Methods/design: A three-arm cluster randomised controlled trial of mobile health (mHealth) and participatory community group interventions will be conducted in four rural upazillas in Faridpur District, Bangladesh. Ninety-six clusters (villages) will be randomised to receive either the mHealth intervention or the participatory community group intervention, or be assigned to the control arm. In the mHealth arm, enrolled individuals will receive twice-weekly voice messages sent to their mobile phone about prevention and control of diabetes. In the participatory community group arm, facilitators will initiate a series of monthly group meetings for men and women, progressing through a Participatory Learning and Action cycle whereby group members and communities identify, prioritise and tackle problems associated with diabetes and the risk of developing diabetes. Both interventions will run for 18 months. The primary outcomes of the combined prevalence of intermediate hyperglycaemia and diabetes and the cumulative 2-year incidence of diabetes among individuals identified as having intermediate hyperglycaemia at baseline will be evaluated through baseline and endline sample surveys of permanent residents aged 30 years or older in each of the study clusters. Data on blood glucose level, blood pressure, body mass index and hip-to-waist ratio will be gathered through physical measurements by trained fieldworkers. Demographic and socioeconomic data, as well as data on knowledge of diabetes, chronic disease risk factor prevalence and quality of life, will be gathered through interviews with sampled respondents.

Discussion: This study will increase our understanding of diabetes and other non-communicable disease burdens and risk factors in rural Bangladesh. By documenting and evaluating the delivery, impact and cost-effectiveness of participatory community groups and mobile phone voice messaging, study findings will provide evidence on how population-level strategies of community mobilisation and mHealth can be implemented to prevent and control noncommunicable diseases and risk factors in this population.

Title: Understanding biosecurity behaviors of Australian beef cattle farmers using the ten basic human values framework

Journal: Frontiers in Veterinary Science

Volume: 10

Date: Feb

Short Title: Understanding biosecurity behaviors of Australian beef cattle farmers using the ten basic human values framework

DOI: 10.3389/fvets.2023.1072929

Article Number: 1072929

Accession Number: WOS:000946721700001

Abstract: Introduction On-farm biosecurity is an essential component of successful disease management in the beef cattle industry on an individual, regional, and national level. Participation in mandatory or voluntary assurance schemes, knowledge and trusted relationships have all been demonstrated to contribute to the development of behaviors that promote biosecurity. However, compliance with rules, socio-psychological relationships and knowledge-seeking behavior are all contingent upon the motivations and beliefs of the individual. It is widely accepted that the motivations and beliefs of all cultures can be defined by ten basic values (Self-direction, Stimulation, Hedonism, Achievement, Power, Security, Conformity, Tradition, Benevolence and Universalism). In this study, we use the ten basic values to characterize the on-farm biosecurity behaviors of Australian beef farmers to facilitate the identification of interventions that are most likely to align with producer motivations and therefore, more likely to result in wider adoption of effective on-farm biosecurity. Methods Semi-structured interviews were conducted with 11 Australian beef farmers to discuss the reasons behind decisions to alter or implement biosecurity practices in response to endemic diseases. Thematic analysis was used to identify the motivations, opportunities, and capability of biosecurity behaviors. The ten basic human values were used to characterize these behaviors and inform enablers and barriers to biosecurity adoption. Results and discussion Benevolence and Self-direction, relating to self-transcendence and an openness to change, were the principal values associated with good biosecurity behaviors. This suggests that farmers will be receptive to education strategies that communicate the actual risk of disease in their area, the impact of disease on animal welfare, and the ability for on-farm biosecurity to mitigate these impacts. Farmers also expressed values of Security which entrenched behaviors as common practice; however, in some cases the Security of trusted relationships was identified as a potential barrier to behavior change. Overall, values associated with biosecurity behaviors were found to align with values that are most important for social cohesion, suggesting that collaborative disease efforts between industry stakeholders and farmers are likely to succeed if designed with these values in mind.

Title: GPs role identifying young people who self-harm: a mixed
methods study
Journal: Family Practice
Volume: 32
Issue: 4
Pages: 415-419
Date: Aug
Short Title: GPs role identifying young people who self-harm: a
mixed methods study
ISSN: 0263-2136
DOI: 10.1093/fampra/cm031
Accession Number: WOS:000359162100009
Abstract: Background: Self-harm is common among young people and is
evident in increasingly younger age groups. Many young people who
self-harm do visit their GP but do not access specialist support.
GP's can find it challenging to raise and discuss this sensitive
subject with young people during short consultations. Objective: To
explore GP's capabilities, motivations and opportunities for
discussing self-harm and to identify barriers to and enablers for
proactively discussing self-harm with young people. Design and
setting: An exploratory, mixed methods study was designed comprising
an online survey and a qualitative interview study with GPs in the
South West of England. Methods: An online survey was completed by 28
GPs. Ten GPs took part by telephone, in semi-structured interviews.
Quantitative data was analysed using descriptive statistical
techniques and thematic analysis was used to analyse the qualitative
data. Findings from the quantitative and qualitative analysis are
synthesized to illustrate GPs' skills, knowledge and perceptions
about young people who self-harm. Results: Experienced GPs may
underestimate the prevalence of self-harm in young people,
particularly in the 11-14 age range. While consultations with young
people and their carers can be challenging, GPs acknowledge that it
is their role to provide support for young people who self-harm. GPs
would welcome training for themselves and other practice staff in
talking to young people and practical information about self-harm.
Conclusion: All primary care staff who provide frontline support to
young people should receive education and practical training in
talking about self-harm.

Article Number: 102092

Accession Number: WOS:000798994600002

Abstract: Evaluation of a complex healthcare intervention should include careful exploration of the mechanisms through which it brings about change. This paper describes a qualitative evaluation of the Redesigning Daily Occupations (ReDO (R)-10) programme as it was implemented for the first time with women with stress-related issues in a primary care setting in Ireland. The ReDO (R)-10 is a 10-week group intervention designed to support participants make changes to their daily activity patterns to have a more satisfying and balanced daily life. Fourteen women were interviewed after completing the programme. The aim was to explore changes that participants perceived they experienced and to understand how the content of ReDO (R)-10 was thought to bring about this change (if it did). Directed content analysis was used to analyse the qualitative data using the Behaviour Change Wheel and Theoretical Domains Framework as a coding framework. Overall, four BCW functions of ReDO (R) -10 were identified: Education, Persuasion, Modelling and Enablement. Participants described improved belief in their own capabilities, knowledge and goals around life changes. Many behaviour changes were also described, particularly in relation to doing more restorative activities in daily life. Behaviour change techniques that were identified as important for change were practicing new, restorative occupations in group sessions and as homework and the use of self-analysis activities to understand the relationship between activities and health for these participants. Modelling, support and other effects of group dynamics were also vital in changes that occurred.

DOI: 10.1007/s40520-022-02305-7

Accession Number: WOS:000912578300001

Abstract: Comprehensive geriatric assessment (CGA) is the gold standard model of care for older adults with frailty. However, despite a large number of published clinical trials, there remain many unanswered questions about how CGA works in different circumstances. This uncertainty stems from CGA being a deeply complex intervention that is heavily modified by context. This review describes recent and novel methodological approaches that explore the active ingredients of CGA and their interaction with context. Future research should continue to embrace broad methodologies that can help us better understand this intervention, in such a way that it can be implemented with fidelity and associated with positive outcomes for older adults.

Title: Promote Community Engagement in Participatory Research for Improving Breast Cancer Prevention: The PINK Study Framework

Journal: Cancers

Volume: 14

Issue: 23

Date: Dec

Short Title: Promote Community Engagement in Participatory Research for Improving Breast Cancer Prevention: The PINK Study Framework

DOI: 10.3390/cancers14235801

Article Number: 5801

Accession Number: WOS:000896574200001

Abstract: Simple Summary More than 50% of breast cancers may be preventable with adherence to healthy lifestyle practices, but the influences of each single preventive/predisposing behaviour and the effects of their combination are still widely debated. The aim of our study was to identify combinations of non-modifiable and lifestyle-related factors that could influence the chance of having breast cancer in post-menopausal women. We used a twofold strategy

of analysis that combines traditional statistical methods and innovative data-driven approaches. We identified some combination of women's features and habits at higher risk for breast cancer occurrence. These preliminary findings could be used to inform tailored prevention policy and health education programs for improving communities' self-empowerment. Breast cancer (BC) has overtaken lung cancer as the most common cancer in the world and the projected incidence rates show a further increase. Early detection through population screening remains the cornerstone of BC control, but a progressive change from early diagnosis only-based to a personalized preventive and risk-reducing approach is widely debated. Risk-stratification models, which also include personal lifestyle risk factors, are under evaluation, although the documentation burden to gather population-based data is relevant and traditional data collection methods show some limitations. This paper provides the preliminary results from the analysis of clinical data provided by radiologists and lifestyle data collected using self-administered questionnaires from 5601 post-menopausal women. The weight of the combinations of women's personal features and lifestyle habits on the BC risk were estimated by combining a model-driven and a data-driven approach to analysis. The weight of each factor on cancer occurrence was assessed using a logistic model. Additionally, communities of women sharing common features were identified and combined in risk profiles using social network analysis techniques. Our results suggest that preventive programs focused on increasing physical activity should be widely promoted, in particular among the oldest women. Additionally, current findings suggest that pregnancy, breast-feeding, salt limitation, and oral contraception use could have different effects on cancer risk, based on the overall woman's risk profile. To overcome the limitations of our data, this work also introduces a mobile health tool, the Dress-PINK, designed to collect real patients' data in an innovative way for improving women's response rate, data accuracy, and completeness as well as the timeliness of data availability. Finally, the tool provides tailored prevention messages to promote critical consciousness, critical thinking, and increased health literacy among the general population.

Short Title: Parents' and clinicians' views of an interactive booklet about respiratory tract infections in children: a qualitative process evaluation of the EQUIP randomised controlled trial

DOI: 10.1186/1471-2296-14-182

Article Number: 182

Accession Number: WOS:000328470400002

Abstract: Background: 'When should I worry?' is an interactive booklet for parents of children presenting with respiratory tract infections (RTIs) in primary care and associated training for clinicians. A randomised controlled trial (the EQUIP study) demonstrated that this intervention reduced antibiotic prescribing and future consulting intentions. The aims of this qualitative process evaluation were to understand how acceptable the intervention was to clinicians and parents, how it was implemented, the mechanisms for any observed effects, and contextual factors that could have influenced its effects. Methods: Semi-structured interviews were conducted with 20 parents and 13 clinicians who participated in the trial. Interviews were audio-recorded and transcribed verbatim. Data were analysed using a framework approach, which involved five stages; familiarisation, development of a thematic framework, indexing, charting, and interpretation. Results: Most parents and clinicians reported that the 'When should I worry' interactive booklet (and online training for clinicians) was easy to use and valuable. Information on recognising signs of serious illness and the usual duration of illness were most valued. The interactive use of the booklet during consultations was considered to be important, but this did not always happen. Clinicians reported lack of time, lack of familiarity with using the booklet, and difficulty in modifying their treatment plan/style of consultation as barriers to use. Increased knowledge and confidence amongst clinicians and patients were seen as key components that contributed to the reductions in antibiotic prescribing and intention to consult seen in the trial. This was particularly pertinent in a context where decisions about the safe and appropriate management of childhood RTIs were viewed as complex and parents reported frequently receiving inconsistent messages. Conclusions: The 'When should I worry' booklet, which is effective in reducing antibiotic prescribing, has high acceptability for clinicians and parents, helps address gaps in knowledge, increases confidence, and provides a consistent message. However, it is not always implemented as intended. Plans for wider implementation of the intervention in health care settings would need to address clinician-related barriers to implementation.

Title: Real Talk: A Realist Dialogic Approach in a Realist
Evaluation

Journal: International Journal of Qualitative Methods

Volume: 21

Date: Aug

Short Title: Real Talk: A Realist Dialogic Approach in a Realist
Evaluation

ISSN: 1609-4069

DOI: 10.1177/16094069221120748

Article Number: 16094069221120748

Accession Number: WOS:000843502600001

Abstract: Realist evaluation is a method increasingly adopted to provide an understanding of how and why a program works, for whom, and under what circumstances. Initial program theories (IPT) are the crucial starting point of any realist evaluation, however descriptions about how they are developed in practice remain under-reported in the published literature. This article argues for the value of genuine research-group conversations using David Bohm's concept of dialogue in realist research. We label it the realist dialogic approach. We draw out the relational qualities as well as the contextual circumstances of dialogue through our development of IPT and interview guides for a research study on the implementation and scaling of a large-system value-based program to transform complex health services. We selected the relevant middle-range theories, conducted a literature review, and drew on informal discussions with key stakeholders, to develop IPT through research-group conversations. The benefits of this approach were: 1) development of rigorous, novel, deep and well-tailored IPT, 2) detailed understanding of the complex intervention under investigation and development of rapport and networks with participants, 3) empirically grounded Context-Mechanism-Outcome (CMO) configurations, predicated on suitable abstract and contextually-contingent middle-range theories, and 4) productive research team interactions which supported the entire research process. The challenges of this approach include: 1) establishing and retaining a sense of humility across the research team, 2) contextual circumstances can hinder dialogic relationship, and 3)

time and resource heavy. This paper uses middle-range theory and ethnographic insights to advance the existing practice of realist evaluations and offer transferable lessons to other scholars considering similar approaches. Moreover, we content that the use of middle-range theory to extend the methodological literature is a novel contribution to realist work.

ISSN: 0197-4572

DOI: 10.1016/j.gerinurse.2016.09.001

Accession Number: WOS:000402231900007

Abstract: The aims of this study were to evaluate establishing and operating a web-based community of practice (CoP) to lead falls prevention in a residential aged care (RAC) setting. A mixed methods evaluation was conducted in two phases using a survey and transcripts from interactive electronic sources. Nurses and allied health staff (n = 20) with an interest in falls prevention representing 13 sites of an RAC organization participated. In Phase 1, the CoP was developed, and the establishment of its structure and composition was evaluated using determinants of success reported in the literature. In Phase 2, all participants interacted using the web, but frequency of engagement by any participant was low. Participatory barriers, including competing demands from other tasks and low levels of knowledge about information communication technology (ICT) applications, were identified by CoP members. A web based CoP can be established and operated across multiple RAC sites if RAC management support dedicated time for web-based participation and staff are given web-based training. Short Title: Fall prevention education for older people being
discharged from hospital: Educators' perspectives

ISSN: 0017-8969

DOI: 10.1177/00178969211032711

Article Number: 00178969211032711

Accession Number: WOS:000677295600001

Abstract: Objective: Falls are a significant problem for many older
patients after hospital discharge. The purpose of this study was to
evaluate the fidelity and impact of a tailored patient fall
prevention education programme from the perspective of the educators
who delivered the programme. Design: Qualitative sequential design.
Setting: Three rehabilitation hospitals in Western Australia.

Method: Three experienced physiotherapists trained as 'educators' to
deliver a tailored fall prevention education programme to 195 older
patients prior to hospital discharge, together with monthly
telephone follow-up for 3 months after discharge. Educator-patient
interactions were recorded in a standardised educator diary. Post-
intervention, educators participated in a mini-focus group,
providing their perspectives regarding education delivery and its
impact on patient abilities to engage in fall prevention strategies.
Data were analysed using deductive content analysis. Results:

Educators followed up 184 (94%) patients, identifying multiple
barriers and enablers affecting patient engagement in planned fall
prevention strategies. Key barriers included unresolved medical
conditions, reluctance to accept assistance on discharge, delays in
assistive service provision, patient beliefs and perceptions about
falls and, in some cases, patients' absolving responsibility for
recovery. Enablers were related to programme design, the completion
of hospital discharge processes and support networks following
discharge. Conclusion: Educators identified several barriers and
enablers to programme delivery, receipt and enactment by older
patients that contributed to the fidelity of the education
programme. The consistent need for more patient support to enable

improved enactment of plans and assist with safe recovery long after discharge warrants further attention at policy and health system levels.

Title: Identifying facilitators of early access to care among Canadian Forces Health Services personnel

Journal: Journal of Military Veteran and Family Health

Volume: 8

Pages: 65-81

Date: Sep

Short Title: Identifying facilitators of early access to care among Canadian Forces Health Services personnel

DOI: 10.3138/jmvfh-2021-0107

Accession Number: WOS:000844136700001

Abstract: LAY SUMMARY Despite the importance of the mental and physical well-being of Canadian Forces Health Services (CFHS) personnel, research suggests they may be under-accessing care. A lot of research has looked at what factors prevent individuals from accessing care (i.e., barriers), but almost none examined what encourages individuals to access care (i.e., facilitators). In addition to examining which facilitators encourage CFHS personnel to access care, the study also examined whether facilitators directly impacted care-seeking behaviour, or whether they also indirectly influence behaviour by impacting general intentions to access care. Results showed that one's health being a priority directly and indirectly influenced care-seeking for both mental and physical health issues. Having the support of senior leadership influenced intention to seek care for mental health issues. Easy access to care influenced intention to seek care for physical health issues. Ensuring CFHS personnel prioritize their own health, have the support of senior leadership, and easy access to care will help promote early access to care. Introduction: Despite the importance of the mental and physical well-being of Canadian Forces Health Services (CFHS) personnel, research suggests they may not access care when needed. While eliminating barriers to care is important, identifying facilitators that encourage personnel to access care is

equally valuable. Methods: CFHS personnel (N = 1,033) were randomly assigned to complete either a mental health or physical health version of the barriers to care survey. The survey included questions on endorsement of facilitators, health-related information, intent to access care, and two condition-specific hypothetical scenarios as proxies for access to care. Multiple regressions using Hayes PROCESS macro were conducted assessing the direct effects and indirect effects (through intent to access care) of the facilitators on early access to care. Results: Across the scenarios, making health a priority was both directly and indirectly related to accessing care. Senior leadership support indirectly influenced access to care for depression. Easy access to sick parade and the illness impacting the ability to perform at work was indirectly related to access to care for pneumonia (marginally significant for back injury). Discussion: Ensuring CFHS personnel prioritize their own health, have the support of senior leadership, and easy access to care will help promote early access to care.

Short Title: Can text messages increase safer sex behaviours in young people? Intervention development and pilot randomised controlled trial

ISSN: 1366-5278

DOI: 10.3310/hta20570

Accession Number: WOS:000382745200001

Abstract: Background: Younger people bear the heaviest burden of sexually transmitted infections (STIs). Partner notification, condom use and STI testing can reduce infection but many young people lack the knowledge, skills and confidence needed to carry out these behaviours. Text messages can provide effective behavioural support. The acceptability and feasibility of a randomised controlled trial of safer sex support delivered by text message are not known.

Objectives: To assess the acceptability and feasibility of a randomised controlled trial of a safer sex intervention delivered by text message for young people aged 16-24 years. Design: (1) Intervention development; (2) follow-up procedure development; (3) a pilot, parallel-arm randomised controlled trial with allocation via remote automated randomisation (ratio of 1 : 1) (participants were unmasked, whereas researchers analysing samples and data were masked); and (4) qualitative interviews. Setting: Participants were recruited from sexual health services in the UK. Participants: Young people aged 16-24 years diagnosed with chlamydia or reporting unprotected sex with more than one partner in the last year.

Interventions: A theory- and evidence-based safer sex intervention designed, with young people's input, to reduce the incidence of STIs by increasing the correct treatment of STIs, partner notification, condom use and STI testing before unprotected sex with a new partner. The intervention was delivered via automated mobile phone messaging over 12 months. The comparator was a monthly text message checking contact details. Main outcome measures: (1) Development of the intervention based on theory, evidence and expert and user views; (2) follow-up procedures; (3) pilot trial primary outcomes: full recruitment within 3 months and follow-up rate for the proposed primary outcomes for the main trial; and (4) participants' views and experiences regarding the acceptability of the intervention.

Results: In total, 200 participants were randomised in the pilot trial, of whom 99 were allocated to the intervention and 101 were allocated to the control. We fully recruited early and achieved an 81% follow-up rate for our proposed primary outcome of the cumulative incidence of chlamydia at 12 months. There was no differential follow-up between groups. In total, 97% of messages sent were successfully delivered to participants' mobile phones. Recipients reported that the tone, language, content and frequency of messages were appropriate. Messages reportedly increased knowledge of and confidence in how to use condoms and negotiate condom use and reduced stigma about STIs, enabling participants to tell a partner about a STI. Conclusions: Our research shows that the intervention is acceptable and feasible to deliver. Our pilot trial demonstrated that a main trial is feasible. It remains unclear which

behaviour change techniques and elements of the intervention or follow-up procedures are associated with effectiveness. A further limitation is that in the trial one person entering data and the participants were unmasked. A randomised controlled trial to establish the effects of the intervention on STIs at 12 months is needed.

DOI: 10.1016/j.ecresq.2014.05.002

Accession Number: WOS:000347263900001

Abstract: This study presents the findings of a quasi-experimental feasibility study examining the Tertiary First Step intervention, an enhanced version of the First Step to Success early intervention program. Tertiary First Step was developed to engage families more effectively and influence and improve parenting practices for children having challenging behavior. Process (fidelity, dosage, and social validity) and outcome data were collected for all participants in the Tertiary First Step condition (N=33). Parent- and teacher-reported outcomes were collected for the comparison condition (N = 22). Process data suggest the intervention was implemented with fidelity, and that teachers, parents, and coaches perceived the intervention as socially valid. This study presents the first empirical examination of the Tertiary Frist Step variation. The outcomes provide compelling evidence that the Tertiary First Step intervention is promising for improving student outcomes on social-behavioral indices, decreasing problem behavior, and improving academic engaged time. Title: Acute pain in the emergency department: Effect of an educational intervention

Journal: Scandinavian Journal of Pain

Volume: 15

Pages: 8-13

Date: Apr

Short Title: Acute pain in the emergency department: Effect of an educational intervention

ISSN: 1877-8860

DOI: 10.1016/j.sjpain.2016.11.004

Accession Number: WOS:000405971800002

Abstract: Background and aims: Pain management is often inadequate in emergency departments (ED) despite the availability of effective analgesics. Interventions to change professional behavior may therefore help to improve the management of pain within the ED. We hypothesized that a 2-h educational intervention combining e-learning and simulation would result in improved pain treatment of ED patients with pain. Methods: Data were collected at the ED of Horsens Regional Hospital during a 3-week study period in March 2015. Pain intensity (NRS, 0-10) and analgesic administration were recorded 24 h a day for all patients who were admitted to the ED during the first and third study weeks. Fifty-three ED nurses and 14 ED residents participated in the educational intervention, which took place in the second study week. Results: In total, 247 of 796 patients had pain >3 on the NRS at the admission to the ED and were included in the data analysis. The theoretical knowledge of pain management among nurses and residents increased as assessed by a multiple choice test performed before and after the educational intervention ($P = 0.001$), but no change in clinical practice could be observed: The administration for analgesics [OR: 1.79 (0.97-3.33)] and for opioids [2.02 (0.79-5.18)] were similar before and after the educational intervention, as was the rate of clinically meaningful pain reduction (NRS >2) during the ED stay [OR: 0.81 (CI 0.45-1.44)]. Conclusions: Conduction of a 2-h educational intervention combining interactive case-based e-learning with simulation-based training in an ED setting was feasible with a high participation rate of nurses and residents. Their knowledge of pain management increased after completion of the program, but transfer of the new knowledge into clinical practice could not be found. Future research should explore the effects of repeated education of healthcare providers on pain management. Implications: It is essential for nurses and residents in emergency departments to

have the basic theoretical and practical skills to treat acute pain properly. A modern approach including e-learning and simulation lead to increased knowledge of acute pain management. Further studies are needed to show how this increased knowledge is transferred into clinical practice. (C) 2016 Scandinavian Association for the Study of Pain. Published by Elsevier B.V. Accession Number: WOS:000782308900001

Abstract: Key word signing, an unaided augmentative, and alternative communication (AAC) system is commonly used by children with Down syndrome who attend mainstream primary schools. To ensure the successful use of key word signing within a mainstream environment, a meaningful, contextually appropriate sign vocabulary must be available to all communication partners. The aim of this study was to develop a core school-based key word signing vocabulary to facilitate effective communication between children with Down syndrome and their communication partners in the first year of mainstream primary school. Four key groups-participants with Down syndrome, their peers, teachers, and special needs assistants-and a speech-language pathologist contributed to the vocabulary over the course of an academic year, through observations, semi-structured interviews, and guided tours of the school environment. Based on criteria of frequency and commonality, 140 words were considered to be core vocabulary. The current study provides new insights into the complex process of vocabulary selection for children who use key word signing at school and highlights the importance of access to a functional sign vocabulary in facilitating inclusive education practices.

ISSN: 0031-9406

DOI: 10.1016/j.physio.2022.08.007

Accession Number: WOS:000875621800013

Abstract: Objective To explore the acceptability, barriers and

enablers of NICE guidelines for osteoarthritis in the Scottish primary care setting using the Joint Implementation of Guidelines for Osteoarthritis in Western Europe (JIGSAW-E) model and investigate the role of Advanced Physiotherapy Practitioners (APPs) in providing evidence-based care. Design A qualitative case study comprised of semi-structured interviews followed by a workshop with participants. Setting 10 Scottish primary care practices. Participants Six general practitioners (GPs) and eight APPs were interviewed. Twenty-three practitioners attended the workshop including 22 physiotherapists and one GP. Results While both GPs and APPs recognised the need to improve and standardise osteoarthritis care delivery, this study found that APPs were better situated to implement the evidence-based model. Barriers to implementation included lack of time for training, limited appointment time for GPs to consult and discuss medication use with patients, limitation of disease specific guidelines for patients with complex multimorbidity, and system-based barriers such as electronic data collection and high staff turnover. The key enabler was practitioners' motivation to provide optimal, standardised quality care for osteoarthritis. To increase acceptance, ownership and usability for both practitioners and patients, the JIGSAW-E model materials required adaptation to the local context. Conclusion This study provides evidence that the JIGSAW-E model is acceptable in Scottish primary care. Furthermore, the evolving roles of GPs and APPs within multidisciplinary primary care teams provides a platform to implement the JIGSAW-E model, where APPs are well placed to provide leadership and training in the delivery of evidence-based care for osteoarthritis. Title: Clinical and cost-effectiveness of a personalised health promotion intervention enabling independence in older people with mild frailty ('HomeHealth') compared to treatment as usual: study protocol for a randomised controlled trial

Journal: BMC Geriatrics

Volume: 22

Issue: 1

Date: Jun

Short Title: Clinical and cost-effectiveness of a personalised health promotion intervention enabling independence in older people with mild frailty ('HomeHealth') compared to treatment as usual:

study protocol for a randomised controlled trial

DOI: 10.1186/s12877-022-03160-x

Article Number: 485

Accession Number: WOS:000805940300001

Abstract: Background: Frailty is clinically associated with multiple adverse outcomes, including reduced quality of life and functioning, falls, hospitalisations, moves to long-term care and mortality. Health services commonly focus on the frailest, with highest levels of need. However, evidence suggests that frailty is likely to be more reversible in people who are less frail. Evidence is emerging on what interventions may help prevent or reduce frailty, such as resistance exercises and multi-component interventions, but few interventions are based on behaviour change theory. There is little evidence of cost-effectiveness. Previously, we co-designed a new behaviour change health promotion intervention ("HomeHealth") to support people with mild frailty. HomeHealth is delivered by trained voluntary sector support workers over six months who support older people to work on self-identified goals to maintain their independence, such as strength and balance exercises, nutrition, mood and enhancing social engagement. The service was well received in our feasibility randomised controlled trial and showed promising effects upon outcomes. Aim: To test the clinical and cost-effectiveness of the HomeHealth intervention on maintaining independence in older people with mild frailty in comparison to treatment as usual (TAU). Methods: Single-blind individually randomised controlled trial comparing the HomeHealth intervention to TAU. We will recruit 386 participants from general practices and the community across three English regions. Participants are included if they are community-dwelling, aged 65 +, with mild frailty according to the Clinical Frailty Scale. Participants will be randomised 1:1 to receive HomeHealth or TAU for 6 months. The primary outcome is independence in activities of daily living (modified Barthel Index) at 12 months. Secondary outcomes include instrumental activities of daily living, quality of life, frailty, wellbeing, psychological distress, loneliness, cognition, capability, falls, carer burden, service use, costs and mortality. Outcomes will be analysed using linear mixed models, controlling for baseline Barthel score and site. A health economic analysis and embedded mixed-methods process evaluation will be conducted. Discussion: This trial will provide definitive evidence on the effectiveness and cost-effectiveness of a home-based, individualised intervention to maintain independence in older people with mild frailty in comparison to TAU, that could be implemented at scale if effective.

Title: Improving Engagement in Antenatal Health Behavior Programs—Experiences of Women Who Did Not Attend a Healthy Lifestyle

Telephone Coaching Program

Journal: Nutrients

Volume: 15

Issue: 8

Date: Apr

Short Title: Improving Engagement in Antenatal Health Behavior Programs—Experiences of Women Who Did Not Attend a Healthy Lifestyle Telephone Coaching Program

DOI: 10.3390/nu15081860

Article Number: 1860

Accession Number: WOS:000977406800001

Abstract: Living Well during Pregnancy (LWdP) is a telephone-based antenatal health behavior intervention that has been shown to improve healthy eating behaviors and physical activity levels during pregnancy. However, one-third of eligible, referred women did not engage with or dropped out of the service. This study aimed to explore the experiences and perceptions of women who were referred but did not attend or complete the LWdP program to inform service improvements and adaptations required for scale and spread and improve the delivery of patient-centered antenatal care. Semi-structured telephone interviews were conducted with women who attended ≤ 2 LWdP appointments after referral. The interviews were thematically analyzed and mapped to the Theoretical Domains Framework and Behavior Change Wheel/COM-B Model to identify the barriers and enablers of program attendance and determine evidence-based interventions needed to improve service engagement and patient-centered antenatal care. Three key themes were identified: (1) the program content not meeting women's expectations and goals; (2) the need for flexible, multimodal healthcare; and (3) information sharing throughout antenatal care not meeting women's information needs. Interventions to improve women's engagement with LWdP and patient-centered antenatal care were categorized as (1) adaptations to LWdP, (2) training and support for program dietitians and antenatal healthcare professionals, and (3) increased promotion of positive health behaviors during pregnancy. Women require flexible and personalized delivery of the LWdP that is aligned with their individual goals and expectations. The use of digital technology has the potential to provide flexible, on-demand access to and engagement with the LWdP program, healthcare professionals, and reliable health information. All healthcare professionals are vital to the promotion of positive health behaviors in pregnancy,

with the ongoing training and support necessary to maintain clinician confidence and knowledge of healthy eating, physical activity, and weight gain during pregnancy.

Short Title: Measuring nurses' perceptions of their work environment and linking with behaviour change theories and implementation strategies to support evidence based practice change

ISSN: 0897-1897

DOI: 10.1016/j.apnr.2020.151374

Article Number: 151374

Accession Number: WOS:000599510300001

Abstract: Purpose: Survey tools, such as the Alberta Context Tool, reliably measure context but researchers have no process to map context to clinician behaviour and develop strategies to support practice change. Therefore, we aimed to map the Alberta Context Tool to the Theoretical Domains Framework and the Behaviour Change Wheel.

Method: The multi-centre study used the Alberta Context Tool to collect data from a convenience sample of nurses working in two emergency departments. These findings were categorised as barriers and enablers, and then mapped to the Theoretical Domains Framework to examine for behavioural domains. Using the Behaviour Change Wheel functions, strategies were developed to target clinician behaviour change. Results: Survey response rate was 42% (n = 68). Nurses perceived a positive work environment in the dimensions of Social Capital (median 4.00, IQR 0.33), Culture (median 3.83, IQR 1.16) and Leadership (median 3.60, IQR 1.1). Low scoring dimensions included Formal Interactions (median 2.75, IQR 1.00); Time (median 2.60, IQR 1.00) Staffing (median 3.0, IQR 2.00) and Space (median 3.0, IQR 2.00). Enablers (n = 77) and barriers (n = 25) were identified in both sites. The Theoretical Domains Framework was mapped to Alberta Context Tool barriers and enablers. The behaviour change strengths included: social and professional role; beliefs about capability; goals; and emotions. Using the Behaviour Change Wheel functions, 67

strategies were developed to address barriers and enablers. Conclusions: The Alberta Context Tool successfully measured two emergency environments identifying barriers and enablers. This approach enabled environment dimensions to be targeted with practical solutions to support evidence-based practice implementation.

Title: Functions of behavior change interventions when implementing multi-professional teamwork at an emergency department: a comparative case study

Journal: BMC Health Services Research

Volume: 14

Date: May

Short Title: Functions of behavior change interventions when implementing multi-professional teamwork at an emergency department: a comparative case study

DOI: 10.1186/1472-6963-14-218

Article Number: 218

Accession Number: WOS:000337323100001

Abstract: Background: While there is strong support for the benefits of working in multi-professional teams in health care, the implementation of multi-professional teamwork is reported to be complex and challenging. Implementation strategies combining multiple behavior change interventions are recommended, but the understanding of how and why the behavior change interventions influence staff behavior is limited. There is a lack of studies focusing on the functions of different behavior change interventions and the mechanisms driving behavior change. In this study, applied behavior analysis is used to analyze the function and impact of different behavior change interventions when implementing multi-professional teamwork. Methods: A comparative case study design was applied. Two sections of an emergency department implemented multi-professional teamwork involving changes in work processes, aimed at increasing inter-professional collaboration. Behavior change interventions and staff behavior change were studied using observations, interviews and document analysis. Using a hybrid thematic analysis, the behavior change interventions were categorized according to the DCOM (R) model. The functions of the behavior change interventions were then analyzed using applied behavior analysis. Results: The two sections used different behavior change interventions, resulting in a large difference in the degree of staff behavior change. The successful section enabled staff

performance of teamwork behaviors with a strategy based on ongoing problem-solving and frequent clarification of directions. Managerial feedback initially played an important role in motivating teamwork behaviors. Gradually, as staff started to experience positive outcomes of the intervention, motivation for teamwork behaviors was replaced by positive task-generated feedback. Conclusions: The functional perspective of applied behavior analysis offers insight into the behavioral mechanisms that describe how and why behavior change interventions influence staff behavior. The analysis demonstrates how enabling behavior change interventions, managerial feedback and task-related feedback interact in their influence on behavior and have complementary functions during different stages of implementation.

Pages: 64-81

Short Title: The work is never ending: uncovering teamwork sustainability using realistic evaluation

ISSN: 1477-7266

DOI: 10.1108/jhom-01-2016-0020

Accession Number: WOS:000398487700006

Abstract: Purpose - The purpose of this paper is to uncover the mechanisms influencing the sustainability of behavior changes following the implementation of teamwork. Design/methodology/approach - Realistic evaluation was combined with a framework (DCOM (R)) based on applied behavior analysis to study the sustainability of behavior changes two and a half years after the initial implementation of teamwork at an emergency department. The DCOM (R) framework was used to categorize the mechanisms of behavior change interventions (BCIs) into the four categories of direction, competence, opportunity, and motivation. Non-participant observation and interview data were used. Findings - The teamwork behaviors were not sustained. A substantial fallback in managerial activities in combination with a complex context contributed to reduced direction, opportunity, and motivation. Reduced direction made staff members unclear about how and why they should work in teams. Deterioration

of opportunity was evident from the lack of problem-solving resources resulting in accumulated barriers to teamwork. Motivation in terms of management support and feedback was reduced. Practical implications – The implementation of complex organizational changes in complex healthcare contexts requires continuous adaptation and managerial activities well beyond the initial implementation period. Originality/value – By integrating the DCOM (R) framework with realistic evaluation, this study responds to the call for theoretically based research on behavioral mechanisms that can explain how BCIs interact with context and how this interaction influences sustainability.

Accession Number: WOS:000783232500049

Abstract: Objectives To understand Canadian's attitudes and current behaviours towards COVID-19 public health measures (PHM), vaccination and current public health messaging, to provide recommendations for a public health intervention. Design Ten focus groups were conducted with 2-7 participants/group in December 2020. Focus groups were transcribed verbatim and analysed using content and inductive thematic analysis. The capability opportunity motivation behaviour Model was used as our conceptual framework. Setting Focus groups were conducted virtually across Canada.

Participants Participants were recruited from a pool of individuals who previously completed a Canada-wide survey conducted by our research team. Main outcome measure Key barriers and facilitators

towards COVID-19 PHM and vaccination, and recommendations for public health messaging. Results Several themes were identified (1) participants' desire to protect family and friends was the main facilitator for adhering to PHM, while the main barrier was inconsistent PHM messaging and (2) participants were optimistic that the vaccine offers a return to normal, however, worries of vaccine efficacy and effectiveness were the main concerns. Participants felt that current public health messaging is inconsistent, lacks transparency and suggested that messaging should include scientific data presented by a trustworthy source. Conclusions We suggest six public health messaging recommendations to increase adherence to PHM and vaccination (1) use an unbiased scientist as a spokesperson, (2) openly address any unknowns, (3) more is better when sharing data, (4) use personalised stories to reinforce PHM and vaccinations, (5) humanise the message by calling out contradictions and (6) focus on the data and keep politics out.

Volume: 53

Issue: 4

Pages: 752-762

Date: Jul

Short Title: Exploring horse owners' understanding of obese body condition and weight management in UK leisure horses

ISSN: 0425-1644

DOI: 10.1111/evj.13360

Accession Number: WOS:000585058400001

Abstract: Background Equine obesity is considered one of the most serious welfare concerns in UK leisure horses, yet little is known about how horse owners conceptualise their horse's weight as part of its health, or how they plan and carry out weight management.

Objectives This study aimed to further our understanding of leisure horse owners' perceptions of equine health and awareness of excess fat in order to clarify our understanding of successful strategies for managing equine weight. Study design This study used a

qualitative research methodology. Methods Data comprised 16 threads from online UK equine discussion fora, 28 individual interviews with

leisure horse owners, 19 interviews with equine professionals such as vets and nutritionists, and two focus groups with a further 21 horse owners. Data were anonymised and analysed using a grounded theory approach. Results Awareness of excess fat was a complex issue, with owners finding it difficult to differentiate equine obesity from the shape they thought the horse was "meant to be", particularly if the horse was a heavier breed such as a native pony or cob. Owners were not necessarily "aware" or "unaware" of fat, but instead equine body fat was constructed as an integral part of the equine body. For example, owners might say that they thought their horse was an ideal weight yet describe their horse's overall body shape as "like a Thelwell". When owners became aware of fat as a changeable part of the horse's body, and/or a threat to health, the presence of fat was articulated as a strong-willed adversary, and weight management was considered a "battle" or "war". Owners found weight management difficult because they perceived that it had immediate negative welfare implications for the horse, and this therefore interfered with their preferred ownership practices and the horse-human relationship. Main limitations Interview data are self-reported, and people may not always do what they say they do. Conclusions This study has provided valuable insight into how owners conceptualise weight and weight management, yielding important information about communicating with owners about weight, tailoring weight management strategies, and promoting positive welfare. Short Title: Examining capabilities, opportunities, and motivations for healthy eating behaviors in Latin American restaurants: a quantitative application of the COM-B model to inform future interventions

DOI: 10.1186/s40795-023-00712-1

Article Number: 57

Accession Number: WOS:000954601000002

Abstract: Background Eating foods away from home has been associated

with poor diet quality and adverse health outcomes. Research is needed to examine barriers and facilitators to making healthier eating choices in restaurant settings. We operationalized the Capability, Opportunity, and Motivation for Behavior Model (COM-B Model) to conduct a behavioral diagnosis for healthy eating behaviors at Latin American restaurants (LARs), an understudied yet increasingly important food environment with the potential to positively influence diets. Methods We conducted an online survey with adults in the United States that reported eating food from LARs at least once a month (n = 509) recruited via an online market research panel to examine capabilities – physical (e.g., skills) and psychological (e.g., knowledge), opportunities – social (e.g., norms) and physical (e.g., environmental), and motivations – reflective (e.g., self-conscious intentions) and automatic (e.g., emotions) associated with healthier choices at LARs. In a survey focused on LAR-associated behaviors, each COM-B domain was scored between 1–5, with scores ≥ 4 denoted as having high capability, opportunity, and motivation to eat healthfully at LARs (potential range of total score = 6–35). Regression analysis was used to examine the association between COM-B scores (total and by domain) and select demographic characteristics (age, gender, race, Latin heritage, income, education, marital status, and Latin majority state of residency). Results More than half of the participants (57.1%) were classified as having high physical capability, followed by psychological capability (43.9%) in the LAR environment. The proportions of participants with either high motivation or high opportunity were low, ranging from 37.3% (reflective motivation) to physical opportunity (15.6%). The overall mean COM-B total score was 19.8 \pm 3.0. Higher total COM-B scores were associated with younger age, self-identifying as white, having Latin heritage, and having higher income ($p < 0.05$). Conclusions This study expands the application of the COM-B framework using quantitative inquiry to evaluate levels of capability, motivation, and opportunity for healthy eating in LAR settings and initial demographic associations with determinants for healthy eating in these settings. This work can aid in tailoring interventions and developing evaluation tools for LAR-related healthy eating interventions.

Article Number: 13563890221096178

Accession Number: WOS:000795769300001

Abstract: The use of multi-agency partnerships, including research-practice partnerships, to facilitate the development, implementation and evaluation of public health interventions has expanded in recent years. However, gaps remain in the understanding of influences on partnership working, and their capacity to facilitate and use evaluation, as well as the characteristics which lead to partnership effectiveness. We applied qualitative methods to explore experiences of stakeholders who were involved in partnerships to deliver and evaluate a national physical activity programme. We combined thematic and network analysis, and drew on concepts of evaluation use, knowledge exchange and organisational systems to interpret our findings and develop a conceptual model of the relationships between partnership characteristics and processes. Our model identifies key partnership characteristics such as high levels of engagement, regular communication and continuity. Furthermore, it highlights the importance of implementing organisational structures and systems to support effective partnership working, knowledge exchange and capacity building.

