 47 MSM in

London, Manchester and Plymouth. HIVST as a concept was discussed and participants were asked to construct their ideal HIVST intervention. OraQuick (TM) and BioSure (TM) kits were then demonstrated and participants commented on procedure, design and instructions. FGDs were recorded and transcribed verbatim, then analysed thematically. Results Convenience and confidentiality of HIVST was seen to facilitate testing. Issues with domestic privacy problematised confidentiality. HIVST kits and instructions were thought to be unnecessarily complicated, and did not cater to the required range of abilities. The window period was the most important element of an HIVST, with strong preference for 4th generation testing. Kits which used a blood sample were more popular than those using saliva due to higher perceived accuracy although phobia of needles and/or blood meant some would only access HIVST if a saliva sample option was available. A range of access options was important to maintain convenience and privacy. HIVST kits were assumed to increase frequency of testing, with concerns related to the dislocation of HIVST from sexual health care pathways and services. Discussion Utility of HIVST arises from relatively high levels of confidentiality and convenience. Until 4th generation assays are available HIVST will be seen as supplementary in a UK context.

ISSN: 0887-0446

DOI: 10.1080/08870446.2023.2182894

Accession Number: WOS:000942744600001

Abstract: ObjectiveTo develop a theory-informed behaviour change intervention to promote appropriate hospital antibiotic use, guided by the Medical Research Council's complex interventions framework.MethodsA phased approach was used, including triangulation of data from meta-ethnography and two qualitative studies. Central to intervention design was the generation of a robust theoretical basis using the Behaviour Change Wheel to identify relevant determinants of behaviour change and intervention components.

Intervention content was guided by APEASE (Acceptability, Practicability, Effectiveness, Affordability, Side-effects, and Equity) criteria and coded using a Behaviour Change Technique Taxonomy. Stakeholders were involved throughout. Results from numerous modifiable prescribing behaviours identified, active 'antibiotic time-out' was selected as the target behaviour to help clinicians safely initiate antibiotic reassessment. Prescribers' capability, opportunity, and motivation were potential drivers for changing this behaviour. The design process resulted in the selection of 25 behaviour change techniques subsequently translated into intervention content. Integral to this work was the development and refinement of a Digital Antibiotic Review Tracking Toolkit. Conclusion This novel work demonstrates how the Behaviour Change Wheel can be used with the Medical Research Council framework to develop a theory-based behaviour change intervention targeting barriers to timely hospital antibiotic reassessment. Future research will evaluate the Antibiotic Toolkit's feasibility and effectiveness.

Title: Changing Hearts and Minds in the Equestrian World One Behaviour at a Time

Journal: Animals

Volume: 13

Issue: 4

Date: Feb

Short Title: Changing Hearts and Minds in the Equestrian World One Behaviour at a Time

ISSN: 2076-2615

DOI: 10.3390/ani13040748

Article Number: 748

Accession Number: WOS:000938068000001

Abstract: Simple Summary Equestrianism is currently facing a range of pressing challenges. These challenges are largely based on evolving attitudes to ethics and equine wellbeing and affect the sport's social licence to operate (i.e., its public acceptability). It is likely that trends within society, features specific to the equestrian sector, and aspects of human nature have all contributed to the current situation. If equestrianism is to flourish, it is evident that much needs to change, not the least, human behaviour. There are established frameworks for explaining and effecting human behaviour change that have been scientifically validated and are rooted in practice. These frameworks, such as the COM-B model and the Behaviour Change Wheel by Michie et al., could be of practical

value for developing and implementing equine welfare strategies. The current review summarises the theory that underpins some behaviour change frameworks and provides a practical, step-by-step approach to designing an effective behaviour change intervention. A real-world example is also provided. This is based on retrospective analysis of an intervention strategy that aimed to increase the use of learning theory in (educational) veterinary practice. In our opinion, incorporating effective behaviour change interventions into any equine welfare improvement strategy may help to safeguard the future of equestrianism. Equestrianism is currently facing a range of pressing challenges. These challenges, which are largely based on evolving attitudes to ethics and equine wellbeing, have consequences for the sport's social licence to operate. The factors that may have contributed to the current situation include overarching societal trends, specific aspects of the equestrian sector, and factors rooted in human nature. If equestrianism is to flourish, it is evident that much needs to change, not the least, human behaviour. To this end, using established behaviour change frameworks that have been scientifically validated and are rooted in practice—most notably, Michie et al.'s COM-B model and Behaviour Change Wheel—could be of practical value for developing and implementing equine welfare strategies. This review summarises the theoretical underpinnings of some behaviour change frameworks and provides a practical, step-by-step approach to designing an effective behaviour change intervention. A real-world example is provided through the retrospective analysis of an intervention strategy that aimed to increase the use of learning theory in (educational) veterinary practice. We contend that the incorporation of effective behaviour change interventions into any equine welfare improvement strategy may help to safeguard the future of equestrianism.

Volume: 32

Issue: 2

Pages: 384-392

Date: Feb

Short Title: Selection of peritoneal dialysis among older eligible patients with end-stage renal disease

ISSN: 0931-0509

DOI: 10.1093/ndt/gfw367

Accession Number: WOS:000397027900025

Abstract: Background: Older patients with end-stage renal disease

(ESRD) are less likely to choose peritoneal dialysis (PD) over hemodialysis (HD). The reasons behind their choice of dialysis modality are not clear. This study seeks to determine the patient-perceived factors that influence ESRD patients' choice of dialysis modality among older ESRD patients who are deemed eligible for both PD and HD. Methods: All patients had completed a multidisciplinary modality assessment, were deemed eligible for both PD and HD, and had received modality education. Semi-structured interviews were conducted and transcripts were read repeatedly to derive potential codes using line-by-line textual analysis. The Capability, Opportunity, Motivation-Behaviour (COM-B) and Theoretical Domain Framework (TDF), validated tools that were developed for designing behavioral change interventions, were used to help guide the coding framework. Results: Among older ESRD patients who are deemed eligible for both PD and HD, factors relevant to their modality decision-making were identified with respect to physical strength/dexterity and having a sound mind (capability), external forces and constraints (opportunity), and values and beliefs (motivation). Often a combination of factors led to an individual's choice of a particular dialysis modality. However, preferences for PD were primarily based around convenience and maintaining a normal life, while a heightened sense of security was the primary reason for those who selected HD. Conclusions: We have identified patient-perceived factors that influence choice of dialysis modality in older individuals with ESRD who are eligible for PD and HD. These factors should be considered and/or addressed within PD programs seeking to promote PD.

Title: Healthcare professionals' perspective on delivering personalised and holistic care: using the Theoretical Domains Framework

Journal: BMC Health Services Research

Volume: 22

Issue: 1

Date: Mar

Short Title: Healthcare professionals' perspective on delivering personalised and holistic care: using the Theoretical Domains Framework

DOI: 10.1186/s12913-022-07630-1

Article Number: 281

Accession Number: WOS:000762768300005

Abstract: Background Interventions to improve personalised and

holistic care delivery by healthcare professionals are more likely to be effective if they target the factors influencing specific behaviours. This study reports on the development and testing of a questionnaire to identify perspectives of healthcare professionals' personalised and holistic care behaviours based on the Theoretical Domains Framework. Methods The study was conducted in public health services in Victoria, Australia. The questionnaire was developed and pilot-tested with behaviour change researchers and healthcare professionals. Doctors, nurses and midwives were recruited via notices and email invitations from Safer Care Victoria's website and mailing lists of healthcare professionals and invited to complete the questionnaire online (hosted on Qualtrics). Health services administrators and allied health professionals were excluded from the study. Confirmatory factor analysis was undertaken to generate the model of best fit and group differences were tested using univariate tests. Results One hundred and four healthcare professionals from public health services in Victoria, Australia, completed the 39-item questionnaire focusing on specific personalised and holistic care behaviours. The final model consisted of 13 factors and 39 items, and CFA produced an acceptable fit, as well as adequate levels of discriminant validity and internal consistency ($\alpha = 0.60$ to 0.84). Seven domains, "social influence", "motivation & goals", "environmental context and resources", "skills", "beliefs about consequences", "behaviour regulation" and "nature of behaviour" were identified. Significant differences in the factors influencing these behaviours were found in groups with different years of experience and role seniority. These findings suggest that future interventions need to be targeted to specific groups. Conclusion This study identified the specific behaviours and the factors associated with performance of personalised and holistic care among healthcare professionals. The findings suggest several interventions and policy functions may be taken to improve personalised and holistic care.

Date: Dec

Short Title: Evaluation of the implementation of information system for postdischarge with the theoretical domains framework by

healthcare professionals: a multistage design with qualitative inquiry and Delphi expert discussion protocol

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2020-046081

Article Number: e046081

Accession Number: WOS:000729858800005

Abstract: Introduction Improving discharge information dissemination may improve patients' health literacy of self-care and health outcomes, avoid unnecessary healthcare utilisation, and reduce the healthcare cost. This study aims to use an implementation science theory guided approach to examine the beliefs and behaviours of healthcare professionals regarding postdischarge information summary (PDIS) implementation in a public inpatient setting. Methods and analysis A multistage study design involving qualitative inquiry and Delphi expert discussion will be used to systematically explore the perceived barriers in the four implemented hospitals and enable the full implementation of the PDIS in geriatric and medical care. The theoretical domains framework (TDF), behavioural change wheel and realistic evaluation framework will be used to guide the investigation of implementation. This study consists of three steps: (1) identifying barriers and enablers from an implementation perspective using a TDF-informed interview guide; (2) devising theory-based implementation strategy packages to facilitate the adoption and enhancement of PDIS by performing a strategy mapping exercise and (3) developing an effective implementation strategy package for scaling up PDIS in other target hospitals as well as other specialities using the Delphi expert discussion. The goal of this multistage study design is to identify the perspectives from healthcare professionals towards the PDIS implementation and explore their barriers and facilitators of the process in the pilot phase. The invited healthcare professionals would share their daily experience on providing PDIS to patient in various study hospitals with similar ward setting. The implementation of discharge intervention in a study setting through different steps to aid in the exploration and development of the modified implementation strategies for the adoption and enhancement of PDIS in the discharge process. Ethics and dissemination Ethics approval for the study was obtained from the Joint Chinese University of Hong Kong-New Territories East Cluster Clinical Research Ethics Committees. Results of the study would be released as a report submitted to the Health and Medical Research Fund of Food and Health Bureau of the Hong Kong Government. The result would also be published in international peer-reviewed medical journals and presented in conferences.

Title: First Data in the Process of Validating a Tool to Evaluate Knowledge, Attitude, and Practice of Healthcare Providers in Oral Care of Institutionalized Elderly Residents: Content Validity, Reliability and Pilot Study

Journal: International Journal of Environmental Research and Public Health

Volume: 18

Issue: 8

Date: Apr

Short Title: First Data in the Process of Validating a Tool to Evaluate Knowledge, Attitude, and Practice of Healthcare Providers in Oral Care of Institutionalized Elderly Residents: Content Validity, Reliability and Pilot Study

DOI: 10.3390/ijerph18084145

Article Number: 4145

Accession Number: WOS:000644085200001

Abstract: Background: Oral health of elderly people is a global concern. Poor oral health in institutionalized elderly people has been attributed to poor knowledge, attitude, and practice (KAP) of healthcare providers. However, no validated KAP tool is available yet. Objective: To develop and validate a tool to measure knowledge, attitude, and practice of healthcare providers in oral care of institutionalized elderly people. Methods: The development and validation of the tool was based on literature reviews, comments from professional experts, and statistical analytic methods. Content validity in the instrument psychometric property and its relevance with reliability are essential. Content validity ratio and content validity index were performed. Then, a pilot study was conducted in 20 institutionalized healthcare providers for testing applicability, feasibility, and reliability. Results: A total of 43 items were developed in three domains, knowledge (19 items), attitude (13 items), and practice (11 items). Content validity analysis revealed the KAP tool with high values of the I-CVI (score 1.00) and S-CVI (S-CVI/UA result 1.00). The test-retest reliability with Cronbach's alphas of knowledge, attitude, practice, and overall KAP were 0.67, 0.93, 0.92, and 0.94, respectively. Conclusions: The developed and validated tool is appropriate to measure KAP of healthcare providers in oral care of institutionalized elderly people. It can be used to measure KAP of institutionalized healthcare providers in order to develop appropriate strategies to improve KAP of healthcare providers.

Title: Factors Associated with Knowledge, Attitudes, and Practice towards Colorectal Cancer and Its Screening among People Aged 50-75 Years

Journal: International Journal of Environmental Research and Public Health

Volume: 18

Issue: 8

Date: Apr

Short Title: Factors Associated with Knowledge, Attitudes, and Practice towards Colorectal Cancer and Its Screening among People Aged 50–75 Years

DOI: 10.3390/ijerph18084100

Article Number: 4100

Accession Number: WOS:000644125100001

Abstract: Background: Colorectal cancer (CRC) screening is effective for early detection of CRC, particularly for males aged 50 or above. However, the rate of participation in the screening program is still low. This study was to examine knowledge, attitudes, and practice toward CRC and its screening and explored their associated factors. **Methods:** A descriptive cross-sectional study was conducted in a convenience sample of adults aged 50–75 years without cognitive problems, who were recruited at multi-elderly centers in Hong Kong. A questionnaire was used to measure knowledge, attitudes, and practice (KAP) towards CRC and its screening. **Results:** The total of 300 Chinese people included 147 (49.0%) males with a mean age of 58.72 (SD 6.91) years old. This study population had good knowledge and practice, as well as very good attitudes toward CRC and its screening. The multivariate regression results showed that receiving insurance coverage was the most significant factor positively associated with knowledge, attitudes, and practice. Other than this, lower educational level had significant negative association with knowledge and practice. Having self-sufficient financial support and receiving screening program information had positive associations with knowledge. **Conclusion:** People who are receiving insurance coverage have better KAP towards CRC and its screening. This indicates that they can receive adequate information about the screening procedure from their insurance agents and receive financial support under their insurance coverage. Therefore, they are more willing to participate in the screening program. Other factors, including having good self-sufficient financial support and receiving adequate information about CRC and its screening, significantly enhance knowledge. Based on the relationships among KAP, knowledge enhancement can improve attitude and practice in participating in the CRC screening program. Those who attained lower education should receive more attention. In this sense, adequate financial support from health insurance or subsidies from the government can increase an individual's willingness to participate in the CRC screening, particularly those at a low socioeconomic level. Educational programs should be promoted to enhance knowledge about CRC and its screening, especially to those who attained lower education levels.

Title: Impact of Implementing New ICF-Based Practices on Staff Valence of Disability Practitioners: An Experience in Hong Kong
Journal: International Journal of Environmental Research and Public Health

Volume: 20

Issue: 2

Date: Jan

Short Title: Impact of Implementing New ICF-Based Practices on Staff Valence of Disability Practitioners: An Experience in Hong Kong

DOI: 10.3390/ijerph20021632

Article Number: 1632

Accession Number: WOS:000914987000001

Abstract: The International Classification of Functioning, Disability, and Health (ICF) was endorsed by The World Health Organization (WHO) in 2001. However, Hong Kong is at the beginning stage of implementing and testing ICF-based practices. This study examines any changes in the valences of disability practitioners in an organization under the newly introduced ICF-based practices. It was hypothesized that the involved staff members' self-perceived valences in relation to the ICF would be enhanced. A pretest-posttest design was adopted. The 27-item Scale on Staff Valence under ICF-based practice (SSV-ICF) was used to measure the impact on staff valence of a pilot scheme in which ICF-based practice was implemented. Self-report questionnaires were completed by the involved staff members at the beginning of the pilot scheme and 12 months later. Analyses used paired samples t-tests and one-way repeated measures ANOVAs, performed by SPSS software, version 25. In total, 91 participants took part in the study. Results showed that participants achieved positive changes in all domains of valences, while participants' level of involvement in the new ICF-based intervention had significant effects on their score differences in the "Competence" domain ($r = 0.262$, $p < 0.05$), "Intrapersonal" domain ($r = 0.242$, $p < 0.05$), and "Total Score" of SSV-ICF ($r = 0.210$, $p < 0.05$). The study demonstrated that disability practitioners who implemented ICF-based practices developed higher staff valences, which, in turn, benefited service users. Implementation of ICF-based practices also contributed to a more positive organizational culture.

Title: How can we improve latent tuberculosis infection management using behaviour change wheel: a systematic review

Journal: Journal of Public Health

Date: 2023 May

Short Title: How can we improve latent tuberculosis infection management using behaviour change wheel: a systematic review

ISSN: 1741-3842

DOI: 10.1093/pubmed/fdad051

Accession Number: WOS:000981926400001

Abstract: Background To ensure the effective delivery of latent tuberculosis infection (LTBI) care, it is vital to overcome potential challenges in LTBI management. This systematic review aims to identify the barriers and interventions to improve LTBI management using the Capability, Opportunity, and Motivation-Behaviour (COM-B) model and Behaviour Change Wheel (BCW). Methods A systematic literature search was performed on five electronic databases from database inception to 3 November 2021. A two-step technique was used in the data synthesis process: (i) the barriers of LTBI management were identified using the COM-B model, followed by (ii) mapping of intervention functions from BCW to address the identified barriers. Results Forty-seven eligible articles were included in this review. The findings highlighted the need for a multifaceted approach in tackling the barriers in LTBI management across the public, provider and system levels. The barriers were summarized into suboptimal knowledge and misperception of LTBI, as well as stigma and psychosocial burden, which could be overcome with a combination of intervention functions, targeting education, environment restructuring, persuasion, modelling, training, incentivization and enablement. Conclusions The remedial strategies using BCW to facilitate policy reforms in LTBI management could serve as a value-added initiative in the global tuberculosis control and prevention program.

Article Number: 117

Accession Number: WOS:000754202900002

Abstract: Background The proportion of the older Thai population is increasing rapidly. Lifestyle may impact active ageing in later

life. Interventions that empower older Thai adults to initiate and carry out lifestyle changes are needed. This study applied the Plan-Do-Study-Act (PDSA) cycle, a tool for improving lifestyle changes, with the aim of exploring interactions among older Thai adults when participating in group activities. Method Focused ethnography was used based on participant observations, field notes and video recordings of 15 older Thai adults aged 62-78 years. Results Older Thai adults faced difficulties at the beginning since they were unfamiliar with initiating and carrying out lifestyle changes according to the PDSA concept. This provided a learning opportunity enabling older Thai adults to reach their individual goals of lifestyle change. Conclusions The PDSA cycle has the potential to empower older adults in group contexts to promote lifestyle changes related to active ageing.

DOI: 10.1093/jacamr/dlac044

Article Number: dlac044

Accession Number: WOS:000783641800002

Abstract: Background In Nigeria, the prescription of surgical antibiotic prophylaxis for prevention of surgical site infection tends to be driven by local policy rather than by published guidelines (e.g. WHO and Sanford). Objectives To triangulate three datasets and understand key barriers to implementation using a behavioural science framework. Methods Surgeons (N = 94) from three teaching hospitals in Nigeria participated in an online survey and in focus group discussions about barriers to implementation. The theoretical domains framework (TDF) was used to structure question items and interview schedules. A subgroup (N = 20) piloted a gamified decision support app over the course of 6 months and reported barriers at the point of care. Results Knowledge of guidelines and intention to implement them in practice was high. Key barriers to implementation were related to environmental context and

resources and concern over potential consequences of implementing recommendations within the Nigerian context applicable for similar settings in low-to-middle-income countries. Conclusions The environmental context and limited resource setting of Nigerian hospitals currently presents a significant barrier to implementation of WHO and Sanford guidelines. Research and data collected from the local context must directly inform the writing of future international guidelines to increase rates of implementation.

Title: Protocol for a randomised pilot study of a novel Parent-Child Interaction Therapy (PCIT) 're-implementation' intervention

Journal: Pilot and Feasibility Studies

Volume: 9

Issue: 1

Date: May

Short Title: Protocol for a randomised pilot study of a novel Parent-Child Interaction Therapy (PCIT) 're-implementation' intervention

DOI: 10.1186/s40814-023-01309-y

Article Number: 73

Accession Number: WOS:000979929200001

Abstract: BackgroundDespite a number of clinicians having been trained in Parent-Child Interaction Therapy (PCIT) in Aotearoa/New Zealand, few are regularly delivering the treatment, with barriers to use including a lack of suitable equipment and lack of professional support. This pragmatic, parallel-arm, randomised, controlled pilot trial includes PCIT-trained clinicians who are not delivering, or only rarely utilising, this effective treatment. The study aims to assess the feasibility, acceptability and cultural responsiveness of study methods and intervention components and to collect variance data on the proposed future primary outcome variable, in preparation for a future, larger trial.MethodsThe trial will compare a novel 're-implementation' intervention with a refresher training and problem-solving control. Intervention components have been systematically developed to address barriers and facilitators to clinician use of PCIT using implementation theory, and a draft logic model with hypothesised mechanisms of action, derived from a series of preliminary studies. The

intervention includes complimentary access to necessary equipment for PCIT implementation (audio-visual equipment, a 'pop-up' time-out space, toys), a mobile senior PCIT co-worker and an optional weekly PCIT consultation group, for a 6-month period. Outcomes will include the feasibility of recruitment and trial procedures; acceptability of the intervention package and data collection methods to clinicians; and clinician adoption of PCIT. Discussion Relatively little research attention has been directed at interventions to resurrect stalled implementation efforts. Results from this pragmatic pilot RCT will refine and shape knowledge relating to what it might take to embed the ongoing delivery of PCIT in community settings, providing more children and families with access to this effective treatment.