Article Number: 1089452

Accession Number: WOS:000952248800001

Abstract: Background Research on the use of digital technologies for delivering behavioral interventions has shown mixed evidence on their efficacy for improving both autistic symptoms and co-occurring psychiatric disorders. Little knowledge exists on the specific use or efficacy of using social media in interventions aimed at autistic individuals. Objective To review and describe the current existing evidence-based research on the use of social media in interventions

aimed at autistic individuals. Methods A search was conducted across 8 databases (PubMed; EMBASE; Cochrane Library; PsycInfo; ERIC; Education Source; Web of Science; and IEEE Xplore). We included primary studies and reviews that dealt with autism spectrum disorder (ASD); described interventions that use social media; and reported results from the intervention. The quality of the evidence of the included primary studies was graded according to the GRADE criteria, and the risk of bias in systematic reviews was assessed by drawing on the AMSTAR guidelines. Results were synthesized and sorted by quality of evidence. Results A total of nine articles were included in this review: eight primary studies (five non-randomized interventions and three randomized interventions) and one systematic review. The total number of participants with an ASD-diagnosis in the included studies was 164 (aged 5 to 22 years old). Studies weighted as being of moderate quality of evidence have reported significant positive effects in the groups that received the social media interventions: increased social engagement and participation in life situations; increased physical activity level; increased improvement on occupational performance, specified goals, and behavioral problems; and decreased plaque scores coupled with parent reports of intervention success. None of the studies have reported any negative effects linked to social media interventions. Conclusion There is very little evidence of good quality on the use of social media in interventions aimed at autistic individuals. While there is a need for more high-quality studies, all the included studies, with one exception found positive results of the interventions. These findings are encouraging, suggesting that social media-based interventions may in fact be useful for supporting behavioral changes in autistic individuals.

Title: Feasibility of a socio-spiritual intervention to improve quality of life of adult Nigerians with cancer and their family caregivers: Protocol for a randomised controlled trial

Journal: Contemporary Clinical Trials Communications

Volume: 22

Date: Jun

Short Title: Feasibility of a socio-spiritual intervention to improve quality of life of adult Nigerians with cancer and their family caregivers: Protocol for a randomised controlled trial

DOI: 10.1016/j.conctc.2021.100802

Article Number: 100802

Accession Number: WOS:000670329900006

Abstract: Background: Despite high psychosocial needs that negatively affect the quality of life of adults living with cancer

and their family caregivers, there is a lack of interventions that are culturally sensitive to low-income countries. This protocol tests the feasibility of a randomised controlled trial on the efficacy of a socio-spiritual intervention to improve the quality of life of adult Nigerians living with cancer and their family caregivers. Methods/design: This two-arm trial will recruit 152 adults with cancer and their family caregivers (76 dyads). Participants will be recruited from a clinical facility in Zaria, Kaduna State, Nigeria. Eligible participants will be randomly assigned to either the intervention or control group at a 1:1 ratio. The intervention consists of four weekly face-to-face sessions with a focus on spirituality, social support, and information needs. Control participants will receive usual care. Outcome measures include feasibility, spiritual need, social need, information, cancer health literacy, and quality of life collected at baseline and immediate post-intervention. Discussion: Nigeria has the highest rate of extreme poverty globally with high rates of cancer mortality. Testing the feasibility of social-spiritual interventions in resource poor settings is important to establish preliminary efficacy and sustainability. Family-centred interventions for adults living with cancer and their family caregivers can strengthen their coping capabilities. If this intervention is feasible and effective, it could be implemented both in clinical practice and communities in other low and middle income countries.

Short Title: Teaching Behavior Change Theory in Canada: Establishing Consensus on Behavior Change Theories That Are Recommended to Be Taught to Undergraduate Students in Courses Addressing Health Behavior Change

ISSN: 2373-3799

DOI: 10.1177/2373379920906178

Accession Number: WOS:000848850900010

Abstract: There is little guidance on which behavior change theories should be taught in undergraduate courses addressing health behavior change. Delphi consensus methods provide a formal, systematic, and reproducible method for establishing consensus among experts.

Objective. Use a Delphi methodology to establish consensus regarding behavior change theories that should be taught to undergraduate students enrolled in health behavior change courses. Method. An online Delphi consensus exercise was completed by instructors who were identified through a systematic search of 94 University course calendars to be teaching health behavior change content to undergraduate students in Canada. In Round 1, 22 participants generated a list of theories taught in undergraduate courses. In Rounds 2 and 3, participants indicated their level of agreement using an 11-point Likert-type scale as to which theories should be taught. Theories that reached predetermined consensus criteria were retained in each round. Results. In Round 1, participants listed over 50 different theories being taught in undergraduate courses. After Round 2, nine theories met consensus criteria which were refined to only six theories in Round 3 (i.e., behavior change wheel, self-determination theory, self-efficacy theory, social ecological model, social cognitive theory, theory of planned behavior). Conclusions. A wide range of theories are taught in undergraduate courses. However, only a minority of these theories reached consensus criteria as being theories that should be taught to undergraduate students enrolled in courses addressing health behavior change. Findings can be used to improve the consistency and quality of instruction of behavior change theories at the undergraduate level.

DOI: 10.1007/s12160-015-9710-7

Accession Number: WOS:000360829000011

Abstract: A cross-disciplinary scoping review identified 83 of behavior change theories, with many similarities and overlapping

constructs. Investigating the derivation of these theories may provide further understanding of their contribution and intended application. To develop and apply a method to describe the explicit derivation of theories of behavior change. A network analysis of the explicit "contributing to" relations between the 83 theories was conducted. Identification of relations involved textual analysis of primary theory sources. One hundred and twenty-two connections between the theories were identified amounting to 1.8 % of the number possible. On average, theories contributed to one or two theories (mean = 1.47 +/- 3.69 contributions) and were informed by one or two theories (mean = 1.47 +/- 1.61 contributing theories). Most behavior change theories appear to be explicitly informed by few prior theories. If confirmed, this suggests a considerable dislocation between generations of theories which would be expected to undermine scientific progress.

Abstract: The coronavirus disease 2019 (COVID-19) pandemic is disproportionately affecting racial and ethnic minorities. In the United States, data show African American, Hispanic, and Native American populations are overrepresented among COVID-19 cases and deaths. As we speed through the discovery and translation of approaches to fight COVID-19, these disparities are likely to increase. Implementation science can help address disparities by guiding the equitable development and deployment of preventive interventions, testing, and, eventually, treatment and vaccines. In this study, we discuss three ways in which implementation science can inform these efforts: (1) quantify and understand disparities; (2) design equitable interventions; and (3) test, refine, and retest interventions.

with lung cancer and cachexia, a qualitative study of healthcare
professionals, patients and carers

ISSN: 1932-2259

DOI: 10.1007/s11764-023-01376-3

Accession Number: WOS:000976940600001

Abstract: Purpose There is some evidence of the benefits of physical
activity (PA) in patients with lung cancer; however, there is a lack
of understanding of acceptable PA for patients with established
cachexia and how to facilitate sustainable behaviour change to
promote PA. Therefore, this study explored the views of healthcare
professionals (HP), patients with lung cancer and cachexia, and
their carers on preferences for, barriers and facilitators of
homebased PA. Methods This qualitative study involved ten telephone
interviews with HPs and face-to-face interviews with seven patients
with lung cancer and cachexia and their carers. Interviews were
transcribed and analysed thematically. The Capability, Opportunity,
Motivation and Behaviour (COM-B) model was used as a framework for
the thematic cross-group analysis. Results The types of homebased PA
suggested by patients with lung cancer and cachexia (n = 7), their
carers (n = 7) and HPs (n = 10) were functional, flexible,
individualised and initially of short duration and low intensity. PA
was influenced by themes within physical and psychological
Capability, physical and social Opportunities as well as automatic
and reflective Motivation. Conclusion Based on a behaviour change
theory, principles to promote homebased PA were developed. These
principles need to be integrated into tools to promote PA in people
with lung cancer and weight loss.

Short Title: A behavior change wheel-based interactive pictorial health education program for hypertensive patients with low blood pressure health literacy: study protocol for a randomized controlled trial

DOI: 10.1186/s13063-022-06300-1

Article Number: 369

Accession Number: WOS:000790174000002

Abstract: Background: The prevalence of hypertension is increasing worldwide. Hypertension self-management usually involves the application and consideration of oral, written, or quantitative information. Hypertensive patients in China have limited high blood pressure health literacy (HBP-HL), which may lead to poorer clinical outcomes. This study aims to determine the feasibility and effectiveness of an interactive pictorial health education program based on behavior change wheel (BCW) theory and its effect on HBP-HL, self-efficacy, self-management ability, and health-related quality of life (HRQOL) in hypertensive patients with low HBP-HL. Methods: This study is a randomized controlled trial (RCT). One of the municipal districts in Huzhou, China, will be randomly selected, and two communities with similar conditions within this district will be screened and selected. A total of 120 hypertensive patients aged 18 years and older will be recruited from these two community settings. One of the communities will be randomly allocated to an interactive pictorial health education program conducted by a comprehensive health literacy strategy that includes (i) training participants in effective health communication skills that address issues encountered in seeking medical care and (ii) the use of self-developed interactive pictorial hypertension education to improve patient understanding and behaviors versus a control group (routine community lecture health education only). The primary outcome measure is HBP-HL. Secondary outcomes are self-efficacy, self-management ability, HRQOL, social support, and improvement in blood pressure. Outcomes will be collected at 6, 9, and 12 months from trial entry. Discussion: The strengths of this study are the establishment of a new health management program for hypertensive patients that closely combines BCW theory and health literacy. This trial has the potential to improve HBP-HL in hypertensive Chinese patients with low health literacy to improve the self-management of hypertension and help control blood pressure.

Article Number: 2745

Accession Number: WOS:000723636200001

Abstract: Changes in dietary habits of the French population have been reported during the national lockdown that was enforced due to the COVID-19 pandemic. This study investigated whether perceived social eating norms were associated with the initiation and maintenance of dietary changes that took place as a result of lockdown. An online study collected information on (1) changes in consumption implemented during the lockdown and the maintenance of these changes, and (2) perceptions about changes in consumption implemented during lockdown by household members, relatives out of home, and the general population. The changes in consumption were classified as foods to increase or to decrease according to French national recommendations. The perception of changes to dietary habits by household members and relatives out of home was related to the changes made by individuals for each of the food categories (all $p < 0.05$) but not to the perception of changes made the general population. Increased consumption of foods to increase was more likely to be maintained when there was a positive perception of the changes made by household members ($p = 0.03$). These results highlight the influence of the perception of social eating norms, especially by household members and relatives, on the implementation of dietary changes during lockdown and suggest that social eating norms can have a lasting influence.

DOI: 10.3390/bs12040108
Article Number: 108
Accession Number: WOS:000787933100001
Abstract: Sexually transmitted infections (STIs) are a major public health challenge. Although theoretically informed public health campaigns are more effective for changing behaviour, there is little evidence of their use when campaigns are commissioned to the commercial sector. This study describes the implementation of the COM-B model to a sexual health campaign that brought together expertise from academics, sexual healthcare, and marketing and creative professionals. Insights were gathered following a review of

the relevant academic literature. Barriers and facilitators to condom use and STI testing were explored with the use of the COM-B model and the Behaviour Change Wheel in a workshop attended by academics, behavioural scientists, healthcare experts and creative designers. Feedback on the creative execution of the campaign was obtained from healthcare experts and via surveys. Barriers to psychological capability, automatic and reflective motivation, and social opportunity were identified as targets for the campaign, and creative solutions to these barriers were collaboratively devised. The final sexual health campaign was rated positively in its ability to change attitudes and intentions regarding the use of condoms and STI testing. This study describes the implementation of the COM-B model of behaviour change to a public sexual health campaign that brought together academics, public and commercial sector expertise. The barriers and facilitators identified in this collaborative process represent potential targets for future public health communication campaigns.

Abstract: Objectives: To identify trials of home-based health behaviour change interventions for frail older people, describe intervention content and explore its potential contribution to intervention effects. Design: 15 bibliographic databases, and reference lists and citations of key papers, were searched for randomised controlled trials of home-based behavioural interventions reporting behavioural or health outcomes. Setting: Participants' homes. Participants: Community-dwelling adults aged ≥ 65 years with frailty or at risk of frailty. Primary and secondary outcome measures: Trials were coded for effects on thematically clustered behavioural, health and well-being outcomes. Intervention content was described using 96 behaviour change techniques, and 9 functions (eg, education, environmental restructuring). Results: 19 eligible trials reported 22 interventions. Physical functioning was most commonly assessed (19 interventions). Behavioural outcomes were assessed for only 4 interventions. Effectiveness on most outcomes was limited, with at most 50% of interventions showing potential positive effects on behaviour, and 42% on physical functioning. 3 techniques (instruction on how to perform behaviour, adding objects to environment, restructuring physical environment) and 2 functions (education and enablement) were more commonly found in interventions showing potential than those showing no potential to improve physical function. Intervention content was not linked to effectiveness on other outcomes. Conclusions: Interventions appeared to have greatest impact on physical function where they included behavioural instructions, environmental modification and practical social support. Yet, mechanisms of effects are unclear, because impact on behavioural outcomes has rarely been considered. Moreover, the robustness of our findings is also unclear, because interventions have been poorly reported. Greater engagement with behavioural science is needed when developing and evaluating home-based health interventions.

Article Number: 2041277

Accession Number: WOS:000759174400001

Abstract: Advances in understanding how habit forms can help people change their behaviour in ways that make them happier and healthier. Making behaviour habitual, such that people automatically act in associated contexts due to learned context-response associations, offers a mechanism for maintaining new, desirable behaviours even when conscious motivation wanes. This has prompted interest in understanding how habit forms in the real world. To reliably inform intervention design, habit formation studies must be conceptually and methodologically sound. This paper proposes methodological criteria for studies tracking real-world habit formation, or potential moderators of the effect of repetition on formation. A narrative review of habit theory was undertaken to extract essential and desirable criteria for modelling how habit forms in naturalistic settings, and factors that influence the relationship between repetition and formation. Next, a methodological review identified exemplary real-world habit formation studies according to these criteria. Fourteen methodological criteria, capturing study design (four criteria), measurement (six criteria), and analysis and interpretation (four criteria), were derived from the narrative review. Five extant studies were found to meet our criteria. Adherence to these criteria should increase the likelihood that studies will offer revealing conclusions about how habits develop in real-world settings.

Short Title: How did the public respond to the 2015 expert consensus public health guidance statement on workplace sedentary behaviour? A qualitative analysis

DOI: 10.1186/s12889-016-3974-0

Article Number: 47

Accession Number: WOS:000393625100001

Abstract: Background: In June 2015, an expert consensus guidance statement was published recommending that office workers accumulate 2–4 h of standing and light activity daily and take regular breaks from prolonged sitting. This paper describes public responses to media coverage of the guidance, so as to understand public acceptability of the recommendations within the guidance, and perceptions of sitting and standing as health behaviours. Methods: UK news media websites that had reported on the sedentary workplace guidance statement, and permitted viewers to post comments responding to the story, were identified. 493 public comments, posted in a one-month period to one of six eligible news media websites, were thematically analysed. Results: Three themes were extracted: (1) challenges to the credibility of the sedentary workplace guidance; (2) challenges to the credibility of public health; and (3) the guidance as a spur to knowledge exchange. Challenges were made to the novelty of the guidance, the credibility of its authors, the strength of its evidence base, and its applicability to UK workplaces. Public health was commonly mistrusted and viewed as a tool for controlling the public, to serve a paternalistic agenda set by a conspiracy of stakeholders with hidden non-health interests. Knowledge exchanges focused on correcting others' misinterpretations, raising awareness of historical or scientific context, debating current workplace health policies, and sharing experiences around sitting and standing. Conclusions: The guidance provoked exchanges of health-promoting ideas among some, thus demonstrating the potential for sitting reduction messages to be translated into everyday contexts by lay champions. However, findings also demonstrated confusion, misunderstanding and misapprehension among some respondents about the health value of sitting and standing. Predominantly unfavourable, mistrusting responses reveal significant hostility towards efforts to displace workplace sitting with standing, and towards public health science more broadly. Concerns about the credibility and purpose of public health testify to the importance of public engagement in public health guidance development.

Abstract: There is little doubt that undergraduate and post-graduate training of physicians, pharmacists, and nurses is insufficient to prepare them to use psychotropics safely and effectively, especially in the context of their expanded off-label uses. Therefore, the development of competencies in psychotropic prescribing needs to be approached as a long-term, practice-based learning commitment.

Proposed are the abilities and knowledge components necessary for safe and effective use of psychotropics. Typical challenges in prescribing for chronic and recurrent illnesses include highly variable responses and tolerability, drug interactions, and adverse effects that can be serious, irreversible, and even fatal.

Prescribing psychotropics is further complicated by negative public and professional reports and growing patient concerns about the quality of care, and questions about the efficacy, safety, and addictive risks of psychotropics. Increased efforts are needed to enhance clinical training and knowledge in psychopharmacology among trainees and practising clinicians, with more comprehensive and sustained attention to the assessment of individual patients, and greater reliance on patient education and collaboration. Improved competence in psychotropic prescribing should lead to more informed, thoughtful, and better-targeted applications as one component of more comprehensive clinical care.

ISSN: 0145–6008

DOI: 10.1111/acer.14491

Accession Number: WOS:000591060500001

Abstract: Hospital inpatient and emergency care settings provide frequent opportunities for clinicians to screen and provide brief interventions to patients who engage in the harmful use of alcohol. However, these services are not always provided, with several reasons given in different studies. We aimed to systematically review clinician–reported barriers in the provision of brief alcohol screening, brief advice, and intervention specific to hospital inpatient and emergency department (ED) settings. A systematic literature review was conducted in MEDLINE, PsycINFO, and CINAHL to identify the barriers perceived by healthcare workers in the provision of alcohol screening and brief intervention. These barriers were then categorized according to the capability, opportunity, and motivation (COM–B) model of behavior change theory. Twenty–five articles were included in this study, which involved questionnaires, surveys, interviews, and conference call discussions. The most commonly cited barriers (i.e., greater than half of the studies) were related to capability (lack of knowledge cited in 60% of studies); opportunity (lack of time and resources, 76 and 52% of studies, respectively); and motivation (personal discomfort in 60% of studies). Twenty–two other barriers were reported but with lower frequency. Clinicians cite a multitude of factors that impede their delivery of alcohol screening and brief interventions in the hospital inpatient and ED settings. These barriers were explored further under the framework of the COM–B model, which allows for intervention design. As such, changes can be made at the policy, managerial, and educational levels to address these barriers and help improve the self–efficacy and knowledge of clinicians who counsel patients on alcohol use.

DOI: 10.1097/j.pain.0000000000002260

Accession Number: WOS:000707417300016

Abstract: In the context of the opioid epidemic and the growing population of older adults living with chronic pain, clinicians are increasingly recommending nonpharmacologic approaches to patients as complements to or substitutes for pharmacologic treatments for pain. Currently, little is known about the factors that influence older adults' use of these approaches. We aimed to characterize the factors that hinder or support the use of nonpharmacologic approaches for pain management among older adults with multiple morbidities. We collected semistructured qualitative interview data from 25 older adults with multiple morbidities living with chronic pain for 6 months or more. Transcripts were coded to identify factors that hindered or supported participants' use of various nonpharmacologic approaches. We used the constant comparative method to develop a person-focused model of barriers and facilitators to participants' use of these approaches for chronic pain management. Participants described a wide range of factors that influenced their use of nonpharmacologic approaches. We grouped these factors into 3 person-focused domains: awareness of the nonpharmacologic approach as relevant to their chronic pain, appeal of the approach, and access to the approach. We propose and illustrate a conceptual model of barriers and facilitators to guide research and clinical care. This study identifies numerous factors that influence patients' use of nonpharmacologic approaches, some of which are not captured in existing research or routinely addressed in clinical practice. The person-centered model proposed may help to structure and support patient-clinician communication about nonpharmacologic approaches to chronic pain management.

Abstract: Indiscriminate antimicrobial use (AMU) in aquaculture to treat and prevent diseases is common and can lead to the emergence of antimicrobial-resistant micro-organisms, potentially impacting public health and connected ecosystems. This study aimed to develop a typology to classify and characterise interventions to reduce AMU in aquaculture and identify points of action. Seventeen aquaculture and animal health professionals in Asian and African countries were interviewed to gather information on characteristics of interventions in different contexts to develop a typology. Seven types of interventions were defined: (i) legislation and regulations; (ii) industry rules and standards; (iii) voluntary instruments; (iv) commercial technology and alternatives to antimicrobials; (v) on-farm management; (vi) learning and awareness-raising; and (vii) activities with co-benefits. Types were based on intervention function, scope of implementation, implementer, compulsion, strength of the intervention, AMU/antimicrobial resistance (AMR) objective and stakeholder to influence. For each type, examples were described and discussed. The most common interventions to address AMU and AMR were legislative and regulatory frameworks and voluntary instruments, including National Action Plans. Interventions addressing AMU/AMR specifically were scarce. Other interventions focused on indirect effect pathways to AMU and AMR reduction aiming to improve good aquaculture practices, disease prevention and improved management. Monitoring and evaluation of these interventions were found to be rare, only present for interventions driven by development projects and international agencies. The presented typology of existing strategies and interventions addressing AMU/AMR in aquaculture systems can guide evaluation of AMR-sensitive interventions that promote responsible AMU, and informs the design and implementation of future interventions. Pages: 978-987

Date: Dec

Short Title: Hospital-acquired pressure ulcers prevention: What is needed for patient safety? The perceptions of nurse stakeholders

ISSN: 0283-9318

DOI: 10.1111/scs.12995

Accession Number: WOS:000659113700001

Abstract: Aim The aim of this study was to understand the perceptions of 11 Portuguese nurses' stakeholders regarding pressure ulcers prevention practice and reality in the hospital setting.

Methods Convenience sampling was used to recruit nursing stakeholders for a heterogeneous focus group. A semi-structured interview was conducted with 11 nursing stakeholders involved in pressure ulcers prevention and/or patient safety. MaxQda 2020 qualitative analysis software was used in the content analysis and data processing. Informed consent was obtained, and anonymity was guaranteed. Results Four themes were approached in the interview: (1) Pressure ulcer risk assessment; (2) Nurses and doctors pressure ulcers monitoring; (3) Pressure ulcer risk profiles; and (4) Effective interventions to improve patient safety. The categorisation of the four themes was created a posteriori based on the 'Awareness/Knowledge/Competence, Opportunity, and Motivation - Behaviour Change Wheel' (adapted COM-B system). Interest, responsibility, autonomy, leadership and prioritisation for decision-making were some categories linked to motivation. Braden scale operationalisation, education given during undergraduate degree continued professional health education, missing care, reliability of the records and patients' clinical characteristics emerged as categories associated with awareness/knowledge/competence. Understaffing/nursing hours, health policies, electronic health records systems and clinical language used, access to appropriate equipment and resources, teamwork and clinical support specialist on tissue viability/wound care were some categories related to opportunity. Conclusions Pressure ulcer prevention is complex and requires a focussed attitude, robust evidenced-based knowledge and enhanced skills in risk assessment, communication and team collaboration. The highlighted categories could be further analysed at an organisational level to develop tailored strategies that could contribute to successful evidence-based practice implementation. Relevance to clinical practice The findings provide directions for behavioural change in the hospital context related to pressure ulcers prevention through awareness/knowledge/competence, motivation and opportunity to improve care delivered.

DOI: 10.1093/pubmed/fdv141

Accession Number: WOS:000388454900011

Abstract: Background Lifestyle risk behaviours show an inverse social gradient, clustering in vulnerable groups. We designed and piloted an intervention to address barriers to lifestyle behaviour change among hospital patients. Methods We designed our intervention using effective components of behaviour change interventions informed by psychological theory, Delivered by a health psychologist based at the Royal Free London NHS Foundation Trust, the 4-week intervention included detailed baseline assessment, personalized goal setting, psychological skills development, motivation support and referral to community services. Primary outcomes were feasibility and patient acceptability. We also evaluated changes to health and well-being. Results From 1 July 2013 to 31 September 2014, 686 patients were referred, 338 (49.3%) attended a first appointment and 172 (25.1 %) completed follow-up. Furthermore, 72.1 % of attenders were female with the median age 55 years and poor self-reported baseline health, After 4 weeks, self-efficacy, health and well-being scores significantly improved: 63% of lifestyle goals and 89% of health management goals were fully achieved; 58% of referrals to community lifestyle behaviour change services and 79% of referrals to other services (e.g. Citizen's Advice Bureau) were accepted; 99% were satisfied/very satisfied with the service. Conclusions Our hospital-based intervention was feasible, acceptable and showed preliminary health and well-being gains.

Abstract: Background: Variability in processes of care and outcomes has been reported widely in high-income settings (at geographic, hospital, physician group and individual physician levels); however, such variability and the factors driving it are rarely examined in low-income settings. Methods: Using data from a cross-sectional survey undertaken in 22 hospitals (60 case records from each hospital) across Kenya that aimed at evaluating the quality of routine hospital services, we sought to explore variability in four binary inpatient paediatric process indicators. These included three prescribing tasks and use of one diagnostic. To examine for sources of variability, we examined intra-class correlation coefficients (ICC) and their changes using multi-level mixed models with random intercepts for hospital and clinician levels and adjusting for patient and clinician level covariates. Results: Levels of performance varied substantially across indicators and hospitals. The absolute values for ICCs also varied markedly ranging from a maximum of 0.48 to a minimum of 0.09 across the models for HIV testing and prescription of zinc, respectively. More variation was attributable at the hospital level than clinician level after allowing for nesting of clinicians within hospitals for prescription of quinine loading dose for malaria (ICC = 0.30), prescription of zinc for diarrhoea patients (ICC = 0.11) and HIV testing for all children (ICC = 0.43). However, for prescription of correct dose of crystalline penicillin, more of the variability was explained by the clinician level (ICC = 0.21). Adjusting for clinician and patient level covariates only altered, marginally, the ICCs observed in models for the zinc prescription indicator. Conclusions: Performance varied greatly across place and indicator. The variability that could be explained suggests interventions to improve performance might be best targeted at hospital level factors for three indicators and clinician factors for one. Our data suggest that better understanding of performance and sources of variation might

help tailor improvement interventions although further data across a larger set of indicators and sites would help substantiate these findings.

Abstract: Balance disorders are expressed with main symptoms of vertigo, dizziness instability and disorientation. Most of them are caused by inner ear pathologies, but neurological, medical and psychological factors are also responsible. Balance disorders overwhelmingly affect daily activities and cause psychological and emotional hardship. They are also the main cause of falls which are a global epidemic. Home based balance rehabilitation is an effective approach for alleviating symptoms and for improving balance and self-confidence. However, the adherence in such programs is usually low with lack of motivation and disease related issues being the most influential factors. Holobalance adopts the Capability, Opportunity and Motivation (COM) and Behaviour (B) model to identify the sources of the behaviour that should be targeted for intervention and proposes specific Information Technology components that provide the identified interventions to the users in order to achieve the target behavioural change, which in this case is adherence to home base rehabilitation.

Short Title: Influences on Pregnant Women's and Health Care
Professionals' Behaviour Regarding Maternal Vaccinations: A
Qualitative Interview Study

DOI: 10.3390/vaccines10010076

Article Number: 76

Accession Number: WOS:000746976100001

Abstract: The uptake of maternal influenza and pertussis
vaccinations is often suboptimal. This study explores the factors
influencing pregnant women's and health care professionals' (HCPs)
behaviour regarding maternal vaccinations (MVs). Pregnant/recently
pregnant women, midwives, pharmacists and general practice staff in
Waikato, New Zealand, were interviewed. The analysis used the
behaviour change wheel model. Interviews of 18 women and 35 HCPs
revealed knowledge about MVs varied with knowledge deficiencies
hindering the uptake, particularly for influenza vaccination. HCPs,
especially midwives, were key in raising women's awareness of MVs.
Experience with vaccinating, hospital work (for midwives) and
training increased HCPs' knowledge and proactivity about MVs. A
"woman's choice" philosophy saw midwives typically encouraging women
to seek information and make their own decision. Women's decisions
were generally based on knowledge, beliefs, HCPs' emphasis and their
perceived risk, with little apparent influence from friends, family,
or online or promotional material. General practice's concentration
on children's vaccination and minimal antenatal contact limited
proactivity with MVs. Busyness and prioritisation appeared to affect
HCPs' proactivity. Multi-pronged interventions targeting HCPs and
pregnant women and increasing MV access are needed. All HCPs seeing
pregnant women should be well-informed about MVs, including how to
identify and address women's questions or concerns about MVs to
optimise uptake.

Title: Alcohol consumption after health deterioration in older adults: a mixed-methods study

Journal: Public Health

Volume: 139

Pages: 79-87

Date: Oct

Short Title: Alcohol consumption after health deterioration in older adults: a mixed-methods study

ISSN: 0033-3506

DOI: 10.1016/j.puhe.2016.05.016

Accession Number: WOS:000386189500011

Abstract: Objective: To examine if and how older adults modify their drinking after health deterioration, and the factors that motivate changing or maintaining stable drinking behaviour. Study design: Explanatory follow-up mixed-methods research. Methods: The association between health deterioration and changes in alcohol consumption was examined using secondary data from the English Longitudinal Study of Ageing, a biennial prospective cohort study of a random sample of adults aged 50 years and older living in England. Data were collected through a personal interview and self-completion questionnaire across three waves between 2004 and 2009. The sample size (response rate) across the three waves was 8781 (49.9%), 7168 (40.3%) and 6623 (37.3%). The Chi-squared test was used to examine associations between diagnosis with a long-term condition or a worsening of self-rated health (e.g. from good to fair or fair to poor) and changes in drinking frequency (e.g. everyday, 5-6 days per week, etc.) and volume (ethanol consumed on a drinking day) between successive waves. In-depth interviews with 19 older adults recently diagnosed with a long-term condition were used to explore the factors that influenced change or maintenance in alcohol consumption over time. A purposive sampling strategy was used to recruit a diverse sample of current and former drinkers from voluntary and community organizations in the north of England. An inductive approach was used to analyze the data, facilitating the development of an a posteriori framework for understanding drinking change. Results: There was no significant relationship between health deterioration and changes in drinking volume over time. There was however a significant association between health deterioration and changes in drinking frequency between successive waves ($\chi^2 = 15.24$, $P < 0.001$ and $\chi^2 = 17.28$, $P < 0.001$). For example, of participants reporting health deterioration between the first two waves, 47.6% had stable drinking frequency, 23.4% increased their drinking frequency and 29% reported decreased drinking frequency. In comparison, of participants reporting no health deterioration, 52.7%

reported stable frequency, 20.8% increased frequency and 26.4% decreased frequency. In qualitative interviews, older adults described a wide range of factors that influence changes in drinking behaviour: knowledge gained from talking to healthcare professionals, online and in the media; tangible negative experiences that were attributed to drinking; mood and emotions (e.g. joy); the cost of alcohol; pub closures; and changes in social roles and activities. Health was just one part of a complex mix of factors that influenced drinking among older adults. Conclusion: Patterns of drinking change after health deterioration in older adults are diverse, including stable, increasing and decreasing alcohol consumption over time. Although health motivations to change drinking influence behaviour in some older adults, social and financial motivations to drink are also important in later life and thus a holistic approach is required to influence behaviour. Title: Moving Well-Being Well: a process evaluation of a physical literacy-based intervention in Irish primary schools

Journal: Physical Education and Sport Pedagogy

Volume: 28

Issue: 2

Pages: 196-211

Date: Mar

Short Title: Moving Well-Being Well: a process evaluation of a physical literacy-based intervention in Irish primary schools

ISSN: 1740-8989

DOI: 10.1080/17408989.2021.1967305

Accession Number: WOS:000685989500001

Abstract: Background Many Irish children are failing to meet the recommended guidelines for physical activity. Research shows that children are failing to develop the necessary physical literacy skills to reverse this trend. Early childhood has been identified as a critical period to intervene, with the school environment identified as a key environment to do so. Qualitative research is increasingly included in intervention studies to aid the development of acceptable, attractive, effective and sustainable interventions. The aim of this study was to evaluate the implementation process of the MWBW intervention (Exploratory trial) in the primary school setting, allowing the research team to assess the quality of the intervention's implementation. Objectives included assessing whether

the intervention is suitable for the primary school environment, and to inform for future, mainstream implementation through a comprehensive process evaluation. Methods The intervention is underpinned by both the theory of constraints and self-determination theory, and is designed using the comprehensive framework outlined by the behaviour change wheel. The intervention was delivered in 18 primary schools (22% DEIS) to 925 participants (age range 6–10 years, mean 7.55). The intervention was co-delivered by trained coaches and class teachers who were being upskilled (by trained coaches) whilst the intervention was being delivered. Qualitative data were gathered in the form of child focus groups (N = 32, 62% Male), teacher (N = 31) and principal (N = 5) questionnaires (open-ended questions), coach focus groups (N = 16, 81% Male) and weekly reflections. Data were analysed thematically following Braun and Clarke guidelines on using thematic analysis. Results Five key themes, with subsequent sub-themes, were identified: (1) Implementation of the Moving Well-Being Well model, (2) Outcomes from the intervention, (3) Fidelity of implementation, (4) Key components of favourite games and (5) Challenges faced and areas to develop. Conclusions Findings would suggest that the MWBW intervention is suited to the Irish primary school environment and its model of implementation can provide benefits to both children participants and teachers. Findings also show that the intervention has largely been delivered as intended showing potentially significant increases in participants overall FMS. Future research should examine the contextual impacts on the overall FMS improvement and how it varies from site to site. Evidence from this study also suggests that in order to produce similar or improved results in the future as part of a wider-scale roll-out of the intervention in schools, researchers should look to further assist teachers (possibly through added resources and/or training) to assist fidelity of implementation as well as looking at other factors that may influence intervention outcomes such as weather, seasonality, access to indoor facilities and environmental factors. Title: Reasons for non-adherence to thromboprophylaxis prescribing guidelines in atrial fibrillation in Western Australia: A qualitative descriptive study of general practitioners' views

Journal: Thrombosis Research

Volume: 208

Pages: 83-91

Date: Dec

Short Title: Reasons for non-adherence to thromboprophylaxis
prescribing guidelines in atrial fibrillation in Western Australia:
A qualitative descriptive study of general practitioners' views
ISSN: 0049-3848

DOI: 10.1016/j.thromres.2021.10.025

Accession Number: WOS:000716969400014

Abstract: Background: A significant proportion of the atrial fibrillation (AF) population attending Australian primary care is not receiving guideline-adherent oral anticoagulant (OAC) treatment. This study aimed to explore reasons for non-adherence to thromboprophylaxis guidelines in AF from the perspectives of general practitioners (GPs) and to map these reasons to the Capability, Opportunity, Motivation-Behaviour (COM-B) model to identify potential opportunities to support practice change. Methods: An exploratory qualitative descriptive study among GPs practising in Western Australia was conducted using semi-structured interviews, from November 2020 to February 2021. The Framework Method was employed to facilitate thematic analysis, using NVivo software. Interview responses were also mapped to the COM-B model. Results: Nine of the 10 GPs initially consented participated in the semi-structured interview (Male = 56%, median age = 52 years, data saturation reached with 6 participants). Two themes emerged from analysis of the interview transcripts: (1) GPs' decision-making process and (2) Patient refusal to take OACs. The COM-B model mapping identified behavioural factors that could impact adherence: capability (GPs' knowledge and understanding of AF guideline recommendations), opportunity (access to a cardiologist, and patients' refusal to take OACs), and motivation (using formal bleeding risk assessment tools). Conclusion: GPs identified various reasons contributing to non-adherence to thromboprophylaxis guidelines in patients with AF. Multifaceted interventions should consider behavioural opportunities to improve adherence, including education and training, electronic decision support, clinical audits by allied health professionals, partnership between general practices and local hospitals, and cardiologist-led interventions to support GPs. Further studies are needed to capture patients' reasons for refusing OACs.

DOI: 10.1111/dme.14790

Article Number: e14790

Accession Number: WOS:000745535500001

Abstract: Aims To explore the preferences of adults with type 2 diabetes regarding the approach to weight management discussions in clinical care. Methods Online survey of Australian adults with type 2 diabetes, recruited via a national diabetes registry. Three open-ended questions explored participants' experiences and ideal approach to discussing weight management with health professionals. Data subjected to inductive thematic template analysis. Results Participants were 254 adults, 58% aged 60+ years, 52% women and 35% insulin-treated. Five themes were developed to categorise participants' preferences for, as well as differing experiences of, weight management discussions: (1) collaborative, person-centred care: working together to make decisions and achieve outcomes, taking personal context into consideration; (2) balanced communication: open, clear messages encouraging action, empathy and kindness; (3) quality advice: knowledgeable health professionals, providing specific details or instructions; (4) weight management intervention: suitable modalities to address weight management and (5) system-wide support: referral and access to appropriate multi-disciplinary care. Conclusions Participants expressed preferences for discussing weight management in collaborative, person-centred consultations, with quality advice and personalised interventions across the health system, delivered with empathy. By adopting these recommendations, health professionals may build constructive partnerships with adults with type 2 diabetes and foster weight management.

Short Title: Barriers and facilitators for systematically registering adverse drug reactions in electronic health records: a qualitative study with Dutch healthcare professionals

ISSN: 1474-0338

DOI: 10.1080/14740338.2022.2020756

Accession Number: WOS:000746422800001

Abstract: Background Systematically registering ADRs in electronic health records (EHRs) likely contribute to patient safety as it enables the exchange of drug safety data. Currently, ADRs registrations by healthcare professionals (HCPs) is suboptimal. This study aimed to identify barriers and facilitators perceived by HCPs to register ADRs systematically in EHRs. Research Design and Methods A qualitative study with individual interviews was conducted among specialist physicians and hospital pharmacists from 10 different Dutch hospitals. A semi-structured interview guide was used to identify experienced barriers and facilitators for systematically registering ADRs. Data was analyzed following thematic analysis. Themes within barriers and facilitators were aligned with the Capability-Opportunity-Motivation-Behavior (COM-B) framework. Results In total, 16 HCPs were interviewed. Identified barriers were: lack of knowledge to recognize ADRs, time constraints, inadequate IT system, lack of support, stuck in routine, and not recognizing the importance of registering ADRs. Identified facilitators were: enhanced knowledge and awareness of ADRs, functional IT systems, expanding accountability for registration, and motivation toward registering. Conclusions Barriers and facilitators for registering spanned all aspects of the COM-B model and occurred in individual, social and environmental domains. Addressing these aspects could improve the registration of ADRs and may contribute to patient safety.

Title: Community pharmacists' perceptions on providing fall prevention services: a mixed-methods study

Journal: International Journal of Clinical Pharmacy

Volume: 43

Issue: 6

Pages: 1533-1545

Date: Dec

Short Title: Community pharmacists' perceptions on providing fall prevention services: a mixed-methods study

ISSN: 2210-7703

DOI: 10.1007/s11096-021-01277-4

Accession Number: WOS:000661042300005

Abstract: Background Pharmacists may contribute to fall prevention particularly by identifying and deprescribing fall risk-increasing drugs (FRIDs) in patients with high fall risk. Objective To assess community pharmacists' perceptions on providing fall prevention services, and to identify their barriers and facilitators in offering these fall prevention services including deprescribing of FRIDs. Setting A mixed-methods study was conducted with Dutch pharmacists. Method Quantitative (ranking statements on a Likert scale, survey) and qualitative data (semi-structured interviews) were collected. Out of 466 pharmacists who were invited to participate, 313 Dutch pharmacists ranked statements, about providing fall prevention, that were presented during a lecture, and 205 completed a survey. To explore pharmacists' perceptions in-depth, 16 were interviewed. Quantitative data were analysed using descriptive statistics. All interviews were audiotaped and transcribed verbatim. The capability opportunity motivation-behaviour model was applied to interpret and analyse the findings of qualitative data. Main outcome measure Community pharmacists' views on providing fall prevention. Results Pharmacists stated that they were motivated to provide fall prevention. They believed they were capable of providing fall prevention by FRID deprescribing. They perceived limited opportunities to contribute. Major barriers included insufficient multidisciplinary collaboration, patient unwillingness to deprescribe FRIDs, and lack of time. Facilitators included goal-setting behaviour, financial compensation, and skilled communication. Conclusion Despite the complex decision-making process in medication-related fall prevention, community pharmacists are motivated and feel capable of providing fall prevention. Opportunities for pharmacists to provide fall prevention services should be enhanced, for example by implementing multidisciplinary agreements.

Abstract: Excessive smartphone use has negative effects on our social relations as well as on our mental and psychological health. Most of the previous work to avoid these negative effects is based on a top-down approach such as restricting or limiting users' use of smartphones. Diverging from previous work, we followed a bottom-up approach to understand the practice of smartphone use in public settings from the users' perspective. We conducted observations in four coffeehouses, six focus group sessions with 46 participants and three design workshops with 15 designers. We identified five themes that help better understand smartphone use behavior in public settings and four alternative design approaches to mediate this behavior, namely enlighteners, preventers, supporters, and compliers. We discuss the implications of these themes and approaches for designing future interactive technologies aimed at mediating excessive smartphone use behavior.