Title: Barriers to Clinician Implementation of Parent-Child Interaction Therapy (PCIT) in New Zealand and Australia: What Role for Time-Out?

Journal: International Journal of Environmental Research and Public Health

Volume: 18

Issue: 24

Date: Dec

Short Title: Barriers to Clinician Implementation of Parent-Child Interaction Therapy (PCIT) in New Zealand and Australia: What Role for Time-Out?

DOI: 10.3390/ijerph182413116

Article Number: 13116

Accession Number: WOS:000738061000001

Abstract: Background: Parent-Child Interaction Therapy (PCIT) is an effective parent training approach for a commonly occurring and disabling condition, namely conduct problems in young children. Yet, despite ongoing efforts to train clinicians in PCIT, the intervention is not widely available in New Zealand and Australia.

Methods: We undertook a cross-sectional online survey of clinicians in New Zealand and Australia who had completed at least the 40-h initial PCIT training, to understand the barriers they encountered in their implementation efforts, and the extent to which attitudes toward time-out influenced implementation. The overall response rate was 47.5% (NZ: 60%; Australia: 31.4%). Results: Responses suggested that participants generally viewed PCIT as both acceptable and effective. Australian participants reported seeing significantly more clients for PCIT per week than those in NZ (Medians 0 and 2, respectively; $\chi^2(1) = 14.08$, $p < 0.001$) and tended to view PCIT as more effective in treating disruptive and oppositional behaviour

(95% CI: -0.70 , -0.13 , $p = 0.005$). Participants currently seeing PCIT clients described it as more enjoyable to implement than those not using PCIT (95% CI: -0.85 , -0.10 , $p = 0.01$). Thirty-eight percent of participants indicated that they adapt or tailor the standardised protocol, primarily by adding in content relating to emotion regulation, and removing content relating to time-out. Participants generally felt that they had fewer skills, less knowledge, and less confidence relating to the Parent-Directed Interaction phase of PCIT (which involves time-out), compared with the Child-Directed Interaction phase. Conclusion: While we had hypothesised that time-out represented an intra-intervention component that detracted from implementation success, results suggested that clinician concern over the use of time-out was present but not prominent. Rather, the lack of access to suitable equipment (i.e., one-way mirror and ear-piece) and difficulties associated with clients attending clinic-based sessions were barriers most commonly reported by clinicians. We suggest that future research might consider whether and how PCIT might be "re-implemented" by already-trained clinicians, moving beyond simply training more clinicians in the approach.

DOI: 10.3390/ijerph19127305

Article Number: 7305

Accession Number: WOS:000816453400001

Abstract: The ability of families to adhere to public health guidance is critical to controlling a pandemic. We conducted qualitative interviews with 30 parents of children aged 18 and under, between 16 and 21 April 2020 when schools in England were closed due to the COVID-19 pandemic. Using the Theoretical Domains Framework, we classified the factors that influenced adherence to

seven non-pharmaceutical interventions. We found 40 factors that influenced a family's ability to adhere. Parents generally indicated they could adhere and reported how their family had changed their behaviour to comply with the guidance. Parents primarily reported they were motivated to adhere out of concern for the health consequences of COVID-19, and because the guidance was delivered by the government. However, we found that reduced access to resources (e.g., technology, transport, and outside space) and social influences that encouraged non-adherent behaviour, decreased adherence. Furthermore, we suggest that families with low psychological and physical ability may face additional challenges to adherence and need to be supported. During future school closures, public health agencies should account for these factors when developing guidance.

Abstract: Introduction and hypothesis Urinary incontinence (UI) is prevalent during pregnancy and postpartum. UI in pregnancy strongly predicts UI postpartum and later in life. UI reduces women's wellbeing and quality of life and presents a significant burden to healthcare resource. Methods A narrative review summarizing quantitative and qualitative evidence about pelvic floor muscle training (PFMT) for prevention and treatment of UI for childbearing women. Results There are clinically important reductions in the risk of developing UI in pregnancy and after delivery for pregnant women who start PFMT during pregnancy, and PFMT offers additional benefits preventing prolapse and improving sexual function. If women develop UI during pregnancy or postpartum then PFMT is an appropriate first-line treatment. For novice exercisers, a programme comprising eight contractions, with 8-s holds, three times a day, 3 days a week, for at least 3 months is a reasonable minimum and 'generic' prescription. All women need clear accurate verbal instruction in

how to do PFMT. Incontinent women, and women who cannot do a correct contraction, require referral for pelvic floor rehabilitation. Behavioural support from maternity care providers (MCPs)—increasing women's opportunity, capability, and motivation for PFMT—is as important as the exercise prescription. Conclusion PFMT is effective to prevent and treat UI in childbearing women. All pregnant and postpartum women, at every contact with a MCP, should be asked if they are continent. Continent women need exercise prescription and behavioural support to do PFMT to prevent UI. Incontinent women require appropriate referral for diagnosis or treatment.

Article Number: e0250545

Accession Number: WOS:000664610500030

Abstract: Adolescence offers a window of opportunity during which improvements in health behaviours could benefit long-term health, and enable preparation for parenthood—albeit a long way off, passing on good health prospects to future children. This study was carried out to evaluate whether an educational intervention, which engages adolescents in science, can improve their health literacy and behaviours. A cluster-randomised controlled trial of 38 secondary schools in England, UK was conducted. The intervention (LifeLab) drew on principles of education, psychology and public health to engage students with science for health literacy, focused on the message "Me, my health and my children's health". The programme comprised: center dot Professional development for teachers. center dot A 2–3 week module of work for 13–14-year-olds. center dot A "hands-on" practical health science day visit to a dedicated facility in a university teaching hospital. Data were collected from 2929 adolescents (aged 13–14 years) at baseline and 2487 (84.9%) at 12-month follow-up. The primary outcome was change in theoretical health literacy from pre- to 12 months post- intervention. This study is registered (ISRCTN71951436) and the trial status is complete. Participation in the LifeLab educational intervention was

associated with an increase in the students' standardised total theoretical health literacy score (adjusted difference between groups = 0.27 SDs (95%CI = 0.12, 0.42)) at 12-month follow-up. There was an indication that intervention participants subsequently judged their own lifestyles more critically than controls, with fewer reporting their behaviours as healthy (53.4% vs. 59.5%; adjusted PRR = 0.94 [0.87, 1.01]). We conclude that experiencing LifeLab led to improved health literacy in adolescents and that they demonstrated a move towards a more critical judgement of health behaviour 12 months after the intervention. Further work is needed to examine whether this leads to sustained behaviour change, and whether other activities are needed to support this change.

Title: Fruits and vegetables: measuring intake and encouraging increased consumption

Journal: Proceedings of the Nutrition Society

Volume: 72

Issue: 2

Pages: 236-245

Date: May

Short Title: Fruits and vegetables: measuring intake and encouraging increased consumption

ISSN: 0029-6651

DOI: 10.1017/s0029665112003059

Accession Number: WOS:000317435000006

Abstract: A high intake of fruit and vegetables (FV) is associated with reduced risk of chronic disease, although the evidence base is mostly observational. Blood biomarkers offer an objective indicator of FV intake, potentially improving estimates of intakes based on traditional methods. A valid biomarker of overall FV intake would be able to confirm population intakes, more precisely evaluate the association between intakes and health outcomes and confirm compliance in FV interventions. Several substances have been proposed as biomarkers of FV intake: vitamin C, the carotenoids and polyphenols. Certain biomarkers are strong predictors of single FV; however, the proposed single biomarkers of FV consumption are only modestly predictive of overall FV consumption. This is likely to be due to the complexity of the FV food group. While accurately measuring FV intake is important in nutrition research, another

critical question is: how best can an increase in FV intake be achieved? Increased FV intake has been achieved in efficacy studies using intensive dietary advice. Alternative, less intensive methods for encouraging FV consumption need to be developed and tested for population level intervention. Systematic reviews suggest peer support to be an effective strategy to promote dietary change. This review will describe the evidence for a link between increased FV intake and good health, outline possible novel biomarkers of FV consumption, present the most recently available data on population intake of FV and examine the usefulness of different approaches to encourage increased consumption of FV.

Short Title: Women's Perceptions and Attitudes to Household Air Pollution Exposure and Capability to Change Cooking Behaviours in Urban Rwanda

DOI: 10.3390/su14031608

Article Number: 1608

Accession Number: WOS:000759159900001

Abstract: Household air pollution (HAP) from cooking on biomass fuel presents significant health, environmental and socioeconomic consequences worldwide. However, there is a lack of understanding of the factors influencing cooking behaviours that affect HAP exposure in Rwanda (e.g., cooking location, removing children from the cooking area). Sixteen qualitative in-depth interviews were undertaken with women living in an underprivileged neighbourhood in Kigali, Rwanda. Deductive thematic analysis was carried out using the Behaviour Change Wheel (Capability-ability to engage with chosen activity, Opportunity-factors which are beyond the individual's control and Motivation-brain processes which direct behaviour: COM-B) to determine the thoughts and perceptions around cooking location and removing children from the cooking area. Facilitators and barriers were subsequently identified within the COM-B framework for the following HAP mitigation interventions: outdoor cooking, removing children from the cooking area and Liquid Petroleum Gas (LPG) use. Of the 16 interviewed, 12 cooked outdoors (75%), two (12.5%) cooked indoors (in the main home) and two (12.5%) in a

separate kitchen. Despite the majority cooking outdoors, this was reported not to be a favourable cooking location. Levels of awareness of HAP sources and knowledge of the health effects of air pollution were observed to be limited, reducing women's capability to change, along with stated barriers of cost, housing constraints and safety. Factors out of the individuals' control (opportunities) included weather, socio-economic and educational factors. Preconceived beliefs, experiencing smoke reduction and the briefly described short-term health effects, directed motivation. Furthermore, participants identified a need for community-based education as a facilitator to changing their behaviour. Despite a high level of observed motivation towards reducing HAP exposure, many women lacked the capability and opportunity to change their behaviour. There are research and policy implications concerning development of community-based interventions which involved end-users and relevant stakeholders in the development process.

Short Title: Antimicrobial agents - optimising the ecological balance

ISSN: 1741-7015

DOI: 10.1186/s12916-016-0661-z

Article Number: 114

Accession Number: WOS:000380830000001

Abstract: Background: There is no more challenging a group of pharmaceuticals than antimicrobials. With the antibiotic era came great optimism as countless deaths were prevented from what were previously fatal conditions. Although antimicrobial resistance was quickly identified, the abundance of antibiotics entering the market helped cement attitudes of arrogance as the "battle against pestilence appeared won". Opposite emotions soon followed as many heralded the return of the pre-antibiotic era, suggesting that the "antibiotic pipeline had dried up" and that our existing armament would soon be rendered worthless. Discussion: In reality, humans overrate their ecological importance. For millions of years there has been a balance between factors promoting bacterial survival and

those disturbing it. The first half century of the "antibiotic era" was characterised by a cavalier attitude disturbing the natural balance; however, recent efforts have been made through several mechanisms to respond and re-strengthen the antimicrobial armament. Such mechanisms include a variety of incentives, educational efforts and negotiations. Today, there are many more "man-made" factors that will determine a new balance or state of ecological harmony. Conclusion: Antibiotics are not a panacea nor will they ever be inutile. New resistance mechanisms will be identified and new antibiotics will be discovered, but most importantly, we must optimise our application of these extraordinary "biological tools"; therein lays our greatest challenge - creating a society that understands and respects the determinants of the effectiveness of antibiotics.

Short Title: Environmental Hazards and Behavior Change: User Perspectives on the Usability and Effectiveness of the AirRater Smartphone App

DOI: 10.3390/ijerph18073591

Article Number: 3591

Accession Number: WOS:000638551500001

Abstract: AirRater is a free smartphone app developed in 2015, supporting individuals to protect their health from environmental hazards. It does this by providing (i) location-specific and near real-time air quality, pollen and temperature information and (ii) personal symptom tracking functionality. This research sought to evaluate user perceptions of AirRater's usability and effectiveness. We collected demographic data and completed semi-structured interviews with 42 AirRater users, identified emergent themes, and used two frameworks designed to understand and support behavior change—the Behavior Change Wheel (BCW) and the Protective Action Decision Model (PADM)—to interpret results. Of the 42 participants, almost half indicated that experiencing symptoms acted as a prompt for app use. Information provided by the app supported a majority of the 42 participants to make decisions and implement behaviors to protect their health irrespective of their location or context. The majority of participants also indicated that they shared information provided by the app with family, friends and/or colleagues. The

evaluation also identified opportunities to improve the app. Several study limitations were identified, which impacts the generalizability of results beyond the populations studied. Despite these limitations, findings facilitated new insights into motivations for behavior change, and contribute to the existing literature investigating the potential for smartphone apps to support health protection from environmental hazards in a changing climate.

Short Title: Implementation of eMental Health care: viewpoints from key informants from organizations and agencies with eHealth mandates

DOI: 10.1186/s12911-017-0474-9

Article Number: 78

Accession Number: WOS:000403874700001

Abstract: Background: The use of technology such as computers, tablets, and smartphones to improve access to and the delivery of mental health care (eMental Health care) is growing worldwide. However, despite the rapidly expanding evidence base demonstrating the efficacy of eMental Health care, its implementation in clinical practice and health care systems remains fragmented. To date, no peer-reviewed, key-informant studies have reported on the perspectives of decision-makers concerned with whether and how to implement eMental Health care. Methods: From September to November 2015, we conducted 31 interviews with key informants responsible for leadership, policy, research, and/or information technology in organizations influential in the adoption of technology for eMental Health care. Deductive and inductive thematic analyses of transcripts were conducted using the Behavior Change Wheel as an organizing framework. Frequency and intensity effect sizes were calculated for emerging themes to further explore patterns within the data. Results: Key informant responses (n = 31) representing 6 developed countries and multiple organizations showed consensus on common factors impacting implementation: individual and organizational capacities (e.g., computer literacy skills [patients and providers], knowledge gaps about cyber security, limited knowledge of available services); motivational drivers of technology-based care (e.g., extending care, data analytics); and opportunities for health systems to advance eMental Health care implementation (e.g., intersectoral research, rapid testing cycles, sustainable funding). Frequency effect sizes showed strong associations between implementation and credibility, knowledge, workflow, patient empowerment, electronic medical record (EMR) integration, sustained funding and intersectoral networks. Intensity effect sizes showed the highest concentration of statements (>10% of all comments) related to funding, credibility, knowledge gaps, and patient empowerment. Conclusion: This study provides previously unavailable information about key informant perspectives on eMental Health care implementation. The themes that emerged, namely the need to intensify intersectoral research, measure/monitor readiness to implement, define cost-utility benchmarks, raise awareness about available technologies, and test assumptions that 'proven' technologies will be easily integrated can inform the design and evaluation of eMental Health care implementation models.

Short Title: Development of a self-management intervention for stroke survivors with aphasia using co-production and behaviour change theory: An outline of methods and processes

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0259103

Article Number: e0259103

Accession Number: WOS:000755756800009

Abstract: Background Self-management is a promising approach to improve quality of life after stroke. However, evidence for the appropriateness and effectiveness of self-management for stroke survivors with aphasia is limited. This article reports on the process used to develop a supported self-management intervention for stroke survivors with aphasia (SSWA) using co-production and behaviour change theory. Preparatory research included systematic reviews, and qualitative interviews and focus groups with SSWA, family members and speech and language therapists (SLTs). Materials and methods We conducted six, 2 hour long intervention development workshops with key stakeholders. The workshops were informed by principles of co-production and the intervention development process outlined by the Behaviour Change Wheel (BCW). We also incorporated the findings of our preparatory research within workshops. Each workshop included an introduction, 1-2 co-production tasks and time for feedback at the end of the session. Data were analysed on an ongoing basis so that findings could be used to feed in to subsequent workshops and intervention development. Results Workshop participants (n = 12) included; SSWA (n = 5), family members (n = 3) and SLTs (n = 4). Together, participants engaged with accessible and participatory co-production tasks which aligned with the BCW framework. Participants engaged in discussion to define self-management in behavioural terms (behavioural diagnosis) and to identify what needed to change to support self-management. Participant's co-produced solutions for supporting self-management and discussed options to implement these in practice. Prototype materials were generated by the research team and evaluated by participants. Intervention functions and behaviour change techniques (BCTs) were mapped to the solutions generated by participants by the research team, after the final workshop. A supported self-management intervention for SSWA was developed which will be delivered by SLTs through community stroke services. Conclusions This paper reports the process we used to integrate co-production work with behaviour change theory to develop a complex self-management intervention. This is of relevance for researchers looking to harness the strengths of co-production methods and theory in intervention design. Future research will feasibility test the supported self-

management intervention developed. This paper provides transparency to our intervention development process which will help others to better interpret the findings of our feasibility work.

Title: Behaviour change theories and techniques used to inform nutrition interventions for adults undergoing bariatric surgery: A systematic review

Journal: Nutrition & Dietetics

Volume: 79

Issue: 1

Pages: 110-128

Date: Feb

Short Title: Behaviour change theories and techniques used to inform nutrition interventions for adults undergoing bariatric surgery: A systematic review

ISSN: 1446-6368

DOI: 10.1111/1747-0080.12728

Accession Number: WOS:000752765800001

Abstract: Aim This systematic review aimed to describe behaviour change theories and techniques used to inform nutrition interventions for adults undergoing bariatric surgery. Methods A systematic search was conducted across PubMed, PsycInfo, CENTRAL, EMBASE and CINAHL from inception until 09 March 2021. Eligible studies were randomised controlled trials involving nutrition interventions performed by a healthcare provider, to adults that were waitlisted or had undergone bariatric surgery and received a nutrition intervention explicitly informed by one or more behaviour change theories or behaviour change techniques. Screening was conducted independently by two authors. Behaviour change techniques were examined using the behaviour change technique taxonomy version one which includes 93 hierarchical techniques clustered into 16 groups. Quality of included studies was assessed using Cochrane risk of bias 2.0. Results Twenty-one publications were included, involving 15 studies and 14 interventions, with 1495 participants. Bias was low or had some concerns. Two interventions reported using behaviour change theories (transtheoretical model and self-determination theory). Thirteen behaviour change technique taxonomy groupings and 29 techniques were reported across 14 interventions. Common techniques included '1.2 Problem solving' (n = 9 studies), '3.1 Social support (unspecified)' (n = 9 studies), '1.1 Goal setting (behaviour)' (n = 6 studies) and '2.3 Self-monitoring of behaviour' (n = 6 studies). Conclusion While behaviour change techniques have been included, behaviour change theory is not consistently reported and/or adopted to inform nutrition interventions for adults undergoing bariatric surgery. Integrating

behaviour change theory and techniques in nutrition interventions is important for researchers and bariatric surgery teams, including dietitians, to effectively target behaviours for this population.