Short Title: Estimation of mortality among HIV-infected people on antiretroviral treatment in east Africa: a sampling based approach in an observational, multisite, cohort study

ISSN: 2352-3018

DOI: 10.1016/s2352-3018(15)00002-8

Accession Number: WOS:000363792000010

Abstract: Background Mortality in HIV-infected people after initiation of antiretroviral treatment (ART) in resource-limited settings is an important measure of the effectiveness and comparative effectiveness of the global public health response. Substantial loss to follow-up precludes accurate accounting of deaths and limits our understanding of effectiveness. We aimed to provide a better understanding of mortality at scale and, by extension, the effectiveness and comparative effectiveness of public health ART treatment in east Africa. **Methods** In 14 clinics in five settings in Kenya, Uganda, and Tanzania, we intensively traced a sample of patients randomly selected using a random number generator, who were infected with HIV and on ART and who were lost to follow-up (>90 days late for last scheduled visit). We incorporated the vital status outcomes for these patients into analyses of the entire clinic population through probability-weighted survival analyses. **Findings** We followed 34 277 adults on ART from Mbarara and Kampala in Uganda, Eldoret, and Kisumu in Kenya, and Morogoro in Tanzania. The median age was 35 years (IQR 30–42), 11 628 (34%) were men, and median CD4 count count before therapy was 154 cells per mu L (IQR 70–234). 5780 patients (17%) were lost to follow-up, 991 (17%) were selected for tracing between June 10, 2011, and Aug 27, 2012, and vital status was ascertained for 860 (87%). With incorporation of outcomes from the patients lost to follow-up, estimated 3 year mortality increased from 3.9% (95% CI 3.6–4.2) to 12.5% (11.8–13.3). The sample-corrected, unadjusted 3 year mortality across settings was lowest in Mbarara (7.2%) and highest in Morogoro (23.6%). After adjustment for age, sex, CD4 count before therapy, and WHO stage, the sample-corrected hazard ratio comparing the settings with highest and lowest mortalities was 2.2 (95% CI 1.5–3.4) and the risk difference for death at 3 years was 11% (95% CI 5.0–17.7). **Interpretation** A sampling-based approach is widely feasible and important to an understanding of mortality after initiation of ART. After adjustment for measured biological drivers, mortality differs substantially across settings despite delivery of a similar clinical package of treatment. Implementation research to understand the systems, community, and patients' behaviours driving these differences is urgently needed.

Accession Number: WOS:000449090100001
Abstract: Background: Few studies have tested whether the stress-buffering effects of leisure-time physical activity (LTPA) depend on other resources, such as the satisfaction of basic psychological needs. Therefore, the present study examines the interaction between perceived stress, LTPA and psychological need satisfaction (PNS) on occupational burnout symptoms in a sample of Swiss workers. Methods: The sample consisted of 306 employees (48% women; M-age = 42.9 years, SD = 14.1). Perceived stress was assessed with the Perceived

Stress Scale, LTPA with the International Physical Activity Questionnaire, PNS (autonomy, relatedness, and competence) with the Need Satisfaction Scale, and occupational burnout symptoms with the Shirom-Melamed Burnout Measure. A hierarchical regression analysis and single slopes tests were performed to examine two- and three-way interactions. Results: Stress was positively correlated with burnout, and negatively correlated with LTPA and PNS levels. LTPA was positively associated with PNS, and negatively correlated with burnout. A negative association existed between PNS and burnout. In the hierarchical regression analysis, all main effects, two- and three-way interactions were significant. People who engaged in more LTPA reported fewer burnout symptoms, if they reported high stress. However, the potential of LTPA to buffer stress was particularly evident in participants who reported low PNS. Conclusion: If adult workers are exposed to elevated stress, they are particularly likely to show increased burnout levels if they report low LTPA in combination with low PNS, specifically a lack of autonomy, competence and relatedness.

Abstract: Despite an abundance of literature on health behavior, behavior change, and motivational psychology, it is not always clear for health app designers how to translate these theoretical models

and constructs into actionable, motivational app features. To bridge the gap between theories and features, we crafted a dyad of lenses. The lens of features offers designers a description at the implementation level. The lens of theories presents an accessible explanation of the health theory. Essential is that each lens offers cross-links: the lens of features links to the different theoretical concepts that ground the feature. The lens of theories cross-links to the different features that operationalize the theory or construct. The dyadic lenses are accessible via an online platform. In this paper, we first present the development of the dyadic lenses, i.e. the selection of the features and mapping to psychological theories. Next, we present an evaluation of the dyadic lenses by 52 aspirant app designers. Results suggest that the platform facilitates the selection and implementation of motivational features in mHealth applications. By making the platform publicly available (www.lensesofmotivationaldesign.com), we aim to provide actionable advice for app creators, and to allow them to integrate motivational features while retaining how these are grounded in theory.

Article Number: 15207

Accession Number: WOS:000887677000001

Abstract: Background: Sustainable and healthy dietary patterns can help achieve both optimal health and reduce environmental impacts. They involve the increased intake of plant-based foods which are local and seasonal, and reduced intake of animal-derived foods and food wastage. There is emerging evidence regarding the use and effectiveness of web-based health promotion programs to improve diet related behaviours especially in young adults. This study investigated the effectiveness of the "Green Hub" pilot study, a four-week web-based experiential nutrition education intervention to

promote sustainable and healthy diets among young adults in Australia. Methods: This study used a pre-/post-study design with process evaluation. The four-week intervention integrated modules on different aspects of a sustainable and healthy diets and was delivered through a private Facebook group. Eligible participants were young adults between the age of 18-25 years old residing in Australia. Results: Out of 19 participants who consented, 17 participants completed the program. Two thirds of participants (67%) stated that they were familiar with the sustainable and healthy diet concept but only 33% were able to define this concept comprehensively. The post-intervention survey resulted in improved knowledge, attitudes, and motivation to adopt more sustainable eating patterns. Conclusion: The "Green Hub" experiential nutrition education program showed positive impact on participants' willingness to adopt sustainable and healthy diets. The findings of this pilot study will inform future larger scale studies and policy development on improving sustainable and healthy diets among young adults.

Short Title: Family doctors' roles and perceptions on antibiotic consumption and antibiotic resistance in Romania: a qualitative study

DOI: 10.1186/s12875-023-02047-z

Article Number: 93

Accession Number: WOS:000966427300001

Abstract: BackgroundAntimicrobial resistance (AMR) is a major global health issue, bringing significant health burden and costs to societies. Increased antibiotic consumption (ABC) is linked to AMR emergence. Some of the known drivers of ABC are antibiotics over-prescription by physicians and their misuse by patients. Family doctors are recognised as important stakeholders in the control of ABC as they prescribe antibiotics and are considered a reliable source of medical information by patients. Therefore, it is important to explore their perceptions, especially in Romania, which has the highest ABC among European Union Member States. Furthermore, there is no published research exploring Romanian family doctors'

perceptions regarding this phenomenon. **Methods** This was a qualitative study with data collection via semi-structured interviews among 12 family doctors. Manifest and latent content analysis was used to gain an in-depth understanding of their perceptions. Findings were mapped onto the domains of the Behaviour Change Wheel to facilitate a theory driven systematization and analysis. **Results** Two main subthemes emerged: i) factors affecting ABC and prescribing and ii) potential interventions to tackle ABC and antibiotic resistance. The factors were further grouped in those that related to the perceived behaviour of family doctors or patients as well as those that had to do with the various systems, local contexts and the COVID-19 pandemic. An overarching theme: 'family doctors in Romania see their role differently when it comes to antibiotic resistance and perceive the lack of patient education or awareness as one of the major drivers of ABC' was articulated. The main findings suggested that the perceived factors span across the capability, opportunity and motivational domains of the behaviour change wheel and could be addressed through a variety of interventions – some identified by the participants. Findings can also be viewed through cultural lenses which shed further light on the family doctor– patient dynamic when it comes to antibiotics use. **Conclusion** Potential interventions to tackle identified factors emerged, revolving mostly on efforts to educate patients or the public. This exploratory research provides key perspectives and facilitates further research on potential interventions to successfully address AMR in Romania or similar settings.

ISSN: 0305-7453

DOI: 10.1093/jac/dkad128

Accession Number: WOS:000981193000001

Abstract: Introduction A large proportion of the burden of infections with antibiotic-resistant bacteria is linked to community-associated infections. This suggests that interventions set in community settings are needed. Currently there is a gap in understanding the potential of such interventions across all

geographies. This systematic review aimed to synthesize the evidence on the value of community-based behaviour change interventions to improve antibiotic use. These are any interventions or innovations to services intended to stimulate behaviour changes among the public towards correct antibiotic use, delivered in a community setting and online. Methods Systematic searches of studies published after 2001 were performed in several databases. Of 14 319 articles identified, 73 articles comprising quantitative, qualitative and mixed-methods studies met the inclusion criteria. Results Findings showed positive emerging evidence of the benefits of community-based behaviour change interventions to improve antibiotic use, with multifaceted interventions offering the highest benefit. Interventions that combine educational aspects with persuasion may be more effective than solely educational interventions. The review uncovered difficulties in assessing this type of research and highlights the need for standardized approaches in study design and outcomes measurements. There is emerging, but limited, indication on these interventions' cost-effectiveness. Conclusions Policy makers should consider the potential of community-based behaviour change interventions to tackle antimicrobial resistance (AMR), complementing the clinical-based approaches. In addition to the direct AMR benefits, these could serve also as a means of (re)building trust, due to their inclusive participation leading to greater public ownership and use of community channels.

Short Title: Evaluation of the Impact of a Mass Media Campaign on Periodontal Knowledge among Iranian Adults: A Three-Month Follow-Up

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0169668

Article Number: e0169668

Accession Number: WOS:000391641500126

Abstract: Objectives This study aimed to evaluate the impact of a national media campaign to promote oral health and periodontal knowledge among adults after a three-month follow-up. Methods We conducted a population-based study of adults aged 18 to 50 years using a stratified multi-stage sampling method in Tehran, Iran in 2011. The campaign included an animation clip about periodontal health and disease telecast on national TV for ten consecutive days.

We used an instrument to assess the effect of the campaign at baseline, immediately after the campaign and after a three-month follow-up. A total of 543 participants responded at baseline and immediately after the intervention, and 294 were interviewed at the three-month follow-up assessment (response rate: 54.1%). We assessed each participant's periodontal knowledge score, calculated as a sum of correct answers, and the change in their score following the campaign. We then used a five-item questionnaire to evaluate the participants' opinion of the success of the campaign. We used descriptive statistics and generalised estimating equations (GEE) analysis to conduct the statistical analysis. Results The mean score for knowledge improvement from baseline to immediate post-intervention evaluation was higher among those who saw the campaign (0.61) than among those who did not (0.29); the corresponding figures from immediate evaluation to three-month followup were -0.17 and 0.15, respectively. Adjusting for baseline values, the GEE analysis demonstrated that improvement in the mean score of post-campaign knowledge associated significantly with age, education and seeing the campaign. Significant interaction between the time since seeing the campaign and whether the participant saw it ($p < 0.001$) revealed that the mean difference in the knowledge score between the groups who did and did not see the campaign was 0.4 at the immediate evaluation and -0.04 at the three-month follow-up. The participants received the campaign well in terms of being appealing (91.4%), worth bearing in mind (83.4%) and containing valuable information (80.3%). Conclusions Our findings indicate that a population-based media campaign promoting oral health and periodontal knowledge among adults had a positive short-term impact, although the effect seemed to plateau after three months.

Short Title: The best possible self-intervention as a viable public health tool for the prevention of type 2 diabetes: A reflexive thematic analysis of public experience and engagement

ISSN: 1369-6513

DOI: 10.1111/hex.13311

Accession Number: WOS:000673026900001

Abstract: Background Public health initiatives seek to modify lifestyle behaviours associated with risk (e.g., diet, exercise, and smoking), but underpinning psychological and affective processes must also be considered to maximize success. Objective This study aimed to qualitatively assess how participants engaged with and utilized the best possible self (BPS)-intervention specifically as a type 2 diabetes (T2D) prevention tool. Design and Methods Fourteen participants engaged with a tailored BPS intervention. Reflexive thematic analysis analysed accounts of participant's experiences and feasibility of use. Results All participants submitted evidence of engagement with the intervention. The analysis considered two main themes: Holistic Health and Control. The analysis highlighted several nuanced ways in which individuals conceptualized their health, set goals, and received affective benefits, offering insights into how people personalized a simple intervention to meet their health needs. Conclusions To our knowledge, this is the first study to tailor the BPS intervention as a public health application for the prevention of T2D. The intervention enabled users to identify their best possible selves in a way that encouraged T2D preventive behaviours. We propose that our tailored BPS intervention could be a flexible and brief tool to assist public health efforts in encouraging change to aid T2D prevention. Public Contribution The format, language and application of the BPS intervention were adapted in response to a public consultation group that developed a version specifically for application in this study.

Accession Number: WOS:000774739700001

Abstract: Objective Given the highly infectious nature of COVID-19,

social distancing practices are key in stemming the spread of the virus. We aimed to assess the complex interplay among psychological factors, socio-demographic characteristics and social distancing behaviours within the framework of the widely used Capability, Opportunity, Motivation-Behaviour (COM-B) model. Design The present research employed network psychometrics on data collected during the first UK lockdown in April 2020 as part of the COVID-19 Psychological Research Consortium (C19PRC) Study. Using a network approach, we examined the predictions of psychological and demographic variables onto social distancing practices at two levels of analysis: macro and micro. Results Our findings revealed several factors that influenced social distancing behaviour during the first UK lockdown. The COM-B model was successful in predicting particular aspects of social-distancing via the influence of psychological capability and motivation at the macro-and micro-levels, respectively. Notably, demographic variables, such as education, income, and age, were directly and uniquely predictive of certain social distancing behaviours. Conclusion Our findings reveal psychological factors that are key predictors of social distancing behaviour and also illustrate how demographic variables directly influence such behaviour. Our research has implications for the design of empirically-driven interventions to promote adherence to social distancing practices in this and future pandemics.

Short Title: Promoting recovery-oriented practice in mental health services: a quasi-experimental mixed-methods study

DOI: 10.1186/1471-244x-13-167

Article Number: 167

Accession Number: WOS:000320382900001

Abstract: Background: Recovery has become an increasingly prominent concept in mental health policy internationally. However, there is a lack of guidance regarding organisational transformation towards a

recovery orientation. This study evaluated the implementation of recovery-orientated practice through training across a system of mental health services. Methods: The intervention comprised four full-day workshops and an in-team half-day session on supporting recovery. It was offered to 383 staff in 22 multidisciplinary community and rehabilitation teams providing mental health services across two contiguous regions. A quasi-experimental design was used for evaluation, comparing behavioural intent with staff from a third contiguous region. Behavioural intent was rated by coding points of action on the care plans of a random sample of 700 patients (400 intervention, 300 control), before and three months after the intervention. Action points were coded for (a) focus of action, using predetermined categories of care; and (b) responsibility for action. Qualitative inquiry was used to explore staff understanding of recovery, implementation in services and the wider system, and the perceived impact of the intervention. Semi-structured interviews were conducted with 16 intervention group team leaders post-training and an inductive thematic analysis undertaken. Results: A total of 342 (89%) staff received the intervention. Care plans of patients in the intervention group had significantly more changes with evidence of change in the content of patient's care plans (OR 10.94, 95% CI 7.01-17.07) and the attributed responsibility for the actions detailed (OR 2.95, 95% CI 1.68-5.18). Nine themes emerged from the qualitative analysis split into two superordinate categories. 'Recovery, individual and practice', describes the perception and provision of recovery orientated care by individuals and at a team level. It includes themes on care provision, the role of hope, language of recovery, ownership and multidisciplinary. 'Systemic implementation', describes organizational implementation and includes themes on hierarchy and role definition, training approaches, measures of recovery and resources. Conclusions: Training can provide an important mechanism for instigating change in promoting recovery-orientated practice. However, the challenge of systemically implementing recovery approaches requires further consideration of the conceptual elements of recovery, its measurement, and maximising and demonstrating organizational commitment.

Short Title: Using the Behaviour Change Wheel to design an intervention for partner abusive men in drug and alcohol treatment

DOI: 10.1186/s40814-021-00911-2

Article Number: 191

Accession Number: WOS:000712385700002

Abstract: Background We aimed to establish what core elements were required in a group therapy programme for men who disclose perpetrating intimate partner abuse in a substance use setting and develop, and test the feasibility of delivering an intervention in this setting. Methods We describe the theoretical development and feasibility testing of an integrated substance use and intimate partner abuse intervention ('ADVANCE') for delivery in substance use services. We employed a comprehensive eight-stage process to guide this development applying the 'COM-B' ('capability', 'opportunity', 'motivation' and 'behaviour') model for intervention design which specifies the following: (1) define the problem, (2) select the target behaviour, (3) specify the target behaviour, (4) identify what needs to change, (5) identify intervention functions, (6) identify policy categories, (7) select behaviour change techniques, and (8) design a mode of delivery. The development was informed by primary research conducted by the authors, consulting with organisation steering groups and by those with personal experiences. The identified targets for intervention and mode and method of delivery were then refined over 4 intervention development meetings, using the nominal group technique with the ADVANCE experts, then further refined following consultation with service user groups and wider expert groups via a learning alliance meetings. Results Our final intervention, the ADVANCE intervention consisted of a group intervention comprising of up to four pre-group individual interviews, followed by 12 x 2-h group sessions supported by integrated safety work for victim/survivors, and risk and safety support and integrity support for the professionals. The main targets for change were personal goal planning, self-regulation, and attitudes and beliefs supporting intimate partner abuse. The intervention was regarded as very acceptable to both staff and clients in substance use services, with group attendees reported positive behaviour changes and development of new skills. Conclusion We have demonstrated the ability to employ a structured eight-step process to develop an integrated intervention to address substance use-related intimate partner abuse that is acceptable to staff and clients in substance use services. This led to a feasibility study (ISRCTN 79435190) involving 104 men and 30 staff at three different locations across the UK was conducted to assess the feasibility and acceptability of the intervention and to refine the content and approach to delivery (BMC Public Health, 21: 980, 2021).

Title: A study protocol to assess the feasibility of conducting an
evaluation trial of the ADVANCE integrated intervention to address
both substance use and intimate partner abuse perpetration to men in
substance use treatment

Journal: Pilot and Feasibility Studies

Volume: 6

Issue: 1

Short Title: A study protocol to assess the feasibility of
conducting an evaluation trial of the ADVANCE integrated
intervention to address both substance use and intimate partner
abuse perpetration to men in substance use treatment

DOI: 10.1186/s40814-020-00580-7

Article Number: 62

Accession Number: WOS:000729238200041

Abstract: Background Strong evidence exists that substance use is a
contributory risk factor for intimate partner abuse (IPA)
perpetration. Men in substance use treatment are more likely to
perpetrate IPA than men from the general population. Despite this,
referral pathways are lacking for this group. This trial will assess
the feasibility of conducting an evaluation trial of a tailored
integrated intervention to address substance use and IPA
perpetration to men in substance use treatment. Methods/design
ADVANCE is a multicentre, parallel-group individually randomised controlled
feasibility trial, with a nested formative evaluation, comparing an
integrated intervention to reduce IPA + substance use treatment as
usual (TAU) to TAU only. One hundred and eight men who have
perpetrated IPA in the past 12 months from community substance use
treatment in London, the West Midlands, and the South West will be
recruited. ADVANCE is a manualised intervention comprising 2-4
individual sessions (2 compulsory) with a keyworker to set goals,
develop a personal safety plan and increase motivation and
readiness, followed by a 12-session weekly group intervention
delivered in substance use services. Men will be randomly allocated
(ratio 1:1) to receive the ADVANCE intervention + TAU or TAU only.
Men's female (ex) partners will be invited to provide outcome data
and offered support from integrated safety services (ISS). Regular
case management meetings between substance use and ISS will manage
risk. Outcome measures will be obtained at the end of the
intervention (approximately 4 months post-randomisation) for all
male and female participants. The main objective of this feasibility
trial is to estimate parameters required for planning a definitive
trial including rates of consent, recruitment, and follow-up by site

and group allocation. Nested formative evaluation including focus groups and in-depth interviews will explore the intervention's acceptability to participants, group facilitators, keyworkers and ISS workers. Secondary outcomes include substance use, IPA, mental health, self-management, health and social care service use, criminal justice contacts, and quality of life. Discussion Findings from this feasibility trial will inform the design of a multicentre randomised controlled trial evaluating the efficacy and cost-effectiveness of the ADVANCE intervention for reducing IPA and improving the well-being of female (ex)partners. Trial registration ISRCTN79435190.

Short Title: A Systematic Review and Meta-analysis of Psychosocial Interventions to Reduce Drug and Sexual Blood Borne Virus Risk Behaviours Among People Who Inject Drugs

ISSN: 1090-7165

DOI: 10.1007/s10461-017-1755-0

Accession Number: WOS:000404629400001

Abstract: Opiate substitution treatment and needle exchanges have reduced blood borne virus (BBV) transmission among people who inject drugs (PWID). Psychosocial interventions could further prevent BBV. A systematic review and meta-analysis examined whether psychosocial interventions (e.g. CBT, skills training) compared to control interventions reduced BBV risk behaviours among PWID. 32 and 24 randomized control trials (2000-May 2015 in MEDLINE, PsycINFO,

CINAHL, Cochrane Collaboration and Clinical trials, with an update in MEDLINE to December 2016) were included in the review and meta-analysis respectively. Psychosocial interventions appear to reduce: sharing of needles/syringes compared to education/information (SMD -0.52; 95% CI -1.02 to -0.03; I-2 = 10%; p = 0.04) or HIV testing/counselling (SMD -0.24; 95% CI -0.44 to -0.03; I-2 = 0%; p = 0.02); sharing of other injecting paraphernalia (SMD -0.24; 95% CI -0.42 to -0.06; I-2 = 0%; p < 0.01) and unprotected sex (SMD -0.44; 95% CI -0.86 to -0.01; I-2 = 79%; p = 0.04) compared to interventions of a lesser time/intensity, however, moderate to high heterogeneity was reported. Such interventions could be included with other harm reduction approaches to prevent BBV transmission among PWID.

Title: Preconditions for successful advance care planning in nursing homes: A systematic review

Journal: International Journal of Nursing Studies

Volume: 66

Pages: 47-59

Date: Jan

Short Title: Preconditions for successful advance care planning in nursing homes: A systematic review

ISSN: 0020-7489

DOI: 10.1016/j.ijnurstu.2016.12.003

Accession Number: WOS:000393253300007

Abstract: Objectives: There is growing evidence of the potential effectiveness of advance care planning. Yet important knowledge gaps remain regarding the preconditions for successful implementation of advance care planning in the nursing home setting. We aim to identify the preconditions related to successful advance care planning in the nursing home setting. By specifying those, we would be able to make well-founded choices for the future design and planning of advance care planning intervention programs. Design: A systematic review. Data sources: PubMed, PsycINFO, EMBASE and CINAHL. Review methods: Two authors independently screened publications. One author assessed methodological quality and extracted textual data, which was double-checked for a random sample. We extracted textual data and used thematic synthesis to

identify "preconditions", defined as requirements, conditions and elements necessary to achieve the desired outcome of advance care planning, i.e. attaining concordance between residents' preferences and actual care or treatment received at the end of life. Main findings: Based on 38 publications, we identified 17 preconditions at five different levels: resident, family, health-care professional, facility and community. Most preconditions were situated on multiple levels but the majority addressed professionals and the nursing home itself. We summarized preconditions in five domains: to have sufficient knowledge and skills, to be willing and able to participate in advance care planning, to have good relationships, to have an administrative system in place, and contextual factors supporting advance care planning within the nursing home. Conclusion: There are multiple preconditions related to successfully implementing advance care planning in the complex nursing home setting that operate at micro, meso and macro level. Future interventions need to address these multiple domains and levels in a whole-system approach in order to be better implementable and more sustainable, while simultaneously target the important role of the health-care professional and the facility itself. Title: Postsurgery wound assessment and management practices: a chart audit

Journal: Journal of Clinical Nursing

Volume: 23

Issue: 21-22

Pages: 3250-3261

Date: Nov

Short Title: Postsurgery wound assessment and management practices: a chart audit

ISSN: 0962-1067

DOI: 10.1111/jocn.12574

Accession Number: WOS:000343835300026

Abstract: Aims and Objectives. To examine wound assessment and management in patients following surgery and to compare these practices with current evidence-based guidelines for the prevention

of surgical site infection across one healthcare services district in Queensland, Australia. Background. Despite innovations in surgical techniques, technological advances and environmental improvements in the operating room, and the use of prophylactic antibiotics, surgical site infections remain a major source of morbidity and mortality in patients following surgery. Design. A retrospective clinical chart audit Methods. A random sample of 200 medical records of patients who had undergone surgery was undertaken over a two-year period (2010–2012). An audit tool was developed to collect the data on wound assessment and practice. The study was undertaken across one healthcare services district in Australia. Results. Of the 200 records that were randomly identified, 152 (76%) met the inclusion criteria. The excluded records were either miscoded or did not involve a surgical incision. Of the 152 records included, 87 (57.2%) procedures were classified as 'clean' and 106 (69.7%) were elective. Wound assessments were fully documented in 63/152 (41.4%) of cases, and 59/152 (38.8%) charts had assessments documented on a change of patient condition. Of the 15/152 (9.9%) patients with charted postoperative wound complications, 4/15 (26.6%) developed clinical signs of wound infection, which were diagnosed on days 3 to 5. Conclusions. The timing, content and accuracy of wound assessment documentation are variable. Standardising documentation will increase consistency and clarity and contribute to multidisciplinary communication. Relevance to clinical practice. These results suggest that postoperative wound care practices are not consistent with evidence-based guidelines. Consequently, it is important to involve clinicians in identifying possible challenges within the clinical environment that may curtail guideline use.

Short Title: Unlocking the "black box" of practice improvement strategies to implement surgical safety checklists: a process evaluation

ISSN: 1178-2390

DOI: 10.2147/jmdh.S124298

Accession Number: WOS:000398615400001

Abstract: Background: Compliance with surgical safety checklists (SSCs) has been associated with improvements in clinical processes such as antibiotic use, correct site marking, and overall safety processes. Yet, proper execution has been difficult to achieve. Objectives: The objective of this study was to undertake a process evaluation of four knowledge translation (KT) strategies used to implement the Pass the Baton (PTB) intervention which was designed to improve utilization of the SSC. Methods: As part of the process evaluation, a logic model was generated to explain which KT strategies worked well (or less well) in the operating rooms of a tertiary referral hospital in Queensland, Australia. The KT strategies implemented included change champions/opinion leaders, education, audit and feedback, and reminders. In evaluating the implementation of these strategies, this study considered context, intervention and underpinning assumptions, implementation, and mechanism of impact. Observational and interview data were collected to assess implementation of the KT strategies relative to fidelity, feasibility, and acceptability. Results: Findings from 35 structured observations and 15 interviews with 96 intervention participants suggest that all of the KT strategies were consistently implemented. Of the 220 staff working in the department, that is, nurses, anesthetists, and surgeons, 160 (72.7%) knew about the PTB strategies. Qualitative analysis revealed that implementation was generally feasible and acceptable. A barrier to feasibility was physician engagement. An impediment to acceptability was participants' skepticism about the ability of the KT strategies to effect behavioral change. Conclusion: Overall, results of this evaluation suggest that success of implementation was moderate. Given the probable impact of contextual factors, that is, team culture and the characteristics of participants, the KT strategies may need modification prior to widespread implementation. Short Title: Implementation of safety checklists in surgery: a realist synthesis of evidence

ISSN: 1748-5908

DOI: 10.1186/s13012-015-0319-9

Article Number: 137

Accession Number: WOS:000361786100001

Abstract: **Aim:** The aim of this review is to present a realist synthesis of the evidence of implementation interventions to improve adherence to the use of safety checklists in surgery. **Background:** Surgical safety checklists have been shown to improve teamwork and patient safety in the operating room. Yet, despite the benefits associated with their use, universal implementation of and compliance with these checklists has been inconsistent. **Data sources:** An overview of the literature from 2008 is examined in relation to checklist implementation, compliance, and sustainability. **Review methods:** Pawson's and Rycroft-Malone's realist synthesis methodology was used to explain the interaction between context, mechanism, and outcome. This approach incorporated the following: defining the scope of the review, searching and appraising the evidence, extracting and synthesising the findings, and disseminating, implementing, and evaluating the evidence. We identified two theories a priori that explained contextual nuances associated with implementation and evaluation of checklists in surgery: the Normalisation Process Theory and Responsive Regulation Theory. **Results:** We identified four a priori propositions: (1) Checklist protocols that are prospectively tailored to the context are more likely to be used and sustained in practice, (2) Fidelity and sustainability is increased when checklist protocols can be seamlessly integrated into daily professional practice, (3) Routine embedding of checklist protocols in practice is influenced by factors that promote or inhibit clinicians' participation, and (4) Regulation reinforcement mechanisms that are more contextually responsive should lead to greater compliance in using checklist protocols. The final explanatory model suggests that the sustained use of surgical checklists is discipline-specific and is more likely to occur when medical staff are actively engaged and leading the process of implementation. Involving clinicians in tailoring the checklist to better fit their context of practice and giving them the opportunity to reflect and evaluate the implementation intervention enables greater participation and ownership of the process. **Conclusions:** A major limitation in the surgical checklist literature is the lack of robust descriptions of intervention methods and implementation strategies. Despite this, two consequential findings have emerged through this realist synthesis: First, the sustained use of surgical checklists is discipline-specific and is more successful when physicians are actively engaged and leading implementation. Second, involving clinicians in tailoring the checklist to their context and encouraging them to reflect on and evaluate the implementation process enables greater participation and ownership.

Abstract: The 2nd International DKFZ Conference on Cancer Prevention (CCP2020) organized by the German Cancer Research Center (DKFZ) was held as a virtual event on 17-18 September 2020. The event gathered experts on cancer prevention from around the world with the aim of generating a stimulating interchange of opinions between clinicians and basic researchers working in the field. The talks and posters of the conference fueled exciting discussions and debates about the state of the art of cancer prevention and provided a comprehensive

outlook on the many aspects of the field. The program was divided into three main sessions, illustrating the most recent methodological approaches and interventions in primary, secondary and tertiary prevention, enriched by introductory lectures depicting the most relevant aspects of each session. The key concepts covered in this meeting were risk factors, early detection, improving life after cancer, cancer prevention in Europe and personalized prevention. The importance of the latter was expressly highlighted, many presentations emphasizing that in the era of personalized medicine, prevention also needs to be based on the unique genetic, epigenetic, social and behavioral characteristics of the individual to achieve maximal efficacy. In this article, we summarize the key messages emerging from each section, with particular attention on the most important challenges yet to be met in the field of cancer prevention.

Short Title: Effects of the Active Choices Program on Self-Managed Physical Activity and Social Connectedness in Australian Defence Force Veterans: Protocol for a Cluster-Randomized Trial

ISSN: 1929-0748

DOI: 10.2196/21911

Article Number: e21911

Accession Number: WOS:000751766900005

Abstract: Background: A stepped-down program is one in which clients transition from the care of a health professional to self-managed care. Very little is known about the effectiveness of stepped-down physical activity (PA) programs for military service veterans.

Objective: This study will test Active Choices, a stepped-down behavioral support program designed to help Australian Defence Force veterans and their dependents who are clients of the Department of Veterans' Affairs, transition from treatment by an exercise physiologist or physiotherapist to self-managed PA. Methods: The study is a parallel-group, randomized trial, with city-based

exercise physiology or physiotherapy practices that recruit eligible Department of Veterans' Affairs clients assigned to Active Choices or a comparison program. The study aims to recruit 52 participants (26 in each group). The Active Choices program will consist of 2 face-to-face (Weeks 1, 12) and 2 telephone (Weeks 4 and 8) consultations. During these sessions, the participant and Active Choices consultant will utilize an evidence-based resource booklet to review the key benefits of an active lifestyle, build an action plan for PA preferences, set and review goals, self-monitor progress relative to set goals, and discuss strategies to overcome PA barriers. Linking participants to local PA communities to overcome social isolation will be a program priority. The comparison program will consist of 2 consultations (Weeks 1 and 12) and use fewer behavioral support strategies (education, self-monitoring, and action planning only) than Active Choices. Outcome measures will be administered at baseline, end-intervention (12 weeks), and follow-up (24 weeks) to assess changes in moderate intensity self-managed PA, psychological well-being, and social connectedness. We will also measure health service utilization and costs as well as PA choices across the intervention period. End-intervention interviews will capture participant experiences. Results: Due to the impacts of the COVID-19 pandemic on human research activities in Australia, participant recruitment will commence when it is safe and feasible to do so. Conclusions: Findings will provide valuable pilot data to support up-scaling of the program and larger effectiveness trials with regional and rural as well as city-based Australian Defence Force veterans and their dependents.

ISSN: 2391-9531

DOI: 10.1515/opag-2021-0034

Accession Number: WOS:000692825300001

Abstract: Against a worsening backdrop of climate stress and population growth, drought-resistant, highly adaptable, nutritious orange-fleshed sweetpotato (OFSP) stands out as a sustainable food crop that supports household resiliency, food security, and health. Recognized as one of the cheapest sources of vitamin A (VA), OFSP holds promise as a food-based approach to combat VA deficiency, a significant public health concern in sub-Saharan Africa. Because the dominant white-fleshed varieties have no beta-carotene, research initiated in the mid-1990s set out to adapt, develop, and promote VA-rich OFSP as a more nutritious alternative to non-OFSP types. Multisectorial strategies that integrate agriculture with health or education sectors hold promise as effective strategies to ensure OFSP reaches and meets the needs of those populations at greatest risk of VA deficiency – pregnant and lactating women, infants, and children. In this article, we share experiences, findings, implementation challenges, and lessons learned from four integrated programs in Kenya, Tanzania, Mozambique, and Ethiopia that aimed to improve the nutrition and health of women and children with production and promotion of OFSP. Across these projects, households significantly increased OFSP production. In all but one, changes in OFSP production were accompanied by improved food security and maternal and child diets.

Title: Characterizing tobacco and marijuana use among youth combustible tobacco users experiencing homelessness – considering product type, brand, flavor, frequency, and higher-risk use patterns and predictors

Journal: BMC Public Health

Volume: 22

Issue: 1

Date: Apr

Short Title: Characterizing tobacco and marijuana use among youth combustible tobacco users experiencing homelessness – considering product type, brand, flavor, frequency, and higher-risk use patterns and predictors

DOI: 10.1186/s12889-022-13244-3

Article Number: 820

Accession Number: WOS:000787314300007

Abstract: Background Cigarette smoking is three times more prevalent among youth experiencing homelessness compared with the general population. Co-use of tobacco and marijuana is also common. The aim

of this study is to characterize tobacco and marijuana use among youth experiencing homelessness who use combustible tobacco in a Midwestern city to inform smoking cessation intervention. Methods This study included 96 youth (ages 14–24 years; 52% male, 39% female, 5% transgender/non-binary) attending a homeless drop-in center who had used at least one combustible tobacco product in the past week. We assessed past-month use of tobacco products and marijuana, other product use characteristics (e.g., frequency, brand and flavor), and psychosocial predictors of more frequent (i.e., daily) use of combustible tobacco and marijuana. Results Most youth experiencing homelessness with past-week combustible tobacco use had used cigarettes (n = 85, 88.5%), cigars (n = 89, 92.7%), and marijuana (n = 82, 85.4%) in the past month. One-third (n = 34) used electronic vapor products (EVPs), 19.8% (n = 19) smoked hookah, and 11.5% (n = 11) used smokeless tobacco (ST). Most marijuana users co-administered with tobacco (n = 67, 69.8%). Daily combustible tobacco smoking was associated with having a child and smoking out of boredom/habit. Daily marijuana use was associated with using substances to cope with one's housing situation. Newport (n = 66, 72.5%) and Black & Mild (n = 48, 51.1%) were the most popular brands of cigarettes and cigars among ever users. Most non-combustible tobacco ever users reported not having a usual brand (EVPs: n = 51, 73.9%; ST: n = 16, 57.1%). Cigar smokers reported the most varied selection of flavors. Conclusions Young combustible tobacco users experiencing homelessness engage in high-risk use patterns, including poly-tobacco use, co-use of tobacco with marijuana, and frequent combustible product use. Interventions that consider the full context of tobacco and marijuana use are needed to support smoking cessation in this population.

Title: The impact of audit and feedback to support change behaviour in healthcare organisations – a cross-sectional qualitative study of primary care centre managers

Journal: BMC Health Services Research

Volume: 21

Issue: 1

Date: Jul

Short Title: The impact of audit and feedback to support change behaviour in healthcare organisations – a cross-sectional qualitative study of primary care centre managers

DOI: 10.1186/s12913-021-06645-4

Article Number: 663

Accession Number: WOS:000672490300003

Abstract: Background This article addresses the role of audit and feedback (A&F) to support change behaviour and quality improvement

work in healthcare organisations. It contributes to the sparse literature on primary care centre (PCC) managers views on A&F practices, taking into account the broad scope of primary care. The purpose was to explore if and how different types of A&F support change behaviour by influencing different forms of motivation and learning, and what contextual facilitators and barriers enable or obstruct change behaviour in primary care. Methods A qualitative research approach was used. We explored views about the impact of A&F across managers of 27 PCCs, in five Swedish regions, through semi-structured interviews. A purposeful sampling was used to identify both regions and PCC managers, in order to explore multiple perspectives. We used the COM-B framework, which describes how Capability, Opportunity and Motivation interact and generate change behaviour and how different factors might act as facilitators or barriers, when collecting and analysing data. Results Existing forms of A&F were perceived as coercive top-down interventions to secure adherence to contractual obligations, financial targets and clinical guidelines. Support to bottom-up approaches and more complex change at team and organisational levels was perceived as limited. We identified five contextual factors that matter for the impact of A&F on change behaviour and quality improvement work: performance of organisations, continuity in staff, size of organisations, flexibility in leadership and management, and flexibility offered by the external environment. Conclusions External A&F, perceived as coercive by recipients of feedback, can have an impact on change behaviour through 'know-what' and 'know-why' types of knowledge and 'have-to' commitment but provide limited support to complex change. 'Want-to' commitment and bottom-up driven processes are important for more complex change. Similar to previous research, identified facilitators and barriers of change consisted of factors that are difficult to influence by A&F activities. Future research is needed on how to ensure co-development of A&F models that are perceived as legitimate by health care professionals and useful to support more complex change.

ISSN: 0040-0912
DOI: 10.1108/et-10-2016-0155
Accession Number: WOS:000417262200005

Abstract: Purpose – The purpose of this paper is to explore the behavioural determinants of work-related benefits claimants' training behaviours and to suggest ways to improve claimants' compliance with training referrals. Design/methodology/approach – Qualitative interviews were conducted with 20 Jobcentre Plus staff and training providers, and 60 claimants. Claimants were sampled based on whether or not they had been mandated to training and whether or not they subsequently participated. Along with general findings, differences between these groups are highlighted. Findings – Claimants' behaviours are affected by their capabilities, opportunities, and motivations in interrelated ways. Training programmes should appreciate this to better ensure claimants' completion of training programmes. Originality/value – Whilst past papers have largely examined a limited number of factors that affect claimants' training behaviours, this report offers a synchronised evaluation of all the behavioural factors that affect claimants' training behaviours.

Short Title: Patients' views and experiences of technology based self-management tools for the treatment of hypertension in the community: A qualitative study

DOI: 10.1186/s12875-015-0333-7

Article Number: 119

Accession Number: WOS:000360884800001

Abstract: Background: Patients with hypertension in the community frequently fail to meet treatment goals. The optimal way to organize and deliver care to hypertensive patients has not been clearly identified. The powerful on-board computing capacity of mobile devices, along with the unique relationship individuals have with newer technologies, suggests that they have the potential to influence behaviour. However, little is known regarding the views and experiences of patients using such technology to self-manage their hypertension and associated lifestyle behaviours. The aim of this study was to explore patients' views and experiences of using technology based self-management tools for the treatment of hypertension in the community. Methods: This focus group study was

conducted with known hypertensive patients over 45 years of age who were recruited in a community setting in Ireland. Taped and transcribed semi-structured interviews with a purposeful sample involving 50 participants in six focus groups were used. Framework analysis was utilized to analyse the data. Results: Four key inter-related themes emerged from the analysis: individualisation; trust; motivation; and communication. The globalisation of newer technologies has triggered many substantial and widespread behaviour changes within society, yet users are unique in their use and interactions with such technologies. Trust is an ever present issue in terms of its potential impact on engagement with healthcare providers and motivation around self-management. The potential ability of technology to influence motivation through carefully selected and tailored messaging and to facilitate a personalised flow of communication between patient and healthcare provider was highlighted. Conclusions: Newer technologies such as mobile devices and the internet have been embraced across the globe despite technological challenges and concerns regarding privacy and security. In the design and development of technology based self-management tools for the treatment of hypertension, flexibility and security are vital to allow and encourage patients to customise, personalise and engage with their devices.

Short Title: Medicine, black magic and supernatural beings: Cultural rituals as a significant threat to slender lorises in India

ISSN: 0011-3891

DOI: 10.1002/pan3.10336

Accession Number: WOS:000797226700001

Abstract: Trade of wildlife for use in traditional medicines, rituals, magical spells and cultural practices occurs globally and has been studied mostly in Africa and Asia. The grey slender loris *Loris lydekkerianus* is used for both medicinal and ritual purposes, but little information is available on how the user is meant to extract their medicinal properties, or the potential impact these

practices have on the species' populations. From 2014–2021, we used open-ended interviews with 293 informants in three slender loris range states in Southern India to collect qualitative information on people's beliefs regarding the use of slender lorises in traditional medicine, black magic rituals and other cultural practices. To understand this further, we analysed data on 139 live slender loris rescues from three rescue and rehabilitation centres and one government organization in Bengaluru, India collected over an 18-year period. We found that 116/139 live individuals had been involved in black magic rituals, including piercing, or burning the body and the eyes. These ritual practices occurred more often to female slender lorises and during the new moon. Data from 293 interviews revealed that astrologers regularly use live lorises for fortune-telling or for warding off evil. Slender loris body parts are used to make traditional folk medicine, develop black magic potions that bring people harm, hypnotize people or to thwart evil. Habitat loss and anthropogenic pressures, coupled with the existing slender loris trade for cultural practices, are a cause for grave concern. Numerous deep-rooted superstitious beliefs and rituals continue to thrive in modern India, and this is potentially one of the major threats to India's already imperilled slender loris population. More research into the prevalence of loris use for black magic is needed to assess the impact on species sustainability. Read the free Plain Language Summary for this article on the Journal blog.

Short Title: Multicentre, England-wide randomised controlled trial of the 'Foundations' smartphone application in improving mental health and well-being in a healthcare worker population

ISSN: 0007-1250

DOI: 10.1192/bjp.2022.103

Accession Number: WOS:000847586100001

Abstract: Background Healthcare workers (HCWs) have faced considerable pressures during the COVID-19 pandemic. For some, this has resulted in mental health distress and disorder. Although interventions have sought to support HCWs, few have been evaluated. Aims We aimed to determine the effectiveness of the 'Foundations' application (app) on general (non-psychotic) psychiatric morbidity. Method We conducted a multicentre randomised controlled trial of HCWs at 16 NHS trusts (trial registration number: EudraCT: 2021-001279-18). Participants were randomly assigned to the app or wait-list control group. Measures were assessed at baseline, after 4 and 8 weeks. The primary outcome was general psychiatric morbidity (using the General Health Questionnaire). Secondary outcomes included: well-being; presenteeism; anxiety; depression and insomnia. The primary analysis used mixed-effects multivariable regression, presented as adjusted mean differences (aMD). Results Between 22 March and 3 June 2021, 1002 participants were randomised (500:502), and 894 (89.2%) followed-up. The sample was predominately women (754/894, 84.3%), with a mean age of 44.3 years (interquartile range (IQR) 34-53). Participants randomised to the app had a reduction in psychiatric morbidity symptoms (aMD = -1.39, 95% CI -2.05 to -0.74), improvement in well-being (aMD = 0.54, 95% CI 0.20 to 0.9) and reduction in insomnia (adjusted odds ratio (aOR) = 0.36, 95% CI 0.21 to 0.60). No other significant findings were found, or adverse events reported. Conclusions The app had an effect in reducing psychiatric morbidity symptoms in a sample of HCWs. Given it is scalable with no adverse effects, the app may be used as part of an organisation's tiered staff support package. Further evidence is needed on long-term effectiveness and cost-effectiveness. Notes: Gnanapragasam, Sam N. Tinch-Taylor, Rose Scott, Hannah R. Abstract: Schools and municipalities play an important role in local health promotion. The Institute of Public Health at Riga Stradins University in collaboration with the National Centre of Disease Prevention and Control carried out an online survey for studying the experiences and needs of health-promoting schools and municipalities in Latvia in implementing health promotion interventions. The aim of this study was to explore the context for developing new intervention model for a health behaviour change model within the Interreg BaltCityPrevention project "Innovative LifestyleRelated Disease Prevention Model in the Baltic Sea Region." Totally 112 municipalities and 100 schools within the National Health Promoting Networks were targeted. Only schools and municipalities that had previous experiences in health promotion intervention development were included in the analysis. This study showed that school-aged children were the most prevalent target group for the both schools and municipality interventions. The interventions in physical activity and nutrition used to be the most common areas for health behaviour changes. Health promotion schools and municipalities reported several significant differences in experienced difficulties and expected future needs in implementing health promotion interventions, which should be considered for increasing the capacity for better health promotion for both schools and municipalities in Latvia.

ISSN: 0091-7435

DOI: 10.1016/j.ypmed.2016.05.025

Accession Number: WOS:000388316700016

Abstract: Objective. Vaccination is an effective preventive measure to reduce influenza transmission, especially important in a pandemic. Despite the messages encouraging vaccination during the last pandemic, uptake remained low (37.6% in clinical risk groups). This study investigated the effect of different types of messages regarding length, content type, and framing on vaccination intention. Method. An online experiment was conducted in February 2015. A representative sample of 1424 people living in England read a newspaper article about a novel influenza pandemic before being randomised to one of four conditions: standard Department of Health (DoH) (long message) and three brief theory-based messages: an abridged version of the standard DoH and two messages additionally targeting pandemic influenza severity and vaccination benefits (framed as risk-reducing or health-enhancing, respectively). Intention to be vaccinated and potential mediators were measured. Results. The shortened DoH message increased vaccination intention more than the longer one, by increasing perceived susceptibility, anticipated regret and perceived message personal relevance while lowering perceived costs, despite the longer one being rated as slightly more credible. Intention to be vaccinated was not improved by adding information on severity and benefits, and the health-enhancing message was not more effective than the risk-reducing. Conclusion. A briefer message resulted in greater intention to be vaccinated, whereas emphasising the severity of pandemic influenza and the benefits of vaccination did not. Future campaigns should consider using brief theoretically-based messages, targeting knowledge about influenza and precautionary measures, perceived susceptibility to pandemic influenza, and the perceived efficacy and reduced costs of vaccination. Accession Number: WOS:000646143200001

Abstract: This systematic review and intervention content analysis used behavioural science frameworks to characterise content and function of interventions targeting supermarket shoppers' purchasing behaviour, and explore if coherence between content and function was linked to intervention effectiveness. Study eligibility: in-store interventions (physical supermarkets) with control conditions, targeting objectively measured food and/or non-alcoholic drink purchases, published in English (no date restrictions). Eleven electronic databases were searched; reference lists of systematic reviews were hand-searched. Methodological quality was assessed using the GATE checklist. A content analysis was performed to characterise intervention content and function, and theoretical coherence between these, using the Behaviour Change Wheel, Behaviour Change Techniques Taxonomy, and Typology of Interventions in Proximal Physical Micro-Environments (TIPPME). Forty-six articles (49 interventions) met inclusion criteria; 26 articles (32 interventions) were included in the content analysis. Twenty behaviour change techniques (BCTs), and four TIPPME intervention types were identified; three BCTs ('Prompts/cues', 'Material incentive', and 'Material reward') were more common in effective interventions. Nineteen interventions solely employed theoretically appropriate BCTs. Theoretical coherence between BCTs and intervention functions was more common in effective interventions. Effective interventions included price promotions and/or in-store merchandising. Future research should explore the effect of specific BCTs using factorial study designs. PROSPERO Registration: CRD42017071065.

Short Title: Interventions to improve oral health of older people: A scoping review

ISSN: 0300-5712

DOI: 10.1016/j.jdent.2020.103451

Article Number: 103451

Accession Number: WOS:000579477000015

Abstract: Objectives: A range of interventions have been tested to improve oral health of older people. We performed a scoping review to map interventions' aims, outcome measures and findings, and to locate them on different levels of care. Data: We systematically screened for (1) controlled studies on (2) people over 65 years of age, (3) comparing at least two interventions to improve oral health. Interventions were summarized according to their aims and the employed intervention type, mapped on their level of action, and classified as primary/secondary/tertiary prevention. Sources: Studies retrieved via MEDLINE, EMBASE, CINAHL. Study selection: Eighty-one studies (published 1997–2019, conducted mainly in high-income countries) were included. Sample sizes varied (n = 24–1987). Follow-up was 0.25–60 months. Most studies (64/81) found a statistically significant benefit of the intervention. A total of 13 different aims were identified, and a range of intervention types employed (e.g. educational interventions, professional oral healthcare, restorative treatment, fluoride application and, generally, dentifrices, mouthwashes, chewing gums/food supplements). Most studies were located on the carer/patient level (56/81 studies) or the system/policy-maker level (44/81). The majority of studies aimed for primary prevention (64/81). Conclusions: Oral health improvement interventions are widely studied. However, study aims, methods and outcome measures are highly heterogeneous, which limits the ability for robust conclusions. Current research focusses on primary prevention on the level of patients/carers or system/policy-maker level. Future studies may want to consider interventions on dentists' level focussing on secondary prevention. These studies should rely on a core set of comprehensive, standardized set of outcome measures. Clinical significance: While specific interventions seem efficacious to improve older people's oral health, the current body of evidence is neither comprehensive (significant gaps exists in relevant levels of the care process) nor comparable enough to draw robust conclusions.

Article Number: e049306

Accession Number: WOS:000777947200015

Abstract: Objectives To assess possible health policy interventions derived from the theoretical domains framework (TDF) by studying barriers and facilitators on the delivery of oral healthcare and oral hygiene in German care homes using a behavioural change framework. Design Qualitative correlational study to evaluate a national intervention programme. Setting Primary healthcare in two care homes in rural Germany. Participants Eleven stakeholders participating in the delivery of oral healthcare (hygiene, treatment) to older people, including two care home managers, four section managers, two nurses/carers and three dentists. Interventions Semistructured interviews conducted in person in the care homes or by phone. A questionnaire developed along the domains of the TDF and the Capabilities, Opportunities and Motivations influencing Behaviours model was used to guide the interviews. Interviews were transcribed and systematised using Mayring's content analysis along the TDF. Results 860 statements were collected. We identified 19 barriers, facilitators and conflicting themes related to capabilities, 34 to opportunities and 24 to motivation. The lack of access to professional dental care was confirmed by all stakeholders as a major limitation hampering better oral health. Primary outcome A range of interventions can be discussed with the methodology we utilised. In our interviews, lack of dentists willing to treat patients at these facilities was the most discussed barrier for improving oral health of nursing home residents. Secondary outcomes Dentists highlighted the need for better incentives and facilities to deliver oral healthcare in these institutions. Differences with urban settings regarding access to healthcare were frequently discussed by our study participants. Conclusions Within our sample, greater capacitation of care home staff, better financial incentives for dentists and increased cooperation between the two stakeholders should be considered when designing interventions to tackle oral health of care home residents in Germany.

Abstract: Introduction Improving hypertension management is a national priority that can decrease morbidity and mortality. Evidence-based hypertension management guidelines advocate self-measured BP (SMBP), but widespread implementation of SMBP is lacking. The purpose of this study was to describe the perspective of primary care physicians (PCPs) on SMBP to identify the barriers and facilitators for implementing SMBP. Methods We collected data from PCPs from a large health system using semi-structured interviews based on the Theoretical Domains Framework (TDF). Responses were recorded, transcribed, and qualitatively analyzed into three overarching TDF domains based on the Behavior Change Wheel (BCW): 1) Motivation 2) Opportunity and 3) Capabilities. The sample size was based on theme saturation. Results All 17 participating PCPs believed that SMBP is a useful, but underutilized tool. Although individual practices varied, most physicians felt that the increased data points from SMBP allowed for better hypertension management. Most felt that overcoming existing barriers would be difficult, but identified several facilitators: physician support of SMBP, the possibility of having other trained health professionals to assist with SMBP and patient education; improving patient engagement and empowerment with SMBP, and the interest of the health system in using technology to improve hypertension management. Conclusion PCPs believe that SMBP can improve hypertension management. There are numerous barriers and facilitators for implementing SMBP. Successful implementation in clinical practice will require implementation strategies targeted at increasing patient acceptability and reducing physician workload. This may need a radical change in the current methods of managing hypertension.

Issue: 1

Date: Sep

Short Title: Factors impacting-stillbirth and neonatal death audit in Malawi: a qualitative study

DOI: 10.1186/s12913-022-08578-y

Article Number: 1191

Accession Number: WOS:000858878600004

Abstract: Background Over one million babies are stillborn or die within the first 28 days of life each year due to preventable causes and poor-quality care in resource-constrained countries. Death audit may be a valuable tool for improving quality of care and decreasing mortality. However, challenges in implementing audit and their subsequent action plans have been reported, with few successfully implemented and sustained. This study aimed to identify factors that affect stillbirth and neonatal death audit at the facility level in the southern region of Malawi. Methods Thirty-eight semi-structured interviews and seven focus group discussions with death audit committee members were conducted. Thematic analysis was guided by a conceptual framework applied deductively, combined with inductive line-by-line coding to identify additional emerging themes. Results The factors that affected audit at individual, facility and national level were related to training, staff motivation, power dynamics and autonomy, audit organisation and data support. We found that factors were linked because they informed each other. Inadequate staff training was caused by a lack of financial allocation at the facility level and donor-driven approaches to training at the national level, with training taking place only with support from funders. Staff motivation was affected by the institutional norms of reliance on monetary incentives during meetings, gazetted at the national level so that audits happened only if such incentives were available. This overshadowed other benefits and non-monetary incentives which were not promoted at the facility level. Inadequate resources to support audit were informed by limited facility-level autonomy and decision-making powers which remained controlled at the national level despite decentralisation. Action plan implementation challenges after audit meetings resulted from inadequate support at the facility level and inadequate audit policy and guidelines at the national level. Poor documentation affected audit processes informed by inadequate supervision and promotion of data usage at both facility and national levels. Conclusions Given that the factors that facilitate or inhibit audits are interconnected, implementers, policymakers and managers need to be aware that addressing barriers is likely to require a whole health systems approach targeting all system levels. This will require behavioural and complex intervention approaches.

Short Title: Exploring barriers to dementia screening and management services by general practitioners in China: a qualitative study using the COM-B model

DOI: 10.1186/s12877-023-03756-x

Article Number: 55

Accession Number: WOS:000919606300001

Abstract: Background Dementia has become a global public health problem, and general practitioners (GPs) play a key role in diagnosing and managing dementia. However, in Chinese primary care settings, dementia is underdiagnosed and inefficiently managed, and dementia screening and management services provided by GPs are suboptimal. The reasons underlying this gap are poorly understood. This study aimed to determine the barriers that hinder GPs from actively promoting dementia screening and management, and thereby provide insights for the successful promotion of dementia screening and management services in primary care. **Methods** Purposive sampling was used. And focus groups and in-depth interviews were conducted face-to-face among GPs from community health service centers (CHSCs) in South China. Thematic analysis was used to identify barriers to screening and managing dementia and map them to the Capability/Opportunity/Motivation-Behavior model (COM-B model). **Results** Fifty-two GPs were included. The COM-B model found nine barriers to implementing dementia screening and management services in primary healthcare: (1) poor capability: lack of systematic knowledge of dementia and inadequate dementia screening skills; (2) little opportunity: unclear pathways for referral, insufficient time for dementia screening and management, lack of dementia-specific leaders, and no guarantee of services continuity; (3) low motivation: outside of GP scope, worries associated with dementia stigma rooted in culture beliefs, and insufficient financial incentives. **Conclusions** Our study concluded that GPs were not yet ready to provide dementia screening and management services due to poor capability related to knowledge and skills of dementia, little opportunity associated with an unsupportive working environment, and low motivation due to unclear duty and social pressure. Accordingly, systematic implementation strategies should be taken, including standardized dementia training programs, standardized community-based dementia guidelines, expansion of primary care workforces, development of dedicated leaders, and the eradication of stigma attached to dementia to promote dementia screening and management services in primary care.

Abstract: Home food gardening is an important component of urban agriculture and sustainable food systems. However, globally there has been limited research into the barriers and enablers to home food gardening in cities. This study used an exploratory approach, utilising a questionnaire survey of households, and in-depth interviews with gardening experts, to assess barriers and enablers to home food gardening in the City of Hobart, Tasmania, Australia. Overall, nine themes were identified that were common across both survey and interview data. These were time, cost, space, knowledge, ownership, soil, wildlife and pests, mobility, support and access, and community. Barriers vary depending on individual circumstances and are often compounding. Our results indicate that while many households are now growing food, or are interested in growing food, there are limitations on the percentage of food intake that

households can grow at home. Key factors to growing more food include control over property, available land, and gardening experience and know-how. Our findings highlight the need for policy, programs, and resources, especially at the level of local governments, that can contribute to an increase in the amount of local, home grown food in cities.

Abstract: Since its publication in 2008, SQUIRE (Standards for Quality Improvement Reporting Excellence) has contributed to the completeness and transparency of reporting of quality improvement work, providing guidance to authors and reviewers of reports on healthcare improvement work. In the interim, enormous growth has occurred in understanding factors that influence the success, and failure, of healthcare improvement efforts. Progress has been particularly strong in three areas: the understanding of the theoretical basis for improvement work; the impact of contextual factors on outcomes; and the development of methodologies for studying improvement work. Consequently, there is now a need to revise the original publication guidelines. To reflect the breadth of knowledge and experience in the field, we solicited input from a wide variety of authors, editors and improvement professionals during the guideline revision process. This Explanation and Elaboration document (E&E) is a companion to the revised SQUIRE guidelines, SQUIRE 2.0. The product of collaboration by an international and interprofessional group of authors, this document provides examples from the published literature, and an explanation

of how each reflects the intent of a specific item in SQUIRE. The purpose of the guidelines is to assist authors in writing clearly, precisely and completely about systematic efforts to improve the quality, safety and value of healthcare services. Authors can explore the SQUIRE statement, this E&E and related documents in detail at <http://www.squire-statement.org>.

ISSN: 0301-5661

DOI: 10.1111/cdoe.12826

Accession Number: WOS:000931523100001

Abstract: Objectives: The importance of tackling ongoing dental health inequities, observed both within and across countries, cannot be overstated. Alarming, health inequities in some areas are widening, resulting in an urgent need to act. The objective of this commentary is to explore oral health inequities through the lens of behavioral science and discuss adapting evidence based interventions for populations experiencing health inequities. Method/Results: The first section of this paper aims to describe the role of health disparities and inequities within oral health, with a specific focus on behaviours. The determinants, from upstream to downstream, and the interplay between these levels of intervention are discussed. This is followed by an overview of oral health promotion interventions, again with a focus on behaviours, which could potentially improve oral health while also taking into account oral health inequities. It is essential to translate evidence-based interventions (EBIs) to populations that have the greatest burden of disease. The second section of this paper discusses the rationale for cultural adaptation of EBIs, criteria to justify EBIs and

considers different cultural adaptation strategies necessary for the development and testing of effective, engaging, equitable and culturally relevant interventions. Conclusions: We conclude with future directions for the development of theory-based multi-level interventions, guided by extent evidence-based interventions, and transdisciplinary approaches to science and key stakeholders such as patients, providers and payers.

ISSN: 1081-0730

DOI: 10.1080/10810730.2014.1002958

Accession Number: WOS:000352323600007

Abstract: Despite decades of effort, around 2.8 billion people still rely on solid fuels to meet domestic energy needs. There is robust evidence this causes premature death and chronic disease, as well as wider economic, social, and environmental problems. Behavior change interventions are effective to reduce exposure to harm such as household air pollution, including those using health communications approaches. This article reports the findings of a project that reviewed the effectiveness of behavior change approaches in cleaner cooking interventions in resource-poor settings. The authors synthesized evidence of the use of behavior change techniques, along the cleaner cooking value chain, to bring positive health, economic, and environmental impacts. Forty-eight articles met the inclusion criteria, which documented 55 interventions carried out in 20 countries. The groupings of behavior change techniques most frequently used were shaping knowledge (n=47), rewards and threats (n=35), social support (n=35), and comparisons (n=16). A scorecard of behavior change effectiveness was developed to analyze a selection of case study interventions. Behavior change techniques have been used effectively as part of multilevel programs. Cooking demonstrations, the right product, and understanding of the barriers and benefits along the value chain have all played a role. Often

absent are theories and models of behavior change adapted to the target audience and local context. Robust research methods are needed to track and evaluate behavior change and impact, not just technology disseminated. Behavior change approaches could then play a more prominent role as the "special sauce" in cleaner cooking interventions in resource poor settings.

ISSN: 1557-2625

DOI: 10.3122/jabfm.2022.02.210223

Accession Number: WOS:000783292600014

Abstract: Objective: Adults with type 2 diabetes diagnosed at a younger age are at increased risk for poor outcomes. We examined life stage-related facilitators and barriers to early self-management among younger adults with newly diagnosed type 2 diabetes. Research Design and Methods: We conducted 6 focus groups that each met twice between November 2017 and May 2018. Participants (n = 41) were aged 21 to 44 years and diagnosed with type 2 diabetes during the prior 2 years. Transcripts were coded using thematic analysis and themes were mapped to the Capability-Opportunity-Motivation-Behavior framework. Results: Participants were 38.4 (65.8) years old; 10 self-identified as Latinx, 12 as Black, 12 as White, and 7 as multiple or other races. We identified 9 themes that fell into 2 categories: (1) the impact of having an adult family member with diabetes, and (2) the role of nonadult children. Family members with diabetes served as both positive and negative role models, and, for some, personal familiarity with the disease made adjusting to the diagnosis easier. Children facilitated their parents' self-management by supporting self-management activities and motivating their parents to remain healthy. However, the stress and time demands resulting from parental responsibilities and the tendency to prioritize children's needs were perceived as barriers to self-management. Conclusions: Our results highlight how the life position of younger-onset individuals with type 2 diabetes

influences their early experiences. Proactively addressing perceived barriers to and facilitators of self-management in the context of family history and parenthood may aid in efforts to support these high-risk, younger patients. (J Am Board Fam Med 2022;35:341-351.)

Accession Number: WOS:000465573600025

Abstract: Sedentary behaviour is influenced by factors across all levels of the social ecological model. This chapter focuses on the physical and social environmental level of analysis. The chapter summarizes environmental correlates of sedentary behaviour, addresses potential theoretical approaches, and examines the evidence for the effectiveness of environmental interventions on sedentary behaviour. Where relevant, the discussion is separated into young people, adults, and older adults. Some features of the home and workplace have been shown to be associated with sedentary behaviour; however, less is known about influences on sedentary behaviour in other contexts. Theoretical perspectives that may be particularly relevant when considering environmental influences are discussed, including social cognitive theory, habit theory, social network analysis, and systems theory. The theories employed need to try and capture the complex interrelationships between individuals, the groups they operate within and the physical and social context. There is evidence to suggest that incorporating environmental modifications into sedentary behaviour interventions is likely to be effective for both young people and adults.

DOI: 10.1177/22104917221075830

Accession Number: WOS:000768405500001

Abstract: Elective Total Hip Replacement (THR) surgery is one of the most common elective surgeries in the UK, costing the National Health Service (NHS) over 300,000,000 pound annually. A review of the literature identified preoperative rehabilitation, known as 'prehabilitation', improves patient outcomes and decreases Length Of hospital Stay (LOS). This approach follows NICE guidelines which recommend prehabilitation for all patients undergoing joint replacement surgery. Challenges accessing prehabilitation classes at UK hospitals due to inadequate transport and COVID-19 restrictions present an opportunity to provide prehabilitation virtually. Physiotherapy services are increasingly utilising technology, in line with The NHS Long Term Plan to increase service accessibility. A review of the literature has established virtual prehabilitation is effective, feasible, and preferable for patients. Quality Improvement methodology has been used to propose an implementation plan for a virtual prehabilitation service. Further research is required to create a standardised prehabilitation protocol, and to assess the long-term effects and sustainability of virtual prehabilitation.

Title: Nurse role and contribution to antimicrobial stewardship: An integrative review

Journal: International Journal of Nursing Studies

Volume: 117

Date: May

Short Title: Nurse role and contribution to antimicrobial stewardship: An integrative review

ISSN: 0020-7489

DOI: 10.1016/j.ijnurstu.2020.103787

Article Number: 103787

Accession Number: WOS:000659205500007

Abstract: Aim: To examine existing published literature regarding nurses and antimicrobial stewardship, and their potential role and contribution, to identify what is known, to evaluate methodologies

used in published research, and to review and integrate findings to inform practice and future priorities for research. Design: Integrative review. Methodology: The approach to this review was informed by Whittemore and Knafl's integrative review methodology. Electronic databases were searched for papers published since the start of the database to November 2019, with abstracts available, related to humans and published in English. Papers were included regardless of practice setting (acute, aged, and primary care) and if they were research based, included nurses as participants and reported specifically on results from nurses or that had implications for nursing practice. Excluded were conference abstracts, and papers focussed solely on nurse prescriber, nurse practitioner, or nurse manager roles. Results: Fifty-two papers were included in the review. Identified themes were: i) nursing knowledge, learning needs and education; ii) nurse perceptions of the nursing role and motivations for involvement; iii) nursing brokerage and influence on information flow to and from patients; iv) nursing workflow, workload and workarounds; and v) nurse leadership. Methodological quality of the included papers varied, limiting transferability and applicability of findings for some of the included studies. Conclusion: Formal inclusion of nurses in antimicrobial stewardship activities has been associated with improved nurse knowledge, nurse confidence, and in some cases improved clinical outcomes for patients. The review reinforces nursing values as a motivator of nursing actions, and reveals the complex yet significant influence of nurses on antimicrobial prescribing. Potential opportunities to enhance nurses' participation and contribution to antimicrobial stewardship include; formal acknowledgement of the nurse role, educating nurses so that they are aware of how they can contribute, collaborating with nurses in planning and implementing local stewardship activities, and ensuring nurse leaders are involved. However, evidence on this topic remains limited. Research is needed to facilitate greater understanding about the nature, scope and influence of the nurse role in antimicrobial stewardship, how nurses enact and carry out their role, and nurses' support needs. Tweetable abstract: Integrative review explores #nurse role in #antimicrobialstewardship. Nurse contribution, influence significant, but not well understood. (c) 2020 Elsevier Ltd. Short Title: Enabling knowledge brokerage intermediaries to be evidence-informed

ISSN: 1744-2648

DOI: 10.1332/174426421x16353477842207

Accession Number: WOS:000893378400007

Abstract: Target audience: What Works Centres; other intermediary brokerage agencies; their funders and users; and researchers of research use. Background: Knowledge brokerage and knowledge mobilisation (KM) are generic terms used to describe activities to enable the use of research evidence to inform policy, practice and individual decision making. Knowledge brokerage intermediary (KBI) initiatives facilitate such use of research evidence. This debate paper argues that although the work of KBIs is to enable evidence-informed decision making (EIDM), they may not always be overt and consistent in how they follow the principles of EIDM in their own practice. Key points for discussion: Drawing on examples from existing brokerage initiatives, four areas are suggested where KBIs could be more evidence-informed in their work: (1) needs analysis: evidence-informed in their analysis of where and how the KBI can best contribute to the existing evidence ecosystem; (2) methods and theories of change: evidence-informed in the methods that the KBI uses to achieve its goals; (3) evidence standards: credible standards for making evidence claims; and (4) evaluation and monitoring: evidence-informed evaluation of their own activities and contribution to the knowledge base on evidence use. For each of these areas, questions are suggested for considering the extent that the principles are being followed in practice. Conclusions and implications: KBIs work with evidence but they may not always be evidence-informed in their practice. KBIs could benefit from more overtly attending to the extent that they apply the logic of EIDM to how they work. In doing so, KBIs can advance both the study, and practice, of using research evidence to inform decision making.

DOI: 10.1111/1468-0009.12496

Accession Number: WOS:000613701200001

Abstract: Policy Points Persistent communication inequalities limit racial/ethnic minority access to life-saving health information and make them more vulnerable to the effects of misinformation.

Establishing data collection systems that detect and track acute gaps in the supply and/or access of racial/ethnic minority groups to credible health information is long overdue. Public investments and support for minority-serving media and community outlets are needed to close persistent gaps in access to credible health information.

Title: Getting over the shock: taking action on Indigenous maternal smoking

Journal: Australian Journal of Primary Health

Volume: 22

Issue: 4

Pages: 276-282

Short Title: Getting over the shock: taking action on Indigenous maternal smoking

ISSN: 1448-7527

DOI: 10.1071/py15066

Accession Number: WOS:000383606400003

Abstract: Smoking rates are slow to decline among pregnant Indigenous women. One in two pregnant Indigenous Australian women is a tobacco smoker compared with one in eight in the non-Indigenous population. The National Close the Gap strategy ambitiously aims to reduce Indigenous smoking prevalence to half by 2018, but this goal is unlikely to be achieved. Evidence is growing to better inform targeted strategies for Indigenous pregnant women based on national and international studies. It is proposed to be an appropriate time to refine translational approaches for anti-tobacco messages and cessation support in this population, rather than waiting for further empirical research before making these essential changes. Systemic barriers to Indigenous pregnant women receiving equitable primary health care have been identified, are remediable, and urgently require addressing. These barriers include: (1) lack of subsidised access to suitable oral forms of nicotine replacement therapy; (2) lack of clinician training in the complex area of management of maternal Indigenous smoking; and (3) lack of targeted health promotion programs addressing the psychosocial challenges

that Indigenous women face. In the interim, translational strategies to target tobacco control and cessation in pregnant Indigenous women need to be based on current evidence.

Short Title: Improving swallowing outcomes in patients with head and neck cancer using a theory-based pretreatment swallowing

intervention package: protocol for a randomised feasibility study

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2016-014167

Article Number: e014167

Accession Number: WOS:000398959400135

Abstract: Introduction: The incidence of head and neck cancer (HNC) in the UK is rising, with an average of 31 people diagnosed daily. Patients affected by HNC suffer significant short-term and long-term post-treatment morbidity as a result of dysphagia, which affects daily functioning and quality of life (QOL). Pretreatment swallowing exercises may provide additional benefit over standard

rehabilitation in managing dysphagia after primary HNC treatments, but uncertainty about their effectiveness persists. This study was

preceded by an intervention development phase to produce an optimised swallowing intervention package (SIP). The aim of the

current study is to assess the feasibility of this new intervention and research processes within a National Health Service (NHS)

setting. Method and analysis: A two-arm non-blinded randomised controlled feasibility study will be carried out at one tertiary

referral NHS centre providing specialist services in HNC. Patients newly diagnosed with stage III and IV disease undergoing planned

surgery and/or chemoradiation treatments will be eligible. The SIP will be delivered pre treatment, and a range of swallowing-related

and QOL measures will be collected at baseline, 1, 3 and 6 months post-treatment. Outcomes will test the feasibility of a future

randomised controlled trial (RCT), detailing rate of recruitment and patient acceptance to participation and randomisation. Salient

information relating to protocol implementation will be collated and study material such as the case report form will be tested. A range

of candidate outcome measures will be examined for suitability in a larger RCT. Ethics and dissemination: Ethical approval was obtained from an NHS Research Ethics Committee. Findings will be published open access in a peer-reviewed journal, and presented at relevant conferences and research meetings.

Short Title: Swallowing interventions for the treatment of dysphagia after head and neck cancer: a systematic review of behavioural strategies used to promote patient adherence to swallowing exercises

DOI: 10.1186/s12885-016-2990-x

Article Number: 43

Accession Number: WOS:000392338300001

Abstract: Background: Dysphagia is a significant side-effect following treatment for head and neck cancers, yet poor adherence to swallowing exercises is frequently reported in intervention studies. Behaviour change techniques (BCTs) can be used to improve adherence, but no review to date has described the techniques or indicated which may be more associated with improved swallowing outcomes.

Methods: A systematic review was conducted to identify behavioural strategies in swallowing interventions, and to explore any relationships between these strategies and intervention effects. Randomised and quasi-randomised studies of head and neck cancer patients were included. Behavioural interventions to improve swallowing were eligible provided a valid measure of swallowing function was reported. A validated and comprehensive list of 93 discrete BCTs was used to code interventions. Analysis was conducted via a structured synthesis approach. Results: Fifteen studies (8 randomised) were included, and 20 different BCTs were each identified in at least one intervention. The BCTs identified in almost all interventions were: instruction on how to perform the behavior, setting behavioural goals and action planning. The BCTs that occurred more frequently in effective interventions, were: practical social support, behavioural practice, self-monitoring of behaviour and credible source for example a skilled clinician delivering the intervention. The presence of identical BCTs in

comparator groups may diminish effects. Conclusions: Swallowing interventions feature multiple components that may potentially impact outcomes. This review maps the behavioural components of reported interventions and provides a method to consistently describe these components going forward. Future work may seek to test the most effective BCTs, to inform optimisation of swallowing interventions.

Title: Patient Experiences of Swallowing Exercises After Head and Neck Cancer: A Qualitative Study Examining Barriers and Facilitators Using Behaviour Change Theory

Journal: Dysphagia

Volume: 32

Issue: 4

Pages: 559-569

Date: Aug

Short Title: Patient Experiences of Swallowing Exercises After Head and Neck Cancer: A Qualitative Study Examining Barriers and Facilitators Using Behaviour Change Theory

ISSN: 0179-051X

DOI: 10.1007/s00455-017-9799-x

Accession Number: WOS:000405910700011

Abstract: Poor patient adherence to swallowing exercises is commonly reported in the dysphagia literature on patients treated for head and neck cancer. Establishing the effectiveness of exercise interventions for this population may be undermined by patient non-adherence. The purpose of this study was to explore the barriers and facilitators to exercise adherence from a patient perspective, and to determine the best strategies to reduce the barriers and enhance the facilitators. In-depth interviews were conducted on thirteen patients. We used a behaviour change framework and model

[Theoretical domains framework and COM-B (Capability-opportunity-motivation-behaviour) model] to inform our interview schedule and structure our results, using a content analysis approach. The most frequent barrier identified was psychological capability. This was highlighted by patient reports of not clearly understanding reasons for the exercises, forgetting to do the exercises and not having a system to keep track. Other barriers included feeling overwhelmed by information at a difficult time (lack of automatic motivation) and pain and fatigue (lack of physical capability). Main facilitators

included having social support from family and friends, the desire to prevent negative consequences such as long-term tube feeding (reflective motivation), having the skills to do the exercises (physical capability), having a routine or trigger and receiving feedback on the outcome of doing exercises (automatic motivation). Linking these findings back to the theoretical model allows for a more systematic selection of theory-based strategies that may enhance the design of future swallowing exercise interventions for patients with head and neck cancer.

Short Title: Development and Evaluation of a Navigation-Based, Multilevel Intervention to Improve the Delivery of Timely, Guideline-Adherent Adjuvant Therapy for Patients With Head and Neck Cancer

ISSN: 2688-1527

DOI: 10.1200/op.20.00943

Accession Number: WOS:000708099700021

Abstract: PURPOSE: More than half of patients with head and neck squamous cell carcinoma (HNSCC) experience a delay initiating guideline-adherent postoperative radiation therapy (PORT), contributing to excess mortality and racial disparities in survival. However, interventions to improve the delivery of timely, equitable PORT among patients with HNSCC are lacking. This study (1) describes the development of NDURE (Navigation for Disparities and Untimely Radiation thErapy), a navigation-based multilevel intervention (MLI) to improve guideline-adherent PORT and (2) evaluates its feasibility, acceptability, and preliminary efficacy. METHODS: NDURE was developed using the six steps of intervention mapping (IM). Subsequently, NDURE was evaluated by enrolling consecutive patients with locally advanced HNSCC undergoing surgery and PORT (n = 15)

into a single-arm clinical trial with a mixed-methods approach to process evaluation. RESULTS: NDURE is a navigation-based MLI targeting barriers to timely, guideline-adherent PORT at the patient, healthcare team, and organizational levels. NDURE is delivered via three in-person navigation sessions anchored to case identification and surgical care transitions. Intervention components include the following: (1) patient education, (2) travel support, (3) a standardized process for initiating the discussion of expectations for PORT, (4) PORT care plans, (5) referral tracking and follow-up, and (6) organizational restructuring. NDURE was feasible, as judged by accrual (88% of eligible patients [100% Blacks] enrolled) and dropout (n = 0). One hundred percent of patients reported moderate or strong agreement that NDURE helped solve challenges starting PORT; 86% were highly likely to recommend NDURE. The rate of timely, guideline-adherent PORT was 86% overall and 100% for Black patients. CONCLUSION: NDURE is a navigation-based MLI that is feasible, is acceptable, and has the potential to improve the timely, equitable, guideline-adherent PORT.

DOI: 10.1108/bfj-11-2021-1188

Accession Number: WOS:000782835900001

Abstract: Purpose Recent reviews and reports have highlighted the need for integrated, context-specific efforts to enable sustainable food transitions. This study aimed to identify pathways to promote healthier and more environmentally friendly food practices in school contexts, with a focus on increased plant-based eating. Design/methodology/approach The study used a systemic approach with data collected from relevant stakeholders in an EU country (Portugal) at diverse levels of influence in the school meals system (i.e.

proximal, intermediate, distal; from end-consumers to food providers, market actors, civil society organizations, and policy and decision-makers). Data from individual interviews (N = 33) were subjected to thematic analysis. Findings Meat-centric cultural perceptions of a 'proper meal' can be a socio-emotional barrier for sustainable food transitions in schools. Main pathways identified to unlock these transitions included: (1) Levering orientations toward ethical and environmentally beneficial consumption; (2) Improving and increasing the offer of plant-based meals; and (3) Mobilizing local communities and society. Originality/value The current findings suggest that promoting healthier and more environmentally friendly food practices in schools requires systemic, integrated approaches which focus on food consumption, food provision, and the broader political and sociocultural environment.

DOI: 10.1371/journal.pone.0279008

Article Number: e0279008

Accession Number: WOS:000925067100046

Abstract: Background The growing prevalence of non-communicable diseases (NCDs) in South African workers has been shown to be associated with absenteeism and increased risk of morbidity. Low-income workers living in urban settings are particularly vulnerable. Consultation with workers is crucial for understanding risks and identifying opportunities for intervention to promote health in the workplace. The purpose of this study was to examine South African pharmaceutical manufacturing workers' perspectives of health risk factors and absenteeism, and to identify how they perceived a role for the organisation to initiate interventions to improve their health. Materials and methods Five focus groups were conducted to

capture 27 employees' perspectives. The semi-structured focus group discussions were recorded and analysed using a thematic content analysis approach. Results Participants indicated that they were aware of behavioural health risks such as prolonged sitting. They showed insight into strategies to prevent injuries and stay healthy, but also expressed dissatisfaction about the lack of organisational support, leading to stress and consequently absenteeism. Participants emphasized the responsibility of the organisation to support a range of health promoting strategies Conclusions The findings of this study are important for cultivating a tailored workplace intervention to reduce NCD risk factors in the pharmaceutical manufacturing workforce. It is vital that these be supported by leadership of the company through the provision of funding and the development of internal healthcare services.

DOI: 10.1186/s13104-021-05765-8

Article Number: 350

Accession Number: WOS:000693817300002

Abstract: Objective The public health message 'move for health' is relevant given the high prevalence of insufficient physical activity, particularly in African countries. The call for behaviour modification including limiting unhealthy dietary patterns in these settings is therefore critical; however, there is limited knowledge on the adoption of health promotion strategies in the workplace. This study aimed to investigate workers' perceptions of physical activity and healthy eating. Results Five focus groups were conducted with 28 participants employed in a South African pharmaceutical manufacturing company to explore perceptions of physical activity and healthy eating. Results showed that two categories emerged: physical activity and unhealthy behaviours. Participants recognised the importance of obtaining sufficient physical activity in various domains, however believed that contemporary lifestyle limited opportunities for movement. Likewise,

participants viewed healthy eating as unrealistic due to financial constraints. There was however agreement that total physical activity time could be increased during recreational pursuits outside of vocational time and may include intermittent walking for travel. These findings are important for workplace interventions and provide a more robust understanding of workers' perceptions of physical activity and healthy eating.

Short Title: Enablers of the Implementation of Tissue Plasminogen Activator in Acute Stroke Care: A Cross-Sectional Survey

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0114778

Article Number: e114778

Accession Number: WOS:000347515300079

Abstract: Objective: To assess emergency physicians' perceptions of individual and system enablers to the use of tissue Plasminogen Activator in acute stroke. Method: Australian fellows and trainees of Australasian College for Emergency Medicine completed a 57-item online survey assessing enablers to implementation of evidence-based practice across six domains: knowledge, skills, modelling, monitoring, feedback, and maintenance. Demographic and workplace characteristics were obtained. Descriptive statistics were calculated to describe demographic and workplace characteristics of responders, and survey responses. Each domain received an overall score (%) based on the number of responders agreeing with all items within the domain. Results: A total of 429 (13%) Australasian College for Emergency Medicine members responded. 17.7% of respondents reported they and/or their workplace met all knowledge-related enablers, however only 2.3% had all skill-related enablers in place. Of respondents who decide which patients receive tissue Plasminogen Activator treatment, 18.1% agreed that all maintenance-related enablers are in place at their hospital, compared to 6.6% for those who do not decide which patients receive tissue Plasminogen Activator treatment. None of the respondents had all items in place cross all domains. Conclusions: Even when allowing

for the low response rate, it seems likely there is a lack of individual and system enablers supporting the implementation of best-practice stroke care in a number of Australian hospitals. Quality improvement programs could target all domains, particularly the skills-training and feedback emergency physicians receive, to aid implementation of tissue Plasminogen Activator treatment for acute stroke.

Volume: 49

Issue: 1

Pages: 156-169

Date: Jan

Short Title: Telehealth delivery of paediatric rehabilitation for children with neurodisability: A mixed methods realist evaluation of contexts, mechanisms and outcomes

ISSN: 0305-1862

DOI: 10.1111/cch.13028

Accession Number: WOS:000822652600001

Abstract: Background Teledelivery of rehabilitation services has been proposed as a cost-effective option for supporting children with neurodisability and their families. However, little is understood of the conditions that support uptake of telehealth in paediatric rehabilitation, what is delivered during telehealth or perceptions of its outcomes. The aim of this study was to identify the context, process and outcomes of telehealth for children with neurodisability and their families. A secondary objective was to identify if variations in these aspects of telehealth occurred for Maori, the indigenous people of New Zealand. Method A mixed-methods, three phase, realist evaluation identified context-mechanism-outcome configurations (CMOCs) of telehealth. In Phase 1, the Determinants of Implementation Behaviour Questionnaire indicated factors affecting practitioner uptake of telehealth (Context). In Phase 2, a casenote audit identified 'practitioner input' during telehealth (Mechanism). Phase 3 interviews with practitioners and parents explored 'parent response' to telehealth and practitioner and parent perceptions of its value (Mechanism and Outcomes). Subgroup analyses for Maori were planned. Results From Phase 1, practitioners (29/37, 78%) intended to use telehealth; however, few did so regularly (7/37, 22%). Positive experiences of telehealth were described by

all practitioners (n = 5) and families (n = 7) in Phase 3. CMOs explained that practitioners' offering of telehealth occurred when practitioners were confident, valued access to therapy over the familiarity of in-person delivery, and when practitioners used coaching-style communication. Parents were receptive to telehealth when they trusted practitioners, felt listened to and were offered telehealth as a choice. When telehealth occurred, access to therapy was timely and more consistent than in-person delivery. Child outcomes appeared to be positive. Confidence in offering telehealth to Maori was low. Conclusions Initiatives to improve uptake of telehealth in paediatric rehabilitation should focus on creating conditions for practitioner implementation. Training in telehealth should include engagement with Maori. Adequate workspace and workplace culture change are required if telehealth is to be offered beyond the current 'early adopters'.