Short Title: Are eHealth interventions for adults who are scheduled for or have undergone bariatric surgery as effective as usual care? A systematic review

ISSN: 1550-7289

DOI: 10.1016/j.soard.2021.07.020

Accession Number: WOS:000744284700019

Abstract: This systematic review aimed to evaluate the effect of eHealth-delivered interventions for adults who undergo bariatric surgery on postoperative weight loss, weight loss maintenance, eating psychopathology, quality of life, depression screening, and self-efficacy. Six electronic databases were searched, with 14 studies (across 17 reports) included, involving 1633 participants. With substantial heterogeneity, qualitative descriptions have been provided. Interventions were delivered via an online program or internet modules (n = 2), telephone (n = 2), text messages (n = 2), videoconferencing (n = 3), mobile application (n = 1), and audiovisual media (n = 1). Three studies included a combination, including internet modules and telephone (n = 1), wireless fidelity scales, emails, and telephone (n = 1), and a combination of online treatment, weekly emails, and access to a private Facebook group (n = 1). All the eHealth interventions, except for one, implemented behavior change techniques, including self-monitoring, problem solving, social support, goal setting, and shaping knowledge. Both eHealth intervention and control groups lost weight across the included studies, and eHealth was found to be as effective as or more effective than the control for weight loss. Two studies measured weight loss maintenance; both eHealth and control groups regained weight in the longer term. The interventions showed

significant improvement on assessment measures for eating psychopathology. In conclusion, when bariatric surgery patients have limited or no access to healthcare teams or require additional support, eHealth may be a suitable option. Future studies implementing eHealth interventions would benefit from reporting intervention components as per the behavior change techniques taxonomy and further consideration of delivering eHealth in a stepped care approach would be beneficial. Accession Number: WOS:000703571900015

Abstract: In the absence of a vaccine, governments have focused on behaviour change (e.g. social distancing and enhanced hygiene procedures) to tackle the COVID-19 pandemic. Existing research on the predictors of compliance with pandemic measures has often produced discrepant results. One explanation for this may be that the determinants of compliance are context specific. Understanding whether this is the case is important for designing public health messaging and for evaluating the generalisability of existing research. We used data from the UCL COVID19 Social Study; a large weekly panel of UK adults from first five months of lockdown in the UK (n = 22,625). We tested whether the extent to which demographic, socio-economic position, personality traits, social and prosocial motivations, and the living environment predict compliance changed across the pandemic using multilevel regression modelling. Low compliance was strongly related to younger age and also to risk attitudes, empathic concern, and high income, among other factors. The size of some of these associations was larger in later months when less stringent lockdown and household mixing measures were in

place. The results showed that compliance was lower and fell faster across some groups, suggesting the importance that public health communications adopt a plurality of messages to maximize broad adherence.

Article Number: 34

Accession Number: WOS:000739975900010

Abstract: Background During the COVID-19 pandemic, the UK government implemented a series of guidelines, rules, and restrictions to change citizens' behaviour to tackle the spread of the virus, such as the promotion of face masks and the imposition of lockdown stay-at-home orders. The success of such measures requires active co-operation on the part of citizens, but compliance was not complete. Detailed research is required on the factors that aided or hindered compliance with these measures. Methods To understand the facilitators and barriers to compliance with COVID-19 guidelines, we used structural topic modelling, a text mining technique, to extract themes from over 26,000 free-text survey responses from 17,500 UK adults, collected between 17 November and 23 December 2020. Results The main factors facilitating compliance were desires to reduce risk to oneself and one's family and friends and to, a lesser extent, the general public. Also of importance were a desire to return to normality, the availability of activities and technological means to contact family and friends, and the ability to work from home. Identified barriers were difficulties maintaining social distancing in public (due to the actions of other people or environmental constraints), the need to provide or receive support from family and friends, social isolation, missing loved ones, and mental health impacts, perceiving the risks as low, social pressure to not comply, and difficulties understanding and keep abreast of changing rules. Several of the barriers and facilitators raised were related to participant characteristics. Notably, women were more likely to discuss needing to provide or receive mental health support from friends and family. Conclusion The results demonstrated an array of

factors contributed to compliance with guidelines. Of particular policy importance, the results suggest that government communication that emphasizes the potential risks of the virus and provides simple, consistent guidance on how to reduce the spread of the virus would improve compliance with preventive behaviours as COVID-19 continues and for future pandemics.

Abstract: Background Governments have implemented a range of measures focused on changing citizens' behaviors to lower the transmission of COVID-19. While international data shows that compliance did decline from the start of the pandemic, average trends could mask considerable heterogeneity in compliance behaviors. Purpose To explore trajectories of compliance with COVID-19 guidelines. Methods We used longitudinal data on self-reported compliance from 50,851 adults in the COVID-19 Social Study collected across two waves of the pandemic in the UK (April 01, 2020-February 22, 2021). We modeled typical compliance trajectories using latent class growth analysis (LCGA) and used multinomial logistic regression to examine whether individual personality and demographic characteristics were related to compliance trajectories. Results We selected a four-class LCGA solution. Most individuals maintained high levels of compliance and reported similar levels of compliance across the first and second waves. Approximately 15% of participants had decreasing levels of compliance across the pandemic, reporting noticeably lower levels of compliance in the second wave. Individuals with declining compliance levels were younger on average, in better physical health, had lower empathy and conscientiousness and greater general willingness to take risks. Conclusions While a minority, not all individuals have maintained high compliance across the pandemic. Decreasing compliance is related to several psychological traits. The results suggest that targeting of behavior change messages later in the pandemic may be needed to increase compliance.

Abstract: Background Governments have implemented a range of measures to tackle COVID-19, primarily focusing on changing citizens' behaviours in order to lower the transmission of the virus. Few studies have looked at the patterns of compliance with different measures within individuals: whether people comply with all measures or selectively choose some but not others. Such research is important for designing interventions to increase compliance. Methods We used cross-sectional data from 20 947 UK adults in the COVID-19 Social Study collected from 17 November to 23 December 2020. Self-report compliance was assessed with six behaviours: mask wearing, hand washing, indoor household mixing, outdoor household mixing, social distancing and compliance with other guidelines. Patterns of compliance behaviour were identified using latent class analysis, and multinomial logistic regression was used to assess demographic, socioeconomic and personality predictors of behaviour patterns. Results We selected a four-latent class solution. Most individuals reported similar levels of compliance across the six behaviour measures. High level of compliance was the modal response. Lower self-reported compliance was related to young age, high risk-taking behaviour, low confidence in government and low empathy, among other factors. Looking at individual behaviours, mask wearing had the highest level of compliance while compliance with social distancing was relatively low. Conclusion Results suggest that individuals choose to comply with all guidelines, rather than some but not others. Strategies to increase compliance should focus on increasing general motivations to comply alongside specifically encouraging social distancing.

Title: Do people reduce compliance with COVID-19 guidelines following vaccination? A longitudinal analysis of matched UK adults

Journal: Journal of Epidemiology and Community Health

Volume: 76

Issue: 2

Pages: 109-115

Date: Feb

Short Title: Do people reduce compliance with COVID-19 guidelines following vaccination? A longitudinal analysis of matched UK adults

ISSN: 0143-005X

DOI: 10.1136/jech-2021-217179

Accession Number: WOS:000728868800001

Abstract: Introduction COVID-19 vaccines do not confer immediate immunity and vaccinated individuals may still be at risk of transmitting the virus. Governments have not exempted vaccinated individuals from behavioural measures to reduce the spread of COVID-19, such as practising social distancing. However, vaccinated individuals may have reduced compliance with these measures, given lower perceived risks. Methods We used monthly panel data from October 2020 to March 2021 in the UK COVID-19 Social Study to assess changes in compliance following vaccination. Compliance was measured with two items on compliance with guidelines in general and compliance with social distancing. We used matching to create comparable groups of individuals by month of vaccination (January, February or not vaccinated by February) and fixed effects regression to estimate changes in compliance over the study period. Results Compliance increased between October 2020 and March 2021, regardless of vaccination status or month of vaccination. There was no clear evidence that vaccinated individuals decreased compliance relative to those who were not yet vaccinated. Conclusion There was little evidence that sample members vaccinated in January or February reduced compliance after receiving vaccination for COVID-19. Continued monitoring is required as younger individuals receive the vaccine, lockdown restrictions are lifted and individuals receive second doses of the vaccine.

Title: Understanding Patients' Experiences and Perspectives of Tele-Prehabilitation: A Qualitative Study to Inform Service Design and Delivery

Journal: Clinics and Practice

Volume: 12

Issue: 4

Pages: 640-652

Date: Aug

Short Title: Understanding Patients' Experiences and Perspectives of Tele-Prehabilitation: A Qualitative Study to Inform Service Design and Delivery

ISSN: 2039-7275

DOI: 10.3390/clinpract12040067

Accession Number: WOS:000846021500001

Abstract: Background: Tele-prehabilitation is a behaviour change intervention that facilitates the modification of unhealthy lifestyle behaviours. Understanding patients' experiences of tele-prehabilitation provides important insights into service improvement. In this study, we aimed to describe our patients' perceptions of tele-prehabilitation and capture their capabilities, opportunities, and motivations to participate. This was a qualitative study to inform our service design and delivery.

Methods: Following purposive sampling, 22 qualitative semistructured interviews were conducted with patients in the community that had completed tele-prehabilitation. Interviews were recorded and transcribed. Deductive content analysis was used to map the identified themes against theoretical determinants of health behaviour change. Results: We conducted 22 interviews. Our patients described their overall experience of tele-prehabilitation as positive and provided important insights that impacted their capabilities, opportunities, and motivations to engage with our service. Our team provided them the capabilities and self-efficacy to engage by personalising multimodal plans and setting goals. The remote delivery of our service was a recurring positive theme in providing flexibility and widening accessibility to participation. A missed opportunity was the potential for peer support through shared experiences with other patients. Patients showed greater motivation to participate for immediate perioperative benefit compared to long-term health gains. Conclusion: Patients' experiences and perspectives of tele-prehabilitation can be enhanced by incorporating the findings from this qualitative study into service redesign and delivery. We recommend: (1) applying holistic principles in care and goal-setting, (2) delivering a combination of home-based and in-centre programmes, and (3) engaging with patients at the start of their cancer journey when they are most motivated. In turn, this can result in more effective uptake, improve adherence to interventions, and greater satisfaction.

Title: The mothers' breastfeeding behaviour within six weeks postpartum: new scale development and psychometric validation study

Journal: BMC Pregnancy and Childbirth

Volume: 23

Issue: 1

Date: Mar

Short Title: The mothers' breastfeeding behaviour within six weeks postpartum: new scale development and psychometric validation study

DOI: 10.1186/s12884-023-05439-2

Article Number: 138

Accession Number: WOS:000942807800003

Abstract: Background The evaluation of mothers' breastfeeding behaviour within 6 weeks postpartum could help health workers comprehensively identify maternal breastfeeding shortcomings, clarify nursing problems, and provide targeted interventions. However, no prior study was found, therefore this study aimed to develop and validate the reliability and validity of the mothers' breastfeeding behaviour scale within 6 weeks postpartum. Methods A main two-step approach was used: (1) a qualitative pilot study using the purposive sampling method was adopted to test the fitness, simplicity, and clarity of items with 30 mothers; (2) a cross-sectional survey using the convenient sampling method was conducted for item analysis and psychometric validation with 600 mothers. Results The final version of the scale consisted of 36 items with seven dimensions, explaining 68.85% of the total variance. The Cronbach's alpha, split-half, and retest coefficients were 0.958, 0.843, and 0.753, respectively. The validity of the scale: (1) Content validity: content validity index (CVI) range of items was between 0.882 and 1.000. The scale-level-CVI was 0.990. (2) Structure validity: The fitting indices were as follows: $\chi^2/df = 2.239$, RMR = 0.049, RMSEA = 0.069, TLI = 0.893, CFI = 0.903, IFI = 0.904, PGFI = 0.674, and PNFI = 0.763. (3) Convergent validity: The composite reliability and average variance extracted (AVE) of the seven dimensions were between 0.876 and 0.920 and between 0.594 and 0.696. (4) Distinguish validity: The correlation coefficients were less than the square root of the AVE, except for self-decision behaviour, self-coping behaviour, and self-control behaviour. However, the fit index of the original three-factor model was better than that of the other new models, with significant differences ($P < 0.001$). (5) Calibration validity: The area under the curve was 0.860 or 0.898 when the scale was used to predict exclusive or any breastfeeding at 42 days. The correlation coefficients of the maternal breastfeeding evaluation scale, breastfeeding self-efficacy short-form scale, and the scale were 0.569 and 0.674, respectively. Conclusion The newly developed mothers' breastfeeding behaviour scale within 6 weeks postpartum consists of 36 items belonging to seven dimensions with good reliability and validity and is a reliable and valid instrument to be used in future maternal breastfeeding behaviour assessments and interventions.

Short Title: Which mothers' breastfeeding behaviours within six weeks postpartum do health workers need to notice? Developing an indicator system based on the Delphi method and analytic hierarchy process

ISSN: 0266-6138

DOI: 10.1016/j.midw.2023.103603

Article Number: 103603

Accession Number: WOS:000927384900001

Abstract: Objective: The six weeks postpartum is the high-incidence period of stopping breastfeeding. The clarity of the internal mechanism of behaviour was an effective way to promote breastfeeding. The aim was to reach a consensus on indicators what should be used and prioritised in evaluating mothers' breastfeeding behaviour within six weeks postpartum in order to provide a theoretical reference for health workers to take targeted strategies toward promoting breastfeeding practices. Design: Two rounds of Delphi method and analytic hierarchy process was conducted in this study. The two-rounds Delphi was performed to select essential indicators and collect revised suggestion. The an-alytic hierarchy process was adopted for pairwise comparison to rank the significance of primary and secondary indicators. Setting and participants: The panel included twenty experts with rich breastfeeding information and dif-ferent general characteristics from China. Findings: Consensus was achieved to include three primary indicators, seven secondary indicators, and forty-five tertiary indicators in the final indicators system of the mothers' breastfeeding behaviour within six weeks postpartum. The weight sequence of primary indicators was self-regulation behaviour (0.401), at-the-breast feeding behaviour (0.383), and resource utilisation behaviour (0.216). The rank of the sec-ondary indicators was breastfeeding operation skills (0.267), self-decision behaviour (0.144), self-control behaviour (0.130), self-coping behaviour (0.127), breastfeeding self-perception (0.116), resource acquisition behaviour (0.115), and resource coordination behaviour (0.101). Key conclusion: The study builds a new and reliable indicators system that intuitively reflects the con-stituent elements of the mothers' breastfeeding behaviour within six weeks postpartum and provides priorities in primary indicators and secondary indicators. Implications for practices: The study helps form a clear and scientific cognition on mothers' breastfeeding behaviour within six weeks postpartum and provides a new perspective and intuitive theoretical refer-ence for health workers to take targeted measures to promote breastfeeding practices and achieve sub-stantial public health gains. Date: Apr

Short Title: The development of a self-management evaluation scale for elderly adults with hypertension based on the capability, opportunity, and motivation-behaviour (COM-B) model

DOI: 10.1186/s12877-023-03879-1

Article Number: 245

Accession Number: WOS:000973922700001

Abstract: Background Using accurate assessment tools to assess patients in clinical practice is important to mining influencing factors and implementing interventions. However, most evaluation tools for the self-management of elderly patients with hypertension lack a theoretical basis and wide applicability, which makes the intervention effect insignificant. Methods Based on the Capability, Opportunity, and Motivation-Behaviour (COM-B) model, combined with literature review and qualitative research, a questionnaire item pool was initially formulated; then the initial items were screened and adjusted through expert consultation and pre-testing to form an initial scale. A field survey of 450 elderly hypertensive patients was then performed using the initial scale to test the reliability and validity of the scale. Cronbach's alpha, test-retest reliability and composite reliability were used to test the reliability of the scale, and the validity of the scale was evaluated from two aspects: content validity and construct validity. The evaluation results of the content validity of the scale by experts were used as the content validity index; the results of exploratory factor analysis and confirmatory factor analysis were used as the structural validity index to further verify the model structure of the scale and develop a formal scale. Results The final self-management scale included 4 dimensions and 33 items. The Scale-Content Validity Index was 0.920. Exploratory factor analysis extracted four factors that explained 71.3% of the total variance. Cronbach's alpha of the formal scale was 0.867, test-retest reliability was 0.894, and composite reliability of the 4 dimensions were within 0.943 similar to 0.973. Confirmatory factor analysis showed the scale had good construct validity. Conclusions The Self-management Capability, Support and Motivation-Behaviour scale for elderly hypertensive

patients has good reliability and validity, providing a tool for medical staff to evaluate the self-management level of elderly hypertensive patients.

Short Title: Tailoring Strength Training Prescriptions for People with Rheumatoid Arthritis: A Scoping Review

ISSN: 1559-8276

DOI: 10.1177/15598276221125415

Accession Number: WOS:000852325400001

Abstract: Introduction: Prescribing strength training (ST) for people with rheumatoid arthritis (RA) is complicated by factors (barriers and facilitators) that affect participation. It is unclear whether guidelines include recommendations beyond prescription parameters (frequency, intensity, time, type, volume, and progression) and adequately incorporate participation factors tailored to people with RA. Objective: To summarize available recommendations to aid in the tailoring of ST prescriptions for people with RA. Methods: Medline, Embase, and CINAHL databases and gray literature were searched for guidelines, recommendations, and review articles containing ST prescription recommendations for RA. Article screening and data extraction were performed in duplicate by two reviewers. Results: Twenty-seven articles met the inclusion criteria. The recommendations address RA-specific ST participation factors including: knowledge gaps (of equipment, ST benefits, disease), memory problems, the management of joint deformity, comorbidity, the fluctuating nature of the disease and symptoms (pain, stiffness, flares), fear avoidance, motivation, need for referral to other professionals, and provision of RA-specific resources. Conclusion: This review summarizes recommendations for tailoring ST prescriptions for people with RA. Future research is required to understand how pain, symptom assessment, and unaddressed ST participation factors like sleep and medication side effects can be addressed to support ST participation amongst people with RA.

Short Title: Simplified HIV Testing and Treatment in China: Analysis of Mortality Rates Before and After a Structural Intervention

ISSN: 1549-1277

DOI: 10.1371/journal.pmed.1001874

Article Number: e1001874

Accession Number: WOS:000362216200009

Abstract: Background Multistage stepwise HIV testing and treatment initiation procedures can result in lost opportunities to provide timely antiretroviral therapy (ART). Incomplete patient engagement along the continuum of HIV care translates into high levels of preventable mortality. We aimed to evaluate the ability of a simplified test and treat structural intervention to reduce mortality. Methods and Findings In the "pre-intervention 2010" (from January 2010 to December 2010) and "pre-intervention 2011" (from January 2011 to December 2011) phases, patients who screened HIV-positive at health care facilities in Zhongshan and Pubei counties in Guangxi, China, followed the standard-of-care process. In the "post-intervention 2012" (from July 2012 to June 2013) and "post-intervention 2013" (from July 2013 to June 2014) phases, patients who screened HIV-positive at the same facilities were offered a simplified test and treat intervention, i.e., concurrent HIV confirmatory and CD4 testing and immediate initiation of ART, irrespective of CD4 count. Participants were followed for 6–18 mo until the end of their study phase period. Mortality rates in the pre-intervention and post-intervention phases were compared for all HIV cases and for treatment-eligible HIV cases. A total of 1,034 HIV-positive participants (281 and 339 in the two pre-intervention phases respectively, and 215 and 199 in the two post-intervention phases respectively) were enrolled. Following the structural intervention, receipt of baseline CD4 testing within 30 d of HIV confirmation increased from 67%/61% (pre-intervention 2010/pre-intervention 2011) to 98%/97% (post-intervention 2012/post-intervention 2013) (all $p < 0.001$ [i.e., for all comparisons between a pre- and post-intervention phase]), and the time from HIV confirmation to ART initiation decreased from 53 d (interquartile range [IQR] 27–141)/43 d (IQR 15–113) to 5 d (IQR 2–12)/5 d (IQR 2–13) (all $p < 0.001$). Initiation of ART increased from 27%/49% to 91%/89% among all cases (all $p < 0.001$) and from 39%/62% to 94%/90% among individuals with CD4 count ≤ 350 cells/mm³ or AIDS (all $p < 0.001$). Mortality decreased from 27%/27% to 10%/10% for all cases (all $p < 0.001$) and from 40%/35% to 13%/13% for cases with CD4 count ≤ 350 cells/mm³ or AIDS (all $p < 0.001$). The simplified test and

treat intervention was significantly associated with decreased mortality rates compared to pre-intervention 2011 (adjusted hazard ratio [aHR] 0.385 [95% CI 0.239–0.620] and 0.380 [95% CI 0.233–0.618] for the two post-intervention phases, respectively, for all newly diagnosed HIV cases [both $p < 0.001$], and aHR 0.369 [95% CI 0.226–0.603] and 0.361 [95% CI 0.221–0.590] for newly diagnosed treatment-eligible HIV cases [both $p < 0.001$]). The unit cost of an additional patient receiving ART attributable to the intervention was US\$83.80. The unit cost of a death prevented because of the intervention was US\$234.52. Conclusions Our results demonstrate that the simplified HIV test and treat intervention promoted successful engagement in care and was associated with a 62% reduction in mortality. Our findings support the implementation of integrated HIV testing and immediate access to ART irrespective of CD4 count, in order to optimize the impact of ART.