Title: Providing oxygen to children in hospitals: a realist review

Journal: Bulletin of the World Health Organization

Volume: 95

Issue: 4

Pages: 288-302

Date: Apr

Short Title: Providing oxygen to children in hospitals: a realist review

ISSN: 0042-9686

DOI: 10.2471/blt.16.186676

Accession Number: WOS:000400631900016

Abstract: Objective To identify and describe interventions to improve oxygen therapy in hospitals in low-resource settings, and to determine the factors that contribute to success and failure in different contexts. Methods Using realist review methods, we scanned the literature and contacted experts in the field to identify possible mechanistic theories of how interventions to improve oxygen therapy systems might work. Then we systematically searched online databases for evaluations of improved oxygen systems in hospitals in low- or middle-income countries. We extracted data on the effectiveness, processes and underlying theory of selected projects, and used these data to test the candidate theories and identify the features of successful projects. Findings We included 20 improved oxygen therapy projects (45 papers) from 15 countries. These used various approaches to improving oxygen therapy, and reported

clinical, quality of care and technical outcomes. Four effectiveness studies demonstrated positive clinical outcomes for childhood pneumonia, with large variation between programmes and hospitals. We identified factors that help or hinder success, and proposed a practical framework depicting the key requirements for hospitals to effectively provide oxygen therapy to children. To improve clinical outcomes, oxygen improvement programmes must achieve good access to oxygen and good use of oxygen, which should be facilitated by a broad quality improvement capacity, by a strong managerial and policy support and multidisciplinary teamwork. Conclusion Our findings can inform practitioners and policy-makers about how to improve oxygen therapy in low-resource settings, and may be relevant for other interventions involving the introduction of health technologies.

Article Number: e0254229

Accession Number: WOS:000674294700014

Abstract: Objectives To evaluate the effect of improved hospital oxygen systems on quality of care (QOC) for children with severe pneumonia, severe malaria, and diarrhoea with severe dehydration. Design Stepped-wedge cluster randomised trial (unblinded), randomised at hospital-level. Setting 12 hospitals in south-west Nigeria. Participants 7,141 children (aged 28 days to 14 years) admitted with severe pneumonia, severe malaria or diarrhoea with severe dehydration between January 2014 and October 2017. Interventions Phase 1 (pulse oximetry) introduced pulse oximetry for

all admitted children. Phase 2 (full oxygen system) (i) standardised oxygen equipment package, (ii) clinical education and support, (iii) technical training and support, and (iv) infrastructure and systems support. Outcome measures We used quantitative QOC scores evaluating assessment, diagnosis, treatment, and monitoring practices against World Health Organization and Nigerian standards. We evaluated mean differences in QOC scores between study periods (baseline, oximetry, full oxygen system), using mixed-effects linear regression. Results 7,141 eligible participants; 6,893 (96.5%) had adequate data for analysis. Mean paediatric QOC score (maximum 6) increased from 1.64 to 3.00 (adjusted mean difference 1.39; 95% CI 1.08–1.69, $p < 0.001$) for severe pneumonia and 2.81 to 4.04 (aMD 1.53; 95% CI 1.23–1.83, $p < 0.001$) for severe malaria, comparing the full intervention to baseline, but did not change for diarrhoea with severe dehydration (aMD -0.12 ; 95% CI -0.46 – 0.23 , $p = 0.501$). After excluding practices directly related to pulse oximetry and oxygen, we found aMD 0.23 for severe pneumonia (95% CI -0.02 – 0.48 , $p = 0.072$) and 0.65 for severe malaria (95% CI 0.41–0.89, $p < 0.001$) comparing full intervention to baseline. Sub-analysis showed some improvements (and no deterioration) in care processes not directly related to oxygen or pulse oximetry. Conclusion Improvements in hospital oxygen systems were associated with higher QOC scores, attributable to better use of pulse oximetry and oxygen as well as broader improvements in clinical care, with no negative distortions in care practices. Pages: 146–151

Date: Feb

Short Title: What Potentially Modifiable Factors are Associated With Treatment Nonadherence in Pediatric Growth Hormone Deficiency? A Quantitative Study

ISSN: 1530-891X

DOI: 10.4158/ep-2020-0543

Accession Number: WOS:000631155500010

Abstract: Objective: A recent systematic review reported that up to 71% of patients with growth hormone deficiency and their families are nonadherent to treatment as prescribed. Nonadherence to growth hormone treatment presents a substantial and costly problem for the patient, health care provider, and health care system. The current study uniquely investigated the potentially modifiable factors associated with treatment nonadherence in this endocrine disorder. Methods: The cross-sectional study was conducted among 82 parent/caregivers of children with growth hormone deficiency who were receiving growth hormone treatment. Self-report questionnaires investigated parent/caregiver perceptions and experiences of their child's condition and prescribed treatment, in addition to their perceived relationship with their health care professional. The 8-item Morisky medication adherence scale was used for the assessment of treatment adherence. Results: Sixty-two percent of parents/caregivers were found to be nonadherent to growth hormone treatment as prescribed. Illness perceptions (consequences, identity, and coherence) and treatment concerns were found to be significantly associated with treatment adherence, as was the quality of the health care professional-parent/caregiver relationship. Conclusion: The study confirmed the extent of the adherence problem evident among the pediatric growth hormone deficiency population. In addition, it presented an insight into the explanatory factors that underpin nonadherence to growth hormone treatment. Our findings can be used to inform the development of adherence-focused interventions, with the purpose of supporting patients and their families and improving the use of prescribed growth hormone treatment within endocrine clinical practice. Title: Implementation of Enhanced Recovery After Surgery: a strategy to transform surgical care across a health system

Journal: Implementation Science

Volume: 12

Date: May

Short Title: Implementation of Enhanced Recovery After Surgery: a strategy to transform surgical care across a health system

ISSN: 1748-5908

DOI: 10.1186/s13012-017-0597-5

Article Number: 67

Accession Number: WOS:000402008800001

Abstract: Background: Enhanced Recovery After Surgery (ERAS) programs have been shown to have a positive impact on outcome. The ERAS care system includes an evidence-based guideline, an implementation program, and an interactive audit system to support

practice change. The purpose of this study is to describe the use of the Theoretic Domains Framework (TDF) in changing surgical care and application of the Quality Enhancement Research Initiative (QUERI) model to analyze end-to-end implementation of ERAS in colorectal surgery across multiple sites within a single health system. The ultimate intent of this work is to allow for the development of a model for spread, scale, and sustainability of ERAS in Alberta Health Services (AHS). Methods: ERAS for colorectal surgery was implemented at two sites and then spread to four additional sites. The ERAS Interactive Audit System (EIAS) was used to assess compliance with the guidelines, length of stay, readmissions, and complications. Data sources informing knowledge translation included surveys, focus groups, interviews, and other qualitative data sources such as minutes and status updates. The QUERI model and TDF were used to thematically analyze 189 documents with 2188 quotes meeting the inclusion criteria. Data sources were analyzed for barriers or enablers, organized into a framework that included individual to organization impact, and areas of focus for guideline implementation. Results: Compliance with the evidence-based guidelines for ERAS in colorectal surgery at baseline was 40%. Post implementation compliance, consistent with adoption of best practice, improved to 65%. Barriers and enablers were categorized as clinical practice (22%), individual provider (26%), organization (19%), external environment (7%), and patients (25%). In the Alberta context, 26% of barriers and enablers to ERAS implementation occurred at the site and unit levels, with a provider focus 26% of the time, a patient focus 26% of the time, and a system focus 22% of the time. Conclusions: Using the ERAS care system and applying the QUERI model and TDF allow for identification of strategies that can support diffusion and sustainment of innovation of Enhanced Recovery After Surgery across multiple sites within a health care system. Short Title: Understanding factors influencing physical activity and exercise in lung cancer: a systematic review

ISSN: 0941-4355

DOI: 10.1007/s00520-016-3484-8

Accession Number: WOS:000393740400034

Abstract: Despite evidence and clinical practice guidelines supporting physical activity (PA) for people with lung cancer, this evidence has not translated into clinical practice. This review aims to identify, evaluate and synthesise studies examining the barriers and enablers for patients with lung cancer to participate in PA from the perspective of patients, carers and health care providers (HCPs). Systematic review of articles using electronic databases: MEDLINE (1950–2016), CINAHL (1982–2016), EMBASE (1980–2016), Scopus (2004–2016) and Cochrane (2016). Quantitative and qualitative studies, published in English in a peer-reviewed journal, which assessed the barriers or enablers to PA for patients with lung cancer were included. Registered-PROSPERO (CRD4201603341). Twenty-six studies (n = 9 cross-sectional, n = 4 case series, n = 11 qualitative) including 1074 patients, 23 carers and 169 HCPs were included. Barriers and enablers to PA were identified (6 major themes, 18 sub-themes): Barriers included patient-level factors (physical capability, symptoms, comorbidities, previous sedentary lifestyle, psychological influences, perceived relevance), HCP factors (time/knowledge to deliver information) and environmental factors (access to services, resources, timing relative to treatment). Enablers included anticipated benefits, opportunity for behaviour change and influences from HCPs and carers. This systematic review has identified the volume of literature demonstrating that barriers and enablers to PA in lung cancer are multidimensional and span diverse factors. These include patient-level factors, such as symptoms, comorbidities, sedentary lifestyle, mood and fear, and environmental factors. These factors should be considered to identify and develop suitable interventions and clinical services in attempt to increase PA in patients with lung cancer.

Short Title: Increased self-reported pharmacist prescribing during the COVID-19 pandemic: Using the Theoretical Domains Framework to identify barriers and facilitators to prescribing

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2022.08.014

Accession Number: WOS:000892465200013

Abstract: Background: Community pharmacists are positioned to improve access to medications through their ever-expanding role as prescribers, with this role becoming more pronounced during the COVID-19 pandemic. Objectives: Our research aimed to determine the extent of self-reported pharmacist prescribing pre-COVID-19 and during the COVID-19 pandemic, to identify barriers and facilitators to pharmacist prescribing, and to explore the relationship between these factors and self-reported prescribing activity. Methods: A questionnaire based on the Theoretical Domains Framework (TDFv2) assessing self-reported pre-prescribing was electronically distributed to all direct patient care pharmacists in NS (N = 1338) in July 2020. Wilcoxon signed-rank tests were used to examine temporal differences in self-reported prescribing activity. TDFv2 responses were descriptively reported as positive (agree/strongly agree), neutral (uncertain), and negative (strongly disagree/disagree) based on the 5-point Likert scale assessing barriers and facilitators to pre-prescribing from March 2020 onward (i.e., 'during' COVID-19). Simple logistic regression was used to measure the relationship between TDFv2 domain responses and self-reported prescribing activity. Results: A total of 190 pharmacists (14.2%) completed the survey. Over 98% of respondents reported prescribing at least once per month in any of the approved prescribing categories, with renewals being the most common activity reported. Since the pandemic, activity in several categories of prescribing significantly increased, including diagnosis supported by protocol (29.0% vs. 58.9%, $p < 0.01$), minor and common ailments (25.3% vs 34.7%, $p = 0.03$), preventative medicine (22.1% vs. 33.2%, $p < 0.01$). Amongst the TDFv2 domains, Beliefs about Consequences domain had the largest influence on prescribing activity (OR = 3.13, 95% CI 1.41-6.97, $p < 0.01$), with Social Influences (OR = 2.85, 95% CI 1.42-5.70, $p < 0.01$) being the next most influential. Conclusion: Self-reported prescribing by direct patient care community pharmacists in Nova Scotia increased during the COVID-19 pandemic, particularly for government-funded services. Key barriers to address, and facilitators to support pharmacist prescribing were identified and can be used to inform future interventions.

Title: Improving management and effectiveness of home blood pressure monitoring: a qualitative UK primary care study

Journal: British Journal of General Practice

Volume: 65

Issue: 640

Pages: E776-E783

Date: Nov

Short Title: Improving management and effectiveness of home blood pressure monitoring: a qualitative UK primary care study

ISSN: 0960-1643

DOI: 10.3399/bjgp15X687433

Accession Number: WOS:000363492400009

Abstract: Background Self-monitoring blood pressure (SMBP) is becoming an increasingly prevalent practice in UK primary care, yet there remains little conceptual understanding of why patients with hypertension engage in self-monitoring. Aim To identify psychological factors or processes prompting the decision to self-monitor blood pressure. Design and setting A qualitative study of patients previously participating in a survey study about SMBP from four general practices in the West Midlands. Method Taped and transcribed in-depth interviews with 16 patients (6 currently monitoring, 2 used to self-monitor, and 8 had never self-monitored). Thematic analysis was undertaken. Results Three main themes emerged: 'self' and 'living with hypertension' described the emotional element of living with an asymptomatic condition; 'self-monitoring behaviour and medication' described overall views about self-monitoring, current practice, reasons for monitoring, and the impact on medication adherence; and 'the GP-patient transaction' described the power relations affecting decisions to self-monitor. Self-monitoring was performed by some as a protective tool against the fears of a silent but serious condition, whereas others self-monitor simply out of curiosity. People who self-monitored tended not to discuss this with their nurse or GP, partly due to perceiving minimal or no interest from their clinician about home monitoring, and partly due to fear of being prescribed additional medication. Conclusion The decision to self-monitor appeared often to be an individual choice with no schedule or systems to integrate it with other medical care. Better recognition by clinicians that patients are self-monitoring, perhaps utilising the results in shared decision-making, might help integrate it into daily practice.

Short Title: Physical activity is good for older adults-but is programme implementation being overlooked? A systematic review of intervention studies that reported frameworks or measures of implementation

ISSN: 0306-3674

DOI: 10.1136/bjsports-2020-102465

Accession Number: WOS:000605859900009

Abstract: Objective To examine older adult physical activity (PA) intervention studies that evaluated implementation and/ or scale-up. Research question 1: What implementation and/or scale-up indicators (specific, observable and measurable characteristics that show the progress of implementation) were reported? Research question 2: What implementation and/or scale-up frameworks were reported? Research question 3: Did studies evaluate the relationship between implementation or scale-up of the intervention and individual level health/behaviour outcomes? If yes, how? Design Systematic review. Data sources Publications from electronic databases and hand searches (2000 to December 2019). Eligibility criteria for selecting studies Any PA intervention studies with community-dwelling older adult participants (mean age \geq 60 years). Required indicators: (a) Must report amount of PA as an outcome, with validated self-report or objective measures, and (b) Must have reported at least one implementation or scale-up framework and/or one implementation or scale-up indicator. Results 137 studies were included for research question 1, 11 for question 2 and 22 for question 3. 137 studies reported an implementation indicator: 14 unique indicators. None were specified as indicators for scale-up evaluation. 11 studies were guided by an implementation or scale-up framework. 22 studies described a relationship between an implementation indicator and an individual-level health outcome. Conclusion There is need for implementation research that extends beyond analysis at the individual level, includes clearly defined indicators and provides a guiding framework to support PA initiatives in older adults. Such implementation studies should evaluate factors in the broader context (eg, political, environmental) that influence scale-up.

Short Title: Stakeholder perspectives of a pilot multicomponent delirium prevention intervention for adult patients with advanced cancer in palliative care units: A behaviour change theory-based qualitative study

ISSN: 0269-2163

DOI: 10.1177/02692163221113163

Accession Number: WOS:000839858400001

Abstract: Background: Theory-based and qualitative evaluations in pilot trials of complex clinical interventions help to understand quantitative results, as well as inform the feasibility and design of subsequent effectiveness and implementation trials. Aim: To explore patient, family, clinician and volunteer ('stakeholder') perspectives of the feasibility and acceptability of a multicomponent non-pharmacological delirium prevention intervention for adult patients with advanced cancer in four Australian palliative care units that participated in a phase II trial, the 'PRESERVE pilot study'. Design: A trial-embedded qualitative study via semi-structured interviews and directed content analysis using Michie's Behaviour Change Wheel and the Theoretical Domains Framework. Setting/participants: Thirty-nine people involved in the trial: nurses (n = 17), physicians (n = 6), patients (n = 6), family caregivers (n = 4), physiotherapists (n = 3), a social worker, a pastoral care worker and a volunteer. Results: Participants' perspectives aligned with the 'capability', 'opportunity' and 'motivation' domains of the applied frameworks. Of seven themes, three were around the alignment of the delirium prevention intervention with palliative care (intervention was considered routine care; intervention aligned with the compassionate and collaborative culture of palliative care; and differing views of palliative care priorities influenced perspectives of the intervention) and four were about study processes more directly related to adherence to the intervention (shared knowledge increased engagement with the intervention; impact of the intervention checklist on attention, delivery and documentation of the delirium prevention strategies; clinical roles and responsibilities; and addressing environmental barriers to delirium prevention).

Conclusion: This theory-informed qualitative study identified multiple influences on the delivery and documentation of a pilot multicomponent non-pharmacological delirium prevention intervention in four palliative care units. Findings inform future definitive studies of delirium prevention in palliative care.

Title: Theory-based formative research on oral rehydration salts and zinc use in Lusaka, Zambia

Journal: BMC Public Health

Volume: 16

Date: Apr

Short Title: Theory-based formative research on oral rehydration salts and zinc use in Lusaka, Zambia

DOI: 10.1186/s12889-016-2984-2

Accession Number: WOS:000373712300001

Abstract: Background: A theoretically grounded formative research study was carried out to investigate behaviour related to the use of Oral Rehydration Salts (ORS) and zinc tablets. The purpose was to inform the design of the behaviour change component of the Programme for Awareness and Elimination of Diarrhoea in Lusaka Province, Zambia, which aims to reduce childhood morbidity and mortality from diarrhoeal disease. Methods: Fourteen behaviour trials were conducted among caregivers of children under-five with diarrhoea. Caregivers were recruited from two clinics situated in rural and peri-urban Lusaka. Trials took ten days and data were captured using video, observation and repeated interviews. Additional data were collected through focus group discussions with mothers, observations in clinics and pharmacies and interviews with clinic and pharmacy staff. Findings were organised according to categories of behavioural determinants from Evo-Eco theory. Results: Participants were all familiar with ORS and most knew its purpose. ORS use was motivated by symptoms of dehydration, rather than the start of a diarrhoea episode, and was stopped when the child had visibly recovered energy. Only four of 14 behaviour trial participants were observed to correctly prepare ORS. Errors were mainly associated with measurement, resulting in a solution that was too concentrated.

ORS was not observed to be given to children at clinics. Although zinc was unknown in this population, it was positively received by mothers keen to learn whether zinc would work better than alternative treatments to stop diarrhoea. Conclusions: ORS was sub-optimally prepared and used at home. It was not used while waiting to be seen at a clinic. In homes, the behaviour change intervention should promote early and continued use of correctly prepared ORS. In the longer-term, these behaviours may best be encouraged by changing the product design or sachet size. Despite its unfamiliarity, this population was well disposed to the use of zinc as a treatment for diarrhoea; when zinc is new to a population, promoting zinc as a solution to stopping diarrhoea, which mothers seek, may drive initial trial. Ensuring the availability of zinc in public clinics and private pharmacies prior to commencement of any promotion activities is crucial.

Title: The effectiveness of interventions to prevent loneliness and social isolation in the community-dwelling and old population: an overview of systematic reviews and meta-analysis

Journal: European Journal of Public Health

Date: 2023 Mar

Short Title: The effectiveness of interventions to prevent loneliness and social isolation in the community-dwelling and old population: an overview of systematic reviews and meta-analysis

ISSN: 1101-1262

DOI: 10.1093/eurpub/ckad006

Article Number: ckad006

Accession Number: WOS:000945921800001

Abstract: Background: Loneliness and social isolation have comparable health effects to widely acknowledged and established risk factors. Although old people are particularly affected, the effectiveness of interventions to prevent and/or mitigate social isolation and loneliness in the community-dwelling older adults is unclear. The aim of this review of reviews was to pool the findings of systematic reviews (SRs) addressing the question of effectiveness. Methods: Ovid MEDLINE (R), Health Evidence, Epistemonikos and Global Health (EBSCO) were searched from January 2017 to November 2021. Two reviewers independently assessed each SR in two consecutive steps based on previously defined eligibility criteria and appraised the methodological quality using a measurement tool to assess SRs 2, AMSTAR 2. One author extracted data from both SRs and eligible studies; another checked this. We

conducted meta-analyses to pool the study results. We report the results of the random-effects and common-effect models. Results: We identified five SRs containing a total of 30 eligible studies, 16 with a low or moderate risk of bias. Our random-effects meta-analysis indicates an overall SMD effect of 0.63 [95% confidence interval (CI): -0.10 to 1.36] for loneliness and was unable to detect an overall effect of the interventions on social support [SMD: 0.00; 95% CI: -0.11 to 0.12]. Discussion: The results show interventions can potentially reduce loneliness in the non-institutionalized, community-dwelling and older population living at home. As confidence in the evidence is low, rigorous evaluation is recommended. Registration: International Prospective Register of SRs (PROSPERO): Registration number: CRD42021255625

Date: Feb

Short Title: The Role of Behavioral Science in Personalized Multimodal Prehabilitation in Cancer

ISSN: 1664-1078

DOI: 10.3389/fpsyg.2021.634223

Article Number: 634223

Accession Number: WOS:000623944200001

Abstract: Multimodal prehabilitation is increasingly recognized as an important component of the pre-operative pathway in oncology. It aims to optimize physical and psychological health through delivery of a series of tailored interventions including exercise, nutrition, and psychological support. At the core of this prescription is a need for considerable health behavior change, to ensure that patients are engaged with and adhere to these interventions and experience the associated benefits. To date the prehabilitation literature has focused on testing the efficacy of devised exercise and nutritional interventions with a primary focus on physiological and mechanistic outcomes with little consideration for the role of behavioral science, supporting individual behavior change or optimizing patient engagement. Changing health behavior is complex and to maximize success, prehabilitation programs should draw on latest insights from the field of behavioral science. Behavioral science offers extensive knowledge on theories and models of health behavior change to further advance intervention effectiveness. Similarly, interventions developed with a person-centered approach,

taking into consideration individual needs and preferences will increase engagement. In this article, we will provide an overview of the extent to which the existing prehabilitation literature incorporates behavioral science, as well as studies that have explored patient's attitudes toward prehabilitation. We will go on to describe and critique ongoing trials in a variety of contexts within oncology prehabilitation and discuss how current scientific knowledge may be enhanced from a behavioral science perspective. We will also consider the role of "surgery schools" and detail practical recommendations that can be embedded in existing or emerging clinical settings.

DOI: 10.3389/fped.2022.980890

Article Number: 980890

Accession Number: WOS:000876462800001

Abstract: BackgroundIncreasing participation in physical activity has the potential to improve outcomes for children and adolescents with cancer during treatment and into survivorship. The aim of this study is to outline the theoretical process behind development of CanMOVE, a behavior change intervention designed to increase physical activity for children and adolescents with cancer. Study designThis study followed a theoretical design process consistent with the Behavior Change Wheel to inform the design of a complex intervention. Materials and methodsThe three stages of the Behavior Change Wheel intervention design process include: (1) understanding physical activity behavior within the pediatric cancer setting, (2) identifying potential intervention functions, and (3) identifying appropriate behavior change and implementation strategies. Qualitative and behavior change literature relevant to the pediatric cancer treatment setting were used to inform each stage. ResultsAn individualized and flexible approach to physical activity promotion that considers intrinsic factors specific to the child/adolescent

and their environment is required. Fifteen behavioral change strategies were identified to form the intervention components of CanMOVE. Implementation strategies were identified to build motivation, opportunity and capacity toward increasing physical activity behaviors. Key intervention components of CanMOVE include standardized assessment and monitoring (physical activity, physical function, and health-related quality of life), provision of an activity monitor to both child/adolescent and parent, and one-on-one capacity building sessions with a healthcare professional. Capacity building sessions include education, goal setting, an active supervised physical activity session, barrier identification and problem solving, and action planning. Conclusion CanMOVE is a novel approach to physical activity promotion in the pediatric cancer treatment setting. The use of a theoretical intervention design process will aid evaluation and replication of CanMOVE when it is assessed for feasibility in a clinical setting. The design process utilized here can be used as a guide for future intervention development.

Article Number: 20552076221113705

Accession Number: WOS:000827435800001

Abstract: Introduction Short messaging service has the potential to improve participation in physical activity in individuals with long-term health conditions. However, successful implementation relies on participant engagement with such programmes. The aim of this study was to undertake a systematic review of qualitative literature exploring participant perspectives of short messaging service-based interventions designed to promote physical activity for people with long-term health conditions. Methods CINHAL, MEDLINE, SPORTSDiscus, Scopus and Web of Science were searched up to 15 February 2021 looking for participants' perspectives on short messaging service programmes designed to promote physical activity in people with long-term health conditions. Included studies were analysed using

thematic synthesis. Results Eight studies involving 533 participants were included and analysed using the principles of thematic analysis and 10 descriptive themes were identified. These descriptive themes were further refined to develop five final analytical themes: taking control of my own health, from information to action, relationship with the programme, perfection required for success and increased expectations. Discussion The findings agree with published work on the factors which influence behaviour. The findings from this synthesis demonstrate that automated short messaging service programmes to increase physical activity are generally acceptable. People report that these interventions support and encourage physical activity. The novel finding of this study was that having more regular and long-lasting contact has the potential to increase the expectations people have of healthcare services. This is a finding which needs to be considered and managed but should not discourage the use of automated short messaging service.

ISSN: 1057-9249

DOI: 10.1002/pon.4388

Accession Number: WOS:000422995000018

Abstract: BackgroundResearch indicates that cancer patients experience significant multifactorial distress during their journey. To address this, cancer centers are implementing Screening for Distress programs; however, little is known about the sustainability of these programs. This study sought to examine the sustainability of a Screening for Distress program in 2 cancer clinics 6months post implementation. MethodsA mixed-methods cross-sectional design was utilized. To determine if screening rates, screening conversations and appropriate interventions occurred and the charts of 184 consecutive patients attending the head and neck or neuro-oncology clinics over a 3week period were reviewed. To examine the barriers and facilitators of sustainability, 16 semi-structured interviews with administrators, physicians, and nurses were conducted. ResultsOf the 184 charts reviewed, 163 (88.6%) had completed

screening tools. Of these 163, 130 (79.8%) indicated that a conversation occurred with the patient about the identified distress as reported on the screening tool. Of the 89 (54.6%) charts where the need for an intervention was indicated, 68 (76.4%) had an intervention documented. Six oncologists, 7 nurses, and 3 administrators were interviewed, and 5 themes which influenced the sustainability of the program emerged: (1) attitudes, knowledge, and beliefs about the program; (2) implementation approach; (3) outcome expectancy of providers; (4) integration with existing practices; and (5) external factors. Conclusions This study suggests that Screening for Distress was largely sustained, possibly due to positive attitudes and outcome expectancy. However, sustainability may be enhanced by formally integrating screening with existing practices, addressing potential knowledge gaps, and ensuring engagement with all stakeholder groups.

Title: Barriers and enabling factors in weight management of patients with nonalcoholic fatty liver disease: A qualitative study using the COM-B model of behaviour

Journal: Health Expectations

Volume: 26

Issue: 1

Pages: 355-365

Date: Feb

Short Title: Barriers and enabling factors in weight management of patients with nonalcoholic fatty liver disease: A qualitative study using the COM-B model of behaviour

ISSN: 1369-6513

DOI: 10.1111/hex.13665

Accession Number: WOS:000884587400001

Abstract: Background Nonalcoholic fatty liver disease (NAFLD) is a global public health problem. Lifestyle modifications aimed at promoting weight loss and weight maintenance remain the current first-line treatments for NAFLD. Objective We aim to identify barriers and enabling factors in weight management among patients with NAFLD using the capability, opportunity, motivation, behaviour (COM-B) model of behaviour. Design This study adopted a qualitative design using semistructured interviews analysed with content analysis and the COM-B framework. Setting and Participants Interviews were conducted with 27 patients with NAFLD who experienced successful or unsuccessful weight reduction. Results Our study included 27 participants: 15 participants with successful weight loss (successful weight loss refers to a decrease in body weight \geq 7% of the initial body weight for patients with NAFLD) and

12 participants with unsuccessful weight loss. Thirty-five themes (19 barriers and 16 facilitators) were mapped onto the COM-B model as barriers and facilitators to weight management among patients with NAFLD. The key barriers were lack of time and energy, lack of awareness of weight, lack of attention to NAFLD, treating food as a reward or compensation and social entertainment. The key facilitators were having basic weight loss knowledge and skills, strong motivation, attention to NAFLD, unsuccessful weight loss experiences and positive feedback from phased success. Conclusion In addition to identifying factors consistent with existing studies, this study identified factors that influence weight management in NAFLD patients, such as basic weight loss skills and rational thinking before weight loss, which were not previously reported. This has clinical implications for clinical healthcare providers and health management services for the improvement of education and support regarding lifestyle improvement and weight management in patients with NAFLD. Patient or Public Contribution We recruited potential participants from the Bariatric Clinic, Hepatology Clinic and Physical Examination Center of hospitals between March 2021 and October 2021. Twenty-seven patients with NAFLD who had successful or unsuccessful weight loss experiences participated in the study and responded to questions on weight management.

Pages: 454-458

Date: Jun

Short Title: Mental toughness as a moderator of the intention-behaviour gap in the rehabilitation of knee pain

ISSN: 1440-2440

DOI: 10.1016/j.jsams.2015.06.010

Accession Number: WOS:000378185800003

Abstract: Objectives: The purpose of this study was to investigate the role of mental toughness in maximising the effect of intentions to perform rehabilitative exercises on behaviour among a sample of people with knee pain. Design: Cross-sectional survey, with a 2-week time-lagged assessment of exercise behaviour. Methods: In total, 193 individuals (n(female) =107, n(male) = 84) aged between 18 and 69 years (M=30.79, SD = 9.39) participated, with 136 (70.5%) retained at both assessment points. At time 1, participants completed an online, multisection survey that encompassed measures of demographic

details, severity of problems associated with the knee (e.g., pain, symptoms), past behaviour, mental toughness, and the theory of planned behaviour constructs (TPB; attitudes, subjective norms, perceived behavioural, intentions). Two weeks later, participants retrospectively reported their exercise behaviour for the past 14 days using an online survey. Results: Moderated regression analyses indicated that mental toughness and its interaction with intention accounted for an additional 3% and 4% of the variance in exercise behaviour, respectively. Past behaviour, attitudes, and mental toughness all had direct effects on behaviour, alongside a meaningful interaction between intentions and mental toughness. Specifically, intentions had a stronger effect on exercise behaviour among those individuals high in mental toughness compared to those low in this personal resource. Conclusions: The results of this study shed new light on the intention-behaviour gap by indicating that mental toughness increases the likelihood that intention is translated into action. Short Title: Methods to improve the translation of evidence-based interventions: A primer on dissemination and implementation science for occupational safety and health researchers and practitioners

ISSN: 0925-7535

DOI: 10.1016/j.ssci.2022.105763

Article Number: 105763

Accession Number: WOS:000821675400003

Abstract: Objective: A limited focus on dissemination and implementation (D&I) science has hindered the uptake of evidence-based interventions (EBIs) that reduce workplace morbidity and mortality. D&I science methods can be used in the occupational safety and health (OSH) field to advance the adoption, implementation, and sustain-ment of EBIs for complex workplaces. These approaches should be responsive to contextual factors, including the needs of partners and beneficiaries (such as employers, employees, and intermediaries). Methods: By synthesizing seminal literature and texts and leveraging our collective knowledge as D&I science and/or OSH researchers, we developed a D&I science

primer for OSH. First, we provide an overview of common D&I terminology and concepts. Second, we describe several key and evolving issues in D&I science: balancing adaptation with intervention fidelity and specifying implementation outcomes and strategies. Next, we review D&I theories, models, and frameworks and offer examples for applying these to OSH research. We also discuss widely used D&I research designs, methods, and measures. Finally, we discuss future directions for D&I science application to OSH and provide resources for further exploration. Results: We compiled a D&I science primer for OSH appropriate for practitioners and evaluators, especially those newer to the field. Conclusion: This article fills a gap in the OSH research by providing an overview of D&I science to enhance understanding of key concepts, issues, models, designs, methods and measures for the translation into practice of effective OSH interventions to advance the safety, health and well-being of workers.

Short Title: Evaluation of a mobile mammography unit: concepts and randomized cluster trial protocol of a population health intervention research to reduce breast cancer screening inequalities

DOI: 10.1186/s13063-022-06480-w

Article Number: 562

Accession Number: WOS:000825728300013

Abstract: Background: Breast cancer is the leading cancer in women in France both in incidence and mortality. Organized breast cancer screening (OBCS) has been implemented nationwide since 2004, but the participation rate remains low (48%) and inequalities in participation have been reported. Facilities such as mobile mammography units could be effective to increase participation in OBCS and reduce inequalities, especially areas underserved in screening. Our main objective is to evaluate the impact of a mobile unit and to establish how it could be used to tackle territorial inequalities in OBCS participation. Methods: A collaborative project will be conducted as a randomized controlled cluster trial in 2022-2024 in remote areas of four French departments. Small geographic areas were constructed by clustering women eligible to

OBCS, according to distance to the nearest radiology centre, until an expected sample of eligible women was attained, as determined by logistic and financial constraints. Intervention areas were then selected by randomization in parallel groups. The main intervention is to propose an appointment at the mobile unit in addition to current OBCS in these remote areas according to the principle of proportionate universalism. A few weeks before the intervention, OBCS will be promoted with a specific information campaign and corresponding tools, applying the principle of multilevel, intersectoral and community empowerment to tackle inequalities. Discussion: This randomized controlled trial will provide a high level of evidence in assessing the effects of mobile unit on participation and inequalities. Contextual factors impacting the intervention will be a key focus in this evaluation. Quantitative analyses will be complemented by qualitative analyses to investigate the causal mechanisms affecting the effectiveness of the intervention and to establish how the findings can be applied at national level.

Short Title: Efficacy of the Virtual Reality Intervention VR FestLab on Alcohol Refusal Self-Efficacy: A Cluster-Randomized Controlled Trial

DOI: 10.3390/ijerph19063293

Article Number: 3293

Accession Number: WOS:000775410700001

Abstract: It is currently unknown whether a virtual social environment can support young people in building their skills to overcome peer pressure when offered alcohol. This study evaluated the efficacy of the newly developed virtual reality simulation game VR FestLab on the refusal self-efficacy regarding social pressures to drink of Danish male and female students aged 15-18. VR FestLab features a party setting where adolescents can "steer" their own party experience. Eleven schools were included in a cluster-randomized controlled trial and allocated to either the intervention

(n = 181) or the active control group (n = 191). Students in intervention schools played VR FestLab, while those in the control group played the VR game Oculus Quest-First Steps. The primary outcome measure was the social pressure subscale of the drinking refusal self-efficacy scale (DRSEQ-RA). The intervention effects were measured immediately after the intervention/control session (T1) and after a 6-week follow-up (T2). Data were examined using linear mixed regression models. Our study did not demonstrate a significant effect of drinking refusal self-efficacy at T1. For all secondary outcomes, we observed no substantial differences between the intervention and control groups. This study provides new insights into the feasibility and effectiveness of an innovative virtual reality alcohol prevention tool. VR FestLab can be an innovative and promising contribution to complement existing school-based alcohol prevention, but more research is needed to improve its effectiveness.

Short Title: Development of a tool to support general practitioners to help adolescents with knee pain: an analysis using the Theoretical Domains Framework

ISSN: 1463-4236

DOI: 10.1017/s1463423623000130

Article Number: e24

Accession Number: WOS:000961394900001

Abstract: Aim:Using the Theoretical Domains Framework (TDF) and COM-B model, this study aimed to determine the facilitators to a support tool for adolescent non-traumatic knee pain in general practice.

Background:Many children and adolescents with non-traumatic knee pain consult their general practice. Currently, there are no tools to support general practitioners in the diagnosis and management of this group. There is a need to identify behavioural targets that would facilitate further development and implementation of such a tool. Methods:This study was designed as a qualitative study using focus group interviews with 12 medical doctors working in general

practice. The semi-structured focus group interviews conducted online and followed an interview guide based on the TDF and COM-B model. Data were analysed via thematic text analysis. Findings: One of the biggest challenges from the general practitioner's perspective was how to manage and guide adolescents with non-traumatic knee pain. The doctors had doubts in their capability to diagnose knee pain and saw opportunity to help structure the consultation. The doctors felt motivated to use a tool but considered access a potential barrier. Increasing opportunity and motivation by creating access in the community among general practitioners was considered important. We identified several barriers and facilitators for a support tool for the management of adolescent non-traumatic knee pain in general practice. To align with user needs, future tools should support diagnostic workup, structure the consultation and be easily available among doctors working in general practice.

Short Title: Objective risk assessment vs standard care for acute coronary syndromes-The Australian GRACE Risk tool Implementation Study (AGRIS): a process evaluation

DOI: 10.1186/s12913-022-07750-8

Article Number: 380

Accession Number: WOS:000772072700002

Abstract: Background Structured risk-stratification to guide clinician assessment and engagement with evidence-based therapies may reduce care variance and improve patient outcomes for Acute Coronary Syndrome (ACS). The Australian Grace Risk score Intervention Study (AGRIS) explored the impact of the GRACE Risk Tool for stratification of ischaemic and bleeding risk in ACS. While hospitals in the active arm had a higher overall rate of invasive ACS management, there was neutral impact on important secondary prevention prescriptions/referrals, hospital performance measures, myocardial infarction and 12-month mortality leading to early trial

cessation. Given the Grace Risk Tool is under investigation internationally, this process evaluation study provides important insights into the possible contribution of implementation fidelity on the AGRIS study findings. Methods Using maximum variation sampling, five hospitals were selected from the 12 centres enrolled in the active arm of AGRIS. From these facilities, 16 local implementation stakeholders (Cardiology advanced practice nurses, junior and senior doctors, study coordinators) consented to a semi-structured interview guided by the Theoretical Domains Framework. Directed Content Analysis of qualitative data was structured using the Capability/Opportunity/Motivation-Behaviour (COM-B) model. Results Physical capability was enhanced by tool usability. While local stakeholders supported educating frontline clinicians, non-cardiology clinicians struggled with specialist terminology. Physical opportunity was enhanced by the paper-based format but was hampered when busy clinicians viewed risk-stratification as one more thing to do, or when form visibility was neglected. Social opportunity was supported by a culture of research/evidence yet challenged by clinical workflow and rotating medical officers. Automatic motivation was strengthened by positive reinforcement. Reflective motivation revealed the GRACE Risk Tool as supporting but potentially overriding clinical judgment. Divergent professional roles and identity were a major barrier to integration of risk-stratification into routine Emergency Department practice. The cumulative result revealed poor form completion behaviors and a failure to embed risk-stratification into routine patient assessment, communication, documentation, and clinical practice behaviors. Conclusions Numerous factors negatively influenced AGRIS implementation fidelity. Given the prominence of risk assessment recommendations in United States, European and Australian guidelines, strategies that strengthen collaboration with Emergency Departments and integrate automated processes for risk-stratification may improve future translation internationally. Short Title: Compliance to Screening Protocols for Multidrug-Resistant Microorganisms at the Emergency Departments of Two Academic Hospitals in the Dutch-German Cross-Border Region

DOI: 10.3390/tropicalmed6010015

Article Number: 15

Accession Number: WOS:000633077300001

Abstract: Infections caused by multidrug-resistant organisms (MDROs) are associated with prolonged hospitalization and higher risk of mortality. Patients arriving in the hospital via the emergency department (ED) are screened for the presence of MDROs in compliance with the screening protocols in order to apply the correct isolation measures. In the Dutch-German border region, local hospitals apply their own screening protocols which are based upon national screening protocols. The contents of the national and local MDRO screening protocols were compared on vancomycin-resistant enterococci (VRE), methicillin-resistant *Staphylococcus aureus* (MRSA), and carbapenemase-producing and carbapenem-resistant Enterobacteriaceae (CPE/CRE). The practicality of the screening protocols was evaluated by performing an audit. As a result, the content of the MDRO screening protocols differed regarding risk factors for MDRO carriage, swab site, personal protective equipment, and isolation measures. The observations and questionnaires showed that the practicality was sufficient; however, the responsibility was not designated clearly and education regarding the screening protocols was deemed inappropriate. The differences between the MDRO screening protocols complicate patient care in the Dutch-German border region. Arrangements have to be made about the responsibility of the MDRO screening, and improvements are necessary concerning education regarding the MDRO screening protocols.

Short Title: Categorizing Chinese Consumers' Behavior to Identify Factors Related to Sustainable Clothing Consumption

DOI: 10.3390/su15076126

Article Number: 6126

Accession Number: WOS:000970405500001

Abstract: Consumers' current clothing consumption behavior patterns have become the primary challenge to environmental sustainability within the clothing industry. In order to ensure any behavioral change intervention is successful, a thorough understanding of consumers' current consumption behavior is required. Accordingly, we aimed to identify factors related to sustainable clothing consumption by categorizing the actual clothing consumption behaviors of Chinese consumers. Specifically, the study aims to answer two sub-questions: (1) how can we categorize clothing consumption behaviors? and (2) what factors influence different types of clothing consumption behaviors? Data were collected through a two-phase survey that included observations and a questionnaire. The consumer behavior was divided into three categories based on the actual total number of clothing items and clothing usage frequency during a designated period. Among these categories, demographics and clothing consumption behavior variables were examined in the purchase, use, and disposal phases, using Chi-square analysis, Fisher's exact test, and variance analysis. The findings show that gender, age, brand preference, annual expenditure, number of new items, purchase priorities, reason for disposal, disposal channels, disposal quantity, repair experience, duration of use, price, and clothing type were the main factors related to sustainable clothing consumption. Finally, we discuss the implications of our findings and define the issues to be addressed in order to move towards sustainable clothing consumption behavior changes.