Abstract: Study design Qualitative study. Objective Use an integrated knowledge translation (IKT) and theory-based approach, to (1) explore factors influencing smoking cessation behaviour among people with SCI, and (2) explore the preferred intervention and implementation options for smoking cessation interventions for persons with SCI. Setting Community. Methods Aligned with an IKT approach, an SCI organization was meaningfully engaged throughout the research process. Semi-structured interviews were conducted with people with SCI who have quit or tried to quit smoking. Barriers and facilitators to smoking cessation were extracted and deductively coded using the Theoretical Domains Framework (TDF) and inductively

analysed. To identify intervention options, a behavioural analysis was conducted using the Behaviour Change Wheel. To identify implementation options, modes of delivery and intervention messengers were extracted. Modes of delivery were deductively coded, and themes relating to intervention messengers were constructed. Results Among the 12 participants (7 males; 6 with tetraplegia), seven had quit and five had relapsed. Across the 12 interviews, 130 barriers and 218 facilitators were coded to the TDF. The prominent TDF domains were beliefs about consequences, social influences, environmental context and resources, and behavioural regulation, and served as themes in the inductive analysis. Multiple modes of delivery and intervention messengers were considered important for the delivery of smoking cessation interventions. Conclusion This study is the first to use IKT and theory-based approaches to explore factors influencing smoking cessation among persons with SCI. Findings from this study resulted in the co-development of practical recommendations for future SCI-specific smoking cessation interventions.

Short Title: Understanding adolescents' and young adults' self-perceptions after cancer treatment in the context of a two-arm, mixed-methods pilot randomized controlled physical activity trial

ISSN: 0941-4355

DOI: 10.1007/s00520-020-05974-0

Accession Number: WOS:000607965600001

Abstract: Purpose The self-perceptions of adolescents and young adults (AYAs) after cancer treatment are not well understood. As part of a two-arm, mixed-methods pilot randomized controlled trial (RCT), this qualitative sub-study explored AYAs' self-perceptions after cancer treatment and investigated how physical activity (PA) may contribute to their self-perceptions. Methods Data were collected from 16 AYAs who completed cancer treatment and who participated in a two-arm, mixed-methods pilot RCT. Recruited AYAs were randomized to a 12-week PA intervention or a wait-list control group, and semi-structured interviews were conducted at baseline (pre-randomization) and 12 weeks later (post-intervention or post-

waiting period) to elicit discussions on self-perceptions and PA. Data were analyzed thematically using inductive and deductive approaches. The exercise and self-esteem model (EXSEM) was the theoretical lens for the deductive analysis. Results Data were organized into four unified main themes: (1) I came out on top and am (re)discovering myself, (2) Comparison to my past self and others induces negative feelings, (3) My changed body brings me down, but it does not rule my life, and (4) My previous experience with PA informs my expectations for my future PA, and two themes contingent on group allocation: (5) Participating in a PA program made me feel better about myself, and (6) I did not notice any changes while waiting for the PA program, but I am anticipating support. Conclusion AYAs' self-perceptions are amenable to change, positively and negatively valenced, and influenced by PA. Although the EXSEM captured intrapersonal factors related to AYAs' self-perceptions after cancer treatment, interpersonal and contextual factors beyond the EXSEM also shaped their self-perceptions. ISSN: 0022-0302
DOI: 10.3168/jds.2021-21745
Accession Number: WOS:000827977600031
Abstract: Lameness represents a significant management challenge in the dairy industry worldwide. In addition to farmers, many advisors are involved in lameness management, including veterinarians, hoof trimmers, and nutritionists. These advisors support farmers through lameness prevention practices, treatments, and advice, but little is known about how advisors view others' roles and the extent to which they work together. This study used qualitative participatory methods to facilitate the formation of lameness advisory groups among 13 advisors (4 veterinarians, 5 hoof trimmers, and 4 nutritionists), with the aims of promoting advisors' engagement with one another and documenting their perceptions of the benefits and challenges of the research activities through semi-structured interviews and thematic analysis. Participants shared predominantly positive views toward the project and voiced appreciation about the quality of discussions and the opportunity to connect and build

relationships with other advisors. Participants reported improved communication with others via sharing reports and farm information, as well as increased confidence in reaching out to other advisors. Reported challenges included time constraints and discomfort in leading the lameness advisory group meetings. Difficulties were also found in bringing issues to farmers' attention when they might not align with the farmers' goals or priorities, as well as participants' questioning other advisors' knowledge and intentions. This study describes a promising avenue of facilitating advisor engagement, although more work is needed to determine whether such engagement translates to a reduction of lameness on farms.

Abstract: Aims and Objectives To explore and compare staff perceived challenges and facilitators in supporting resident self-determination in ethno-specific and mainstream nursing homes.

Background Staff and residents in ethno-specific and mainstream nursing homes in most developed countries have shown increased cultural and linguistic diversity. This socio-demographic change poses significant challenges for staff to support resident self-determination of their own care. In-depth understanding of those challenges in the two types of nursing homes is much needed to inform practice in nurse-led nursing home care settings. Method A qualitative description approach with thematic analysis was used in the study. Data were collected through five focus groups with 29 various direct care workers from two ethno-specific nursing homes and a mainstream nursing home in Australia between March-September 2020. The study report followed the COREQ checklist. Results Four themes were identified from focus group data. First, participants perceived communication challenges in identifying residents' preferences, especially in ethno-specific nursing homes. Second, team efforts that included residents and their family members were highly valued as a way to meet residents' preferences. Third, participants described various levels of staff engagement in

residents' care planning. In addition, staff in ethno-specific nursing homes possessed richer resources to maintain meaningful relationships for residents compared with their counterparts in the mainstream nursing home. Conclusions Staff in ethno-specific nursing homes experience more challenges in supporting resident self-determination but have richer resources to develop culturally safe and culturally competent care compared with their counterparts in the mainstream nursing home. Relevance to clinical practice Findings provide new insights into challenges and practical solutions in supporting residents to self-determine their own care in cross-cultural aged care. Patient or Public Contribution This study was co-designed with three aged care organisations who funded the study. Staff employed by these organisations participated in the study. Short Title: Effectiveness of clinical dashboards as audit and feedback or clinical decision support tools on medication use and test ordering: a systematic review of randomized controlled trials

ISSN: 1067-5027

DOI: 10.1093/jamia/ocac094

Accession Number: WOS:000809430400001

Abstract: Background Clinical dashboards used as audit and feedback (A&F) or clinical decision support systems (CDSS) are increasingly adopted in healthcare. However, their effectiveness in changing the behavior of clinicians or patients is still unclear. This systematic review aims to investigate the effectiveness of clinical dashboards used as CDSS or A&F tools (as a standalone intervention or part of a multifaceted intervention) in primary care or hospital settings on medication prescription/adherence and test ordering. Methods Seven major databases were searched for relevant studies, from inception to August 2021. Two authors independently extracted data, assessed the risk of bias using the Cochrane RoB II scale, and evaluated the

certainty of evidence using GRADE. Data on trial characteristics and intervention effect sizes were extracted. A narrative synthesis was performed to summarize the findings of the included trials. Results Eleven randomized trials were included. Eight trials evaluated clinical dashboards as standalone interventions and provided conflicting evidence on changes in antibiotic prescribing and no effects on statin prescribing compared to usual care. Dashboards increased medication adherence in patients with inflammatory arthritis but not in kidney transplant recipients. Three trials investigated dashboards as part of multicomponent interventions revealing decreased use of opioids for low back pain, increased proportion of patients receiving cardiovascular risk screening, and reduced antibiotic prescribing for upper respiratory tract infections. Conclusion There is limited evidence that dashboards integrated into electronic medical record systems and used as feedback or decision support tools may be associated with improvements in medication use and test ordering.

Accession Number: WOS:000924514400008

Abstract: Introduction Research on the needs and preferences of patients with poorly controlled type 2 diabetes mellitus (T2DM) with mobile health (mHealth) service is limited. With the principles of co-production, this study aims to address this research gap by exploring the health needs of Chinese patients with poorly controlled T2DM. Methods and analysis This study uses a three-phase, exploratory sequential mixed-method design. Phase 1 aims to assess

the health needs of patients with poorly controlled T2DM by conducting semi-structured interviews with patients, doctors and nurses. Participants will be recruited by purposive sampling with maximum variation. Content analysis will be employed. Phase 2 will form item generation and develop the mHealth need scale. The scale will be subject to pilot testing and psychometric evaluation, including content validity, construct validity, discriminant validity, internal validity and test-retest reliability. Phase 3 will explore the priority of health needs perceived by patients with poorly controlled T2DM through a cross-sectional study. The measurement tools include an mHealth needs scale, the Summary of Diabetes Self-care Activities Questionnaire, the Diabetes Empowerment Scale-Short Form, the Diabetes Health Literacy Scale and the eHealth Literacy Scale. Multiple regression techniques with a hierarchical block design will be used for the model building to identify the factors contributing to the heterogeneity of the perceived mHealth needs. The findings of phase 1 and phase 3 will be integrated using data correlation, comparison and consolidation. Ethics and dissemination The Ethics Committee of the School of Nursing, Sun Yat-sen University, has approved this study (No. 2021ZSLYEC). The results of this study will be disseminated through conference presentations and peer-reviewed publications. Short Title: Barriers and enablers of pelvic floor rehabilitation behaviours in pregnant women with stress urinary incontinence: a qualitative analysis using the theoretical domains framework

DOI: 10.1186/s12884-023-05633-2

Article Number: 300

Accession Number: WOS:000984325100002

Abstract: Background Stress urinary incontinence during pregnancy is closely related to the occurrence of postpartum and long-term urinary incontinence. Early pelvic floor management is of great significance in promoting the recovery of pelvic floor tissues in pregnant women. However, effective management of urinary incontinence is far from achievable owing to the low adherence of pregnant women in partaking in pelvic floor rehabilitation. As a comprehensive framework for behavioural theory, the Theoretical Domain Framework allows for comprehensive identification of behavioural determinants. Using Theoretical Domain Framework, this

study aimed to identify barriers and enablers of pelvic floor rehabilitation behaviours in pregnant women with stress urinary incontinence. Methods A descriptive, qualitative design was used in this study. Face-to-face semi-structured interviews were conducted with pregnant women with stress urinary incontinence based on the Theoretical Domain Framework. The data were analysed using a combination of inductive and deductive methods. Results Twenty pregnant women with stress urinary incontinence were interviewed. Seven themes were summarised and used to explain the pelvic floor rehabilitation behaviours of pregnant women with stress urinary incontinence. The seven themes were (1) individual knowledge and experience of pelvic floor management, (2) judgments about expected outcomes, (3) interactions of interpersonal situations, (4) environment, resources, and decision-making processes, (5) personal goal-setting and efforts towards behaviour change, (6) emotional influences on decision-making, and (7) personal characteristics. Besides the "Optimism" domain, 13 of the 14 Theoretical Domains Framework domains were found to influence pregnant patients' pelvic floor rehabilitation behaviours after deductive mapping of themes to the Theoretical Domains Framework. In addition, the inductive analysis generated a theme of personal characteristics that did not map to any of the Theoretical Domains Framework domains. Conclusions The pelvic floor rehabilitation behaviours of pregnant women with stress urinary incontinence are complex and are affected by many factors. The findings confirm the need for multiple interventions to support pelvic floor management in pregnant women with stress urinary incontinence, focusing on enhancing knowledge and skills in pelvic floor care and using appropriate behaviour change techniques (such as prompts) to provide a supportive environment.

Short Title: Core implementation strategies for improving cirrhosis care in the Veterans Health Administration

ISSN: 0270-9139

DOI: 10.1002/hep.32395

Accession Number: WOS:000769915100001

Abstract: Background and Aims The Veterans Health Administration (VHA) provides care for more than 80,000 veterans with cirrhosis. This longitudinal, multimethod evaluation of a cirrhosis care quality improvement program aimed to (1) identify implementation strategies associated with evidence-based, guideline-concordant cirrhosis care over time, and (2) use qualitative interviews to operationalize strategies for a manualized intervention. Approach and Results VHA providers were surveyed annually about the use of 73 implementation strategies to improve cirrhosis care in fiscal years 2018 (FY18) and 2019 (FY19). Implementation strategies linked to guideline-concordant cirrhosis care were identified using bivariate statistics and comparative configurational methods. Semistructured interviews were conducted with 12 facilities in the highest quartile of cirrhosis care to specify the successful implementation strategies and their mechanisms of change. A total of 106 VHA facilities (82%) responded at least once over the 2-year period (FY18, n = 63; FY19, n = 100). Facilities reported using a median of 12 (interquartile range [IQR] 20) implementation strategies in FY18 and 10 (IQR 19) in FY19. Of the 73 strategies, 35 (48%) were positively correlated with provision of evidence-based cirrhosis care. Configurational analysis identified multiple strategy pathways directly linked to more guideline-concordant cirrhosis care. Across both methods, a subset of eight strategies was determined to be core to cirrhosis care improvement and specified using qualitative interviews. Conclusions In a national cirrhosis care improvement initiative, a multimethod approach identified a core subset of successful implementation strategy combinations. This process of empirically identifying and specifying implementation strategies may be applicable to other implementation challenges in hepatology.

Short Title: Getting to implementation: Adaptation of an implementation playbook

DOI: 10.3389/fpubh.2022.980958

Article Number: 980958

Accession Number: WOS:000919430300001

Abstract: Introduction: Implementation strategies supporting the translation of evidence into practice need to be tailored and adapted for maximum effectiveness, yet the field of adapting implementation strategies remains nascent. We aimed to adapt "Getting To Outcomes"((R)) (GTO), a 10-step implementation playbook designed to help community-based organizations plan and evaluate behavioral health programs, into "Getting To Implementation" (GTI) to support the selection, tailoring, and use of implementation strategies in health care settings. Methods: Our embedded evaluation team partnered with operations, external facilitators, and site implementers to employ participatory methods to co-design and adapt GTO for Veterans Health Administration (VA) outpatient cirrhosis care improvement. The Framework for Reporting Adaptations and Modifications to Evidenced-based Implementation Strategies (FRAME-IS) guided documentation and analysis of changes made pre- and post-implementation of GTI at 12 VA medical centers. Data from multiple sources (interviews, observation, content analysis, and fidelity tracking) were triangulated and analyzed using rapid techniques over a 3-year period. Results: Adaptations during pre-implementation were planned, proactive, and focused on context and content to improve acceptability, appropriateness, and feasibility of the GTI playbook. Modifications during and after implementation were unplanned and reactive, concentrating on adoption, fidelity, and sustainability. All changes were collaboratively developed, fidelity consistent at the level of the facilitator and/or implementer. Conclusion; GTO was initially adapted to GTI to support health care teams' selection and use of implementation strategies for improving guideline-concordant medical care. GTI required ongoing modification, particularly in steps regarding team building, context assessment, strategy selection, and sustainability due to difficulties with step clarity and progression. This work also highlights the challenges in pragmatic approaches to collecting and synthesizing implementation, fidelity, and adaptation data.

Title: Barriers and Enablers to Objective Testing for Asthma and COPD in Primary Care A Systematic Review Using the Theoretical Domains Framework

Journal: Chest

Volume: 161

Issue: 4

Pages: 888-905

Date: Apr

Short Title: Barriers and Enablers to Objective Testing for Asthma and COPD in Primary Care A Systematic Review Using the Theoretical Domains Framework

ISSN: 0012-3692

DOI: 10.1016/j.chest.2021.10.030

Accession Number: WOS:000798829600013

Abstract: BACKGROUND: Although guidelines long have recommended objective pulmonary function testing to diagnose asthma and COPD, many primary care patients receive a clinical diagnosis of asthma or COPD without objective testing. This often leads to unnecessary treatment with associated incremental costs and side effects and delays actual diagnosis. RESEARCH QUESTION: What are the barriers and enablers to lung function testing for asthma, COPD, or both in primary care? STUDY DESIGN AND METHODS: We searched the literature for qualitative and quantitative studies reporting barriers, enablers, or both to in-office or out-of-office lung function testing for diagnosing asthma, COPD, or both in primary care. Two reviewers independently screened abstracts and full texts, assessed methodologic quality using the Mixed Methods Appraisal Tool, and extracted data from included studies. Identified barriers and enablers were categorized using the Theoretical Domains Framework (TDF), applying a pre-established coding manual. RESULTS: We identified 7,988 unique articles, reviewed 336 full-text articles, and included 18 studies in this systematic review. Of these 18, 12 were quantitative, three were qualitative, and three used mixed methods. All 18 addressed in-office testing and 11 also addressed out-of-office testing. Barriers and enablers overlapped for asthma and COPD, and in-office and out-of-office settings. We identified more reported barriers (eg, lack of knowledge of the usefulness of spirometry) than enablers (eg, skills for performing reliable spirometry). Barriers mapped to nine (of a possible 14) TDF domains (for both in-office and out-of-office settings). Enablers mapped to three domains for in-office testing and five domains for out-of-office testing. INTERPRETATION: Barriers to objective testing for airway disease in primary care are complex and span many theoretical domains. Correspondingly, a successful intervention must leverage multiple behavior change techniques. A theory-based, multifaceted intervention to address underuse of diagnostic testing for asthma or COPD now should be developed and tested.

Short Title: The moderating effect of parental skills for antibiotic identification on the link between parental skills for antibiotic use and inappropriate antibiotic use for children in China

DOI: 10.1186/s12889-023-15099-8

Article Number: 156

Accession Number: WOS:000921917200007

Abstract: Background Inappropriate antibiotic consumption promotes antibiotic resistance. However, findings on the association between antibiotic-related knowledge and behaviors are inconsistent and contradictory, resulting in unjustified guidance of interventions. The mechanisms between the different kinds of antibiotic-related skills contained in knowledge modules in some previous studies are indistinct and rarely studied. **Methods** A cross-sectional survey was conducted between June 2017 and April 2018 in three Chinese provinces, investigating 9526 parents with children aged 0–13 years old. Data from 1944 parents who self-medicated their children and 2478 respondents whose children sought care were analyzed. **Results** Skills for antibiotic identification were found to be a moderator for the association between skills for antibiotic use and two inappropriate behaviors. Compared with parents with low levels of both skills for antibiotic identification and use, those mastering both skills at either medium (OR = 0.48, 95% CI [0.26–0.88]) or high (OR = 0.15, 95% CI [0.07–0.34]) level were less likely to self-medicate their children with antibiotics. Parents with a medium level of skills for antibiotic identification and high level of skills for antibiotic use (OR = 0.18, 95% CI [0.08–0.44]) and those with a high level of both skills (OR = 0.15, 95% CI [0.05–0.47]) were less likely to ask doctors for antibiotics when seeking care. **Conclusion** Parents' high level of skills for antibiotic identification is revealed to promote inappropriate antibiotic use when parents master a low level of skills for antibiotic use. Conversely, based on excellent skills for antibiotic use, better skill for antibiotic identification is associated with a greater reduction in inappropriate behaviors. We recommend future health education to strengthen skills for antibiotic identification along with guidance on antibiotic use.

Accession Number: WOS:000898640900006

Abstract: Background. Dentists in the United States frequently prescribe opioids for dental-related pain, although evidence shows superior efficacy of nonopioids for pain management. A national sample of US dentists was interviewed to understand the barriers and facilitators to opioid prescribing. Methods. Semistructured one-on-one telephone interviews were conducted with dentists sampled from the 6 regions of The National Dental Practice-Based Research Network. Responses were coded into the domains of the Capability, Opportunity and Motivation Model of Behavior. Potential behavior change interventions were identified for targeted themes. Results. Seventy-three interviews were qualitatively analyzed. Most of those interviewed were general dentists (86.3%) and on average (SD) were in practice for 24.3 (13.0) years. Ten themes were identified within the Capability, Opportunity and Motivation Model of Behavior. Dentists' knowledge of opioid risk, ability to identify substance use disorder behavior, and capability of communicating pain management plans to patients or following clinic policies or state and federal regulations were linked with judicious opioid prescribing. Dentists reported prescribing opioids if they determined clinical necessity or feared negative consequences for refusing to prescribe opioids. Conclusions. Dentists' opioid decision making is influenced by a range of real-world practice experiences and patient and clinic factors. Education and training that target dentists' knowledge gaps and changes in dentists' practice environment can encourage effective communication of pain management strategies with patients and prescribing of nonopioids as first-line analgesics while conserving opioid use. Practical Implications. Identified knowledge gaps in dentistry can be targets for education, clinical guidelines, and policy interventions to ensure safe and appropriate prescribing of opioids.