DOI: 10.1016/j.dsx.2021.05.023

Article Number: 102150

Accession Number: WOS:000684974800001

Abstract: Background and aim: There is a lack of data on

effectiveness of diabetes self-management education and support (DSMES) programs for South Asian adults with type 1 diabetes mellitus (T1DM). This formative research was conducted to explore existing practices on the said subject and gather information for planning an intervention program. Methods and materials: We conducted in-depth semi-structured interviews with endocrinologists, dietitians, diabetes educators and adults with T1DM. The participants were selected from a mix of public and private health facilities. Thematic analysis using inductive and deductive approach was undertaken. The intervention was developed and refined using the principles of FUSED and COM-B models. Results: In total, 28 in-depth interviews were conducted, 18 with health care professionals and 10 with adult individuals with T1DM. The results demonstrated deficiencies in the implementation of a structured self-management program for diabetes owing to several patient and healthcare system-related factors. A detailed nutritional counseling was provided at all sites by a qualified dietitian, however, carbohydrate counting was not routinely practiced. The interviews of this formative research revolved around: (a) evaluation of the existing usual care and gaps in implementation of a structured DSMES program, and (b) development of themes that will help in formulation of an intervention package and its effective delivery to the participants. Conclusion: This research study comprehensively investigated the existing practices among diabetes health care professionals caring for persons living with T1DM and rendered insights towards development of a scientific DSMES program. Title: A personalized biomedical risk assessment infographic for people who smoke with COPD: a qualitative study

Journal: Addiction Science & Clinical Practice

Volume: 17

Issue: 1

Date: Jan

Short Title: A personalized biomedical risk assessment infographic for people who smoke with COPD: a qualitative study

ISSN: 1940-0640

DOI: 10.1186/s13722-021-00283-1

Article Number: 1

Accession Number: WOS:000739958800002

Abstract: Background: Chronic obstructive pulmonary disease (COPD)

causes 3 million deaths each year, yet 38% of COPD patients continue to smoke. Despite proof of effectiveness and universal guideline recommendations, smoking cessation interventions are underused in practice. We sought to develop an infographic featuring personalized biomedical risk assessment through future lung function decline prediction (with vs without ongoing smoking) to both prompt and enhance clinician delivery of smoking cessation advice and pharmacotherapy, and augment patient motivation to quit. Methods: We recruited patients with COPD and pulmonologists from a quaternary care center in Toronto, Canada. Infographic prototype content and design was based on best evidence. After face validation, the prototype was optimized through rapid-cycle design. Each cycle consisted of: (1) infographic testing in a moderated focus group and a clinician interview (recorded/transcribed) (with questionnaire completion); (2) review of transcripts for emergent/critical findings; and (3) infographic modifications to address findings (until no new critical findings emerged). We performed iterative transcript analysis after each cycle and a summative qualitative transcript analysis with quantitative (descriptive) questionnaire analysis. Results: Stopping criteria were met after 4 cycles, involving 20 patients (58% male) and 4 pulmonologists (50% male). The following qualitative themes emerged: Tool content (infographic content preferences); Tool Design (infographic design preferences); Advantages of Infographic Messaging (benefits of an infographic over other approaches); Impact of Tool on Determinants of Smoking Cessation Advice Delivery (impact on barriers and enablers to delivery of smoking cessation advice in practice); and Barriers and Enablers to Quitting (impact on barriers and enablers to quitting). Patient Likert scale ratings of infographic content and format/usability were highly positive, with improvements in scores for 20/21 questions through the design process. Providers scored the infographic at 77.8% ("superior") on the Suitability Assessment of Materials questionnaire. Conclusions: We developed a user preference-based personalized biomedical risk assessment infographic to drive smoking cessation in patients with COPD. Our findings suggest that this tool could impact behavioural determinants of provider smoking-cessation advice delivery, while increasing patient quit motivation. Impacts of the tool on provider care, patient motivation to quit, and smoking cessation success should now be evaluated in real-world settings.

Short Title: Level of appropriate primary diabetic eyecare delivered and achievable in optometry practices in Australia

ISSN: 0816-4622

DOI: 10.1080/08164622.2022.2033107

Accession Number: WOS:000751695200001

Abstract: Background To examine the appropriateness of diabetic eye-care delivery and establish achievable benchmarks of care (ABCs) for optometry practices in Australia. Method In a retrospective audit, clinical records of patients with type-II diabetes obtained from a randomly selected nationally representative sample of optometry practices were assessed against evidence-based clinical indicators. Appropriate care is defined as care delivered in compliance with the indicators. The ABC for each indicator was calculated as the average performance for the top 10% of optometry practices after Bayesian adjustment to account for a low number of eligible records. Results The audit of 420 randomly selected patient records from 42 practices against 12 clinical indicators showed an overall appropriateness of 69% (95% confidence interval (CI) 66%, 73%) for overall diabetic eye care. While a high level of appropriateness was identified for recall period (93%, 95% CI 85%, 100%) and referral (100%, 95% CI 38%, 100%), larger gaps existed in history taking (46%, 95% CI 44%, 52%), dilated fundus examination (80%, 95% CI 76%, 84%) and iris examination (0%, 95% CI 0%, 56%). The ABCs for 8 of 12 indicators were 100%, and the remaining three indicators had ABCs above 80%. An ABC for the iris examination indicator could not be calculated owing to the low number of eligible patient record cards. Conclusions This study demonstrated a systematic process of practice evaluation and benchmarking in optometry practices. The diabetic eye care delivered by Australian optometrists was largely appropriate; however, improvement opportunities exist for history taking and physical examination. The ABCs demonstrate that excellence in primary diabetic eye care is attainable and will serve as an important tool in future initiatives to reduce the identified evidence-to-practice gaps.

DOI: 10.1111/opo.12912

Accession Number: WOS:000715261900001

Abstract: Purpose A recent nationwide medical record audit of optometry practices has identified an evidence-to-practice gap in primary diabetic eyecare delivery. This study aimed to explore the determinants (barriers and enablers) to appropriate diabetic eyecare delivery in Australia. Methods A qualitative study involving focus-group discussions and interviews of a purposeful sample of Australian optometrists was conducted. Participants were asked about the perceived barriers to adherence to four underperforming clinical indicators related to primary diabetic eyecare identified by the recent national optometry practice audit. The Theoretical Domain Framework was used for thematic analysis and coding salience to identify key behavioural determinants. Results Optometrists participated in eight focus groups (n = 27) and individual interviews (n = 4). The most salient barriers were related to Environmental resources (e.g., limited chair time); Beliefs about consequences (e.g., lack of perceived importance); Knowledge (e.g., poor understanding); Professional role/identity (e.g., the perceived role of optometry in care process); Social influences (e.g., the influence of senior optometrists) and Intentions (e.g., apathy). Key enablers were Environmental resources (e.g., electronic record system and practice aids); Knowledge (e.g., keeping up with knowledge/professional development); reinforcements (e.g., fear of legal actions) and behavioural regulations (e.g., self-monitoring/audit). Conclusions This study shows that the evidence-to-practice gap in primary diabetic eyecare delivery in Australia can be attributed in part to several interconnected factors related to optometrists' individual capability and motivation as well as the social and practice environment within which they sit. These behavioural determinants will inform the design of an intervention to improve the appropriateness of primary diabetic eyecare delivery.

Accession Number: WOS:000849492000010
Abstract: Wildfire smoke is a rapidly growing threat to global cardiovascular health. We review the literature linking wildfire smoke exposures to cardiovascular effects. We find substantial evidence that short-term exposures are associated with key cardiovascular outcomes, including mortality, hospitalization, and acute coronary syndrome. Wildfire smoke exposures will continue to increase over the majority of Earth's surface. For example, the United States alone has experienced a 5-fold increase in annual area burned since 1972, with 82 million individuals estimated to be exposed to wildfire smoke by midcentury. The associated rise in excess morbidity and mortality constitutes a growing global public health crisis. Fortunately, the effect of wildfire smoke on cardiovascular health is modifiable at the individual and population levels through specific interventions. Health systems therefore have an opportunity to help safeguard patients from smoke exposures. We provide a roadmap of evidence-based interventions to reduce risk and protect cardiovascular health. Key interventions include preparing health systems for smoke events; identifying and educating vulnerable patients; reducing outdoor activities; creating cleaner air environments; using air filtration devices and personal respirators; and aggressive management of chronic diseases and traditional risk factors. Further research is needed to test the efficacy of interventions on reducing cardiovascular outcomes.

Abstract: South Africa is the epicentre of the HIV pandemic. Although there have been health promotion education campaigns to reduce HIV incidence, these have not achieved the desired outcomes. When exploring the effectiveness of these campaigns, it is useful not only to examine HIV knowledge, but also to explore the relationship between that knowledge and health-related behaviour. This study aimed to determine the (1) level of knowledge of HIV prevention, (2) relationship between the level of knowledge and the adoption of these behaviours and (3) barriers to sexual behaviour change of vulnerable women in Durban's city centre, KwaZulu-Natal, South Africa. A mixed methods approach was used to collect information from a marginalised population of women (n = 109) attending a non-governmental organisation, which provides for the needs of people from low socio-economic strata. Data were collected during September 2018 at a wellness day programme at the centre. A total of 109 women, over the age of 18 years answered the questionnaire. Knowledge of HIV transmission was high, with majority of participants correctly identifying modes of transmission. Almost all the participants (91.2%) had been tested for HIV, with 68.8% tested a minimum of three times. Despite this, sexual risk behaviour was high. Despite the high level of knowledge of HIV transmission, there was no relationship between HIV knowledge and adoption of behaviours for the prevention of HIV transmission ($p = .457$). However, bivariate analysis showed an association between transactional sex and living in informal housing (OR = 31.94, 95% CI: 5.65-180.63, $p < .001$). Living in informal housing was also associated with having multiple current sexual partners (OR = 6.30, 95% CI: 1.39-28.42, $p = .02$). Multivariate analysis, after adjusting for all other factors, indicated that the odds of having transactional sex was increased by 23 times in those who did not have formal housing (OR = 23.306, 95% CI: 3.97-144.59, $p = .001$). Qualitative responses showed that women perceived poverty as the overarching factor determining the lifestyle choices which impacted their health. They indicated a need for employment opportunities and provision of housing to alleviate both poverty as well as transactional sex. Although, participants from this study understood the benefits of the protective behaviours to prevent HIV transmission, economic and social factors do not afford this vulnerable group the opportunity nor the motivation to adopt such behaviours. In the current climate of increasing unemployment and escalating GBV, urgent interventions are needed in terms of employment opportunities and empowerment drives to prevent an increase in HIV transmission.

Abstract: Background Clinical quality registries (CQRs) can likely improve quality in healthcare and research. However, studies indicate that effective use of CQRs is hindered by lack of engagement and interest among stakeholders, as well as factors related to organisational context, registry design and data quality. To fulfil the potential of CQRs, more knowledge on stakeholders' perceptions of the factors that will facilitate or hamper the development of CQRs is essential to the more appropriate targeting of registry implementation and the subsequent use of the data. The primary aim of this study was to examine factors that can potentially affect the development of a national CQR for interventional radiology in Norway from the perspective of stakeholders. Furthermore, we wanted to identify the intervention functions likely to enable CQR development. Only one such registry, located in Sweden, has been established. To provide a broader context for the Norwegian study, we also sought to investigate experiences with the development of this registry. Methods A qualitative study of ten Norwegian radiologists and radiographers using focus groups was conducted, and an in-depth interview with the initiator of the Swedish registry was carried out. Questions were based on the Capability, Opportunity and Motivation for Behaviour Model and the Theoretical Domains Framework. The participants' responses were categorised into predefined themes using a deductive process of thematic analysis. Results Knowledge of the rationale used in establishing a CQR, beliefs about the beneficial consequences of a registry for quality improvement and research and an opportunity to learn from a well-developed registry were perceived by the participants as factors facilitating CQR development. The study further identified a range of development barriers related to environmental and resource factors (e.g., a lack of organisational support, time) and individual-level factors (e.g., role boundaries, resistance to change), as well as several

intervention functions likely to be appropriate in targeting these barriers. Conclusion This study provides a deeper understanding of factors that may be involved in the behaviour of stakeholders regarding the development of a CQR. The findings may assist in designing, implementing and evaluating a methodologically rigorous CQR intervention.

DOI: 10.3390/ijerph192214784

Article Number: 14784

Accession Number: WOS:000887196900001

Abstract: Background: Several quantitative studies have found a decline in physical activity in response to COVID-19 pandemic restrictions. The aim of the present study was to use large-scale free text survey data to qualitatively gain a more in-depth understanding of the impact of the COVID-19 pandemic on physical activity, then map barriers and facilitators to the Capability, Opportunity, Motivation, and Behaviour (COM-B) Model of Behaviour to aid future intervention development. Methods: 17,082 participants provided a response to the free text module, and data from those who mentioned a physical activity related word in any context were included. Data were analysed using thematic analysis and key themes identified. Results: 5396 participants provided 7490 quotes related to physical activity. The sample were predominately female (84%), white (British/Irish/Other) (97%) and aged <60 years (57%). Seven key themes were identified: the importance of outdoor space, changes in daily routine, COVID-19 restrictions prevented participation, perceived risks or threats to participation, the importance of physical health, the importance of physical activity for mental health and the use of technology. Conclusion: Future physical activity interventions could encourage people to walk outdoors, which is low cost, flexible, and accessible to many. Developing online resources to promote and support physical activity provides a flexible way to deliver quality content to a large audience.

Title: Patient-Provider Communication and Adherence to Cholesterol Management Advice: Findings from a Cross-Sectional Survey
Journal: Population Health Management
Volume: 24
Issue: 5
Pages: 581-588
Date: Oct
Short Title: Patient-Provider Communication and Adherence to Cholesterol Management Advice: Findings from a Cross-Sectional Survey

ISSN: 1942-7891

DOI: 10.1089/pop.2020.0290

Accession Number: WOS:000606627100001

Abstract: High cholesterol is a preventable risk factor for heart disease. This study examines which aspects of patient-provider communication are associated with patient report of increased adherence to cholesterol management advice in a diverse, low-income patient population accessing the health care safety net, using the 2014 Health Center Patient Survey. Patient-provider communication measures included patient report of: how often a provider listened carefully, gave easy-to-understand information, knew important information about the patient's medical history, showed respect, and spent enough time with the patient. Outcome measures were patient report of following provider advice to eat fewer high fat or high cholesterol foods, manage weight, increase physical activity, or take prescribed medicine. In adjusted analyses, when patients perceived their provider always knew their medical history, patients were more likely to report taking prescribed medication (adjusted odds ratio [aOR]: 3.2; 95% confidence interval [CI]: 1.6, 6.6). Knowledge of medical history (aOR: 2.8, 95% CI: 1.4, 5.8), spending enough time (aOR: 2.3, 95% CI: 1.2, 4.4), and providing easily understandable information (aOR: 2.2, 95% CI: 1.0, 4.7) were significantly associated with report of following physical activity advice. Knowledge of medical history (aOR: 2.3, 95% CI: 1.0, 5.2) and providing easily understandable information (aOR: 3.3, 95% CI: 1.4, 7.9) were significantly associated with report of following weight management advice. This study indicates different components of patient-provider communication influence patient adherence to lifestyle modification advice and medication prescription. These results suggest a tailored approach to optimize the impact of patient-provider communication on cholesterol management advice adherence.

Title: Minimizing the knowledge-to-action gap; identification of interventions to change nurses' behavior regarding fall prevention, a mixed method study

Journal: BMC Nursing

Volume: 20

Issue: 1

Date: May

Short Title: Minimizing the knowledge-to-action gap; identification of interventions to change nurses' behavior regarding fall prevention, a mixed method study

ISSN: 1472-6955

DOI: 10.1186/s12912-021-00598-z

Article Number: 80

Accession Number: WOS:000652605700001

Abstract: Background The need for effective continuing education is especially high in in-hospital geriatric care, as older patients have a higher risk of complications, such as falls. It is important that nurses are able to prevent them. However, it remains unknown which interventions change the behavior of nurses. Therefore, the aim of this study is to identify intervention options to change the behavior of hospital nurses regarding fall prevention among older hospitalized patients. Methods This study used a mixed method design. The Behavior Change Wheel (BCW) was used to identify intervention functions and policy categories to change the behavior of nurses regarding fall prevention. This study followed the eight steps of the BCW and two methods of data collection were used: five focus groups and three Delphi rounds. The focus groups were held with hospital nurses (n = 26). Geriatric experts (n = 11), managers (n = 13) and educators (n = 13) were included in the Delphi rounds. All data were collected within ten tertiary teaching hospitals in the Netherlands. All participants were included based on predefined in- and exclusion criteria and availability. Results In Geriatric experts' opinions interventions targeting behavior change of nurses regarding fall prevention should aim at 'after-care', 'estimating fall risk' and 'providing information'. However, in nurses' opinions it should target; 'providing information', 'fall prevention' and 'multifactorial fall risk assessment'. Nurses experience a diversity of limitations relating to capability, opportunity and motivation to prevent fall incidents among older patients. Based on these limitations educational experts identified three intervention functions: Incentivisation, modelling and enablement. Managers selected the following policy categories; communication/marketing, regulation and environmental/social planning. Conclusions The results of this study show there is a discrepancy in opinions of nurses, geriatric experts, managers and educators. Further insight in the role and collaboration of managers, educators and nurses is necessary for the development of education programs strengthening

change at the workplace that enable excellence in nursing practice.

Short Title: Applying the behaviour change wheel to assess the theoretical underpinning of a novel smartphone application to increase physical activity in adults with spinal cord injuries

DOI: 10.21037/mhealth-22-52

Accession Number: WOS:000957686600001

Abstract: Background: People with spinal cord injuries (SCI) are physically inactive. Smartphone applications (or apps) may prove as one strategy to overcome this. This study examines the theoretical underpinning of a novel mHealth intervention that aims to improve physical activity in people with SCI, namely, the Accessercise smartphone app, using the behaviour change wheel (BCW).Methods: Accessercise was evaluated using the BCW in eight steps across the following three stages: (I) understanding the behaviour, (II) identifying intervention options, and (III) identifying content and implementation options.Results: Thirteen target behaviours were identified to improve physical activity and reduce sedentary behaviours in adults with SCI, including goal setting and monitoring, increasing self-confidence, interest and motivation for undertaking physical activity, improving the knowledge/awareness of available physical activity opportunities and resources, and reducing stigma and negative attitudes associated with physical activity. Accessercise incorporates the necessary components for adults with SCI to be physically and psychologically capable of undertaking physical activity, offering social and physical opportunities to reduce sedentary behaviours, and supports automatic and reflective motivation.Conclusions: This systematic approach of assessing the theoretical underpinning of Accessercise in the context of the BCW has revealed potential mechanisms of action for improving physical activity in adults with SCI. This serves as a blueprint to inform further intervention development, as well as high-quality effectiveness studies, namely, randomised controlled trials, assessing whether fitness apps can improve physical and psychological health outcomes in individuals with SCI.

Abstract: Exploring everyday life dynamics in meat reduction - a cluster analysis of flexitarians in Denmark. Flexitarians are attracting increasing attention in the research on meat reduction. But there has been limited focus on comprehensive understandings of a broader range of dynamics that can work as barriers and facilitators for meat reduction. In this article, we use social practice theory (SPT) as a comprehensive approach to barriers and facilitators in meat reduction in everyday life. We present an analysis of data from a representative Danish cross-sectional survey. We show, first, that Danish flexitarians can be divided into four distinct clusters (what we will refer to as classes) in accordance with combinations of everyday facilitators and barriers. Second, we show that the prevalence of these classes varies considerably depending on how long people have been flexitarians. We argue that the patterns in this variation indicate that over time people transition to other classes where barriers to plant-rich eating become less significant, and routinization emerges in different ways. Finally, third, we show that flexitarians do report eating less meat than consumers who label themselves as eating meat with no re-strictions. But we also highlight that the difference is relatively modest. Indeed, meat intake is still quite common even in classes where routinization is highest. Throughout the paper, we discuss similarities and differences between the SPT framework and another recent framework, the COM-B model, that also provides a comprehensive approach to the understanding of behavioural change.

Abstract: Introduction There is global recognition that low back pain (LBP) should be managed with a biopsychosocial approach. Previous implementation of this approach resulted in low uptake and highlighted the need for ongoing support. This study aims to explore the feasibility of (i) training and using a champion to support implementation, (ii) using a cluster randomised controlled trial (RCT), (iii) collecting patient reported outcome measures in a Canadian public healthcare setting and to identify contextual barriers to implementation. Methods A pragmatic cluster RCT with embedded qualitative study with physiotherapists treating LBP in publicly funded physiotherapy departments in Newfoundland and Labrador, Canada. Participants will complete a previously developed online training course to equip them to deliver a biopsychosocial intervention for LBP. Clusters randomised to the intervention arm will receive additional support from a champion. A minimum champion training package has been developed based on known barriers in the literature. This includes strategies to target barriers relating to group-based scheduling issues, lack of managerial support, perceived patient factors such as addressing patient expectations for other types of treatments or selecting which patients might be best suited for this intervention, and anxiety about delivering something new. This package will be further codeveloped with study champions based on identified implementation barriers using the Behaviour Change Wheel. Clusters will be monitored for 6 months to assess champion and physiotherapist recruitment and retention, acceptability and implementation of the champion training, and the viability of conducting a cluster RCT in this setting. A purposive sample of physiotherapists will be interviewed from both arms. Ethics and dissemination This study was approved by Newfoundland and Labrador Health Research Ethics Authority in December 2018. Results will be disseminated to academic audiences through conferences and peer reviewed publications; to all study participants, their clinical leads, and patients with LBP.

Accession Number: WOS:000683906100032

Abstract: Health-related behavior change refers to a body of behavior change strategies that aim to align people's behavior with advances in evidence-based knowledge and decision-making. However, human behavior is complex, and changing it often requires a combination of strategies to be effective. The challenge is in choosing the combination of strategies that will work best.

Implementation science, the study of behavior change, has rapidly expanded in recent years and has pioneered work in providing more transparent and theory-based methods for choosing and evaluating behavior change strategies. There are several models and frameworks that underlie the science of implementation, the most recent and comprehensive of which include the Implementation of Change Model, the COM-B (capability, motivation, and behavior) Model, and the Theoretical Domains Framework, as well as the behavior change techniques (BCTs) taxonomy. These models and frameworks can be applied to help support the development and evaluation of behavior change interventions. In this chapter, we will review the latest advances and lessons learned from implementation science as it applies to health-related behavior change.

Article Number: e050283

Accession Number: WOS:000749001500057

Abstract: Objectives To explore barriers and facilitators to prescribing error reporting across primary care. Design Qualitative semi-structured face-to-face and telephone interviews were conducted to explore facilitators and barriers to reporting prescribing errors. Data collection and thematic analysis were informed by the COM-B model of behaviour change. Framework analysis was used for coding and charting the data with the assistance of NVivo software (V.12). General and context specific influences on prescribing error reporting were mapped to constructs from the COM-B model (ie, capability, opportunity and motivation). Setting Primary care organisations, including community pharmacy, general practice and community care from North East England. Participants We interviewed a maximal variation purposive sample of 25 participants, including prescribers, community pharmacists and key stakeholders with primary care or medicines safety roles at local, regional and national levels. Results Our findings describe a range of factors that influence the capability, opportunity and motivation to report prescribing errors in primary care. Three key contextual factors are also highlighted that were found to underpin many of the behavioural influences on reporting in this setting: the nature of prescribing; heterogeneous priorities for error reporting across and within different primary care organisations; and the complex infrastructure of reporting and learning pathways across primary care. Findings suggest that there is a lack of consistency in how, when and by whom, prescribing errors are reported across primary care.

Conclusions Further research is needed to identify cross-organisational and interprofessional consensus on agreed reporting thresholds and how best to facilitate a more collaborative approach to reporting and learning, that is, sensitive to the needs and priorities of disparate organisations across primary care. Despite acknowledged challenges, there may be potential for an increased role of community pharmacy in prescribing error reporting to support future learning.

Accession Number: WOS:000648544700008

Abstract: The development of non-alcoholic fatty liver disease is closely linked to lifestyle factors, namely excessive caloric intake coupled with reduced physical activity and exercise. This review aims to examine the evidence behind lifestyle change as a tool to improve hepatic steatosis and liver histology in patients with non-alcoholic fatty liver disease/non-alcoholic steatohepatitis.

Furthermore, potential barriers to adopting lifestyle changes and strategies to overcome these barriers in the clinical setting are discussed. (c) 2019 Published by Elsevier B.V. This is an open access article under the CC BY-NC-ND license (<http://creativecommons.org/licenses/by-nc-nd/4.0/>).

DOI: 10.1186/s12889-022-14496-9

Article Number: 2213

Accession Number: WOS:000890289900005

Abstract: Background System-level approaches that target social determinants of health are promising strategies to support substance use prevention, holistic youth development and wellbeing. Yet, the youth services system is largely based on individual-focused programs that do not adequately account for social determinants of health and place the responsibility for wellness on the individual. There is a need to understand how to enhance adoption of complex

system-level approaches that support comprehensive youth development. The Icelandic Prevention Model (IPM) represents a collaborative initiative that takes an ecological, system-level approach to prevent substance use and promote wellness in youth. This research was designed to examine key stakeholder perceptions to better understand social motivations and contextual complexities that influence stakeholder support to garner community-level adoption of the IPM in a rural Canadian community. Methods This research applies a case study approach using qualitative interviews to explore strategies to support uptake in the early stages of IPM

adoption associated with developing community buy-in and acceptance. A thematic analysis was applied using QSR NVivo. Results Nine interviews were conducted with community partners leading the implementation of the IPM. Three over-arching themes emerged from the data: 1) Motivating influences 2) Strategies to develop buy-in, and 3) Resistance to the adoption of the IPM. Findings reflect issues that affect behaviour change in system transformation in general as well as upstream prevention and the IPM, in particular. Conclusions The findings from this research describe critical insight derived from implementing community-driven initiatives that are designed to support health promotion. It contributes new scientific knowledge related to implementation of complex system-level innovations and practical information that is useful for communities interested in implementing the IPM or following similar approaches to prevent substance use.

Article Number: e0271023

Accession Number: WOS:000911392100122

Abstract: Objectives This study aimed to explore current data collection and feedback practice, in the form of monitoring and evaluation, among youth mental health (YMH) services and healthcare commissioners; and to identify barriers and enablers to this practice. Design Qualitative semi-structured interviews were conducted via Zoom videoconferencing software. Data collection and analysis were informed by the Theoretical Domains Framework (TDF). Data were deductively coded to the 14 domains of the TDF and inductively coded to generate belief statements. Setting Healthcare commissioning organisations and YMH services in Australia.

Participants Twenty staff from healthcare commissioning organisations and twenty staff from YMH services. Results The umbrella behaviour 'monitoring and evaluation' (ME) can be sub-

divided into 10 specific sub-behaviours (e.g. planning and preparing, providing technical assistance, reviewing and interpreting data) performed by healthcare commissioners and YMH services. One hundred belief statements relating to individual, social, or environmental barriers and enablers were generated. Both participant groups articulated a desire to improve the use of ME for quality improvement and had particular interest in understanding the experiences of young people and families. Identified enablers included services and commissioners working in partnership, data literacy (including the ability to set appropriate performance indicators), relational skills, and provision of meaningful feedback. Barriers included data that did not adequately depict service performance, problems with data processes and tools, and the significant burden that data collection places on YMH services with the limited resources they have to do it. Conclusions Importantly, this study illustrated that the use of ME could be improved. YMH services, healthcare commissioners should collaborate on ME plans and meaningfully involve young people and families where possible. Targets, performance indicators, and outcome measures should explicitly link to YMH service quality improvement; and ME plans should include qualitative data. Streamlined data collection processes will reduce unnecessary burden, and YMH services should have the capability to interrogate their own data and generate reports. Healthcare commissioners should also ensure that they provide meaningful feedback to their commissioned services, and local and national organisations collecting youth mental health data should facilitate the sharing of this data. The results of the study should be used to design theory-informed strategies to improve ME use.

Abstract: Background Cognitive rehabilitation is a complex and specialized area of practice, as it aims to support individuals with diverse neuropsychological profiles, personal characteristics, and intersectionalities in achieving meaningful, functional change in personally relevant aspects of their everyday lives. In many ways, cognitive rehabilitation is the epitome of a 'black box': it has

complicated internal processes that are mysterious to users. We argue that this complex practice has suffered from a lack of specificity of clinical processes and treatment components, resulting in negative consequences for both providers and clients. Aim To unpack the black box of cognitive rehabilitation by describing a unifying set of frameworks that can effectively direct clinical practice across clinical disciplines: the International Classification of Functioning, Disability, and Health (ICF), the Rehabilitation Treatment Specification System (RTSS), and the Planning, Implementation, and Evaluation framework (PIE). We present a clinical case that illustrates the application of the three frameworks. Conclusion Implementation of these three integrated frameworks supports clinical reasoning, replication of treatments, and communication across disciplines with the ultimate impact of improving rehabilitation outcomes. The frameworks provide a structure for clinicians to clearly define both the what and the how of treatment, with a level of specificity to maximize both effectiveness and efficiency of intervention.

Abstract: Aims Sustained engagement in type 1 diabetes self-management behaviours is a critical element in achieving improvements in glycated haemoglobin (HbA1c) and minimising risk of complications. Evaluations of self-management programmes, such as Dose Adjustment for Normal Eating (DAFNE), typically find that initial improvements are rarely sustained beyond 12 months. This study identified behaviours involved in sustained type 1 diabetes self-management, their influences and relationships to each other. Methods A mixed-methods study was conducted following the first two steps of the Behaviour Change Wheel framework. First, an expert stakeholder consultation identified behaviours involved in self-management of type 1 diabetes. Second, three evidence sources

(systematic review, healthcare provider-generated 'red flags' and participant-generated 'frequently asked questions') were analysed to identify and synthesise modifiable barriers and enablers to sustained self-management. These were characterised according to the Capability-Opportunity-Motivation-Behaviour (COM-B) model. Results 150 distinct behaviours were identified and organised into three self-regulatory behavioural cycles, reflecting different temporal and situational aspects of diabetes self-management: Routine (e.g. checking blood glucose), Reactive (e.g. treating hypoglycaemia) and Reflective (e.g. reviewing blood glucose data to identify patterns). Thirty-four barriers and five enablers were identified: 10 relating to Capability, 20 to Opportunity and nine to Motivation. Conclusions Multiple behaviours within three self-management cycles are involved in sustained type 1 diabetes self-management. There are a wide range of barriers and enablers that should be addressed to support self-management behaviours and improve clinical outcomes. The present study provides an evidence base for refining and developing type 1 diabetes self-management programmes.

DOI: 10.2807/1560-7917.Es.2022.27.17.2100411

Article Number: 2100411

Accession Number: WOS:000794036100001

Abstract: Background: Influenza vaccination is widely recommended for healthcare workers (HCWs) in European countries, but the coverage is not always satisfactory. In Finland, a new act was introduced in March 2017, according to which it is the employer's responsibility to appoint only vaccinated HCWs for servicing

vulnerable patients. Aim: We determined the influenza vaccination coverage among HCWs in Finnish acute care hospitals in three influenza seasons after introduction of the act. Methods: We analysed data collected by an internet-based survey sent annually to all Finnish acute care hospitals and described the influenza vaccination coverage among HCWs during seasons 2017/18, 2018/19 and 2019/20. We calculated mean coverage per healthcare district and season. Results: In season 2017/18, 38 of 39 hospitals, in 2018/19, 35 of 36 hospitals and in 2018/19 31 of 33 hospitals provided data. The mean influenza vaccination coverage was 83.7% (SD: 12.3) in season 2017/18, 90.8% (SD: 8.7) in 2018/19 and 87.6% (SD: 10.9) in season 2019/20. There was no significant increase or decrease in the mean coverage across the three seasons. The differences between districts were only significant in 2018/19 ($p < 0.005$). Conclusions: The coverage of influenza-vaccinated HCWs in Finnish hospitals was high in all three seasons and the current legal situation (semi-mandatory system) in Finland seems to provide a good background for this. Data collection should be maintained and improved for further monitoring.

Title: Women's Views on Their Diagnosis and Management for Borderline Gestational Diabetes Mellitus

Journal: Journal of Diabetes Research

Volume: 2015

Short Title: Women's Views on Their Diagnosis and Management for Borderline Gestational Diabetes Mellitus

ISSN: 2314-6745

DOI: 10.1155/2015/209215

Article Number: 209215

Accession Number: WOS:000350762100001

Abstract: Introduction. Little is known about women's views relating to a diagnosis of borderline gestational diabetes mellitus (GDM) and the subsequent management. This study aimed to explore women's experiences after being diagnosed with borderline GDM, their attitudes about treatment, and factors important to them for achieving any lifestyle changes. Methods. We conducted face-to-face, semistructured interviews with women diagnosed with borderline GDM. Results. A total of 22 women were interviewed. After a diagnosis of borderline GDM, 14 (64%) women reported not being concerned or worried. Management of borderline GDM was thought by 21 (95%) women to be very important or important. Eighteen (82%) women planned to improve their diet and/or exercise to manage their borderline GDM. The most frequently mentioned enabler for achieving intended

lifestyle change was being more motivated to improve the health of their baby and/or themselves (15 women). The most frequent barrier was tiredness and/or being physically unwell (11 women).

Conclusions. A diagnosis of borderline GDM caused some concern to one-third of women interviewed. The majority of women believed managing their borderline GDM was important and they planned to improve their lifestyle. Women's own and their babies' future health were powerful motivators for lifestyle change.

Title: Immediate versus sustained effects: interrupted time series analysis of a tailored intervention

Journal: Implementation Science

Volume: 8

Date: Nov

Short Title: Immediate versus sustained effects: interrupted time series analysis of a tailored intervention

ISSN: 1748-5908

DOI: 10.1186/1748-5908-8-130

Article Number: 130

Accession Number: WOS:000327597100001

Abstract: Background: Detailed intervention descriptions and robust evaluations that test intervention impact—and explore reasons for impact—are an essential part of progressing implementation science. Time series designs enable the impact and sustainability of intervention effects to be tested. When combined with time series designs, qualitative methods can provide insight into intervention effectiveness and help identify areas for improvement for future interventions. This paper describes the development, delivery, and evaluation of a tailored intervention designed to increase primary health care professionals' adoption of a national recommendation that women with mild to moderate postnatal depression (PND) are referred for psychological therapy as a first stage treatment.

Methods: Three factors influencing referral for psychological treatment were targeted using three related intervention components: a tailored educational meeting, a tailored educational leaflet, and changes to an electronic system data template used by health professionals during consultations for PND. Evaluation comprised time series analysis of monthly audit data on percentage referral rates and monthly first prescription rates for antidepressants.

Interviews were conducted with a sample of health professionals to explore their perceptions of the intervention components and to identify possible factors influencing intervention effectiveness.

Results: The intervention was associated with a significant, immediate, positive effect upon percentage referral rates for

psychological treatments. This effect was not sustained over the ten month follow-on period. Monthly rates of anti-depressant prescriptions remained consistently high after the intervention. Qualitative interview findings suggest key messages received from the intervention concerned what appropriate antidepressant prescribing is, suggesting this to underlie the lack of impact upon prescribing rates. However, an understanding that psychological treatment can have long-term benefits was also cited. Barriers to referral identified before intervention were cited again after the intervention, suggesting the intervention had not successfully tackled the barriers targeted. Conclusion: A time series design allowed the initial and sustained impact of our intervention to be tested. Combined with qualitative interviews, this provided insight into intervention effectiveness. Future research should test factors influencing intervention sustainability, and promote adoption of the targeted behavior and dis adoption of competing behaviors where appropriate.

Short Title: Applying the COM-B model to creation of an IT-enabled health coaching and resource linkage program for low-income Latina moms with recent gestational diabetes: the STAR MAMA program

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0426-2

Article Number: 73

Accession Number: WOS:000376092700001

Abstract: Background: One of the fastest growing risk groups for early onset of diabetes is women with a recent pregnancy complicated by gestational diabetes, and for this group, Latinas are the largest at-risk group in the USA. Although evidence-based interventions, such as the Diabetes Prevention Program (DPP), which focuses on low-cost changes in eating, physical activity and weight management can lower diabetes risk and delay onset, these programs have yet to be tailored to postpartum Latina women. This study aims to tailor a IT-enabled health communication program to promote DPP-concordant behavior change among postpartum Latina women with recent gestational diabetes. The COM-B model (incorporating Capability,

Opportunity, and Motivational behavioral barriers and enablers) and the Behavior Change Wheel (BCW) framework, convey a theoretically based approach for intervention development. We combined a health literacy-tailored health IT tool for reaching ethnic minority patients with diabetes with a BCW-based approach to develop a health coaching intervention targeted to postpartum Latina women with recent gestational diabetes. Current evidence, four focus groups (n = 22 participants), and input from a Regional Consortium of health care providers, diabetes experts, and health literacy practitioners informed the intervention development. Thematic analysis of focus group data used the COM-B model to determine content. Relevant cultural, theoretical, and technological components that underpin the design and development of the intervention were selected using the BCW framework. Results: STAR MAMA delivers DPP content in Spanish and English using health communication strategies to: (1) validate the emotions and experiences postpartum women struggle with; (2) encourage integration of prevention strategies into family life through mothers becoming intergenerational custodians of health; and (3) increase social and material supports through referral to social networks, health coaches, and community resources. Feasibility, acceptability, and health-related outcomes (weight loss, physical activity, consumption of healthy foods, breastfeeding, and glucose screening) will be evaluated at 9 months postpartum using a randomized controlled trial design. Conclusions: STAR MAMA provides a DPP-based intervention that integrates theory-based design steps. Through systematic use of behavioral theory to inform intervention development, STAR MAMA may represent a strategy to develop health IT intervention tools to meet the needs of diverse populations.

Short Title: What matters when exploring fidelity when using health IT to reduce disparities?

DOI: 10.1186/s12911-021-01476-z

Article Number: 119

Accession Number: WOS:000638040300003

Abstract: Background Implementation of evidence-based interventions often involves strategies to engage diverse populations while also attempting to maintain external validity. When using health IT tools

to deliver patient-centered health messages, systems-level requirements are often at odds with 'on-the ground' tailoring approaches for patient-centered care or ensuring equity among linguistically diverse populations. Methods We conducted a fidelity and acceptability-focused evaluation of the STAR MAMA Program, a 5-month bilingual (English and Spanish) intervention for reducing diabetes risk factors among 181 post-partum women with recent gestational diabetes. The study's purpose was to explore fidelity to pre-determined 'core' (e.g. systems integration) and 'modifiable' equity components (e.g. health coaching responsiveness, and variation by language) using an adapted implementation fidelity framework. Participant-level surveys, systems-level databases of message delivery, call completion, and coaching notes were included. Results 96.6% of participants are Latina and 80.9% were born outside the US. Among those receiving the STAR MAMA intervention; 55 received the calls in Spanish (61%) and 35 English (39%). 90% (n = 81) completed \geq one week. Initially, systems errors were common, and increased triggers for health coach call-backs. Although Spanish speakers had more triggers over the intervention period, the difference was not statistically significant. Of the calls triggering a health coach follow-up, attempts were made for 85.4% (n = 152) of the English call triggers and for 80.0% (n = 279) of the Spanish call triggers (NS). Of attempted calls, health coaching calls were complete for 55.6% (n = 85) of English-language call triggers and for 56.6% of Spanish-language call triggers (NS). Some differences in acceptability were noted by language, with Spanish-speakers reporting higher satisfaction with prevention content ($p = < 0.01$) and English-speakers reporting health coaches were less considerate of their time ($p = 0.03$). Conclusions By exploring fidelity by language-specific factors, we identified important differences in some but not all equity indicators, with early systems errors quickly remedied and high overall engagement and acceptability. Practice implications include: (1) establishing criteria for language-equity in interventions, (2) planning for systems level errors so as to reduce their impact between language groups and over time; and (3) examining the impact of engagement with language-concordant interventions on outcomes, including acceptability. Trial Registration National Clinical Trials registration number: CT02240420 Registered September 15, 2014. ClinicalTrials.gov.

DOI: 10.1016/j.gerinurse.2016.06.019

Accession Number: WOS:000391157200008

Abstract: Falls are a serious problem in residential aged care settings. The aims of the study were to determine the feasibility of surveying care staff regarding falls prevention, and describe care staff levels of knowledge and awareness of residents' risk of falls, knowledge about falls prevention, motivation and confidence to implement falls prevention strategies. A custom designed questionnaire was administered to care staff at one site of a large residential aged care organization in Australia. The survey response was 58.8%. Feedback from staff was used to inform the administration of the survey to the wider organization. Seven (29.2%) care staff reported they were unsure or thought residents were at low risk of falls. Only five (20.8%) care staff were able to suggest more than three preventive strategies. These preliminary findings suggest that education to change care staff behavior regarding falls prevention should target improving care staff knowledge and awareness of falls. (C) 2016 Elsevier Inc. Short Title: Identifying the Association Between Older Adults' Characteristics and Their Health-Related Outcomes in a Transition Care Setting: A Retrospective Audit

DOI: 10.3389/fpubh.2021.688640

Article Number: 688640

Accession Number: WOS:000674996700001

Abstract: Introduction: Continued evaluation of Transition Care Programs (TCP) is essential to improving older adults' outcomes and

can guide which older adults may benefit from undertaking TCP. The aim of this study was to audit a transition care service to identify the association between the characteristics of older adults undertaking a facility-based TCP and (i) discharge destination and (ii) functional improvement. Materials and methods: An audit (n = 169) of older adults aged 60 years and above who completed a facility-based TCP in Australia was conducted. Outcomes audited were performance of activities of daily living (ADL) measured using the Modified Barthel Index (MBI) and discharge destination. Data were analyzed using logistic regression and linear mixed modeling. Results: Older adults [mean age 84.2 (+/- 8.3) years] had a median TCP stay of 38 days. Fifty-four older adults (32.0%) were discharged home, 20 (11.8%) were readmitted to hospital and 93 (55%) were admitted to permanent residential aged care. Having no cognitive impairment [OR = 0.41 (95% CI 0.18-0.93)], being independent with ADL at admission [OR = 0.41 (95% CI 0.16-1.00)] and a pre-planned team goal of home discharge [OR = 24.98 (95% CI 5.47-114.15)] was significantly associated with discharge home. Cases discharged home showed greater improvement in functional ability [MBI 21.3 points (95% CI 17.0-25.6)] compared to cases discharged to other destinations [MBI 9.6 points (95% CI 6.5-12.7)]. Conclusion: Auditing a facility-based TCP identified that older adults who were independent in ADL and had good cognitive levels were more likely to be discharged home. Older adults with cognitive impairment also made clinically significant functional improvements.