Title: Perceptions and help-seeking behaviours among community-dwelling older people with urinary incontinence: A systematic integrative review

Journal: Journal of Advanced Nursing

Volume: 78

Issue: 6

Pages: 1574-1587

Date: Jun

Short Title: Perceptions and help-seeking behaviours among community-dwelling older people with urinary incontinence: A systematic integrative review

ISSN: 0309-2402

DOI: 10.1111/jan.15183

Accession Number: WOS:000761759000001

Abstract: Aim To synthesize research evidence on perceptions and help-seeking behaviours in community-dwelling older people with urinary incontinence based on the Capability-Opportunity-Motivation-Behaviours model. Background Urinary incontinence is highly prevalent in community-dwelling older people, yet only a small proportion seek help from health professionals. Untreated urinary incontinence has a detrimental impact on older people's quality of life and distresses their caregivers. Design Systematic integrative review. Data sources Ten databases were searched systematically between 9 November 2020 and 17 December 2020 including Medline (PubMed), CINAHL, Ageline, Web of Science, Scopus, ProQuest, PsycInfo, CNKI, Wanfang and Vip. Review methods Quality appraisal was applied to assess the quality of selected articles. Data relevant to the review aim were extracted from included articles for analysis. Convergent qualitative synthesis was used to synthesize findings. Results Twenty articles were included and two main themes with six sub-themes were identified. Theme one described three common perceptions including urinary incontinence as a part of normal ageing, a stigma and a health problem. Each perception had a profound impact on older people's motivation to self-report the problem to health professionals. Theme two revealed three main help-seeking approaches comprising self-help, help from friends and help from health professionals. Of these, self-help was the dominant approach used to conceal urinary incontinence and contributed to social isolation. Conclusion Improving urinary incontinence management in community-dwelling older people requires the development of their capability and motivation, and increased opportunities to access and gain help from skilled health professionals. Impact Findings can facilitate resource development to improve health literacy for the general public pertinent to

urinary incontinence and associated stigma. Moreover, findings can inform a user-friendly reporting and referral system for the problem. In addition, findings can inform education and skill training for health professionals, older people and their caregivers to effectively manage the problem.

Short Title: A pilot sequential multiple assignment randomized trial (SMART) protocol for developing an adaptive coaching intervention around a mobile application for athletes to improve carbohydrate periodization behavior

DOI: 10.1016/j.conctc.2022.100899

Article Number: 100899

Accession Number: WOS:000820423400015

Abstract: Background: It has recently been identified that manipulating carbohydrate availability around exercise activity can enhance training-induced metabolic adaptations. Despite this approach being accepted in the athletic populations, athletes do not systematically follow the guidelines. Digital environments appear to allow nutritionists to deliver this intervention at scale, reducing expensive human coaching time. Yet, digitally delivered dietary behavior change interventions for athletes and the coaching strategy to support them are still novel concepts within sports nutrition.

Methods/design: We aim to recruit 900 athletes across the UK. 500 athletes will be recruited to test the feasibility of a novel menu planner mobile application with coaching for 6 weeks. 250 athletes with pre-existing nutritionist support will also be recruited as control. We will then conduct a 4-week pilot sequential multiple assignment randomized trial (SMART) with an additional 150 athletes. In the SMART, athletes will be given the application and additional coaching according to their engagement responses. The primary outcomes are the mobile application and coach uptake, retention, engagement, and success in attaining carbohydrate periodization behavior. Secondary outcomes are changes in goal, weight, carbohydrate periodization self-efficacy, and beliefs about

consequences. Due to the high attrition nature of digital interventions, all quantitative analyses will be carried out based on both the intention-to-treat and per-protocol principles. Discussion: This study will be the first to investigate improving carbohydrate periodization using a digital approach and tailored coaching strategies under this context. Foundational evidence from this study will provide insights into the feasibility of the digital approach.

Title: Implementation Barriers: A TASKS Framework

Journal: Journal of Integrated Design & Process Science

Volume: 25

Issue: 3-4

Pages: 134-147

Short Title: Implementation Barriers: A TASKS Framework

ISSN: 1092-0617

DOI: 10.3233/jid-210011

Accession Number: WOS:000963150600007

Abstract: Implementation is ubiquitous. The identification of barriers to implementation is critical for achieving implementation success. This paper introduces and discusses a deductive theory-based framework, TASKS, to guide the identification of implementation barriers. The TASKS framework deals with the relationships between a Task and the task implementer's Affect, Skills, and Knowledge, based on the inversed U-shaped mental Stress-mental effort relation. The TASKS framework classifies implementation barriers into four categories: 1) emotion barriers, 2) logic barriers, 3) knowledge barriers, and 4) resources barriers. The TASKS framework detects barriers to implementation following three steps, 1) identifying the ideal TASKS components, 2) modelling the implementer's mental capability, and 3) detecting barriers to implementation. The TASKS framework can be applied to a wide range of disciplines for effective and efficient task implementation.

Short Title: The perceived ethicality of promoting employee workplace energy conservation for a competitiveness reason

ISSN: 0959-6526

DOI: 10.1016/j.jclepro.2023.136677

Article Number: 136677

Accession Number: WOS:000958265200001

Abstract: Literature of cleaner production demonstrates that the conduction of pro-environmental behaviour individually at work contributes to the improvement of an organisation's environmental performance. However, employees' intentions to engage in pro-environmental behaviour are susceptible to their perceived ethicality towards organisational behaviours, such as workplace green initiatives. An ongoing issue is that whether symbolic motives, particularly, the competitiveness motive, to PEB is perceived ethical by employees to perform at the workplace context. With a specific focus on that matter, this study aims to examine employees' perceived ethicality of promoting workplace energy conservation based on a competitiveness (motivational) message as an intervention initiated by the organisation. Results from survey data (N = 200) indicate that promoting workplace energy conservation through a competitiveness message leads to a lower perceived ethicality of message than via a control message. Also, the competitiveness message did not significantly affect employees' behavioural intention towards workplace energy conservation. Notably, employees' attitude towards message significantly affected their workplace energy conservation intention.

Accession Number: WOS:000893079400003

Abstract: Preventive interventions targeting tobacco, alcohol, healthy diets and physical activity are key strategies to tackle the

most pressing health challenges in modern society. A major gap remains in how to translate research evidence into population-level behaviour change to reduce the disease burden. We use the case for the role of physical activity-related behaviour and cancer to illustrate the iterative, multidirectional, and transdisciplinary nature of translational research. The issues we address in this context are generalizable and applicable to other behavioral risk factors and non-communicable diseases. There is now solid evidence that physical activity re-duces cancer risk and improves outcomes after cancer diagnosis. Here we provide a framework for how to implement this knowledge into real-world settings. We provide the rationale for combining systems, causal and design thinking to develop interventions that can be implemented for this type of behaviour change. The pro-posed model is iterative, multidirectional and transdisciplinary. We identify major knowledge gaps in epidemiology and science of behaviour change on physical activity and cancer control and propose approaches to suggest priorities for future research.

DOI: 10.2196/38567

Article Number: e38567

Accession Number: WOS:000879234300001

Abstract: Background: The WeChat platform has become a primary source for medical information in China. However, no study has been conducted to explore the quality of information on WeChat for the treatment of hypertension, the leading chronic condition. Objective: This study aimed to explore the quality of information in articles on WeChat that are related to hypertension treatment from the aspects of credibility, concreteness, accuracy, and completeness. Methods: We searched for all information related to hypertension treatment on WeChat based on several inclusion and exclusion criteria. We used 2 tools to evaluate information quality, and 2 independent reviewers performed the assessment with the 2 tools separately. First, we adopted the DISCERN instrument to assess the credibility and concreteness of the treatment information, with the outcomes classified into five grades: excellent, good, fair, poor,

and very poor. Second, we applied the Chinese Guidelines for Prevention and Treatment of Hypertension (2018 edition) to evaluate the accuracy and completeness of the article information with regard to specific medical content. Third, we combined the results from the 2 assessments to arrive at the overall quality of the articles and explored the differences between, and associations of, the 2 independent assessments. Results: Of the 223 articles that were retrieved, 130 (58.3%) full texts were included. Of these 130 articles, 81 (62.3%) described therapeutic measures for hypertension. The assessment based on the DISCERN instrument reported a mean score of 31.22 (SD 8.46). There were no articles rated excellent (mean score >63); most (111/130, 85.4%) of the articles did not refer to the consequences—in particular, quality of life—of no treatment. For specific medical content, adherence to the Chinese Guidelines for Prevention and Treatment of Hypertension was generally low in terms of accuracy and completeness, and there was much erroneous information. The overall mean quality score was 10.18 (SD 2.22) for the 130 articles, and the scores differed significantly across the 3 types ($P=.03$) and 5 sources ($P=.02$). Articles with references achieved higher scores for quality than those reporting none ($P<.001$). The results from the DISCERN assessment and the medical content scores were highly correlated ($\rho=0.58$; $P<.001$). Conclusions: The quality of hypertension treatment-related information on the WeChat platform is low. Future work is warranted to regulate information sources and strengthen references. For the treatment of hypertension, crucial information on the consequences of no treatment is urgently needed.

Short Title: The Person-Based Approach to Intervention Development: Application to Digital Health-Related Behavior Change Interventions

ISSN: 1438-8871

DOI: 10.2196/jmir.4055

Article Number: e30

Accession Number: WOS:000374123300026

Abstract: This paper describes an approach that we have evolved for developing successful digital interventions to help people manage their health or illness. We refer to this as the "person-based"

approach to highlight the focus on understanding and accommodating the perspectives of the people who will use the intervention. While all intervention designers seek to elicit and incorporate the views of target users in a variety of ways, the person-based approach offers a distinctive and systematic means of addressing the user experience of intended behavior change techniques in particular and can enhance the use of theory-based and evidence-based approaches to intervention development. There are two key elements to the person-based approach. The first is a developmental process involving qualitative research with a wide range of people from the target user populations, carried out at every stage of intervention development, from planning to feasibility testing and implementation. This process goes beyond assessing acceptability, usability, and satisfaction, allowing the intervention designers to build a deep understanding of the psychosocial context of users and their views of the behavioral elements of the intervention. Insights from this process can be used to anticipate and interpret intervention usage and outcomes, and most importantly to modify the intervention to make it more persuasive, feasible, and relevant to users. The second element of the person-based approach is to identify "guiding principles" that can inspire and inform the intervention development by highlighting the distinctive ways that the intervention will address key context-specific behavioral issues. This paper describes how to implement the person-based approach, illustrating the process with examples of the insights gained from our experience of carrying out over a thousand interviews with users, while developing public health and illness management interventions that have proven effective in trials involving tens of thousands of users.

DOI: 10.1186/s13063-022-06539-8

Article Number: 612

Accession Number: WOS:000833015400005

Abstract: Background: There are around 250 million adolescents in India. Adolescents are vulnerable to common mental disorders with depression and self-harm accounting for a major share of the burden of death and disability in this age group. Around 20% of children and adolescents are diagnosed with/ or live with a disabling mental illness. A national survey has found that suicide is the third leading cause of death among adolescents in India. The authors hypothesise that an intervention involving an anti-stigma campaign co-created by adolescents themselves, and a mobile technology-based electronic decision support system will help reduce stigma, depression, and suicide risk and improve mental health for high-risk adolescents living in urban slums in India. **Methods:** The intervention will be implemented as a cluster randomised control trial in 30 slum clusters in each of the cities of Vijayawada and New Delhi in India. Adolescents aged 10 to 19 years will be screened for depression and suicide ideation using the Patient Health Questionnaire (PHQ-9). Two evaluation cohorts will be derived—a high-risk cohort with an elevated PHQ-9 score ≥ 10 and/or a positive response (score ≥ 2) to the suicide risk question on the PHQ-9, and a non-high-risk cohort comprising an equal number of adolescents not at elevated risk based on these scores. **Discussion:** The key elements that ARTEMIS will focus on are increasing awareness among adolescents and the slum community on these mental health conditions as well as strengthening the skills of existing primary healthcare workers and promoting task sharing. The findings from this study will provide evidence to governments about strategies with potential for addressing the gaps in providing care for adolescents living in urban slums and experiencing depression, other significant emotional or medically unexplained complaints or increased suicide risk/self-harm and should have relevance not only for India but also for other low- and middle-income countries.

Article Number: 240

Accession Number: WOS:000812646100002

Abstract: Background Task shifting is a well-tested implementation strategy within low- and middle-income countries that addresses the shortage of trained mental health personnel. Task shifting can increase access to care for patients with mental illnesses. In Kenya, community health workers (CHWs) are a combination of community health assistants and community health volunteers and have played a crucial role on this front. In our study, we seek to assess the acceptability and feasibility of Group Interpersonal Psychotherapy (IPT-G) delivered by CHWs among depressed postpartum adolescents (PPAs) living with human immunodeficiency virus (HIV). **Method** The study used theoretical framework of behaviour change including: Capability, Opportunity and Motivation (COM-B model) to help understand behavioural changes due to IPT-G intervention delivered by the CHWs. 24 PPAs were administered IPT-G by trained CHWs from two health centres. A two-arm study design (IPT-G intervention and treatment as usual) with an intent to treat was used to assess the acceptability and feasibility of IPT-G. With purposeful sampling, participants who scored > 10 on the Edinburgh postnatal depression scale and who were 6-12 weeks postpartum were eligible for the study. Participants were equally distributed into two groups: one group for intervention and another as a wait-listed group. This was achieved by randomly allocating numerical numbers and separating those with odd numbers (intervention group) and even numbers (wait-listed group). Focus group discussions and in-depth interviews ascertained the experiences and perceptions of the PPAs and the CHWs during IPT-G delivery process. In addition to weekly face-to-face continuous supportive supervision for the CHWs, the researchers also utilized phone calls, short messages services and WhatsApp instant messaging services. **Results** The CHWs found the intervention useful for their own knowledge and skill-set. With regards to participation, 21 out of the 24 adolescents attended all sessions. Most of the adolescents reported an improvement in their interpersonal relationships with reduced distress and lessening of HIV-related stigma. Primary healthcare workers embraced the intervention by accommodating the sessions in their routine clinic activities. **Conclusion** Our study demonstrates the possible benefits of task shifting in addressing mental health problems within low-resource settings in Kenya, and IPT-G is demonstrated to be both acceptable and feasible by health workers and adolescents receiving care.

Short Title: Promoting healthy lifestyle behaviours in youth:
Findings from a novel intervention for children at risk of
cardiovascular disease

ISSN: 1205-7088

DOI: 10.1093/pch/pxab033

Accession Number: WOS:000743300200008

Abstract: Objectives: Obesity is the most prevalent risk factor for cardiovascular disease (CVD) in children. We developed a 2-year lifestyle intervention for youth at risk of CVD. We assessed changes in body mass index z-scores (zBMI) and key cardiometabolic risk factors, physical fitness, and capacity among those who completed the program. Methods: The CIRCUIT program is a multidisciplinary lifestyle intervention for children aged 4 to 18 years at risk of CVD, based on a personalized plan to improve cardiometabolic outcomes by increasing physical activity and reducing sedentary behaviours. Both at baseline and 2-year follow-up, we measured zBMI, blood pressure z-scores (zBP), adiposity (%body and %trunk fat), fasting blood glucose and lipid profile, aerobic (VO₂max) and anaerobic (5x5 m shuttle run test) fitness, and physical capacity indicators. Differences between baseline and follow-up were examined using paired t-tests (for age-sex standardized outcomes) and multivariable mixed effect models, adjusted for age and sex (for other outcomes). Results: Among the 106 participants (53 males) who completed the 2-year program, mean age at baseline was 10.9 years (SD=3.2). After 2 years, zBMI and diastolic zBP decreased by 0.30SD (95% CI: -0.44; -0.16) and 0.43SD (95% CI: -0.65; -0.23), respectively. Participants improved %body and %trunk fat, lipid profile, aerobic and anaerobic fitness levels, and physical capacity (p<0.02). No changes in systolic zBP nor in fasting plasma glucose were observed. Conclusion: Our findings showed improved zBMI, cardiometabolic outcomes, physical fitness, and capacity among children at risk of CVD, suggesting that CIRCUIT is a promising intervention. Short Title: Children and Urban Green Infrastructure in the Digital Age: A Systematic Literature Review
DOI: 10.3390/ijerph19105906
Article Number: 5906
Accession Number: WOS:000802543800001
Abstract: In the digital age, time spent outdoor in green areas is significantly decreasing for children living in cities. With the advent of digital technology, a series of digital tools are gradually integrated into children's lives and act as a double-edged sword: on the one hand, an increasing number of children tend to stay at home and play digital games instead of interacting with nature; on the other hand, new digital technology is increasingly being used to engage children with outdoor activities. A host of studies have investigated children's behaviour in the natural environment. However, a systematic literature review of children's interaction with the urban green infrastructure (UGI) and the respective role of digital environment, based on a theoretical framework that explicitly takes the multi-level determinants and individual-level mechanism of behaviour change into account does not exist yet. This work provides a conceptual framework that covers various determinants, such as motivation, capability, and opportunity related factors of children's behaviour in terms of their UGI interaction at the city and neighbourhood levels, while taking into account the individual-level mechanism of behavioural change and the role of the digital environment. The framework is used to systematically review recent international empirical evidence on the determinants of children-UGI interaction. The results are useful for laying the theoretical foundation for future empirical research on children-UGI interaction, specifically in the presence of digital interventions. They also provide urban/digital intervention designers and policymakers with theory-based design and policy guidelines for the creation of child-friendly UGI.

Short Title: Do Social Norms for Cigarette Smoking and Nicotine Vaping Product Use Predict Trying Nicotine Vaping Products and Attempts to Quit Cigarette Smoking Amongst Adult Smokers? Findings From the 2016-2020 International Tobacco Control Four Country Smoking and Vaping Surveys

ISSN: 1462-2203

DOI: 10.1093/ntr/ntac212

Accession Number: WOS:000862036800001

Abstract: Introduction To examine whether perceived injunctive and descriptive social norms towards cigarette and nicotine vaping product (NVP) use predicted subsequent trying NVPs and attempts to quit cigarette smoking amongst current smokers and whether associations varied across countries. Aims and Methods Three waves of longitudinal cohort data from the International Tobacco Control Four Country Smoking and Vaping Survey were collected between 2016 and 2020 from 2290 adult smokers in Canada, Australia, England, and the United States who had never used NVPs at baseline (either wave 1 or wave 2) and followed up at the subsequent wave (wave 2 or wave 3, respectively) were analyzed using Generalized Estimating Equations. Results Of the injunctive and descriptive norm measures for smoking and NVP use, NVP initiation was only independently predicted by the injunctive interpersonal norm for NVP use, with perceived approval of NVP use by important others predicting higher odds of trying NVPs (AOR = 1.65, 95% CI = 1.20 to 2.27). This predictive effect was independent of baseline quit intention with no country variations found. By contrast, making cigarette smoking quit attempts were independently predicted by both injunctive and descriptive interpersonal norms with perceived disapproval of smoking by important others (AOR = 1.65, 95% CI = 1.38 to 1.99) and close friends using NVPs (AOR = 1.37, 95% CI = 1.04 to 1.79), both associated with higher odds of smoking quit attempts. Conclusions Adult smokers who perceive NVP use as normative, either because such behavior is socially approved or common within their close social networks, appear more inclined to try NVPs or make smoking quit

attempts than smokers who do not. Implications Social norms can shape a person's behavior and result in behavior change. This study shows that initiation of NVP use behavior among smokers can be reliably predicted by their perception of whether NVP use is acceptable to those important to them within their close social networks. Similarly, any attempts to stop cigarette smoking can be predicted by their perception of how acceptable cigarette smoking is among those who are important to them and whether any of their close friends use NVPs. Changing social norms towards cigarette smoking and NVP use could therefore be incorporated into smoking cessation interventions to help smokers to quit and/or switch to NVP use.

Accession Number: WOS:000749005200001

Abstract: The COVID-19 pandemic has caused severe damage to the global tourism industry. However, there is hope that the industry will recover in the near future. This study investigates how the pandemic has affected the peoples' traveling intention and provide implications for accelerating the recovery of the industry. A PLS-SEM analysis of 382 samples confirms the significant effect of COVID-19 risk perception on travel intention while also highlighting the mediating role of perceived effectiveness of COVID-19 protective measures. The study also concludes that there is a significant difference in the perceived protective measure effectiveness-travel intention relation based on accommodation preference.

Article Number: 793473

Accession Number: WOS:000766666700001

Abstract: IntroductionThe perspectives of healthcare professionals (HCPs) are pivotal to co-development of self-management strategies for patients with diabetes. However, literature has been largely limited to perspectives of patients within the context of a Western healthcare setting. This study aims to explore factors influencing diabetes self-management in adult patients with diabetes from the perspectives of HCPs and their views of the value of mHealth application for diabetes self-management. **Materials and Methods**We conducted focus group discussions (FGD) with purposively selected HCPs in Singapore. All FGDs were audio-recorded and transcribed verbatim. Thematic analysis was conducted using NVivo 12. **Results**A total of 56 HCPs participated in the study. Barriers to self-management included limited patient commitment to lifestyle changes, suboptimal adherence to medication and treatment, patient resistance to insulin initiation and insufficient rapport between patients and HCPs. Patients' perceived susceptibility to complications, social support from family and community, multidisciplinary team care and patient's understanding of the benefits of self-care were viewed as facilitating self-management. HCPs saw mHealth apps as a vital opportunity to engage patients in the self-management of conditions and empower them to foster behavior changes. Yet, there were concerns regarding patient's limited digital literacy, lack of integration into routine electronic system and reluctance. **Discussion**We identified a set of factors influencing self-management in adult patients with diabetes and useful app features that can empower patients to manage their conditions. Findings will inform the development of a mHealth application, and its features designed to improve self-care.

Article Number: 816385

Accession Number: WOS:000770442200001

Abstract: Objective This study aimed to identify facilitators and barriers to the uptake of a community-based diabetes prevention program (DPP) from the perspectives of decliners with prediabetes in a multi-ethnic Asian community. Methods Semi-structured interviews were conducted with 29 individuals with prediabetes who declined participation in a large community-based diabetes prevention program in Singapore. Thematic analysis was undertaken to identify themes, which were subsequently mapped onto the Capacity-Opportunity-Motivation and Behavior model (COM-B). Results We identified 16 key themes under three COM-B domains. Health status at the time of invitation, perceived ability of self-management, understanding of prediabetes condition and/or the program intention (Capability) were important determinants. Family commitment had the strong potential to enable or hinder physical and social Opportunity related to participation. Many participants desired involvement of physician as part of program invitation and component. Fear of exacerbation coupled with an automatic aversion for suffering influenced Motivation for participation. Conclusion Identifying facilitators and barriers embedded in the COM-B will assist systematic program modifications to increase participation of individuals with prediabetes. How information about modifiable risk factors is communicated by physicians at the point of diagnosis and program introduction is key to participation. Co-locating programs with family activity, development of mHealth, readiness assessment, and tailored explanation of program purpose may increase participation. These findings will be used to guide future national interventions in the community to ensure successful implementation.

Accession Number: WOS:000692637900013

Abstract: Empirical studies to disentangle the effects of multicomponent implementation interventions are needed to inform the development of future interventions. This study aims to examine which behavior change techniques (BCTs) primarily targeting canteen manager are associated with school's healthy canteen policy implementation. This is a secondary data analysis from three randomized controlled trials assessing the impact of a "high," "medium," and "low" intensity intervention primarily targeting canteen managers on school's implementation of a healthy canteen policy. The policy required primary schools to remove all "red" (less healthy items) or "banned" (sugar sweetened beverages) items from regular sate and ensure that "green" (healthier items) dominated the menu (>50%). The delivery of BCTs were retrospectively coded. We undertook an elastic net regularized logistic regression with all BCTs in a single model Five k-fold cross-validation elastic net models were conducted. The percentage of times each strategy remained across 1,000 replications was calculated. For no "red" or "banned" items (n = 162), the strongest BCTs were: problem solving, goal setting (behavior), and review behavior goals. These BCTs were identified in 100% of replications as a strong predictor in the cross-validation elastic net models. For the outcome relating to >50% "green" items, the BCTs problem solving, instruction on how to perform behavior and demonstration of behavior were the strongest predictors. Two strategies were identified in 100% of replications as a strong (i.e., problem solving) or weak predictor (i.e., feedback on behavior). This study identified unique BCTs associated with the implementation of a healthy canteen policy.

Accession Number: WOS:000667504700001
Abstract: Aim Implementation science theories, models and frameworks help to address evidence-practice gaps, which have increasing importance for dietetic practice. This paper aims to provide dietitians with insight into how implementation science can be applied to practice, using multiple 'real-life' case studies. Methods Three case studies were purposively selected across areas of dietetics practice to demonstrate application of commonly-used implementation theories, models and frameworks. Reflections from the authors were provided in response to a structured set of questions outlining how the theoretical approach was selected and used, and considerations for future application. Within and cross-case analysis was undertaken. Results Dietitians used diverse implementation theories, models and frameworks to identify barriers and enablers, to plan for implementation, and to guide the selection of implementation strategies. Implementation theory was used to evaluate the implementation process in one case study. Cross-case analysis identified that mentoring by those with implementation expertise, multidisciplinary implementation teams, and leadership and investment in research and translation at an organisational and departmental level as key enablers. Conclusions This paper offers dietitians insight into how implementation science can be applied to improve the uptake of evidence-based practices within nutrition and dietetics, and suggests that there needs to be investment in implementation science as a foundation science within nutrition and dietetics, including education, training and mentoring for dietitians.

ISSN: 1479-6694
DOI: 10.2217/fon-2020-1078
Accession Number: WOS:000683768900001
Abstract: Early detection of cancer through organized screening is a central component of population-level strategies to reduce cancer mortality. For screening programs to be effective, it is important that those invited to screening participate. However, uptake rates are suboptimal in many populations and vary between screening programs, indicating a complex combination of patient factors that require elucidation to develop evidence-based strategies to increase participation. In this review, the authors summarize individual-level (sociodemographic and psychosocial) factors associated with cancer screening uptake and evidence for the effectiveness of behavioral interventions to increase uptake. The authors reflect on current trends and future directions for behavioral cancer screening research to overcome challenges and address unmet needs in reducing cancer mortality.

Title: Maximising the health impacts of free advice services in the UK: A mixed methods systematic review
Journal: Health & Social Care in the Community
Volume: 30
Issue: 5
Pages: 1713-1725
Date: Sep
Short Title: Maximising the health impacts of free advice services in the UK: A mixed methods systematic review
ISSN: 0966-0410
DOI: 10.1111/hsc.13777
Accession Number: WOS:000770888400001
Abstract: After a decade of austerity spending cuts and welfare reform, the COVID-19 pandemic has posed further challenges to the finances, health and wellbeing of working-age, low-income people. While advice services have been widely seen (and funded) as an income maximisation intervention, their health and well-being impact

is less clear. Previous systematic reviews investigating the link between advice services and health outcomes have found a weak evidence base and cover the period up until 2010. This mixed methods review examined up to date evidence to help understand the health impacts of free and independent welfare rights advice services. We included evaluations of free to access advice services on social welfare issues for members of the public that included health outcomes. Through comprehensive searches of two bibliographic databases and websites of relevant organisations we identified 15 articles based on a mixture of study designs. The advice interventions evaluated were based in a range of settings and only limited information was available on the delivery and nature of advice offered. We undertook a convergent synthesis to analyse data on the effectiveness of advice services on health outcomes and to explain variation in these outcomes. Our synthesis suggested that improvements in mental health and well-being measures are commonly attributed to advice service interventions. However, there is little insight to explain these impacts or to inform the delivery of services that maximise health benefits. Co-locating services in health settings appears promising and embracing models of delivery that promote collaboration between organisations tackling the social determinants of health may help to address the inherent complexities in the delivery of advice services and client needs. We make recommendations to improve routine monitoring and reporting by advice services, and methods of evaluation that will better account for complexity and context.

Abstract: Purpose: The purpose of this article is to describe the emerging use of design thinking methodologies in hearing health care research using a participatory action approach with a consumer and community involvement panel, audiologists, and adults with hearing loss. Method: Two connected hearing health care projects that adopted design thinking principles are presented here as case studies. Case 1 investigated the applicability and acceptability of

smart voice assistant technology as posthearing aid fitting support. Case 2 investigated the feasibility of providing support for new adult patients with hearing loss before they attend their hearing assessment appointment. Discussion: The design thinking process provided a flexible structure in which researchers were able to empathize with stakeholders, define their unmet needs, and ideate potential connected hearing health care solutions to develop and evaluate prototypes in clinical and home settings. Conclusion: Utilizing a needs-based, collaborative design thinking approach to conduct development in hearing health care research is a viable and novel option to produce innovative, relevant, and translational hearing health solutions that address stakeholder needs.

DOI: 10.1371/journal.pone.0086706

Article Number: e86706

Accession Number: WOS:000333051000073

Abstract: Background: An evidence-based approach to health care is recognized internationally as a key competency for healthcare practitioners. This overview systematically evaluated and organized evidence from systematic reviews on teaching evidence-based health care (EBHC). Methods/Findings: We searched for systematic reviews evaluating interventions for teaching EBHC to health professionals compared to no intervention or different strategies. Outcomes covered EBHC knowledge, skills, attitudes, practices and health outcomes. Comprehensive searches were conducted in April 2013. Two reviewers independently selected eligible reviews, extracted data and evaluated methodological quality. We included 16 systematic reviews, published between 1993 and 2013. There was considerable overlap across reviews. We found that 171 source studies included in the reviews related to 81 separate studies, of which 37 are in more than one review. Studies used various methodologies to evaluate educational interventions of varying content, format and duration in

undergraduates, interns, residents and practicing health professionals. The evidence in the reviews showed that multifaceted, clinically integrated interventions, with assessment, led to improvements in knowledge, skills and attitudes. Interventions improved critical appraisal skills and integration of results into decisions, and improved knowledge, skills, attitudes and behaviour amongst practicing health professionals. Considering single interventions, EBHC knowledge and attitude were similar for lecture-based versus online teaching. Journal clubs appeared to increase clinical epidemiology and biostatistics knowledge and reading behavior, but not appraisal skills. EBHC courses improved appraisal skills and knowledge. Amongst practicing health professionals, interactive online courses with guided critical appraisal showed significant increase in knowledge and appraisal skills. A short workshop using problem-based approaches, compared to no intervention, increased knowledge but not appraisal skills. Conclusions: EBHC teaching and learning strategies should focus on implementing multifaceted, clinically integrated approaches with assessment. Future rigorous research should evaluate minimum components for multifaceted interventions, assessment of medium to long-term outcomes, and implementation of these interventions. Title: Mapping of the digital climate nudges in Nordic online grocery stores

Journal: Sustainable Production and Consumption

Volume: 37

Pages: 202-212

Date: May

Short Title: Mapping of the digital climate nudges in Nordic online grocery stores

ISSN: 2352-5509

DOI: 10.1016/j.spc.2023.02.018

Accession Number: WOS:000955213400001

Abstract: This paper explores how 21 Nordic online food retailers nudge their customers towards more climate-friendly food choices. We use a choice architecture taxonomy dividing the nudges into decision information, decision structure, and decision assistance. We find that most retailers use several types of climate nudges. Most of these are decision information type nudges, such as personalized carbon footprint apps and climate labels. Wide use of non-salient nudges, often presenting the climate impact after the customers have made their purchase, limits the potential impact of information on consumers' environmental footprints. Furthermore, the use of broad climate categories and aggregated CO2 measures reflect the challenges in calculating the footprints of individual products. The lack of industry-wide standards for emission data and climate labels

makes the current situation challenging for customers wanting to compare emissions across stores. Our results also show that few stores have any form of decision structure or decision assistance nudges, even though these are often found to be the most effective types in the literature on nudges. We end with discussing promising digital climate nudging opportunities for retailers seeking to reduce the environmental footprint of their customers.(c) 2023 The Authors. Title: Digitalized Cognitive Behavioral Interventions for Depressive Symptoms During Pregnancy: Systematic Review

Journal: Journal of Medical Internet Research

Volume: 24

Issue: 2

Date: Feb

Short Title: Digitalized Cognitive Behavioral Interventions for Depressive Symptoms During Pregnancy: Systematic Review

ISSN: 1438-8871

DOI: 10.2196/33337

Article Number: e33337

Accession Number: WOS:000766784600001

Abstract: Background: Studies have shown a high prevalence of depression during pregnancy, and there is also evidence that cognitive behavioral therapy (CBT) is one of the most effective psychosocial interventions. Emerging evidence from randomized controlled trials (RCTs) has shown that technology has been successfully harnessed to provide CBT interventions for other populations. However, very few studies have focused on their use during pregnancy. This approach has become increasingly important in many clinical areas due to the COVID-19 pandemic, and our study aimed to expand the knowledge in this particular clinical area.

Objective: Our systematic review aimed to bring together the available research-based evidence on digitalized CBT interventions for depression symptoms during pregnancy. Methods: A systematic review of the Web of Science, Cochrane Central Register of

Controlled Trials, CINAHL, MEDLINE, Embase, PsycINFO, Scopus, ClinicalTrials.gov, and EBSCO Open Dissertations databases was carried out from the earliest available evidence to October 27, 2021. Only RCT studies published in English were considered. The PRISMA (Preferred Reporting Items of Systematic Reviews and Meta-analyses) guidelines were followed, and the protocol was registered

on the Prospective Register of Systematic Reviews. The risk of bias was assessed using the revised Cochrane risk-of-bias tool for randomized trials. Results: The review identified 7 studies from 5 countries (the United States, China, Australia, Norway, and Sweden) published from 2015 to 2021. The sample sizes ranged from 25 to 1342 participants. The interventions used various technological elements, including text, images, videos, games, interactive features, and peer group discussions. They comprised 2 guided and 5 unguided approaches. Using digitalized CBT interventions for depression during pregnancy showed promising efficacy, with guided intervention showing higher effect sizes (Hedges $g=1.21$) than the unguided interventions (Hedges $g=0.14-0.99$). The acceptability of the digitalized CBT interventions was highly encouraging, based on user feedback. Attrition rates were low for the guided intervention (4.5%) but high for the unguided interventions (22.1%-46.5%). A high overall risk of bias was present for 6 of the 7 studies. Conclusions: Our search only identified a small number of digitalized CBT interventions for pregnant women, despite the potential of this approach. These showed promising evidence when it came to efficacy and positive outcomes for depression symptoms, and user feedback was positive. However, the overall risk of bias suggests that the efficacy of the interventions needs to be interpreted with caution. Future studies need to consider how to mitigate these sources of biases. Digitalized CBT interventions can provide prompt, effective, evidence-based interventions for pregnant women. This review increases our understanding of the importance of digitalized interventions during pregnancy, including during the COVID-19 pandemic.

Short Title: Factors limiting and facilitating changes in caring for the intensive care unit patients' relatives

ISSN: 1362-1017

DOI: 10.1111/nicc.12095

Accession Number: WOS:000350153900005

Abstract: Aim To explore how the intensive care unit (ICU) context influenced receptivity to change in clinical practice, in order to improve the care offered to patients' relatives. Background Families of critically ill patients have unmet needs that are not being addressed. Lack of attention to these needs is related more to the ICU context than to a lack of scientific evidence.

Design Participatory action research (PAR), a qualitative study conducted in a Spanish ICU. **Method** Eleven participants agreed to represent their teams in all scheduled group discussions. Field diaries were kept by the principal investigator and discussion participants, and five in-depth interviews were conducted. **Content analysis** was performed. **Results** Four factors limited change: (1) Not acknowledging the legitimacy of scientific evidence regarding the families of critically ill patients. (2) Imbalanced power relationships between the members of multidisciplinary teams. (3) Lack of nurse participation in the information flows. (4) The organization of time and physical space in the unit. Three factors facilitated change: (1) A sense of individual and shared commitment. (2) Leadership in day-to-day matters. (3) A process based on reflection. **Conclusions** PAR can lead to change in clinical practice, although the process is complex and requires substantial input of time and energy. Contextual factors limiting this change were structural whereas facilitating factors were circumstantial and depended upon individuals' characteristics. Professionals working at the bedside are capable of identifying, developing and introducing changes to the context in which they work. **Relevance to clinical practice** Knowing these factors and sharing the experience of a successful change process can help others design processes appropriate to their site.

Short Title: Transforming a conservative clinical setting: ICU nurses' strategies to improve care for patients' relatives through a participatory action research

ISSN: 1320-7881

DOI: 10.1111/nin.12112

Accession Number: WOS:000368344200007

Abstract: This study focuses on change strategies generated through a dialogical-reflexive-participatory process designed to improve the care of families of critically ill patients in an intensive care unit (ICU) using a participatory action research in a tertiary hospital in the Balearic Islands (Spain). Eleven professionals (representatives) participated in 11 discussion groups and five in-depth interviews. They represented the opinions of 49 colleagues (participants). Four main change strategies were created: (i) Institutionally supported practices were confronted to make a shift from professional-centered work to a more inclusive, patient-centered approach; (ii) traditional power relations were challenged to decrease the hierarchical power differences between physicians and nurses; (iii) consensus was built about the need to move from an individual to a collective position in relation to change; and (iv) consensus was built about the need to develop a critical attitude toward the conservative nature of the unit. The strategies proposed were both transgressive and conservative; however, when compared with the initial situation, they enhanced the care offered to patients' relatives and patient safety. Transforming conservative settings requires capacity to negotiate positions and potential outcomes. However, when individual critical capacities are articulated with a new approach to micropolitics, transformative proposals can be implemented and sustained.

Short Title: Factors influencing appropriate use of interventions for management of women experiencing preterm birth: A mixed-methods systematic review and narrative synthesis

ISSN: 1549-1277

DOI: 10.1371/journal.pmed.1004074

Article Number: e1004074

Accession Number: WOS:000942951500001

Abstract: Background Preterm birth-related complications are the leading cause of death in newborns and children under 5. Health outcomes of preterm newborns can be improved with appropriate use of antenatal corticosteroids (ACSs) to promote fetal lung maturity, tocolytics to delay birth, magnesium sulphate for fetal neuroprotection, and antibiotics for preterm prelabour rupture of membranes. However, there are wide disparities in the rate and consistency in the use of these interventions across settings, which may underlie the differential health outcomes among preterm newborns. We aimed to assess factors (barriers and facilitators) affecting the appropriate use of ACS, tocolytics, magnesium sulphate, and antibiotics to improve preterm birth management. **Methods and findings** We conducted a mixed-methods systematic review including primary qualitative, quantitative, and mixed-methods studies. We searched MEDLINE, EMBASE, CINAHL, Global Health, and grey literature from inception to 16 May 2022. Eligible studies explored perspectives of women, partners, or community members who experienced preterm birth or were at risk of preterm birth and/or received any of the 4 interventions, health workers providing maternity and newborn care, and other stakeholders involved in maternal care (e.g., facility managers, policymakers). We used an iterative narrative synthesis approach to analysis, assessed methodological limitations using the Mixed Methods Appraisal Tool, and assessed confidence in each qualitative review finding using the GRADE-CERQual approach. Behaviour change models (Theoretical Domains Framework; Capability, Opportunity, and Motivation (COM-B)) were used to map barriers and facilitators affecting appropriate use of these interventions. We included 46 studies from 32 countries, describing factors affecting use of ACS (32/46 studies), tocolytics (13/46 studies), magnesium sulphate (9/46 studies), and antibiotics (5/46 studies). We identified a range of barriers influencing appropriate use of the 4 interventions globally, which include the following: inaccurate gestational age assessment, inconsistent guidelines, varied knowledge, perceived risks and benefits, perceived uncertainties and constraints in administration, confusion around prescribing and administering authority, and inadequate stock, human resources, and labour and newborn care. Women reported hesitancy in accepting interventions, as they typically learned about them during emergencies. Most included studies were from high-income countries (37/46 studies), which may affect the transferability of these findings to low- or middle-income settings. **Conclusions** In this study, we identified critical factors affecting implementation of 4 interventions to improve preterm birth management globally. Policymakers and implementers can consider these barriers and facilitators when formulating policies and planning implementation or scale-up of these interventions. Study findings can inform clinical preterm birth guidelines and implementation to ensure that barriers are addressed, and enablers are reinforced to ensure these interventions are widely available and appropriately used globally.

Abstract: Building energy consumption can be enhanced to a certain level, but human-oriented dimensions can open the doors to new opportunities. This article presents an assessment on the interactions between human-driven factors and energy consumption patterns in office buildings based on empirical evidence and a co-simulation. The objective of this work is to evaluate a range for saving capacities as a result of readjusting occupants' prior habits and engaging them in building operation by determining internal and external factors associated with human-building drivers, needs, actions, and systems. The study is based on a real office building, and according to real behavioral data and subjective measurement to analyze human attitudes and interactions with the building end-uses such as cooling, lighting, and equipment along with factors that directly impact energy use such as fenestrations and window blinds. The survey results are extensively investigated and the correlations between demographic/socioeconomic traits and behavioral factors are examined. The survey results are incorporated into a co-simulation testbed to represent occupant attitudes and behaviors and model human-building interactions accordingly. Different scenarios are designed to perform an assessment on the role of human factors such as attitude, awareness of consequences, habits, ascription of responsibility and personal/social norms on building energy end-uses. The outcomes of this study demonstrate that by adjusting behavioral factors in an office building, an energy saving between 9 and 18% can be achieved without sophisticated technology interface or building retrofit/upgrade. The results are elaborated, and recommendations are explained in detail.