Title: What explains the socioeconomic status gap in activity? Educational differences in determinants of physical activity and screentime

Journal: BMC Public Health

Volume: 17

Date: Feb

Short Title: What explains the socioeconomic status gap in activity? Educational differences in determinants of physical activity and screentime

DOI: 10.1186/s12889-016-3880-5

Article Number: 144

Accession Number: WOS:000393624800001

Abstract: Background: Designing evidence-based interventions to address socioeconomic disparities in health and health behaviours

requires a better understanding of the specific explanatory mechanisms. We aimed to investigate a comprehensive range of potential theoretical mediators of physical activity (PA) and screen time in different socioeconomic status (SES) groups: a high SES group of high school students, and a low SES group of vocational school students. The COM-B system, including the Theoretical Domains Framework (TDF), was used as a heuristic framework to synthesise different theoretical determinants in this exploratory study. Methods: Finnish vocational and high school students (N = 659) aged 16–19, responded to a survey assessing psychological, social and environmental determinants of activity (PA and screen time). These determinants are mappable into the COM-B domains: capability, opportunity and motivation. The outcome measures were validated self-report measures for PA and screen time. The statistical analyses included a bootstrapping-based mediation procedure. Results: Regarding PA, there were SES differences in all of the COM-B domains. For example, vocational school students reported using less self-monitoring of PA, weaker injunctive norms to engage in regular PA, and fewer intentions than high school students. Mediation analyses identified potential mediators of the SES-PA relationship in all of three domains: The most important candidates included self-monitoring (CI95 for b: 0.19–0.47), identity (0.04–0.25) and material resources available (0.01–0.16). However, SES was not related to most determinants of screentime, where there were mainly gender differences. Most determinants were similarly related with both behaviours in both SES groups, indicating no major moderation effect of SES on these relationships. Conclusions: This study revealed that already in the first years of educational differentiation, levels of key PA determinants differ, contributing to socioeconomic differences in PA. The analyses identified the strongest mediators of the SES-PA association, but additional investigation utilising longitudinal and experimental designs are needed. This study demonstrates the usefulness of combining constructs from various theoretical approaches to better understand the role of distinct mechanisms that underpin socioeconomic health behaviour disparities.

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2020-037466

Article Number: e037466

Accession Number: WOS:000561426800012

Abstract: Objective The COVID-19 pandemic has highlighted ongoing challenges to optimal supportive end-of-life care for adults living in long-term care (LTC) facilities. A supportive end-of-life care approach emphasises family involvement, optimal symptom control, multidisciplinary team collaboration and death and bereavement support services for residents and families. Community-based and palliative care specialist physicians who visit residents in LTC facilities play an important role in supportive end-of-life care. Yet, perspectives, experiences and perceptions of these physicians remain unknown. The objective of this study was to explore barriers and facilitators to optimal supportive end-of-life palliative care in LTC through the experiences and perceptions of community-based and palliative specialist physicians who visit LTC facilities. Design Qualitative study using semi-structured interviews, basic qualitative description and directed content analysis using the COM-B (capability, opportunity, motivation - behaviour) theoretical framework. Setting Residential long-term care. Participants 23 physicians who visit LTC facilities from across Alberta, Canada, including both in urban and rural settings of whom 18 were community-based physicians and 5 were specialist palliative care physicians. Results Motivation barriers include families' lack of frailty knowledge, unrealistic expectations and emotional reactions to grief and uncertainty. Capability barriers include lack of symptom assessment tools, as well as palliative care knowledge, training and mentorship. Physical and social design barriers include lack of dedicated spaces for death and bereavement, inadequate staff, and mental health and spiritual services of insufficient scope for the population. Conclusion Findings reveal that validating families' concerns, having appropriate symptom assessment tools, providing mentorship in palliative care and adapting the physical and social environment to support dying and grieving with dignity facilitates supportive, end-of-life care within LTC.

Article Number: 326

Accession Number: WOS:000657706300004

Abstract: Background: Optimal supportive end of life care for frail, older adults in long term care (LTC) homes involves symptom management, family participation, advance care plans, and organizational support. This 2-phase study aimed to combine multi-disciplinary opinions, build group consensus, and identify the top interventions needed to develop a supportive end of life care strategy for LTC. Methods: A consensus-building approach was undertaken in 2 Phases. The first phase deployed modified Delphi questionnaires to address and transform diverse opinions into group consensus. The second phase explored and prioritized the interventions needed to develop a supportive end of life care strategy for LTC. Development of the Delphi questionnaire was based on findings from published results of physician perspectives of barriers and facilitators to optimal supportive end of life care in LTC, a literature search of palliative care models in LTC, and published results of patient, family and nursing perspectives of supportive end of life care in long term care. The second phase involved World Cafe Style workshop discussions. A multi-disciplinary purposive sample of individuals inclusive of physicians; staff, administrators, residents, family members, and content experts in palliative care, and researchers in geriatrics and gerontology participated in round one of the modified Delphi questionnaire. A second purposive sample derived from round one participants completed the second round of the modified Delphi questionnaire. A third purposive sample (including participants from the Delphi panel) then convened to identify the top priorities needed to develop a supportive end-of-life care strategy for LTC. Results: 19 participants rated 75 statements on a 9-point Likert scale during the first round of the modified Delphi questionnaire. 11 participants (participation rate 58 %) completed the second round of the modified Delphi questionnaire and reached consensus on the inclusion of 71 candidate statements. 35 multidisciplinary participants discussed the 71 statements remaining and prioritized the top clinical practice, communication, and policy interventions

needed to develop a supportive end of life strategy for LTC.
Conclusions: Multi-disciplinary stakeholders identified and prioritized the top interventions needed to develop a 5-point supportive end of life care strategy for LTC.

Title: Protocol for a pilot trial to assess the feasibility of the Move More @ Work intervention to encourage employees to take the opportunity to move (be physically active) after every 30 min of sitting

Journal: Pilot and Feasibility Studies

Volume: 7

Issue: 1

Date: Sep

Short Title: Protocol for a pilot trial to assess the feasibility of the Move More @ Work intervention to encourage employees to take the opportunity to move (be physically active) after every 30 min of sitting

DOI: 10.1186/s40814-021-00903-2

Article Number: 172

Accession Number: WOS:000695057900001

Abstract: Background: Prolonged sitting increases the risk of cardio-metabolic disease. Office-based employees are particularly susceptible to high rates of this sedentary behaviour during work hours. Laboratory studies indicate that regularly interrupting periods of prolonged sitting with short bouts (2 min) of physical activity can improve markers of cardio-metabolic health. This method of interrupting sitting time is yet to be tested in an occupational setting and may provide an alternative to providing sit-to-stand desks. Drawing on the Behaviour Change Wheel and evidence on the barriers and motivators to performing regular activity breaks, the Move More @ Work intervention was developed. The objectives of this pilot study are to examine the feasibility, and preliminary outcomes, of this intervention designed to encourage participants to perform 1-2 min of activity after every 30 min of continuous sitting throughout the work day. The study will inform if progress to a full effectiveness trial is warranted. Methods: An interrupted time series design consisting of a 4-week baseline (control period), a 12-week intervention, and a 12-week follow-up will be utilised. At least 57 university employees who self-report spending > 5 h per day sitting at work on at least 3 days per week will be recruited to participate. The intervention consists of (1) a structured consultation with a Move More @ Work coach, containing a number of

behaviour change techniques to create an individualised plan of how to incorporate the activity breaks into the working day, and (2) strategies to create a supportive workplace culture for performing the activity breaks. Feasibility will be assessed by recruitment and retention rates, and acceptability of the intervention. Pilot outcomes are the number of regular activity breaks taken during the workday, cardio-metabolic risk score and self-reported health, and work-related productivity outcomes. Discussion: If the Move More @ Work intervention is shown to be feasible, acceptable, and shows evidence of effectiveness, this will provide justification for the progression to a full scale evaluation of the intervention. In the longer-term, this intervention may provide an alternative means of improving health outcomes through interrupting sedentary time than that offered by current sedentary behaviour interventions.

Short Title: An observational cohort study to determine the impact of research capacity building strategies implemented in an Australian metropolitan hospital occupational therapy department

ISSN: 0045-0766

DOI: 10.1111/1440-1630.12782

Accession Number: WOS:000733649300001

Abstract: Introduction Research capacity building enhances the abilities of individuals and is critical within health systems for quality patient care and promotes a culture of excellence within the occupational therapy profession. A research capacity building toolkit was proposed identifying strategies to support allied health professionals to undertake research. This study evaluated participant-reported outcomes of research capacity building toolkit implementation in an occupational therapy department. Methods An observational pre-post-cohort study at a tertiary hospital with volunteer occupational therapists using the standardised Research Capacity in Context Tool (RCCT) and an author-designed quality improvement (QI) survey was employed. The RCCT measures research capacity and culture at organisation, team and individual levels. Semi-structured interviews were used to elicit reflections regarding

participant experience. Results All levels of the toolkit were implemented successfully. The response rate was 59% (n = 36) at baseline and 49.1% (n = 26) at follow-up. Eighty-five percent of participants held direct clinical roles. Nine clinicians participated in the interviews. There were significant improvements in the estimate mean for the organisation (6.51 [2019] compared with 8.13 [2020], p = <0.001) and the team (5.52 [2019] compared with 7.15 [2020], p = 0.001). The individual level did not significantly change with an estimate mean of 4.20 in 2019 increasing slightly to 4.84 in 2020 (p = 0.128). This was supported by the QI survey where improvements were noted in the department but not at an individual level. The qualitative findings verified the components of the toolkit including 'supporting clinicians in research', 'working together', 'valuing research for excellence' and reflected the importance of 'individual attributes'. Conclusion The toolkit supported the implementation of specific strategies to enhance research capacity and culture. Improvements within the organisation and team were evident; however, these were not seen at an individual level. Further research about the contribution of individual-related factors and processes to the building of research capacity is required.

Title: Barriers and facilitators influencing adherence to occupational therapy home assessment recommendations: a mixed methods systematic review protocol

Journal: Jbi Evidence Synthesis

Volume: 19

Issue: 2

Pages: 440-446

Date: Feb

Short Title: Barriers and facilitators influencing adherence to occupational therapy home assessment recommendations: a mixed methods systematic review protocol

DOI: 10.11124/jbies-20-00162

Accession Number: WOS:000696249000009

Abstract: Objective: To identify and describe the barriers and facilitators that influence adherence to recommendations provided as part of an occupational therapy home assessment. Introduction: Home assessments, including environmental interventions, are commonly used by occupational therapists. Home assessment recommendations aim to support a patient's independence in their occupational roles and improve safety in the home. Research evaluating home assessments and adherence to recommended strategies is limited. However, low adherence has been associated with poorer outcomes including falls,

deconditioning, and decreased function. This research aims to synthesize factors that influence adherence to home assessment recommendations. Inclusion criteria: This review will consider all qualitative and quantitative studies that report on adherence to recommendations provided during occupational therapy home assessments. Studies will include adults (>18) and/or their caregivers, who live in the community and receive an occupational therapy home assessment. Methods: A mixed methods systematic review will be undertaken. Eight databases will be searched for studies published in English reporting on adherence following home assessments completed by occupational therapists published after January 2000. Study quality will be assessed using standardized JBI critical appraisal tools dependent on study design. Data extraction will be performed using a standardized tool, followed by data transformation. Data synthesis will follow the convergent integrated approach. All findings will be tabulated to explore factors that influence adherence. Systematic review registration number: PROSPERO CRD42020159233

DOI: 10.1111/1440-1630.12823

Accession Number: WOS:000807470200001

Abstract: Introduction Low implementation rates of occupational therapy home assessment recommendations have previously been reported. The objective was to identify and describe the barriers and facilitating factors that influence implementation of home assessment recommendations. Methods A mixed methods systematic review consisting of studies involving adults living in the community who received an occupational therapy home assessment was conducted. Seven databases were last searched in August 2021. Study quality was assessed using the Joanna Briggs Institute (JBI) critical appraisal tools (SUMARI) dependent on study design. Data synthesis followed the convergent integrated approach. Findings were mapped to the theoretical Capability Opportunity Motivation

Behaviour (COM-B) model of health behaviour change. Results From 5,540 citations, 22 articles met the criteria for the systematic review. Implementation of occupational therapy home assessment recommendations ranged between 55% and 90%. Six synthesised findings were identified. Capability barriers included a patient's cognitive and physical ability. Motivation barriers included a perceived lack of need and stigma; patient reported decreased involvement and lack of choice. Opportunity barriers included limited family or carer involvement, carer stress, level of service provision available, including funding, therapy dosage and timing and environmental restrictions. Overall facilitators included patient-centred care, including choice and understanding need, individualised tailored recommendations, involvement of families and carers, provision of written record and strategies to support implementation. Results were limited by methodological weaknesses in identified studies and heterogeneity in the definition and measurement of implementation impacting on comparison. Specific intervention components were often poorly described. Conclusion The theoretical model elucidates priority factors to address for promoting implementation of home assessment recommendations. Future high-quality research clearly defining intervention components is required to support short- and long-term implementation of recommendations in the home environment. Behaviour change techniques could be utilised to support home assessment practices in future research.

Short Title: Understanding small business adaptation to natural hazards: A critical review*

ISSN: 2212-4209

DOI: 10.1016/j.ijdr.2021.102403

Article Number: 102403

Accession Number: WOS:000687418100001

Abstract: Research into small business adaptation to natural hazards is immature and poorly focussed, with too much emphasis on capacity factors and too little focus on the motivators of adaptation. More theorisation and use of models would help avoid such omissions in future. There is firm evidence for the importance of some predictors: relevant skills; perceptions of response costs; building tenure; owner education; business sector, and business size. More qualitative and quantitative exploration is now needed to identify the factors that mediate these predictors and to establish the reasons for the inconsistent findings on the influence of hazard

experience. Furthermore, evidence on the importance of other potentially important predictors is partial and fragmented – for example, social norms, social prompting and the concentration of clients in the area affected by a hazard event. More research also needs to be conducted in the Global South, where natural hazards have the greatest impact and the socio-cultural environment differs to that elsewhere. Given the importance of small businesses for economic development, equity of opportunity and the resilience of the wider community, it is important for these lacunae to be addressed.

Title: Perceptions of Cognitive Training Games and Assessment Technologies for Dementia: Acceptability Study With Patient and Public Involvement Workshops

Journal: Jmir Serious Games

Volume: 10

Issue: 2

Date: Apr-Jun

Short Title: Perceptions of Cognitive Training Games and Assessment Technologies for Dementia: Acceptability Study With Patient and Public Involvement Workshops

ISSN: 2291-9279

DOI: 10.2196/32489

Article Number: e32489

Accession Number: WOS:000822088800017

Abstract: Background: Cognitive training and assessment technologies offer the promise of dementia risk reduction and a more timely diagnosis of dementia, respectively. Cognitive training games may help reduce the lifetime risk of dementia by helping to build cognitive reserve, whereas cognitive assessment technologies offer the opportunity for a more convenient approach to early detection or screening. Objective: This study aims to elicit perspectives of potential end users on factors related to the acceptability of cognitive training games and assessment technologies, including their opinions on the meaningfulness of measurement of cognition, barriers to and facilitators of adoption, motivations to use games, and interrelationships with existing health care infrastructure. Methods: Four linked workshops were conducted with the same group, each focusing on a specific topic: meaningful improvement, learning and motivation, trust in digital diagnosis, and barriers to technology adoption. Participants in the workshops included local involvement team members acting as facilitators and those recruited via Join Dementia Research through a purposive selection and volunteer sampling method. Group activities were recorded, and transcripts were analyzed using thematic analysis with a combination

of a priori and data-driven themes. Using a mixed methods approach, we investigated the relationships between the categories of the Capability, Opportunity, and Motivation-Behavior change model along with data-driven themes by measuring the phi coefficient between coded excerpts and ensuring the reliability of our coding scheme by using independent reviewers and assessing interrater reliability. Finally, we explored these themes and their relationships to address our research objectives. Results: In addition to discussions around the capability, motivation, and opportunity categories, several important themes emerged during the workshops: family and friends, cognition and mood, work and hobbies, and technology. Group participants mentioned the importance of functional and objective measures of cognitive change, the social aspect of activities as a motivating factor, and the opportunities and potential shortcomings of digital health care provision. Our quantitative results indicated at least moderate agreement on all but one of the coding schemes and good independence of our coding categories. Positive and statistically significant phi coefficients were observed between several coding themes between categories, including a relatively strong positive phi coefficient between capability and cognition (0.468; $P < .001$). Conclusions: The implications for researchers and technology developers include assessing how cognitive training and screening pathways would integrate into existing health care systems; however, further work needs to be undertaken to address barriers to adoption and the potential real-world impact of cognitive training and screening technologies.

ISSN: 0035-8843

DOI: 10.1308/rcsann.2021.0271

Accession Number: WOS:000810116100005

Abstract: Introduction Surgery is a major contributor to the large environmental impact of healthcare, demanding urgent attention. To date there are no data on the attitudes and behaviours of surgeons towards climate change, or perceived barriers towards sustainable

practice. Methods We invited surgeons and surgical trainees in the UK and Ireland to participate in an online survey (developed in accordance with the CHERRIES checklist) conducted between June and November 2020 and disseminated via the Royal College of Surgeons of England, Edinburgh and Ireland, the Association of Surgeons in Training and through local communication. Results We received 130 responses, across 14 surgical specialties. The majority of respondents (122/130; 94%) were concerned about the threat of climate change. Most respondents had instigated more sustainable practices in their personal lives (113/130; 87%) and, to a lesser extent, at work (73/130; 56%). Surgeons were willing to make changes to their clinical practice (107/130; 82%), but the main perceived barrier to improving sustainability was a lack of leadership (92/130; 70%). Surgeons welcomed greater leadership and guidance from national bodies (118/130; 91%) and more monitoring and regulation (113/130; 87%). Conclusions The surgeons who responded to our survey are concerned about climate change and willing to engage in efforts to transition to more sustainable practice, but would welcome greater support, guidance and leadership.

Title: School-based self-management intervention using theatre to improve asthma control in adolescents: a pilot cluster-randomised controlled trial

Journal: Pilot and Feasibility Studies

Volume: 8

Issue: 1

Date: Mar

Short Title: School-based self-management intervention using theatre to improve asthma control in adolescents: a pilot cluster-randomised controlled trial

DOI: 10.1186/s40814-022-01031-1

Article Number: 67

Accession Number: WOS:000772413700002

Abstract: Background: Children with poorly controlled asthma have higher rates of unplanned healthcare use and school absences, as well as lower rates of medication adherence and knowledge. They also feel less comfortable using their medication at school, due to social fears and bullying. In this study, this was addressed through two school-based self-management interventions piloted to determine which one to use in a full trial. Methods: We sought to assess the feasibility and acceptability of two school-based self-management intervention aimed at improving asthma control. Schools in London were randomised to (i) a theatre workshop for the whole year group

aimed at raising awareness of asthma in schools, followed by self-management workshops for children (full intervention), (ii) theatre workshop alone (theatre only), or (iii) usual care (controls). Opt-out consent was obtained from parents. The study was a cluster randomised pilot trial, using London schools as the unit of allocation. Our primary aim was to assess the feasibility of delivering a self-management intervention in schools aimed at improving the asthma control test (ACT) score at 6 months. Secondary outcomes included acceptability of the school-based interventions, suitability of the theatre intervention and the full intervention with the self-management workshops, and generation of randomised data to inform future power calculations. Data were analysed by generalised mixed-effect models. Results: The recruitment strategy for this trial was effective. Five schools were randomised to full intervention (189 children), four to theatre only (103 children), and six to controls (83 children). Asthma control test (ACT) score at baseline and 6 months was obtained from 178/358 participating children. Compared with the controls, there were no large differences found in ACT score with the full intervention; knowledge and perception of asthma improved though. GP and hospital visits increased in the full intervention group. Compared with controls, ACT score was unchanged in the theatre only group. Conclusion: The asthma self-management intervention trial in schools is feasible and acceptable. The full intervention consisting of both theatre and self-management workshop for asthmatics tended to be better suited to improve outcomes than the theatre intervention on its own. This full intervention should be the one carried forward into a main trial if funding for further research was sought. Further work is needed to understand why there was evidence that unscheduled visits to healthcare professionals increased with the full intervention. Title: Designing complex interventions: A description of the development of an intervention to reduce inequalities in planned dental visiting

Journal: Community Dentistry and Oral Epidemiology

Date: 2023 Feb

Short Title: Designing complex interventions: A description of the development of an intervention to reduce inequalities in planned dental visiting

ISSN: 0301-5661

DOI: 10.1111/cdoe.12842

Accession Number: WOS:000928821600001

Abstract: There are multifaceted reasons for a social gradient in

planned dental visiting involving various psycho-social variables that interact with each other and the environment. Interventions in this area are therefore inevitably complex interventions. While guidance recommends undertaking theory and modelling work before experimental work is done, there is a shortage of descriptions of how this is done, especially in the field of oral health.

ObjectivesTo describe theory, qualitative and public engagement work, and identification of behaviour change techniques (BCTs) to define features of an opportunistic dental visiting intervention for adult users of urgent dental care services. **Methods**A systematic review and synthesis of theory, qualitative and quantitative work, along with expert input, generated a list of psycho-social determinants linked to planned dental visiting intentions. Modelling involved ethnographic work in urgent dental care settings and work with members of the community from the targeted demographic. This enabled verification, in the context of their idiosyncratic expression for the target population in question, of behavioural determinants (BDs) identified in the theory phase. It also facilitated generating intervention material which was infused with the identity of the end user. BDs identified were then mapped to BCTs using an accepted BCT taxonomy and an intervention prototype developed. The prototype then underwent iterative testing with target users before it was ready for a feasibility trial.

ResultsTheory and modelling identified five key intervention focuses: affordable resources (time/ cost), the importance of oral health, trust in dentists, embarrassment of having poor oral health and dental anxiety. Short videos were developed to incorporate role modelling which were well received. Prototype testing resulted in shifting from 'if-then' plans to action planning. **Conclusions**Complex intervention development involves an iterative rather than sequential process of combining theory, empirical work and user involvement, of which the article provides an example.

Accession Number: WOS:000329681300005

Abstract: Rehabilitation is in need of an organized system or taxonomy for classifying treatments to aid in research, practice, training, and interdisciplinary communication. In this article, we describe a work-in-progress effort to create a rehabilitation treatment taxonomy (RTT) for classifying rehabilitation interventions by the underlying treatment theories that explain their effects. In the RTT, treatments are grouped together according to their targets, or measurable aspects of functioning they are intended to change; ingredients, or measurable clinician decisions and behaviors responsible for effecting changes; and the hypothesized mechanisms of action by which ingredients are transformed into changes in the target. Four treatment groupings are proposed: structural tissue properties, organ functions, skilled performances, and cognitive/affective representations, which are similar in the types of targets addressed, ingredients used, and mechanisms of action that account for change. The typical ingredients and examples of clinical treatments associated with each of these groupings are explored, and the challenges of further subdivision are discussed. Although a Linnaean hierarchical tree structure was envisioned at the outset of work on the RTT, further development may necessitate a model with less rigid boundaries between classification groups, and/or a matrix-like structure for organizing active ingredients along selected continua, to allow for both qualitative and quantitative variations of importance to treatment effects. ISSN: 1530-7085

DOI: 10.1111/papr.13142

Accession Number: WOS:000853985100004

Abstract: Background Low-value care that wastes resources and harms patients is prevalent in health systems everywhere. Methods As part

of an invited keynote presentation at the Pain in Motion IV conference held in Maastricht, Holland, in May 2022, we reviewed evidence for low-value care in musculoskeletal conditions and discussed possible solutions. Results Drivers of low-value care are diverse and affect patients, clinicians, and health systems everywhere. We show that low-value care for back pain, neck pain, and osteoarthritis is prevalent in all professional groups involved in caring for people who seek care for these conditions. Implementation efforts that aim to reverse low-value care seem to work better if designed using established conceptual and theoretical frameworks. Conclusion Low-value care is prevalent in the care of people with musculoskeletal conditions. Reducing low-value care requires behaviour change among patients and clinicians as well as in health systems. There is evidence that behaviour change can be facilitated through good conceptual and theoretical frameworks but not convincing evidence that it changes patient outcomes. Abstract: Objectives To determine if subpopulations of students benefit equally from school-based physical activity interventions in terms of cardiorespiratory fitness and physical activity. To examine if physical activity intensity mediates improvements in cardiorespiratory fitness. Design Pooled analysis of individual participant data from controlled trials that assessed the impact of school-based physical activity interventions on cardiorespiratory fitness and device-measured physical activity. Participants Data for 6621 children and adolescents aged 4–18 years from 20 trials were included. Main outcome measures Peak oxygen consumption (V_{O2}Peak mL/kg/min) and minutes of moderate and vigorous physical activity. Results Interventions modestly improved students' cardiorespiratory fitness by 0.47 mL/kg/min (95% CI 0.33 to 0.61), but the effects were not distributed equally across subpopulations. Girls and older students benefited less than boys and younger students, respectively. Students with lower levels of initial fitness, and those with higher levels of baseline physical activity benefitted more than those who were initially fitter and less active, respectively. Interventions had a modest positive effect on physical activity with approximately one additional minute per day of both moderate and vigorous physical activity. Changes in vigorous, but not moderate intensity, physical activity explained a small amount (similar to 5%) of the intervention effect on cardiorespiratory fitness. Conclusions Future interventions should include targeted strategies to address the needs of girls and older students. Interventions may also be improved by promoting more vigorous intensity physical activity. Interventions could mitigate declining youth cardiorespiratory fitness, increase physical activity and promote cardiovascular health if they can be delivered equitably and their effects sustained at the population level.

Short Title: Translating evidence into healthcare policy and practice: Single versus multi-faceted implementation strategies - is there a simple answer to a complex question?

DOI: 10.15171/ijhpm.2015.54

Accession Number: WOS:000379267900001

Abstract: How best to achieve the translation of research evidence into routine policy and practice remains an enduring challenge in health systems across the world. The complexities associated with changing behaviour at an individual, team, organizational and system level have led many academics to conclude that tailored, multifaceted strategies provide the most effective approach to knowledge translation. However, a recent overview of systematic reviews questions this position and sheds doubt as to whether multi-faceted strategies are any better than single ones. In this paper, we argue that this either-or distinction is too simplistic and fails to recognize the complexity that is inherent in knowledge

translation. Drawing on organizational theory relating to boundaries and boundary management, we illustrate the need for translational strategies that take account of the type of knowledge to be implemented, the context of implementation and the people and processes involved.

Title: The integration of harm reduction services in the Veterans
Health Administration (VHA): a qualitative analysis of barriers and
facilitators

Journal: Journal of Addictive Diseases

Date: 2023 May

Short Title: The integration of harm reduction services in the
Veterans Health Administration (VHA): a qualitative analysis of
barriers and facilitators

ISSN: 1055-0887

DOI: 10.1080/10550887.2023.2210021

Accession Number: WOS:000982591300001

Abstract: Background Substance use is common among U.S. military
veterans and veterans are at high risk for negative consequences
associated with substance use, such as injection-related infections
and overdose. Although harm reduction services (HRS) are highly
evidence-based, implementation in traditional healthcare settings
has been limited. This formative, qualitative study sought to
identify barriers and facilitators to the integration of HRS and
identify appropriate implementation strategies to support the
optimized integration of a comprehensive bundle of HRS in the
Veterans Health Administration (VHA). Methods Semi-structured
interviews explored how harm reduction is currently understood by
VHA providers and elicited input on perceived facilitators and
barriers to implementation. Data were analyzed using a directed
content analysis and the Practical, Robust Implementation and
Sustainability Model (PRISM) implementation framework was used to
organize findings. Results were then mapped to relevant
implementation strategies using the Consolidated Framework for
Implementation Research - Expert Recommendations for Implementing
Change (CFIR - ERIC) tool. Results 15 interviews with VHA providers
were conducted across 5 sites. Respondents reported that current HRS
are fragmented and dependent on the knowledge, time, and comfort
level of individual providers. Stigma around substance use at the
patient, provider, and institutional levels was noted to be a key
barrier to HRS adoption. Based on identified barriers and
facilitators, strategies that may be effective for increasing
adoption of HRS include engagement of champions, communication and
educational strategies, and adaptation of existing
infrastructure. Conclusions Many of the barriers identified in this

formative study may be addressed using evidence-based implementation strategies. Additional research is needed to identify implementation strategies that are effective for addressing stigma, which is perceived to be a persistent challenge to the provision of integrated harm reduction services.

Title: Development of targeted, theory-informed interventions to improve bronchiolitis management

Journal: BMC Health Services Research

Volume: 21

Issue: 1

Date: Aug

Short Title: Development of targeted, theory-informed interventions to improve bronchiolitis management

DOI: 10.1186/s12913-021-06724-6

Article Number: 769

Accession Number: WOS:000683746100005

Abstract: Background Despite international guidelines providing evidence-based recommendations on appropriate management of infants with bronchiolitis, wide variation in practice occurs. This results in infants receiving care of no benefit, with associated cost and is potentially harmful. Theoretical frameworks are increasingly used to develop interventions, utilising behaviour change techniques specifically chosen to target factors contributing to practice variation, with de-implementation often viewed as harder than implementing. This paper describes the stepped process using the Theoretical Domains Framework (TDF) to develop targeted, theory-informed interventions which subsequently successfully improved management of infants with bronchiolitis by de-implementing ineffective therapies. Explicit description of the process and rationale used in developing de-implementation interventions is critical to dissemination of these practices into real world clinical practice. Methods A stepped approach was used: (1) Identify evidence-based recommendations and practice variation as targets for change, (2) Identify factors influencing practice change (barriers and enablers) to be addressed, and (3) Identification and development of interventions (behaviour change techniques and methods of delivery) addressing influencing factors, considering evidence of effectiveness, feasibility, local relevance and acceptability. The mode of delivery for the intervention components was informed by evidence from implementation science systematic reviews, and setting specific feasibility and

practicality. Results Five robust evidence-based management recommendations, targeting the main variation in bronchiolitis management were identified: namely, no use of chest x-ray, salbutamol, glucocorticoids, antibiotics, and adrenaline. Interventions developed to target recommendations addressed seven TDF domains (identified following qualitative clinician interviews (n =20)) with 23 behaviour change techniques chosen to address these domains. Final interventions included: (1) Local stakeholder meetings, (2) Identification of medical and nursing clinical leads, (3) Train-the-trainer workshop for all clinical leads, (4) Local educational materials for delivery by clinical leads, (5) Provision of tools and materials targeting influencing factors, and prompting recommended behaviours, and (6) Audit and feedback. Conclusion A stepped approach based on theory, evidence and issues of feasibility, local relevance and acceptability, was successfully used to develop interventions to improve management of infants with bronchiolitis. The rationale and content of interventions has been explicitly described allowing others to de-implement unnecessary bronchiolitis management, thereby improving care. DOI: 10.1017/s1368980023000253

Article Number: Pii s1368980023000253

Accession Number: WOS:000942652600001

Abstract: Objective: Web-based dietary interventions could support healthy eating. The Advice, Ideas and Motivation for My Eating (Aim4Me) trial investigated the impact of three levels of personalised web-based dietary feedback on diet quality in young adults. Secondary aims were to investigate participant retention, engagement and satisfaction. Design: Randomised controlled trial.

Setting: Web-based intervention for young adults living in Australia.
Participants: 18–24-year-olds recruited across Australia were randomised to Group 1 (control: brief diet quality feedback), Group 2 (comprehensive feedback on nutritional adequacy + website nutrition resources) or Group 3 (30-min dietitian consultation + Group 2 elements). Australian Recommended Food Score (ARFS) was the primary outcome. The ARFS subscales and percentage energy from nutrient-rich foods (secondary outcomes) were analysed at 3, 6 and 12 months using generalised linear mixed models. Engagement was measured with usage statistics and satisfaction with a process evaluation questionnaire. Results: Participants (n 1005, 85 % female, mean age 21 center dot 7 +/- 2 center dot 0 years) were randomised to Group 1 (n 343), Group 2 (n 325) and Group 3 (n 337). Overall, 32 (3 %), 88 (9 %) and 141 (14 %) participants were retained at 3, 6 and 12 months, respectively. Only fifty-two participants (15 % of Group 3) completed the dietitian consultation. No significant group-by-time interactions were observed (P > 0 center dot 05). The proportion of participants who visited the thirteen website pages ranged from 0 center dot 6 % to 75 %. Half (Group 2 = 53 %, Group 3 = 52 %) of participants who completed the process evaluation (Group 2, n 111; Group 3, n 90) were satisfied with the programme. Conclusion: Recruiting and retaining young adults in web-based dietary interventions are challenging. Future research should consider ways to optimise these interventions, including co-design methods.

Short Title: Early mobility after fragility hip fracture: a mixed methods embedded case study

DOI: 10.1186/s12877-021-02083-3

Article Number: 181

Accession Number: WOS:000629381900001

Abstract: Background Following a hip fracture up to 60% of patients

are unable to regain their pre-fracture level of mobility. For hospitalized older adults, the deconditioning effect of bedrest and functional decline has been identified as the most preventable cause of ambulation loss. Recent studies demonstrate that this older adult population spends greater than 80% of their time in bed during hospitalization, despite being ambulatory before their fracture. We do not fully understand why there continues to be such high rates of sedentary times, given that evidence demonstrates functional decline is preventable and early mobility recommendations have been available for over a decade. Methods A descriptive mixed method embedded case study was selected to understand the phenomenon of early mobility after fragility hip fracture surgery. In this study, the main case was one post-operative unit with a history of recommendation implementation, and the embedded units were patients recovering from hip fracture repair. Data from multiple sources provided an understanding of mobility activity initiation and patient participation. Results Activity monitor data from eighteen participants demonstrated a mean sedentary time of 23.18h. Median upright time was 24min, and median number of steps taken was 30. Qualitative interviews from healthcare providers and patients identified two main categories of themes; themes external to the person and themes unique to the person. We identified four factors that can influence mobility; a patient's pre-fracture functional status, cognitive status, medical unpredictability, and preconceived notions held by healthcare providers and patients. Conclusions There are multi-level factors that require consideration with implementation of best practice interventions, namely, systemic, healthcare provider related, and patient related. An increased risk of poor outcomes occurs with compounding multiple factors, such as a patient with low pre-fracture functional mobility, cognitive impairment, and a mismatch of expectations. The study reports several variables to be important considerations for facilitating early mobility. Communicating mobility expectations and addressing physical and psychological readiness are essential. Our findings can be used to develop meaningful healthcare provider and patient-centred interventions to address the risks of poor outcomes.

DOI: 10.1108/jhom-12-2013-0271

Accession Number: WOS:000379808900007

Abstract: Purpose - The purpose of this paper is to analyze how staff and managers in health and social care organizations use scientific evidence when making decisions about the organization of care practices. Design/methodology/approach - Document analysis and repeated interviews (2008-2010) with staff (n = 39) and managers (n = 26) in health and social care organizations. The respondents were involved in a randomized controlled study about testing a continuum of care model for older people. Findings - Scientific evidence had no practical function in the social care organization, while it was a prioritized source of information in the health care organization. This meant that the decision making regarding care practices was different in these organizations. Social care tended to rely on ad hoc practice-based information and political decisions when organizing care, while health care to some extent also relied in an unreflected manner on the scientific knowledge. Originality/value - The study illustrates several difficulties that might occur when managers and staff try to consider scientific evidence when making complicated decisions about care practices.

Accession Number: WOS:000379675100001

Abstract: Background. Excessive gestational weight gain poses significant short- and long-term health risks to both mother and baby. Professional bodies and health services increasingly recommend greater attention be paid to weight gain in pregnancy. A large Australian tertiary maternity hospital plans to facilitate the (re)introduction of routine weighing of all women at every antenatal visit. Objective. To identify clinicians' perspectives of barriers and enablers to routinely weighing pregnant women and variations in current practice, knowledge, and attitudes between different staff

groups. Method. Forty-four maternity staff from three professional groups were interviewed in four focus groups. Staff included midwives; medical staff; and dietitians. Transcripts underwent qualitative content analysis to identify and examine barriers and enablers to the routine weighing of women throughout pregnancy. Results. While most staff supported routine weighing, various concerns were raised. Issues included access to resources and staff; the ability to provide appropriate counselling and evidence-based interventions; and the impact of weighing on patients and the therapeutic relationship. Conclusion. Many clinicians supported the practice of routine weighing in pregnancy, but barriers were also identified. Implementation strategies will be tailored to the discrete professional groups and will address identified gaps in knowledge, resources, and clinician skills and confidence.

Title: Implementation of a mental health medication management intervention in Australian community pharmacies: Facilitators and challenges

Journal: Research in Social & Administrative Pharmacy

Volume: 13

Issue: 5

Pages: 969-979

Date: Sep-Oct

Short Title: Implementation of a mental health medication management intervention in Australian community pharmacies: Facilitators and challenges

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2017.05.017

Accession Number: WOS:000408519700012

Abstract: Background: Community pharmacists are in an ideal position to promote and provide mental health medication management services. However, formalised or structured pharmacy services to support consumers with mental health conditions are scarce. Australian mental health consumers indicated a need for targeted community pharmacy mental health services which presented an opportunity to develop an intervention that were integrated with remunerated professional services. Objectives: The study aimed to pilot a mental health medication management intervention in Australian community pharmacies. Pharmacists worked in partnership with consumers, carers and mental health workers over three to six months to set and support achievement of individual goals related to medicines use,

physical health and mental wellbeing. This paper provides a comparison of community pharmacies that successfully delivered the intervention with those that did not and identifies facilitators and challenges to service implementation. Methods: One hundred pharmacies opted to pilot the delivery of the intervention in three Australian states (Queensland, Western Australia and northern New South Wales). Of those, 55 successfully delivered the intervention (completers) whilst 45 were unsuccessful (non-completers). A mixed methods approach, including quantitative pharmacy surveys and qualitative semi-structured interviews, was used to gather data from participating pharmacies. Following intervention development, 142 pharmacists and 21 pharmacy support staff attended training workshops, received resource kits and ongoing support from consumer and pharmacist mentors throughout intervention implementation. Baseline quantitative data was collected from each pharmacy on staff profile, volume of medicines dispensed, the range of professional services delivered and relationships with health professionals. At the completion of the study participants were invited to complete an online exit survey and take part in a semi-structured interview that explored their experiences of intervention implementation and delivery. Twenty-nine staff members from completer pharmacies returned exit surveys and interviews were conducted with 30 staff from completer and non-completer pharmacies. Results: Descriptive analyses of quantitative data and thematic analyses of qualitative data were used to compare completers and non-completers. Baseline similarities included numbers of general and mental health prescriptions dispensed and established professional services. However, there was greater prevalence of diabetes management, opioid substitution services, and relationships with mental health services in completer pharmacies. Key facilitators for completers included pharmacy owner/manager support, staff buy-in and involvement, intervention flexibility, recruitment immediately following training, integration of intervention with existing services, changes to workflow, and regular consumer contact. Key barriers for both groups included lack of pharmacy owner/manager support or staff buy-in, time constraints, privacy limitations and pilot project associated paperwork. Conclusions: Insights into factors that underpinned successful intervention implementation and delivery should inform effective strategies for similar future studies and allocation of pharmacy mental health service delivery resources. Date: Jun

Short Title: Ordering of computed tomography scans for head and cervical spine: a qualitative study exploring influences on doctors' decision-making

DOI: 10.1186/s12913-022-08156-2

Article Number: 790

Accession Number: WOS:000812639900004

Abstract: Background Ordering of computed tomography (CT) scans needs to consider diagnostic utility as well as resource utilisation and radiation exposure. Several factors influence ordering decisions, including evidence-based clinical decision support tools to rule out serious disease. The aim of this qualitative study was to explore factors influencing Emergency Department (ED) doctors' decisions to order CT of the head or cervical spine. **Methods** In-depth semi-structured interviews were conducted with purposively selected ED doctors from two affiliated public hospitals. An interview tool with 10 questions, including three hypothetical scenarios, was developed and validated to guide discussions. Interviews were audio recorded, transcribed verbatim, and compared with field notes. Transcribed data were imported into NVivo Release 1.3 to facilitate coding and thematic analysis. **Results** In total 21 doctors participated in semi-structured interviews between February and December 2020; mean interview duration was 35 min. Data saturation was reached. Participants ranged from first-year interns to experienced consultants. Five overarching emerging themes were: 1) health system and local context, 2) work structure and support, 3) professional practices and responsibility, 4) reliable patient information, and 5) holistic patient-centred care. Mapping of themes and sub-themes against a behaviour change model provided a basis for future interventions. **Conclusions** CT ordering is complex and multifaceted. Multiple factors are considered by ED doctors during decisions to order CT scans for head or c-spine injuries. Increased education on the use of clinical decision support tools and an overall strategy to improve awareness of low-value care is needed. Strategies to reduce low-yield CT ordering will need to be sustainable, sophisticated and supportive to achieve lasting change.

Abstract: In recent years, youth mentoring programmes (YMPs) have received significant attention as an intervention tool delivered to young people with the aim of fostering positive psychosocial development. The aim of the current study was to conduct a needs assessment that examined the current trends in YMPs across Australia to inform their implementation. Utilizing the COM-B model, a mixed-method design that consisted of an exploratory survey administered to young people and semi-structured interviews conducted with key YMP stakeholders was adopted. The findings of this study provided several compelling insights regarding the need for YMPs and the barriers and enablers to their implementation, while also highlighting several positive outcomes that are commonly experienced by young people who engage in mentoring. Based on these promising findings, several recommendations for the implementation of YMPs are provided herein in order to maximize their effectiveness in fostering positive psychological and behavioural outcomes among young people.