Abstract: In strategic energy planning, human-oriented factors are
uncertain and lead to unpredictable challenges. Thus, decision-
makers must contextualize the target society to address these
uncertainties. More precisely, uncertainties lead to performance
gaps between assumed and actual sustainability target outcomes. This
study proposed a new framework that considers vital elements,
including occupant motivation, preference, socioeconomic
characteristics, and building features (MPSEB). To utilize this
model, a thorough face-to-face survey questionnaire was administered
to measure these elements. This study explored how these elements
affect the patterns of residential energy consumption in a region
with numerous expat communities of various ethnic and cultural
backgrounds. In particular, the study investigated the patterns of
energy behaviors and human-building interactions among the residents
of Qatar by collecting empirical evidence and conducting a
subsequent survey analysis. Machine learning approaches were
employed to explore the survey data and determine the
interdependencies between features, as well as the significance of
the fundamental factors influencing humanbuilding interactions. The
XGBoost method was used to conduct a feature importance analysis to
determine factors contributing to residential energy consumption.
The results revealed the primary behavioral and socioeconomic
factors that affect residential energy consumption, and confirmed
the influence of human factors in Qatar while considering its
diverse population.

DOI: 10.1186/s13012-020-01058-z

Article Number: 4

Accession Number: WOS:000608277600004

Abstract: Background Improving quality of care is a key priority to reduce neonatal mortality and stillbirths. The Safe Care, Saving Lives programme aimed to improve care in newborn care units and labour wards of 60 public and private hospitals in Telangana and Andhra Pradesh, India, using a collaborative quality improvement approach. Our external evaluation of this programme aimed to evaluate programme effects on implementation of maternal and newborn care practices, and impact on stillbirths, 7- and 28-day neonatal mortality rate in labour wards and neonatal care units. We also aimed to evaluate programme implementation and mechanisms of change. Methods We used a quasi-experimental plausibility design with a nested process evaluation. We evaluated effects on stillbirths, mortality and secondary outcomes relating to adherence to 20 evidence-based intrapartum and newborn care practices, comparing survey data from 29 hospitals receiving the intervention to 31 hospitals expected to receive the intervention later, using a difference-in-difference analysis. We analysed programme implementation data and conducted 42 semi-structured interviews in four case studies to describe implementation and address four theory-driven questions to explain the quantitative results. Results Only 7 of the 29 intervention hospitals were engaged in the intervention for its entire duration. There was no evidence of an effect of the intervention on stillbirths [DiD - 1.3 percentage points, 95% CI - 2.6-0.1], on neonatal mortality at age 7 days [DiD - 1.6, 95% CI - 9-6.2] or 28 days [DiD - 3.0, 95% CI - 12.9-6.9] or on adherence to target evidence-based intrapartum and newborn care practices. The process evaluation identified challenges in engaging leaders; challenges in developing capacity for quality improvement; and challenges in activating mechanisms of change at the unit level, rather than for a few individuals, and in sustaining these through the creation of new social norms. Conclusion Despite careful planning and substantial resources, the intervention was not

feasible for implementation on a large scale. Greater focus is required on strategies to engage leadership. Quality improvement may need to be accompanied by clinical training. Further research is also needed on quality improvement using a health systems perspective.

Short Title: Immunisation status screening in the emergency department: Why are we forgetting the elderly?

DOI: 10.1016/j.auec.2019.10.004

Accession Number: WOS:000541704900003

Abstract: Background: Pneumonia is one of the most common reasons patients over the age of 65 years present to the Emergency Department (ED). There is a 23-valent pneumococcal vaccine (23vPPV) available under the National Immunisation Program (NIP) with demonstrated 61-71% effectiveness against Invasive Pneumococcal Disease (IPD), but only 51% of adults aged over 65 years are vaccinated in Australia. Methods: Short semi-structured interviews were conducted with emergency nurses working across a Local Health District in Sydney New South Wales (n= 9) in order to determine their knowledge, behaviour and attitudes towards immunisation status screening in the elderly who present to the ED with pneumonia. Questions were structured to the COM-B Model (capability, opportunity and motivation to change behaviour), and a thematic analysis was conducted. Results: There were three major themes identified: (1) The importance of routinisation, (2) Low knowledge levels and, (3) The 'vaccination is for children' heuristic, as well as suggestions for future interventions to improve screening. Conclusions: These findings clarify how to improve vaccine uptake amongst this vulnerable cohort. They suggest that emergency departments should provide education to nurses. In addition, checklists/tick boxes can prompt nurses whilst conducting routine work, which may lead to increased vaccination uptake. Abstract: This study examined external factors affecting policy and
program decision-making in a specific public health policy context:
injury prevention and rehabilitation compensation in the Australian
state of Victoria. The aim was twofold: identify external factors
that affect policy and program decision-making in this specific
context; use this evidence to inform targeting of interventions
aimed at increasing research use in this context. Qualitative
interviews were undertaken from June 2011 to January 2012 with 33
employees from two state government agencies. Key factors identified
were stakeholder feedback and action, government and ministerial
input, legal feedback and action, injured persons and the media. The
identified external factors were able to significantly influence
policy and program decision-making processes: acting as both
barriers and facilitators, depending on the particular issue at
hand. The factors with the most influence were the Minister and
government, lawyers, and agency stakeholders, particularly health
providers, trade unions and employer groups. This research revealed
that interventions aimed at increasing use of research in this
context must target and harness the influence of these groups. This
research provides critical insights for researchers seeking to
design interventions to increase use of research in policy
environments and influence decision-making in Victorian injury
prevention and rehabilitation compensation. (c) 2014 Elsevier Ltd.

Short Title: Response to a novel, weight self-awareness plan used in a multi-component lifestyle intervention programme to reduce breast cancer risk factors in older women-Secondary analysis from the ActWELL trial

ISSN: 0952-3871

DOI: 10.1111/jhn.13062

Accession Number: WOS:000834862600001

Abstract: Background The ActWELL randomised controlled trial assessed the effectiveness of a weight management programme delivered by volunteer lifestyle coaches (LCs) in women attending breast clinics. The intervention focused on caloric intake and physical activity, utilising behavioural change techniques including a weight awareness plan (WAP). The current work is a secondary analysis of the ActWELL data and aims to examine the response to the weight self-awareness plan (used as part of the intervention programme). Methods The LCs invited participants (n = 279) to undertake an implementation intention discussion to formulate a self-weighing (SW) plan. Bodyweight scales were offered, and recording books provided. The physical activity component of the intervention focused on a walking plan assessed by accelerometers. The LCs contacted participants by telephone monthly and provided personalised feedback. Mann-Whitney tests and chi-squared analysis were used to examine the effect of SW on weight change. A

qualitative evaluation utilising semi-structured interviews was also undertaken. Results Most participants (96.4%) agreed to set a weekly SW goal and 76 (27%) requested scales. At 12 months, 226 (81%) returned for follow up. The median (interquartile range) weight change for those who self-reported at least one weight (n = 211) was -2.3 kg (-5.0 to 0.0) compared to -1.2 kg (-5.0 to 0.03) in those who did not (n = 14). Participants who reported weights on more than eight occasions (39%) were significantly more likely (p = 0.012) to achieve 5% weight loss compared to those who weighed less often. Low numbers of accelerometers were returned that did not allow for significance testing. Qualitative data (n = 24) indicated that many participants found the WAP helpful and motivating.

Conclusions Greater adherence to the WAP initiated by volunteer coaches is associated with achieving 5% weight loss.

Short Title: The perceptions and adoption of environmentally
sustainable practices among anesthesiologists—a qualitative study

ISSN: 0832-610X

DOI: 10.1007/s12630-022-02392-0

Accession Number: WOS:000932457500001

Abstract: Purpose Previous surveys of anesthesiologists showed that despite a strong interest in implementing environmentally sustainable anesthetic practices, less than a third do so. Qualitative understanding of the capability, opportunity, and motivational factors that influence "green" behavior will inform the design of effective interventions to promote environmentally sustainable practices in the operating room (OR). Methods We conducted 23 semistructured interviews with anesthesiologists, with data saturation achieved. Applying the Behavior Change Wheel, interview questions addressed "capability," "opportunity," and "motivation" determinants of behavior. Results Preference for sevoflurane and syringe reuse were most commonly cited as existing environmentally sustainable anesthetic practices. Several participants reported lack of knowledge and feedback as impediments to sustainable anesthetic practices. Reported physical barriers included inadequate recycling facilities and abundance of supplies. Interviewees also discussed the importance of habitual behavior in improving skill sets and reducing cognitive load required to perform environmentally sustainable practices. General awareness of environmental issues and aggregation of marginal gains were reasons for environmentally sustainable measures in the OR. Organizational practice and culture played a significant role in the propagation of sustainable anesthetic practices, with senior staff often carrying a greater influence. While the majority preferred a top-down approach to effect change, others favored the use of incentives. Conclusion This study provides insight into the factors that influence the adoption of environmentally sustainable practices in the OR. Measures to promote these practices include education and training, feedback on efforts, engagement of senior anesthesiologists as role models and for

change management, environmental restructuring, and policy designs that balance a top-down vs bottom-up approach to influencing change.

Title: Patient and health system level barriers to and facilitators for tuberculosis treatment initiation in Uganda: a qualitative study

Journal: BMC Health Services Research

Volume: 22

Issue: 1

Date: Jun

Short Title: Patient and health system level barriers to and facilitators for tuberculosis treatment initiation in Uganda: a qualitative study

DOI: 10.1186/s12913-022-08213-w

Article Number: 831

Accession Number: WOS:000819014800004

Abstract: Background The WHO END TB strategy targets to place at least 90% of all patients diagnosed with Tuberculosis (TB) on appropriate treatment. In Uganda, approximately 20% of patients diagnosed with TB are not initiated on TB treatment. We sought to identify the patient and health system level barriers to and facilitators for TB treatment initiation in Uganda. Methods We conducted the study at ten public health facilities (three primary care, four district and three tertiary referral hospitals). We carried out in-depth interviews with patients diagnosed with TB and key informant interviews with health managers. In addition, we held focus group discussions with healthcare workers involved in TB care. Data collection and thematic analysis of transcripts was informed by the Capability, Opportunity, Motivation and Behavior (COM-B) model. We identified relevant intervention functions using the Behavior Change Wheel. Results We interviewed 79 respondents (31 patients, 10 health managers and 38 healthcare workers). Common barriers at the health facility level included; lack of knowledge about the proportion of patients not initiated on TB treatment (psychological capability); difficulty accessing sputum results from the laboratory as well as difficulty tracing patients due to inadequate recording of patient addresses (physical opportunity). At the patient level, notable barriers included long turnaround time for sputum results and lack of transport funds to return to health facilities (physical opportunity); limited TB knowledge (psychological capability) and stigma (social opportunity). The most important facilitators identified were quick access to sputum test results either on the date of first visit (same-day diagnosis) or on the date of first return and availability of TB treatment (physical opportunity). We

identified education, restructuring of the service environment to improve sputum results turnaround time and enablement to improve communication of test results as relevant intervention functions to alleviate these barriers to and enhance facilitators for TB treatment initiation. Conclusion We found that barriers to treatment initiation existed at both the patient and health facility-level across all levels of the (Capability, Opportunity and Motivation) model. The intervention functions identified here should be tested for feasibility.

Article Number: e0265035

Accession Number: WOS:000843613300011

Abstract: Background One in five patients diagnosed with TB in Uganda are not initiated on TB treatment within two weeks of diagnosis. We evaluated a multifaceted intervention for improving TB treatment initiation among patients diagnosed with TB using Xpert (R) MTB/RIF testing in Uganda. Methods This was a pre-post interventional study at one tertiary referral hospital. The intervention was informed by the COM-B model and included; i) medical education sessions to improve healthcare worker knowledge about the magnitude and consequences of pretreatment loss to follow-up; ii) modified laboratory request forms to improve recording of patient contact information; and iii) re-designed workflow processes to improve timeliness of sputum testing and results dissemination. TB diagnostic process and outcome data were collected and compared from the period before (June to August 2019) and after (October to December 2019) intervention initiation. Results In September 2019, four CME sessions were held at the hospital and were attended by 58 healthcare workers. During the study period, 1242 patients were evaluated by Xpert (R) MTB/RIF testing at the hospital (679 pre and 557 post intervention). Median turnaround time for sputum test results improved from 12 hours (IQR 4-46) in the pre-intervention period to 4 hours (IQR 3-6) in the post-intervention period. The

proportion of patients started on treatment within two weeks of diagnosis improved from 59% (40/68) to 89% (49/55) (difference 30%, 95% CI 14%–43%, $p < 0.01$) while the proportion of patients receiving a same-day diagnosis increased from 7.4% (5/68) to 25% (14/55) (difference 17.6%, 95% CI 3.9%–32.7%, $p < 0.01$). Conclusion The multifaceted intervention was feasible and resulted in a higher proportion of patients initiating TB treatment within two weeks of diagnosis.

Title: Monitoring/Evaluation in Nutritional Therapy for People with Gastrointestinal Complaints: Online Survey with Dietitians

Journal: Aktuelle Ernährungsmedizin

Date: 2022 Dec

Short Title: Monitoring/Evaluation in Nutritional Therapy for People with Gastrointestinal Complaints: Online Survey with Dietitians

ISSN: 0341-0501

DOI: 10.1055/a-1895-2430

Accession Number: WOS:000896689300001

Abstract: Introduction Dietary interventions are part of the therapy approach in gastrointestinal disorders. However, guidance on what outcomes to assess (in the form of a core outcome set) for dietitians to demonstrate the effectiveness of their interventions is lacking. This study provides preliminary work for the development of a core outcome set to systematically assess outcomes of nutrition therapy in clients with gastrointestinal complaints by examining how monitoring/evaluation are conducted by dietitians. Methods This is a quantitative online survey for dietitians to assess the current situation around the globe concerning monitoring and evaluation. An online survey with 26 questions divided into six sections (rated importance, implementation, resources/obstacles, instrument requirements, statistical questions and experiences with the Nutrition Care Process) was developed. The questionnaire was available in English, French and German. Results In total 740 responses were analysed. Monitoring/ evaluation of clients with gastrointestinal symptoms was rated by 98 % to be quite important to very important. The systematic implementation of monitoring and evaluation according to a concept/model was rated by 57 % as 'rather often' to 'very often/always'. Conclusion Dietitians are aware of the importance of the measurability of dietetic interventions. The most dominant barriers are lacking time in daily practice and lack of a suitable monitoring/evaluation instrument. A suitable core outcome set in the field of gastrointestinal complaints is needed to increase systematic monitoring/evaluation.

Abstract: To combat climate change, we need to change user transportation behavior to be less carbon intensive. Prior work on motivating this behavior change has been predominantly qualitative and lacks comparison. This makes it challenging to determine which interventions should be deployed at scale. The behavior change community needs a process to compare interventions against each other in pilot studies before committing deployment resources. We perform the first quantitative comparison, to our knowledge, of behavior change strategies in the transportation behavior domain. Since this is a pilot with a limited recruitment budget, we design a Randomized Controlled Trial (RCT) using an open source platform. We assign 41 users to three mobile applications: Emotion, Information, Control. The RCT allows us to draw statistically valid inferences that can suggest future avenues for larger-scale studies. We found that Emotion resulted in greater engagement with the application ($p=0.006$, 0.035 , 0.031 , 0.040) while Information improved the sustainability of travel behavior ($p = 0.043$). These exploratory statistical results can motivate the design of future studies to further explore combinations of these approaches for sustainable transportation behavior.

Article Number: 10821
Accession Number: WOS:000851673700001
Abstract: Repairing and repurposing clothes can extend their lifetime, helping reduce the environmental impacts of the fashion industry. We aimed to investigate influences on clothing repair and repurpose using the Theoretical Domains Framework. A survey was conducted with a representative sample of 300 UK citizens. The frequency of, and influences on, clothing repair and repurpose behaviour were measured with self-report scales and a free-text item. Quantitative (logistic regression) and qualitative (thematic) analyses were used to identify barriers and enablers of behaviour. Findings showed that participants typically engaged in the behaviour every six months. The main barriers concerned a lack of skills, poor product design, unaffordability of repair services, and incongruence with identity. Key enablers concerned the ability to focus during DIY tasks, dynamic social norms, beliefs about benefits of repairing, emotional attachment to clothing, and having routines and habits of repairing. This study is the first to apply the Behaviour Change Wheel to identify intervention types and behaviour change techniques that can modify these influences, such as training workshops and the provision of free repair and repurpose services. Policy options were suggested to support implementation, such as extended producer responsibility. Awareness and skill-building campaigns, while important, are not enough to support behaviour change; structural and policy changes are needed.

Abstract: The coronavirus disease 2019 (COVID–19) pandemic poses wide–ranging impacts on the physical and mental health of people around the world, increasing attention from both researchers and practitioners on the topic of resilience. In this article, we review previous research on resilience from the past several decades, focusing on how to cultivate resilience during emerging situations such as the COVID–19 pandemic at the individual, organizational, community, and national levels from a socioecological perspective. Although previous research has greatly enriched our understanding of the conceptualization, predicting factors, processes, and consequences of resilience from a variety of disciplines and levels, future research is needed to gain a deeper and comprehensive understanding of resilience, including developing an integrative and interdisciplinary framework for cultivating resilience, developing an understanding of resilience from a life span perspective, and developing scalable and cost–effective interventions for enhancing resilience and improving pandemic preparedness.

Accession Number: WOS:000867445200004

Abstract: Objectives: Even though guidelines are available to guide dysphagia identification and management practice, there is still a gap between evidence and practice, which requires improvement. The purpose of this study was to determine the effect of using tailored, multifaceted strategies to improve evidence–based post–stroke dysphagia identification and management practice in a community hospital. Methods: Guided by the Knowledge to Action framework, the tailored, multifaceted strategies were developed and implemented for

5 months in a community hospital using a before-and-after study design. These strategies consisted of training intervention, policy intervention, and audit and feedback intervention. Nurses' level of knowledge and adherence, were collected in March 2019 and again in January 2020. Patients' quality of life and satisfaction were evaluated during the pre-intervention period (between February 2019 and April 2019) and the post-intervention period (between November 2019 and January 2020). Results: A total of 55 patients with post-stroke dysphagia (28 in the pre-intervention period and 27 in the post-intervention period) and 17 registered nurses were recruited. Following implementation, there were statistically significant improvements in patients' outcomes (quality of life and satisfaction) and nurses' outcomes (level of knowledge and adherence). Conclusions: This study assists in closing the research-practice gap by using tailored, multifaceted strategies to increase the use of evidence-based nursing care for dysphagia identification and management practices. Abstract: The advancement of Internet-of-Things (IoT) and artificial intelligence contribute to the prevailing development of smart office, which is capable of understanding employees' context and adapting to their demands. The smart office brings numerous opportunities for delivering prevention and control measures of health issues associated with office work (e.g., musculoskeletal disorders and computer vision syndrome). Even though there exist multiple studies across different disciplines, there still lacks a holistic survey on the smart office for employee health promotion. Hence, this paper focuses on three contributions: (1) clarifying the fundamentals of smart office, (2) reviewing the key aspects of this theme based on 60 studies selected from a systematic survey process, and (3) identifying the challenges and future research opportunities. We hope this study can bring an inter-disciplinary

and collaborative perspective for employee health promotion and encourage more researches in this emerging and promising field.

Abstract: Engaging in a healthy lifestyle could be helpful to decrease lifestyle-related health risks and bring long-term health benefits. This research investigated how implicit theories of body weight influence people's engagement in healthy lifestyle among young adults in China. The results suggested that implicit theories of body weight significantly influence people's engagement in healthy eating behaviors and physical activity. Self-control mediated the effect of implicit (incremental) theories of body weight on people's engagement in healthy eating. Implications of the current research for understanding how to promote engagement in healthy lifestyle and directions for future research are discussed.

ISSN: 2296-701X

DOI: 10.3389/fevo.2023.1145928

Article Number: 1145928

Accession Number: WOS:000979860000001

Abstract: IntroductionAs the demand for herbal medicines is surging worldwide, regions of medicinal plants are vulnerable to large-scale and unsustainable exploitation for commercial trade and use. Yet, we still lack the understanding about the relationship between indigenous people harvesting and trade practices of medicinal plants and their influencing factors for possible intervention measures. **Methods**Here, we combined qualitative and quantitative methods to survey traders (N = 20) and local harvesters (N = 923) from nine Tibetan townships in Hongyuan county, Sichuan Province, on the eastern Qinghai-Tibetan plateau in China. Specifically, we elucidated the local value chain of medicinal plants trade and harvest of *Nardostachy jatamansi* and *Fritillaria cirrhosa*, and explored the factors influencing harvester's willingness to harvest these plants. Furthermore, we empirically tested the constructs of the COM-B model (Capability, Opportunity, Motivation -Behavior) in predicting the sustainable harvesting behavior of medicinal plants. **Results and Discussion**Our results revealed that the trade characteristics of *N. jatamansi* and *F. cirrhosa* were contrasting, and the sustainability of the former species was largely dependent on the latter one. Importantly, the traders' practices were affected by the supply, while the harvesters' willingness to harvest were mainly influenced by harvest incomes, past harvesting experience, and grassland tenure. Finally, though motivation was not directly affecting harvesting behavior, the harvesters' ecological worldview indirectly affected their harvesting behavior, particularly through the mediation of the level of compliance of village rules and customs. Overall, our results provided crucial insights for the conservation and sustainable management of the valuable wild medicinal plants.

Short Title: Social Media for ImpLementing Evidence (SMILE):

Conceptual Framework

DOI: 10.2196/29891

Article Number: e29891

Accession Number: WOS:000854073700075

Abstract: Background: Social media has become widely used by individual researchers and professional organizations to translate research evidence into health care practice. Despite its increasing popularity, few social media initiatives consider the theoretical perspectives of how social media works as a knowledge translation strategy to affect research use. Objective: The purpose of this paper is to propose a conceptual framework to understand how social media works as a knowledge translation strategy for health care providers, policy makers, and patients to inform their health care decision-making. Methods: We developed this framework using an integrative approach that first involved reviewing 5 long-standing social media initiatives. We then drafted the initial framework using a deductive approach by referring to 5 theories on social media studies and knowledge translation. A total of 58 empirical studies on factors that influenced the use of social media and its messages and strategies for promoting the use of research evidence via social media were further integrated to substantiate and fine-tune our initial framework. Through an iterative process, we developed the Social Media for Implementing Evidence (SMILE) framework. Results: The SMILE framework has six key constructs: developers, messages and delivery strategies, recipients, context, triggers, and outcomes. For social media to effectively enable recipients to use research evidence in their decision-making, the framework proposes that social media content developers respond to target recipients' needs and context and develop relevant messages and appropriate delivery strategies. The recipients' use of social media messages is influenced by the virtual-technical, individual, organizational, and system contexts and can be activated by three types of triggers: sparks, facilitators, and signals. Conclusions: The SMILE framework maps the factors that are hypothesized to influence the use of social media messages by recipients and offers a heuristic device for social media content developers to create interventions for promoting the use of evidence in health care decision-making. Empirical studies are now needed to test the propositions of this framework.

ISSN: 1530-5627

DOI: 10.1089/tmj.2022.0213

Accession Number: WOS:000843405800001

Abstract: Background: Although theoretical frameworks exist to guide social media interventions, few of them make it explicit how social media is supposed to work to improve the knowledge use by health care providers. This study aimed to synthesize literature to understand how and under what circumstances social media supports knowledge use by health care providers in clinical practice. **Methods:** We followed the realist review methodology described by Pawson et al. It involved six iterative steps: (1) develop an initial program theory; (2) search for evidence; (3) select and appraise studies; (4) extract data; (5) synthesize data; and (6) draw conclusions. **Results:** Of the 7,175 citations retrieved, 32 documents were prioritized for synthesis. We identified two causal explanations of how social media could support health care providers' knowledge use, each underpinned by distinct context-mechanism-outcome (CMO) configurations. We defined these causal explanations as: (1) the rationality-driven approach that primarily uses open social media platforms (n = 8 CMOs) such as Twitter, and (2) the relationality-driven approach that primarily uses closed social media platforms (n = 6 CMOs) such as an online community of practice. Key mechanisms of the rationality-driven approach included social media content developers capabilities and capacities, in addition to recipients' access to, perceptions of, engagement with, and intentions to use the messages, and ability to function autonomously within their full scope of practice. However, the relationality-driven approach encompassed platform receptivity, a sense of common goals, belonging, trust and ownership, accessibility to expertise, and the fulfillment of needs as key mechanisms. **Conclusion:** Social media has the potential to support knowledge use by health care providers. Future research is necessary to refine the two causal explanations and investigate their potential synergistic effects on practice change.

Abstract: Choice context influences decision processes and is one of
the primary determinants of what people choose. This insight has
been used by academics and practitioners to study decision biases
and to design behavioral interventions to influence and improve
choices. We analyzed the effects of context-based behavioral
interventions on the computational mechanisms underlying decision-
making. We collected data from two large laboratory studies
involving 19 prominent behavioral interventions, and we modeled the
influence of each intervention using a leading computational model
of choice in psychology and neuroscience. This allowed us to
parametrize the biases induced by each intervention, to interpret
these biases in terms of underlying decision mechanisms and their
properties, to quantify similarities between interventions, and to
predict how different interventions alter key choice outcomes. In
doing so, we offer researchers and practitioners a theoretically
principled approach to understanding and manipulating choice context
in decision-making.

Abstract: BackgroundThe results of rehabilitation trials are often
not fully attained when the intervention is implemented beyond the

initial trial. One of the key reasons is that a patients' ability and/or capacity to take part in their own healthcare is not considered in the trial design yet has significant impact on the outcomes during the implementation phase. Body of text We propose a shift from a therapist-focus to patient-focus in trial design, through addressing patient engagement as a core consideration in trials. We argue that engaging patients in any rehabilitation program is a process of behavioural change. Exercise prescription is used as an example to illustrate how the Behaviour Change Wheel can be applied to analyse barriers and facilitators associated with patients' capabilities, opportunities and motivations in integrating trial interventions into their daily life. We propose a framework to assist in this shift. Conclusion A core part of implementing rehabilitation interventions at the primary care level requires patient engagement. Related aspects of interventions should be identified and assessed using the COM-B model at the outset of trial design to ensure that the results are realistic, meaningful and transferable, so as to enable real impact.

Article Number: e1004034

Accession Number: WOS:000914162900003

Abstract: Background Rapid intravenous thrombolysis (IVT) for acute ischemic stroke (AIS) is crucial for improving outcomes. However, few randomized trials of interventions aimed at reducing in-hospital delay have been carried out in China. We aimed to evaluate the effect of a multicomponent intervention on thrombolytic door-to-needle time (DNT) of AIS patients via video teleconference based on the Behavior Change Wheel (BCW) method. Methods and findings This

cluster-randomized trial, conducted between January 1, 2019 and December 31, 2019, randomly allocated 22 hospitals equally to PEITEM (Persuasion Environment reconstruction Incentivization Training Education Modeling) intervention or routine care plus stroke registry and subsequently enrolled 1,634 AIS patients receiving IVT within 4.5 hours upon stroke onset from participant hospitals. The PEITEM group received a 1-year PEITEM 6-component intervention based on the behavioral theory monthly via video teleconference. The primary outcome was the proportion of patients with a DNT of 60 minutes or less. A total of 987 patients participated in the PEITEM group (mean age, 69 years; female, 411 [41.6%]) and 647 patients in the control group (mean age, 70 years; female, 238 [36.8%]). Of all participants, the proportion of DNT ≤ 60 minutes in the PEITEM group was higher than in the control group (82.0% versus 73.3%; adjusted odds ratio, 1.77; 95% confidence interval (CI), 1.17 to 2.70; ICC, 0.04; P = 0.007). Among secondary outcomes, the average DNT was 43 minutes in the PEITEM group and 50 minutes in the control group (adjusted mean difference: -8.83; 95% CI, -14.03 to -3.64; ICC, 0.12; P = 0.001). Favorable functional outcome (score of 0 to 1 on the modified Rankin scale (mRS)) was achieved in 55.6% patients of the PEITEM group and 50.4% of the control group (adjusted odds ratio, 1.38; 95% CI, 1.00 to 1.90; ICC, 0.01; P = 0.049). Main study limitations include non-blinding of clinicians, and that specific interventions component responsible for the observed changes could not be determined. Conclusions The teleconference-delivered PEITEM intervention resulted in a moderate but clinically relevant shorter DNT and better functional outcome in AIS patients receiving IVT. Short Title: Adopting a metaverse-based workspace to support research team collaboration: a pilot study from an academic health informatics laboratory

DOI: 10.1093/jamiaopen/ooad010

Article Number: ooad010

Accession Number: WOS:000940792800001

Abstract: Objective: This study aimed to understand how a metaverse-

based (virtual) workspace can be used to support the communication and collaboration in an academic health informatics lab. Materials and Methods: A survey of lab members (n = 14) was analyzed according to a concurrent triangulation mixed methods design. The qualitative survey data were organized according to the Capability, Opportunity, Motivation, Behavior (COM-B) model and combined to generate personas that represent the overall types of lab members. Additionally, scheduled work hours were analyzed quantitatively to complement the findings of the survey feedback. Results: Four personas, representative of different types of virtual workers, were developed using the survey responses. These personas reflected the wide variety of opinions about virtual work among the participants and helped to categorize the most common feedback. The Work Hours Schedule Sheet analysis showed the low number of possible collaboration opportunities that were utilized compared to the number available. Discussion: We found that informal communication and co-location were not supported by the virtual workplace as we had originally planned. To solve this issue, we offer 3 design recommendations for those looking to implement their own virtual informatics lab. First, labs should establish common goals and norms for virtual workplace interactions. Second, labs should carefully plan the virtual space layout to maximize communication opportunities. Finally, labs should work with their platform of choice to address technical limitations for their lab members to improve user experience. Future work includes a formal, theory-guided experiment with consideration on ethical and behavioral impact.

DOI: 10.1016/j.enbuild.2013.11.042

Accession Number: WOS:000336779000067

Abstract: Air Conditioners (ACs) in office buildings consume so much energy that the Chinese government enacted a regulation to limit the temperature setting range. To evaluate its effectiveness and provide clues for new behavior change methods, the study surveyed 527 office workers' knowledge of the compulsory approach, temperature sensation and preferences. The latter is included to evaluate the

reasonableness of the regulation. Their actual behaviors covered in this survey include factors influencing temperature setting, operating patterns in setting, and readjusting behaviors after setting. The aim is to find possible ways to encourage higher temperature setting and correct operation. The results show that although the regulation is reasonable (within the [26 degrees C to 28 degrees C range), more than half of the users violate it with an average setting at 24.9 degrees C. The low awareness of the regulation (31.9%) can only account for part of the ineffectiveness: people with knowledge set higher, but still below 26 degrees C. The survey also found some non-comfort motivations that can be potentially used to encourage higher temperature setting: personal health, noontime napping, connecting with nature, and protecting the environment. On the contrary, office workers would set the temperature lower when they first entered the office. It should be noted that office workers strongly consider colleagues when setting the temperature, but generally do not consider electricity consumption. Some of their operating patterns should also be paid attention like setting a low initial temperature; and constantly shutting off and turning on the AC. The discussion includes applications of these findings in terms of enhancing user motivation and simplifying thermostat operation. (C) 2013 Elsevier B.V. All rights reserved.

Accession Number: WOS:000861915800001

Abstract: Introduction: Eating fish before and during pregnancy is important but care must be taken to choose fish which maximize developmental outcomes. Physicians, a trusted health information source, could provide this nuanced communication. This cross-sectional survey of a representative sample of 400 family medicine and obstetrics and gynecology (OB-GYN) physicians in Minnesota was

designed to understand physician behaviors and beliefs about safe fish consumption, describe barriers to physician-patient conversations about safe fish consumption generally and as part of prenatal care and to identify resources to help facilitate conversations on this topic. Methods: Data was collected January to April 2020. Two hundred nineteen surveys were completed (55% response rate) with 194 reporting seeing patients at least 1 day a week. Descriptive survey results from all were summarized and analyzed overall and by physician specialty. Responses to 3 open-ended questions were thematically coded to enrich the quantitative results. Results: While 62% of these reported discussing nutrition topics, only about one-third reported discussing with patients the benefits and about one-quarter the risks of eating fish. Despite the relative infrequency of fish discussions, almost all (>90%) respondents agreed that it is important to discuss fish consumption with people who are or may become pregnant. The largest reported barrier to these conversations was time (82%), and the most endorsed resource to overcome identified barriers was talking points (72%). Conclusions: Because physicians report limited time, resources that facilitate fish consumption should be succinct while serving to both nudge the message and direct clinicians and their patients to robust information.

Date: Aug

Short Title: Measuring Memory for Treatment Using Patient Conceptualizations of Clinical Vignettes: A Pilot Psychometric Study in the Context of Cognitive Therapy for Depression

ISSN: 0147-5916

DOI: 10.1007/s10608-022-10293-1

Accession Number: WOS:000749434800001

Abstract: Background Patient memory for psychological treatment contents is a promising transdiagnostic mechanism of change, but there is little consensus concerning its measurement. We conducted a pilot psychometric investigation of the Conceptualization Task, a

novel measure of patient memory for treatment. Methods Data were from a trial comparing cognitive therapy-as-usual to cognitive therapy plus the Memory Support Intervention (MSI) for adults with depression (N = 171). For the Conceptualization Task, patients read clinical vignettes and provided written responses to assess three facets of conceptualization: identifying contributing factors to psychopathology, making intervention recommendations, and providing a rationale for recommendations. Higher scores were given to responses reflecting accurate memory for the theoretical model and change strategies used in treatment. Results The Conceptualization Task showed excellent inter-rater reliability and sensitivity to change during treatment, but only fair test-retest reliability and insufficient internal consistency. Findings supported discriminant validity with measures of education, IQ, and general memory functioning, but not convergent validity with existing measures of patient memory for treatment. Criterion validity analyses showed that some aspects of the Conceptualization Task were associated with therapist use of memory support strategies from the MSI and treatment outcome. However, findings were mixed, effect sizes were small, and some results did not remain statistically significant after correcting for multiple comparisons. Conclusions Further refinement and testing is needed before the Conceptualization Task may be used to assess the patient memory for treatment contents. Notes: Zieve, Garret G. Armstrong, Courtney C. Short Title: Improving person-centered occupational health care for workers with chronic health conditions: a feasibility study

DOI: 10.1186/s12909-023-04141-3

Article Number: 224

Accession Number: WOS:000963562900002

Abstract: Background Person-centered care is needed to effectively support workers with chronic health conditions. Person-centered care aims to provide care tailored to an individual person's preferences, needs and values. To achieve this, a more active, supportive, and coaching role of occupational and insurance physicians is required. In previous research, two training programs and an e-learning training with accompanying tools that can be used in the context of

person-centered occupational health care were developed to contribute to this changing role. The aim was to investigate the feasibility of the developed training programs and e-learning training to enhance the active, supportive, and coaching role of occupational and insurance physicians needed for person-centered occupational health care. Information about this is important to facilitate implementation of the tools and training into educational structures and occupational health practice. Methods A qualitative study was conducted, with N = 29 semi-structured interviews with occupational physicians, insurance physicians, and representatives from occupational educational institutes. The aim was to elicit feasibility factors concerning the implementation, practicality and integration with regard to embedding the training programs and e-learning training in educational structures and the use of the tools and acquired knowledge and skills in occupational health care practice after following the trainings and e-learning training. Deductive analysis was conducted based on pre-selected focus areas for a feasibility study. Results From an educational perspective, adapting the face-to-face training programs to online versions, good coordination with educational managers and train-the-trainer approaches were mentioned as facilitating factors for successful implementation. Participants underlined the importance of aligning the occupational physicians' and insurance physicians' competences with the educational content and attention for the costs concerning the facilitation of the trainings and e-learning training. From the professional perspective, factors concerning the content of the training and e-learning training, the use of actual cases from practice, as well as follow-up training sessions were reported. Professionals expressed good fit of the acquired skills into their consultation hour in practice. Conclusion The developed training programs, e-learning training and accompanying tools were perceived feasible in terms of implementation, practicality, and integration by occupational physicians, insurance physicians and educational institutes.

Short Title: Applying a systems perspective to understand the mechanisms of the European School Fruit and Vegetable Scheme

ISSN: 1101-1262

DOI: 10.1093/eurpub/ckac054

Accession Number: WOS:000894226700013

Abstract: Background: For the past two decades, the percentage of European children who consume fruit daily has remained at around 40%, despite numerous school-based policy efforts and interventions. This study aimed to apply a systems approach to provide an integrated perspective of the mechanisms of the European School Fruit and Vegetable Scheme (the Scheme) to understand better how to increase its long-term impact on children's fruit and vegetable consumption. Methods: We developed a causal loop diagram by synthesizing peer-reviewed articles and national government documents related to the Scheme, following the conceptualization steps of system dynamics. The initial causal loop diagrams were then validated in three stages by consulting with experts (two individuals and a group) in school-based fruit and vegetable programmes, children's fruit and vegetable consumption and the Scheme, using disconfirmatory interview guidelines. Results: The findings suggest that a central self-reinforcing mechanism through which children socialize during fruit and vegetable consumption is critical in the habituation process. Additionally, the initial increase in children's fruit and vegetable consumption following the Scheme implementation is due to growth in three self-reinforcing loops related to motivation and capability mechanisms; however, this trend gradually slows and stops due to four balancing feedback loops with alternative goals related to opportunity mechanisms that reach their limits. Conclusions: The scheme's design should incorporate activities that align the objectives of the implementers and recipients of the Scheme at all levels. This alignment should provide children with ongoing opportunities to consume fruits and vegetables and strengthen the motivation and capability mechanisms. Abstract: Medication nonadherence is a serious public health concern. Although there are promising interventions that improve medication adherence, most interventions are developed and tested in tightly controlled research environments that are dissimilar from the real-world settings where the majority of patients receive health care. Implementation science methods have the potential to facilitate and accelerate the translation shift from the trial world to the real world. We demonstrate their potential by reviewing published, high-quality medication adherence studies that could potentially be translated into clinical practice yet lack essential implementation science building blocks. We further illustrate this point by describing an adherence study that demonstrates how implementation science creates a junction between research and real-world settings. This article is a call to action for researchers, clinicians, policy makers, pharmaceutical companies, and others involved in the delivery of care to adopt the implementation science paradigm in the scale-up of adherence (research) programs.

Title: Implementation of Electronic Medical Records in Mental Health
Settings: Scoping Review

Journal: Jmir Mental Health

Volume: 8

Issue: 9

Date: Sep

Short Title: Implementation of Electronic Medical Records in Mental
Health Settings: Scoping Review

ISSN: 2368-7959

DOI: 10.2196/30564

Article Number: e30564

Accession Number: WOS:000714012600018

Abstract: Background: The success of electronic medical records (EMRs) is dependent on implementation features, such as usability and fit with clinical processes. The use of EMRs in mental health settings brings additional and specific challenges owing to the personal, detailed, narrative, and exploratory nature of the assessment, diagnosis, and treatment in this field. Understanding the determinants of successful EMR implementation is imperative to

guide the future design, implementation, and investment of EMRs in the mental health field. Objective: We intended to explore evidence on effective EMR implementation for mental health settings and provide recommendations to support the design, adoption, usability, and outcomes. Methods: The scoping review combined two search strategies that focused on clinician-facing EMRs, one for primary studies in mental health settings and one for reviews of peer-reviewed literature in any health setting. Three databases (Medline, EMBASE, and PsycINFO) were searched from January 2010 to June 2020 using keywords to describe EMRs, settings, and impacts. The Proctor framework for implementation outcomes was used to guide data extraction and synthesis. Constructs in this framework include adoption, acceptability, appropriateness, feasibility, fidelity, cost, penetration, and sustainability. Quality assessment was conducted using a modified Hawker appraisal tool and the Joanna Briggs Institute Critical Appraisal Checklist for Systematic Reviews and Research Syntheses. Results: This review included 23 studies, namely 12 primary studies in mental health settings and 11 reviews. Overall, the results suggested that adoption of EMRs was impacted by financial, technical, and organizational factors, as well as clinician perceptions of appropriateness and acceptability. EMRs were perceived as acceptable and appropriate by clinicians if the system did not interrupt workflow and improved documentation completeness and accuracy. Clinicians were more likely to value EMRs if they supported quality of care, were fit for purpose, did not interfere with the clinician-patient relationship, and were operated with readily available technical support. Evidence on the feasibility of the implemented EMRs was mixed; the primary studies and reviews found mixed impacts on documentation quality and time; one primary study found downward trends in adverse events, whereas a review found improvements in care quality. Five papers provided information on implementation outcomes such as cost and fidelity, and none reported on the penetration and sustainability of EMRs. Conclusions: The body of evidence relating to EMR implementation in mental health settings is limited. Implementation of EMRs could benefit from methods used in general health settings such as co-designing the software and tailoring EMRs to clinical needs and workflows to improve usability and acceptance. Studies in mental health and general health settings rarely focused on long-term implementation outcomes such as penetration and sustainability. Future evaluations of EMRs in all settings should consider long-term impacts to address current knowledge gaps.

Abstract: This study uses the capability–opportunity–motivation behavior framework as a theoretical basis and partial least squares structural equation modeling as an empirical research method to identify factors that influence the interest in studying abroad. We rely on primary microdata collected through a self-administered questionnaire among Egyptian students and apply a structural equation model to estimate the different relationships. Our analysis yielded interesting results: (a) 58% of our respondents were somehow interested in studying abroad; (b) physical capability, physical opportunity, and automatic motivation were the main predictors of interest in overseas academic mobility; and (c) a three-pillar policy program based on guidelines, communication and marketing, and regulation could be implemented to promote the interest of young Egyptians in studying abroad.