Title: Smart food policies for obesity prevention

Journal: Lancet

Volume: 385

Issue: 9985

Pages: 2410–2421

Date: Jun

Short Title: Smart food policies for obesity prevention

ISSN: 0140–6736

DOI: 10.1016/s0140–6736(14)61745–1

Accession Number: WOS:000356003700035

Abstract: Prevention of obesity requires policies that work. In this Series paper, we propose a new way to understand how food policies could be made to work more effectively for obesity prevention. Our approach draws on evidence from a range of disciplines (psychology, economics, and public health nutrition) to develop a theory of change to understand how food policies work. We focus on one of the key determinants of obesity: diet. The evidence we review suggests that the interaction between human food preferences and the environment in which those preferences are learned, expressed, and reassessed has a central role. We identify four mechanisms through which food policies can affect diet: providing an enabling environment for learning of healthy preferences, overcoming barriers to the expression of healthy preferences, encouraging people to reassess existing unhealthy preferences at the point-of-purchase, and stimulating a food-systems response. We explore how actions in three specific policy areas (school settings, economic instruments, and nutrition labelling) work through these mechanisms, and draw implications for more effective policy design. We find that effective food-policy actions are those that lead to positive changes to food, social, and information environments and the systems that underpin them. Effective food-policy actions are tailored to the preference, behavioural, socioeconomic, and

demographic characteristics of the people they seek to support, are designed to work through the mechanisms through which they have greatest effect, and are implemented as part of a combination of mutually reinforcing actions. Moving forward, priorities should include comprehensive policy actions that create an enabling environment for infants and children to learn healthy food preferences and targeted actions that enable disadvantaged populations to overcome barriers to meeting healthy preferences. Policy assessments should be carefully designed on the basis of a theory of change, using indicators of progress along the various pathways towards the long-term goal of reducing obesity rates.

Title: Implementation of ReSPECT in acute hospitals: A retrospective observational study

Journal: Resuscitation

Volume: 178

Pages: 26-35

Date: Sep

Short Title: Implementation of ReSPECT in acute hospitals: A retrospective observational study

ISSN: 0300-9572

DOI: 10.1016/j.resuscitation.2022.06.020

Accession Number: WOS:000838694600003

Abstract: Aims: To evaluate, in UK acute hospitals, the early implementation of the Recommended Summary Plan for Emergency Care and Treatment (ReSPECT), which embeds cardiopulmonary resuscitation (CPR) recommendations within wider emergency treatment plans. To understand for whom and how the process was being used and the quality of form completion. Methods: A retrospective observational study evaluating emergency care and treatment planning approaches used in acute UK hospitals (2015-2019), and in six English hospital trusts the extent of ReSPECT use, patient characteristics and completion quality in a sample 3000 patient case notes. Results: The use of stand-alone Do Not Attempt Cardiopulmonary Resuscitation forms fell from 133/186 hospitals in 2015 to 64/186 in 2019 (a 38% absolute reduction). ReSPECT accounted for 52% (36/69) of changes. In the six sites, ReSPECT was used for approximately 20% of patients (range 6%-41%). They tended to be older, to have had an emergency medical admission, to have cognitive impairment and a lower predicted 10 year survival. Most (653/706 (92%)) included a 'not for

attempted resuscitation' recommendation 551/706 (78%) had at least one other treatment recommendation. Capacity was not recorded on 13% (95/706) of forms; 11% (79/706) did not record patient/family involvement. Conclusions: ReSPECT use accounts for 52% of the change, observed between 2015 and 2019, from using standalone DNACPR forms to approaches embedding DNACPR decisions within in wider emergency care plans in NHS hospitals in the UK. Whilst recommendations include other emergencies most still tend to focus on recommendations relating to CPR. Completion of ReSPECT forms requires improvement.

Short Title: The theoretical basis of a nationally implemented type 2 diabetes prevention programme: how is the programme expected to produce changes in behaviour?

DOI: 10.1186/s12966-021-01134-7

Article Number: 64

Accession Number: WOS:000656153900002

Abstract: Background It is considered best practice to provide clear theoretical descriptions of how behaviour change interventions should produce changes in behaviour. Commissioners of the National Health Service Diabetes Prevention Programme (NHS-DPP) specified that the four independent provider organisations must explicitly describe the behaviour change theory underpinning their interventions. The nationally implemented programme, launched in 2016, aims to prevent progression to Type 2 diabetes in high-risk adults through changing diet and physical activity behaviours. This study aimed to: (a) develop a logic model describing how the NHS-DPP is expected to work, and (b) document the behaviour change theories underpinning providers' NHS-DPP interventions. Methods A logic model detailing how the programme should work in changing diet and activity behaviours was extracted from information in three specification documents underpinning the NHS-DPP. To establish how

each of the four providers expected their interventions to produce behavioural changes, information was extracted from their programme plans, staff training materials, and audio-recorded observations of mandatory staff training courses attended in 2018. All materials were coded using Michie and Prestwich's Theory Coding Scheme. Results The NHS-DPP logic model included information provision to lead to behaviour change intentions, followed by a self-regulatory cycle including action planning and monitoring behaviour. None of the providers described an explicit logic model of how their programme will produce behavioural changes. Two providers stated their programmes were informed by the COM-B (Capability Opportunity Motivation – Behaviour) framework, the other two described targeting factors from multiple theories such as Self-Regulation Theory and Self-Determination Theory. All providers cited examples of proposed links between some theoretical constructs and behaviour change techniques (BCTs), but none linked all BCTs to specified constructs. Some discrepancies were noted between the theory described in providers' programme plans and theory described in staff training. Conclusions A variety of behaviour change theories were used by each provider. This may explain the variation between providers in BCTs selected in intervention design, and the mismatch between theory described in providers' programme plans and staff training. Without a logic model describing how they expect their interventions to work, justification for intervention contents in providers' programmes is not clear.

Short Title: The behaviours identified and the behaviour change techniques planned in health partnerships for antimicrobial stewardship

ISSN: 1758-0846

DOI: 10.1111/aphw.12421

Accession Number: WOS:000891023700001

Abstract: Antimicrobial stewardship (AMS) interventions promote optimised use of antimicrobials by healthcare professionals. In 2019-2020, the Commonwealth Partnerships for Antimicrobial Stewardship (CwPAMS) supported 12 global health partnerships in low- and middle-income countries to co-develop education and training interventions to improve AMS practices amongst hospital staff. This

study aimed to describe six of the CwPAMS health partnerships' target behaviours and behaviour change techniques (BCTs) within their planned AMS interventions. Content analysis extracted behaviours and BCTs from partnership materials. Techniques used by partnerships with (n = 2) and without (n = 4) an embedded behavioural scientist were compared, to understand their added value. Nineteen AMS related behaviours for hospital staff were targeted; most commonly hand hygiene and antibiotic prescribing behaviours. Twenty-three BCTs were coded, with instructing participants on how to perform the behaviours the most prominent across all, including partnerships with a behavioural scientist. Intervention materials did not always report the context of the intervention being delivered, including who was delivering it and the target. Behaviours for change were also often not specified. Partnerships varied in reporting their content and specific behaviours, impacting replicability of their interventions, and limiting knowledge exchange. An AMS behaviour change intervention resource is recommended to support clear specification of prospective AMS interventions.

Title: Understanding Youth Sport Coaches' Perceptions of Evidence-Based Injury-Prevention Training Programs: A Systematic Literature Review

Journal: Journal of Athletic Training

Volume: 57

Issue: 9-10

Pages: 877-893

Date: Sep

Short Title: Understanding Youth Sport Coaches' Perceptions of Evidence-Based Injury-Prevention Training Programs: A Systematic Literature Review

ISSN: 1062-6050

DOI: 10.4085/1062-6050-0215.22

Accession Number: WOS:000914818700003

Abstract: Objective: To systematically review and summarize the knowledge, attitudes, beliefs, and contextual perceptions of youth sport coaches toward injury-prevention training programs by using the Theoretical Domains Framework to guide the organization of results. Data Sources: Systematic searches of PubMed and Google Scholar were undertaken in November 2021. Study Selection: The Preferred Reporting Items for Systematic Reviews and Meta-Analyses

protocol was followed. Results were limited to full-text articles that were published in peer-reviewed journals and printed in English. Additional studies were added after a citation search of included studies. Studies were eligible for inclusion if researchers evaluated youth sport coaches' knowledge, beliefs, contextual perceptions, or all 3 of anterior cruciate ligament injury-prevention training programs. Data Extraction: Data charting was performed by 1 author and confirmed by a separate author. Data Synthesis: Of the 1194 articles identified, 19 were included in the final sample. Among articles in which researchers assessed knowledge (n = 19), coaches' awareness of the existence and components of injury-prevention training programs was inconsistent. Among articles in which researchers assessed beliefs (n = 19), many coaches had positive attitudes toward injury-prevention training programs, but few believed youth athletes are at a high risk of injury. Among articles in which researchers assessed contextual perceptions (n = 13), many coaches did not feel they had access to information about injury-prevention training programs and cited a lack of time, space, support, and other resources as barriers to implementation. Conclusions: Our findings support the need for programs, protocols, and policies to enhance knowledge of and support for youth sport coaches who wish to implement injury-prevention training programs. A gap exists in the research about addressing the needs of youth sport coaches in the United States high school sports setting. The use of multilevel implementation science frameworks (such as the Theoretical Domains Framework) will be beneficial for identifying constructs that affect implementation and developing train-the-trainer programming to meet the needs of individual youth sport coaches.

DOI: 10.1002/nau.22771

Accession Number: WOS:000359710200005

Abstract: Aims This review aims to locate and summarize the findings of qualitative studies exploring the experience of and adherence to pelvic floor muscle training (PFMT) to recommend future directions for practice and research. Methods Primary qualitative studies were identified through a conventional subject search of electronic databases, reference-list checking, and expert contact. A core eligibility criterion was the inclusion of verbatim quotes from participants about PFMT experiences. Details of study aims, methods, and participants were extracted and tabulated. Data were inductively grouped into categories describing modifiers of adherence (verified by a second author) and systematically displayed with supporting illustrative quotes. Results Thirteen studies (14 study reports) were included; eight recruited only or predominantly women with urinary incontinence, three recruited postnatal women, and two included women with pelvic organ prolapse. The quality of methodological reporting varied. Six modifiers of adherence were described: knowledge; physical skill; feelings about PFMT; cognitive analysis, planning, and attention; prioritization; and service provision. Conclusions Individuals' experience substantial difficulties with capability (particularly knowledge and skills), motivation (especially associated with the considerable cognitive demands of PFMT), and opportunity (as external factors generate competing priorities) when adopting and maintaining a PFMT program. Expert consensus was that judicious selection and deliberate application of appropriate behavior change strategies directed to the modifiers of adherence identified in the review may improve PFMT outcomes. Future research is needed to explore whether the review findings are congruent with the PFMT experiences of antenatal women, men, and adults with fecal incontinence. *Neurourol. Article Number: 12787

Accession Number: WOS:000734763100001

Abstract: The unrelenting obesity pandemic in Middle Eastern (ME) adolescents living in Australia warrants culturally responsive and locally engineered interventions. Given the influence of parents on the lifestyle behaviours of adolescents, this qualitative study aimed to capture the opinions of ME parents on the barriers and enablers to sufficient physical activity and limiting screen time behaviours in adolescents. Semi-structured interviews were conducted with 26 ME parents (female) aged 35–59 years old, most of whom resided in lower socioeconomic areas (n = 19). A reflexive thematic analysis using the Theoretical Domains Framework and the Capability, Opportunity, Motivation–Behaviour model was performed for coding. Parents voiced confidence in their knowledge of the importance of physical activity and limiting screen time but were less optimistic in their ability to enable change in behaviours, especially for older adolescents without outside support. Despite adolescents having the necessary skills to engage in a wide array of sports, the parents admitted deep fears regarding the safety of the social environment and restricted their children's independent mobility. Gender differences were noted, with parents reporting older girls expressing disinterest in sports and having limited physical opportunities to participate in sports at school. It may be that a community-based participatory framework is needed to improve physical activity opportunities and to address specific physical, social, and cultural barriers.

DOI: 10.3390/nu13113918

Article Number: 3918

Accession Number: WOS:000725760800001

Abstract: The unyielding obesity epidemic in adolescents from Middle Eastern (ME) backgrounds warrants culturally-responsive and co-designed prevention measures. This study aimed to capture the opinions of ME parents residing in Australia on the crisis and their enablers and barriers to healthy eating interventions given their

influence on adolescent eating behaviors. Twenty-six semi-structured interviews were conducted with ME mothers, aged 35-59 years, and most residing in low socioeconomic areas (n = 19). A reflexive thematic analysis using the Capability, Opportunity, Motivation-Behaviour model and Theoretical Domain Framework was conducted. Parents expressed confidence in knowledge of importance of healthy eating, but were reluctant to believe behaviours were engaged in outside of parental influence. Time management skills are needed to support working mothers and to minimize reliance on nearby fast-food outlets, which was heightened during COVID-19 with home-delivery. Time constraints also meant breakfast skipping was common. A culture of feeding in light of diet acculturation and intergenerational trauma in this diaspora was also acknowledged. Parents pleaded for upstream policy changes across government and school bodies to support parental efforts in the form of increased regulation of fast-food and subsidization of healthy products. Opportunities for weight-inclusive programs including parenting workshops underpinned by culturally-responsive pedagogy were recommended.

Abstract: Background: Cardiovascular diseases (CVD) are responsible for significant morbidity, premature mortality, and economic burden. Despite established evidence that supports the use of preventive medications among patients at high CVD risk, treatment gaps remain. Building on prior evidence and a theoretical framework, a complex intervention has been designed to address these gaps among high-risk, under-treated patients in the Australian primary care setting.

This intervention comprises a general practice quality improvement tool incorporating clinical decision support and audit/feedback capabilities; availability of a range of CVD polypills (fixed-dose combinations of two blood pressure lowering agents, a statin +/- aspirin) for prescription when appropriate; and access to a pharmacy-based program to support long-term medication adherence and lifestyle modification. Methods: Following a systematic development process, the intervention will be evaluated in a pragmatic cluster randomized controlled trial including 70 general practices for a median period of 18 months. The 35 general practices in the intervention group will work with a nominated partner pharmacy, whereas those in the control group will provide usual care without access to the intervention tools. The primary outcome is the proportion of patients at high CVD risk who were inadequately treated at baseline who achieve target blood pressure (BP) and low-density lipoprotein cholesterol (LDL-C) levels at the study end. The outcomes will be analyzed using data from electronic medical records, utilizing a validated extraction tool. Detailed process and economic evaluations will also be performed. Discussion: The study intends to establish evidence about an intervention that combines technological innovation with team collaboration between patients, pharmacists, and general practitioners (GPs) for CVD prevention. Abstract: Background:The UK 5-year antimicrobial resistance (AMR) National Action Plan highlights the need to prevent community infections through education of children. Activities around infection prevention (IP) and antibiotics were piloted by UK youth groups in 2016–2018, prompting Public Health England (PHE) to develop a standardised programme. The aim of the study was to develop and pilot an educational programme on IP and antibiotics for use by community youth groups in the UK. Methods:A working group, including youth group volunteers interested in IP and AMR, agreed on the programme content through consensus, informed by the Capability, Opportunity, Motivation, Behaviour model (COM-B). The Antibiotic Guardian Youth Badge (AGYB) included learning through interactive e-Bug activities on IP and prudent antibiotic use, action setting through Antibiotic Guardian pledges and consolidation through poster development. The programme was piloted and evaluated with conveniently recruited youth groups in 2019, including quantitative and qualitative questionnaire feedback from community leaders and children. Results:Fourteen youth group leaders and 232 children from uniformed Girlguiding/Scout groups in England and Scotland participated in the pilot evaluation, as well as two primary schools. Leaders reported alignment to the themes of their youth organisation, but struggled to teach antibiotics and antibiotic resistance. Children reported enjoyment and intentions to improve hygiene behaviour. Conclusion:Community youth groups are a suitable setting for IP and antibiotics education. The AGYB was officially launched in March 2020 and promoted for use with home-schooling children and remote youth group meetings to educate about IP during the coronavirus disease 2019 (COVID-19) pandemic.

Article Number: 793

Accession Number: WOS:000983143400001

Abstract: Since 2020, England's Pharmacy Quality Scheme (PQS) has incentivised increased antimicrobial stewardship (AMS) activities in community pharmacy. In 2020/21, this included the requirement for staff to complete an AMS e-Learning module, pledge to be an Antibiotic Guardian and develop an AMS Action plan. To build and embed these initiatives, in 2021/22, the PQS required the use of the TARGET Antibiotic Checklist (an AMS tool for use when patients present with a prescription for antibiotics to support conducting and recording of a series of safety and appropriateness checks against each prescribed antibiotic). This paper describes the implementation of the national PQS criteria from 2020 to 2022, and details community pharmacies' AMS activities and barriers to implementation of the 2021/22 criteria. A total of 8374 community pharmacies submitted data collected using the TARGET Antibiotic Checklist for 213,105 prescriptions; 44% surpassed the required number for the PQS. Pharmacy teams reported checking the following: duration, dose, and appropriateness of antibiotics; patient allergies and medicine interactions (94-95%); antibiotic prescribing guideline adherence (89%); and the patient's previous use of antibiotics (81%). The prescriber was contacted for 1.3% of TARGET Antibiotic Checklists (2741), and the most common reasons for such contacts were related to dose, duration, and possible patient allergy. A total of 105 pharmacy staff responded to a follow-up questionnaire, which suggested that some AMS principles had been embedded into daily practice; however, the necessary time commitment was a barrier. The PQS was able to incentivise mass AMS activities at pace over consecutive years for England's community pharmacies simultaneously. Future research should monitor the continuation of activities and the wider impacts on primary care.

Abstract: Cardiovascular diseases (CVD) are the leading cause of death in the Western world. Several modifiable risk factors contribute to the pathogenesis of CVD which are all addressed during cardiac rehabilitation (CR). CR is conducted in three phases: I: acute care hospital, II: subsequent in- or outpatient CR, and III: out-patient CR with focus on lifelong prevention. Despite its proven merits, the adherence to healthy lifestyle changes following completion of CR phase II is challenging. This gap is addressed in recent recommendations, suggesting that clinicians should help patients to set personal goals to i) achieve and maintain the benefits of physical activity, ii) include physical activity into their daily routine and iii) overcome barriers to exercise, to achieve behavior change more effectively and more sustainably. We have developed tele-rehabilitation services to support patients during home-based exercise training in CR phase III. Our services provide a link between CR experts and patients by means of individualized exercise prescription supported by different kinds of wearables for measuring e.g. physical activity volume. The effectiveness of such services and other supportive measures regarding adherence to home training plans and changes in exercise capacity during CR phase III CR is currently evaluated in a study.

Short Title: Figuring out fidelity: a worked example of the methods used to identify, critique and revise the essential elements of a contextualised intervention in health policy agencies

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0378-6

Article Number: 23

Accession Number: WOS:000370696500002

Abstract: Background: In this paper, we identify and respond to the fidelity assessment challenges posed by novel contextualised interventions (i.e. interventions that are informed by composite social and psychological theories and which incorporate standardised and flexible components in order to maximise effectiveness in complex settings). We (a) describe the difficulties of, and propose a method for, identifying the essential elements of a contextualised intervention; (b) provide a worked example of an approach for critiquing the validity of putative essential elements; and (c) demonstrate how essential elements can be refined during a trial without compromising the fidelity assessment. We used an exploratory test-and-refine process, drawing on empirical evidence from the process evaluation of Supporting Policy In health with Research: an Intervention Trial (SPIRIT). Mixed methods data was triangulated to identify, critique and revise how the intervention's essential elements should be articulated and scored. Results: Over 50 provisional elements were refined to a final list of 20 and the scoring rationalised. Six (often overlapping) challenges to the validity of the essential elements were identified. They were (1) redundant-the element was not essential; (2) poorly articulated-unclear, too specific or not specific enough; (3) infeasible-it was not possible to implement the essential element as intended; (4) ineffective-the element did not effectively deliver the change principles; (5) paradoxical-counteracting vital goals or change principles; or (6) absent or suboptimal-additional or more effective ways of operationalising the theory were identified. We also identified potentially valuable 'prohibited' elements that could be used to help reduce threats to validity. Conclusions: We devised a method for critiquing the construct validity of our intervention's essential elements and modifying how they were articulated and measured, while simultaneously using them as fidelity indicators. This process could be used or adapted for other contextualised interventions, taking evaluators closer to making theoretically and contextually sensitive decisions upon which to base fidelity assessments.

ISSN: 1063-8652

DOI: 10.1123/japa.2020-0116

Accession Number: WOS:000643257400013

Abstract: The Coaching for Healthy Ageing trial evaluated the impact on physical activity (PA) and falls based on a year-long intervention in which participants aged 60+ receive a home visit, regular health coaching by physiotherapists, and a free activity monitor. This interview study describes the participants' experiences of the intervention and ideas for improvement. The authors sampled purposively for maximum variation in experiences. The data were analyzed thematically by two researchers. Most of the 32 participants reported that the intervention increased PA levels, embedded activities, and generated positivity about PA. They were motivated by quantified PA feedback, self-directed goals, and person-centered coaching. Social connectivity motivated some, but the intervention did not support this well. The intervention structure allowed participants to trial and embed activities. Autonomy and relatedness were emphasized and should be included in future program theory. The authors identified synergistic effects, likely "essential ingredients," and potential areas for improving this and similar interventions.

Abstract: Advance Care Planning involves having conversations, completing documents detailing individuals' end-of life treatment and care preferences, and appointing legal proxies who make health, lifestyle, or financial decisions. Although beneficial outcomes have been demonstrated, community rates of Advance Care Planning remain low. We developed a theoretically based workshop to increase knowledge and change behaviors in relation to Advance Care Planning; 347 participants completed the workshop. Advance Care Planning knowledge and action significantly improved three months post workshop. The intervention increased Advance Care Planning knowledge and changed behaviors.

Short Title: Indonesian midwives' perspectives on changes in the provision of maternity care during the COVID-19 pandemic: A qualitative study

ISSN: 0266-6138

DOI: 10.1016/j.midw.2022.103291

Article Number: 103291

Accession Number: WOS:000805810300010

Abstract: Objective: To explore how COVID-19 influenced the provision of high-quality maternity care in Indonesia. Design and methods: A qualitative descriptive study using in-depth interviews was undertaken. Thematic analysis was used to analyse data, and behaviour change frameworks (Theoretical Domain Framework (TDF) and Capability, Opportunity, and Motivation (COM-B)) were used to identify and map facilitators and barriers influencing maternity care provision during the COVID-19 pandemic. Setting and participants: Fifteen midwives working in community maternity care facilities in Surabaya and Mataram, Indonesia were included. Surabaya is in western Indonesia, with around 56,000 births per year and a population of around 3 million. Mataram is in eastern Indonesia, with around 7,000 births per year and a population of around 500,000. Findings: The main changes to maternity care

provision during the COVID-19 pandemic were reduced frequency of antenatal and postpartum care visits, reduced support for women, including unavailability of maternity care and reduced number of antenatal care and labour companions, changes in location of provision of care, and public health changes related to COVID-19. The main factors influencing the provision of high-quality maternity care during the COVID-19 pandemic were behavioural regulation, professional role and identity, and environmental context and resources. Key conclusions and implications for practice: Maternity care provision underwent substantial changes during the COVID-19 pandemic in Indonesia. Findings from this study can contribute to better understanding of how maternity care provision changed during the pandemic, and how positive changes can be reinforced, and negative changes can be addressed. DOI: 10.1080/14999013.2021.2019854

Accession Number: WOS:000750163700001

Abstract: Young people with neurodevelopmental disorders are overrepresented in the youth justice system and face many disadvantages due to their impairments. The current study investigated what factors predict and contribute to the behavior of youth justice professionals working in the Queensland (QLD) youth justice system, utilizing a behavior change wheel framework. Eighty-one youth justice professionals participated in an online survey assessing capability, opportunity and motivation and additional open-ended questions capturing their recommendations for

improvement. Results demonstrated that training frequency, capability, opportunity and motivation significantly predicted behaviors to identify and support young people with neurodevelopmental disorders (i.e., target behaviors). Capability ($p = <.001$) and motivation ($p = .02$) were significant independent predictors of the target behaviors. Examination of open-ended responses provided by the youth justice professionals identified several key areas, consistent with existing literature, which were in need of modifications to further support young people with neurodevelopmental disorders. These included: use of language, availability of resources, increased liaison with stakeholders, and knowledge and understanding of neurodevelopmental disorders. Overall, the current results provide helpful directions in terms of future targets for implementation strategies and interventions to better support young people with neurodevelopmental conditions who are involved with the QLD youth justice system.

Article Number: e008859

Accession Number: WOS:000882758700001

Abstract: BackgroundThe burden of tobacco use is disproportionately high in low- and middle-income countries (LMICs). There is scarce theorisation on what works with respect to implementation of tobacco control policies in these settings. Given the complex nature of tobacco control policy implementation, diversity in outcomes of widely implemented policies and the defining role of the context, we conducted a realist synthesis to examine tobacco control policy implementation in LMICs.MethodsWe conducted a systematic realist literature review to test an initial programme theory developed by the research team. We searched EBSCOHost and Web of Science,

containing 19 databases. We included studies on implementation of government tobacco control policies in LMICs. Results We included 47 studies that described several contextual factors, mechanisms and outcomes related to implementing tobacco control policies to varying depth. Our initial programme theory identified three overarching strategies: awareness, enforcement, and review systems involved in implementation. The refined programme theory identifies the plausible mechanisms through which these strategies could work. We found 30 mechanisms that could lead to varying implementation outcomes including normalisation of smoking in public places, stigmatisation of the smoker, citizen participation in the programme, fear of public opposition, feeling of kinship among violators and the rest of the community, empowerment of authorised officials, friction among different agencies, group identity among staff, shared learning, manipulation, intimidation and feeling left out in the policy-making process. Conclusions The synthesis provides an overview of the interplay of several contextual factors and mechanisms leading to varied implementation outcomes in LMICs. Decision-makers and other actors may benefit from examining the role of one or more of these mechanisms in their particular contexts to improve programme implementation. Further research into specific tobacco control policies and testing particular mechanisms will help deepen our understanding of tobacco control implementation in LMICs. PROSPERO registration number CRD42020191541.

Abstract: Food is a major contributor of greenhouse gases in the world. Changing what you eat to a less greenhouse gas intensive diet can have a major impact on the greenhouse gas emission. While campaigns and efforts about changing diets directed towards individuals have a potential to reduce total greenhouse gases, efforts directed towards institutional producers of meals have much greater potential to have impact since just a few key players need to be affected. In this paper, we describe a system we have developed for calculating carbon footprint for school meals, making it possible for decisions makers to compare schools with each other, and identify schools with both low footprint (who can serve as good examples) and schools with high footprints (who have the greatest possibility to change). Preliminary results from 10 schools in the Stockholm area are also presented.

Article Number: 106987

Accession Number: WOS:000891617000009

Abstract: Background: The first 1000 days of a child's life are increasingly recognized as a critical window for establishing a healthy growth trajectory to prevent childhood obesity and its associated long-term comorbidities. The purpose of this manuscript is to detail the methods for a multi-site, comparative effectiveness trial designed to prevent childhood overweight and obesity from birth to age 2 years. Methods: This study is a multi-site, individually randomized trial testing the comparative effectiveness of two active intervention arms: 1) the Greenlight intervention; and 2) the Greenlight Plus intervention. The Greenlight intervention is administered by trained pediatric healthcare providers at each well-child visit from 0 to 18 months and consists of a low health literacy toolkit used during clinic visits to promote shared goal

setting. Families randomized to Greenlight Plus receive the Greenlight intervention plus a health information technology intervention, which includes: 1) personalized, automated text-messages that facilitate caregiver self-monitoring of tailored and age-appropriate child health behavior goals; and 2) a web-based, personalized dashboard that tracks child weight status, progress on goals, and electronic Greenlight content access. We randomized 900 parent-infant dyads, recruited from primary care clinics across six academic medical centers. The study's primary outcome is weight for length trajectory from birth through 24 months. Conclusions: By delivering a personalized and tailored health information technology intervention that is asynchronous to pediatric primary care visits, we aim to achieve improvements in child growth trajectory through two years of age among a sample of geographically, socioeconomically, racially, and ethnically diverse parent-child dyads.

Short Title: An exploration of the use of photobiomodulation for management of oral mucositis in children and young people undergoing cancer treatment in the UK

ISSN: 0941-4355

DOI: 10.1007/s00520-022-07450-3

Accession Number: WOS:000880539000002

Abstract: Purpose Oral mucositis affects up to 80% of children and young people (CYP) receiving chemotherapy. This can result in pain, reduced oral intake and, in severe cases, hospitalisation for parental nutrition and pain relief. Photobiomodulation is recommended by multiple bodies for mucositis management for those undergoing cancer treatments. The current use of photobiomodulation within the UK, and the barriers and facilitators to implementation is unknown. Method An online mixed-methods survey was administered to representatives from the Children's Cancer and Leukaemia Group (CCLG) between October 2021 and March 2022. This explored: use of

photobiomodulation, planned future use, barriers and facilitators to implementation and dental assessment. Quantitative data underwent descriptive statistics. Barriers and facilitators to the implementation of photobiomodulation were analysed using the Theoretical Domains Framework (TDF). Results All UK CCLG centres responded (n = 20, a response rate of 100%). Two units in Scotland were delivering photobiomodulation. A further four units were planning to implement a service. Most units, 65% (n = 13) utilised specialist Paediatric Dentistry services for dental assessment. In the TDF analysis, five domains were most frequently populated: knowledge, skills, environmental context and resources, social influences, and social/professional role and identity. Conclusion Photobiomodulation was only available in Scotland in two children's cancer units. Lack of knowledge and skills, and insufficient environmental resources were identified as barriers. Collaboration with paediatric dental services was identified as a facilitator. The establishment of a national network of Paediatric Dentists and Oncologists would promote collaboration to standardise protocols and to address the identified barriers to wider implementation of photobiomodulation.

Title: Barriers and enablers to deprescribing in long-term care facilities: a 'best-fit' framework synthesis of the qualitative evidence

Journal: Age and Ageing

Volume: 51

Issue: 1

Date: Jan

Short Title: Barriers and enablers to deprescribing in long-term care facilities: a 'best-fit' framework synthesis of the qualitative evidence

ISSN: 0002-0729

DOI: 10.1093/ageing/afab250

Article Number: afab250

Accession Number: WOS:000776252000012

Abstract: Introduction older adults are at risk of adverse outcomes due to a high prevalence of polypharmacy and potentially inappropriate medications (PIMs). Deprescribing interventions have been demonstrated to reduce polypharmacy and PIMs. However, deprescribing is not performed routinely in long-term care facilities (LTCFs). This qualitative evidence synthesis aims to

identify the factors which limit and enable health care workers' (HCWs) engagement with deprescribing in LTCFs. Methods the 'best-fit' framework approach was used to synthesise evidence by using the Theoretical Domains Framework (TDF) as the a priori framework. Included studies were analysed qualitatively to identify LTCF barriers and enablers of deprescribing and were mapped to the TDF. Constructs within domains were refined to best represent the LTCF context. A conceptual model was created, hypothesising relationships between barriers and enablers. Results of 655 records identified, 14 met the inclusion criteria. The 'best-fit' framework included 17 barriers and 16 enablers, which mapped to 11 of the 14 TDF domains. Deprescribing barriers included perceptions of an 'established hierarchy' within LTCFs, negatively affecting communication and insufficient resources which limited HCWs' engagement with deprescribing. Enablers included tailored deprescribing guidelines, interprofessional support and working with a patient focus, allowing the patients' condition to influence decisions. Discussion this study identified that education, interprofessional support and collaboration can facilitate deprescribing. To overcome deprescribing barriers, change is required to a patient-centred model and HCWs need to be equipped with necessary resources and adequate reimbursement. The LTCF organisational structure must support deprescribing, with communication between health care systems.

DOI: 10.1111/ijsw.12164

Accession Number: WOS:000366142200011

Abstract: Despite the recent movement towards greater research use in many areas of social work, criticisms persist that decision making in practice is seldom informed by sound research evidence. Discourse about the research-to-practice gap in social work has tended to focus on the feasibility of evidence-based practice for

the profession, but has rarely drawn from the broader knowledge utilisation literature. There are important understandings to be gained from the knowledge utilisation field, which spans more than six decades of interdisciplinary research. This article introduces the wider knowledge utilisation literature to a social work audience. It considers the potential of this body of literature to facilitate research use in social work, as well as conceptual issues that may be hindering it from informing improvements to research utilisation in practice.

Short Title: Assessing the Impacts of Creating Active Schools on Organisational Culture for Physical Activity

DOI: 10.3390/ijerph192416950

Article Number: 16950

Accession Number: WOS:000902632800001

Abstract: Background: National and international guidance recommends whole-school approaches to physical activity, but there are few studies assessing their effectiveness, especially at an organisational level. This study assesses the impact of the Creating Active School's (CAS) programme on organisational changes to physical activity provision. Methods: In-school CAS leads completed a 77-item questionnaire assessing school-level organisational change. The questionnaire comprised 19 domains aligned with the CAS framework and COM-B model of behaviour change. Wilcoxon Signed Rank Tests assessed the pre-to-nine-month change. Results: >70% of schools (n = 53) pre-CAS had inadequate whole-school physical activity provision. After nine months (n = 32), CAS had a significant positive effect on organisational physical activity. The positive change was observed for: whole-school culture and ethos, teachers and wider school staff, academic lessons, physical education (PE) lessons, commute to/from school and stakeholder behaviour. Conclusions: This study provides preliminary evidence that CAS is a viable model to facilitate system-level change for

physical activity in schools located within deprived areas of a multi-ethnic city. To confirm the results, future studies are required which adopt controlled designs combined with a holistic understanding of implementation determinants and underlying mechanisms.

Short Title: Perspectives of Fijian Policymakers on the Obesity Prevention Policy Landscape

ISSN: 2314-6133

DOI: 10.1155/2015/926159

Article Number: 926159

Accession Number: WOS:000360753900001

Abstract: In Fiji and other Pacific Island countries, obesity has rapidly increased in the past decade. Therefore, several obesity prevention policies have been developed. Studies show that their development has been hampered by factors within Fiji's policy landscape such as pressure from industry. Since policymakers in the

Fijian national government are primarily responsible for the development of obesity policies, it is important to understand their perspectives; we therefore interviewed 15 policymakers from nine Fijian ministries. By applying the "attractor landscape" metaphor from dynamic systems theory, we captured perceived barriers and facilitators in the policy landscape. A poor economic situation, low food self-sufficiency, power inequalities, inappropriate framing of obesity, limited policy evidence, and limited resource sharing hamper obesity policy developments in Fiji. Facilitators include policy entrepreneurs and policy brokers who were active when a window of opportunity opened and who strengthened intersectoral collaboration. Fiji's policy landscape can become more conducive to obesity policies if power inequalities are reduced. In Fiji and other Pacific Island countries, this may be achievable through increased food self-sufficiency, strengthened intersectoral collaboration, and the establishment of an explicit functional focal unit within government to monitor and forecast the health impact of policy changes in non-health sectors.

Accession Number: WOS:000331159300009

Abstract: Objectives: Although 'integrated' public health policies are assumed to be the ideal way to optimize public health, it remains hard to determine how far removed we are from this ideal, since clear operational criteria and defining characteristics are lacking. Methods: A literature review identified gaps in previous operationalizations of integrated public health policies. We searched for an approach that could fill these gaps. Results: We propose the following defining characteristics of an integrated policy: (1) the combination of policies includes an appropriate mix

of interventions that optimizes the functioning of the behavioral system, thus ensuring that motivation, capability and opportunity interact in such a way that they promote the preferred (health-promoting) behavior of the target population, and (2) the policies are implemented by the relevant policy sectors from different policy domains. Conclusion: Our criteria should offer added value since they describe pathways in the process towards formulating integrated policy. The aim of introducing our operationalization is to assist policy makers and researchers in identifying truly integrated cases. The Behavior Change Wheel proved to be a useful framework to develop operational criteria to assess the current state of integrated public health policies in practice. (C) 2013 Elsevier Ireland Ltd. Accession Number: WOS:000356025900006

Abstract: Objectives: Intersectoral collaboration (ISC) is defined as collaboration between health and non-health local government officials and is a prerequisite for the development of integrated policies that address wicked public health problems. In practice, ISC has proven to be problematic, which might be related to differing views on ISC across various policy sectors. Therefore, our objective was to explore local officials views on ISC. Methods: We interviewed 19 officials responsible for 10 different policy sectors within two small-sized municipal governments within one Dutch region. We asked interviewees about ISC facilitators and barriers and categorized them in the theory-based concepts of capability, opportunity and motivation. Results: Capability was found to be determined by the ability to share policy goals, and was more likely to increase when officials had greater motivation to continue learning. Interviewees in both municipalities expected that flatter organizational structures and coaching of officials by managers could improve ISC opportunities. When the perceived feasibility of ISC and professional autonomy was low, motivation to learn new ISC skills was low. Conclusion: In the view of government officials, ISC is an appropriate tool to address wicked public health problems, but implementing ISC requires flatter organizational structures, merging of departmental cultures and leadership by heads of departments and town clerks in order to decrease officials fears of losing professional autonomy. Public Health Service officials can play a more active role in merging cultures by increasing understanding about the multi-dimensionality of public health and reframing health goals in the terminology of the non-health sector. DOI: 10.1186/1748-5908-8-46

Article Number: 46

Accession Number: WOS:000318420200002

Abstract: Background: Childhood obesity is a 'wicked' public health problem that is best tackled by an integrated approach, which is enabled by integrated public health policies. The development and implementation of such policies have in practice proven to be difficult, however, and studying why this is the case requires a tool that may assist local policy-makers and those assisting them. A comprehensive framework that can help to identify options for improvement and to systematically develop solutions may be used to support local policy-makers. Discussion: We propose the 'Behavior Change Ball' as a tool to study the development and implementation of integrated public health policies within local government. Based on the tenets of the 'Behavior Change Wheel' by Michie and colleagues (2011), the proposed conceptual framework distinguishes organizational behaviors of local policy-makers at the strategic, tactical and operational levels, as well as the determinants (motivation, capability, opportunity) required for these behaviors, and interventions and policy categories that can influence them. To illustrate the difficulty of achieving sustained integrated approaches, we use the metaphor of a ball in our framework: the mountainous landscapes surrounding the ball reflect the system's resistance to change (by making it difficult for the ball to roll). We apply this framework to the problem of childhood obesity prevention. The added value provided by the framework lies in its comprehensiveness, theoretical basis, diagnostic and heuristic nature and face validity. Summary: Since integrated public health policies have not been widely developed and implemented in practice, organizational behaviors relevant to the development of these policies remain to be investigated. A conceptual framework that can assist in systematically studying the policy process may facilitate this. Our Behavior Change Ball adds significant value to existing public health policy frameworks by incorporating multiple theoretical perspectives, specifying a set of organizational behaviors and linking the analysis of these behaviors to interventions and policies. We would encourage examination by others of our framework as a tool to explain and guide the development of integrated policies for the prevention of wicked public health problems.

Abstract: In hospitals, patient falls prevention education is frequently delivered by nurses and allied health professionals. Hospital falls rates remain high globally, despite the many systems and approaches that attempt to mitigate falling. The aim of this study was to investigate health professional views on the enablers and barriers to providing patient falls education in hospitals. Four focus groups with 23 nursing and allied health professionals were conducted at 3 hospitals. Three researchers independently coded the data and findings were analysed thematically with a descriptive qualitative approach to identify and develop themes according to barriers and enablers. Barriers included (i) limited interprofessional communication about patient falls; (ii) sub-optimal systems for falls education for patients and health professionals, and (iii) perceived patient-related barriers to falls education. Enablers to providing patient falls education included: (i) implementing strategies to increase patient empowerment; (ii) ensuring that health professionals had access to effective modes of patient education; and (iii) facilitating interprofessional collaboration. Health professionals identified the need to overcome organisational, patient and clinician-related barriers to falls education. Fostering collective responsibility amongst health professionals for evidence-based falls prevention was also highlighted.

Abstract: Despite its acknowledged benefits for health promotion, the full potential of persuasive technology is not (yet) reached in regard to usability, effectiveness, and reproducibility. It often lacks an effective combination of technical features and behavior change strategies. This paper presents a multidisciplinary approach, addressing both aspects. It builds on the frameworks of situated Cognitive Engineering and Intervention Mapping. The approach generates building blocks from theory originating from different relevant disciplines; it specifies change objectives and requirements, described in the context of use, for intervention (strategy) and interaction (technology); it evaluates process, effect and impact, whereby claims on interaction and intervention are validated. To cope with language barriers between developers from different disciplines, the approach is presented as a guideline, illustrated with a case study. This approach is expected to contribute to a sound design rationale, a broad reach and ongoing use of the technology, and larger results in regard to health promotion.

Abstract: Objectives(1) Generate empirical knowledge of a Musculoskeletal (MSK) Advanced Practice Physiotherapist (APP) Service in Scottish Primary Care; (2) Identify the incidence and baseline time to diagnosis of Axial Spondyloarthritis (AxSpA); (3) Identify APP Rheumatology referral fulfilment of the NICE 2017 Guidelines and Spondylarthritis Diagnosis Evaluation (SPADE) Tool; (4) Calculate APP Rheumatology referral conversion rates for AxSpA diagnosis and further investigation; (5) Contribute towards the current body of literature for informing analysis of MSK APP services within Scottish Primary Care. MethodsAn audit and evaluation approach was undertaken over a 3-year period (May 2019–April 2022). Relevant clinical cases from the whole-service data-set were identified and analysed, using retrospective electronic healthcare record review and descriptive statistical techniques. ResultsA total of 37,656 primary care MSK APP consultations took place, with N = 19 suspected AxSpA referrals made to Rheumatology. N = 6 cases of AxSpA were diagnosed by a Rheumatologist (31.6%). The mean age of individuals diagnosed with AxSpA was 39.6 +/- 8.8, and 66.7% (4/6) were female. Mean time to diagnosis was 3.4 years, and incidence per-10,000 person-years was 1.6. Compliance of referrals with the NICE 2017 Guidelines and SPADE Tool Criteria was 78.9%. Of those diagnosed with AxSpA, 66.7% met both referral criterion sets. ConclusionThose referred by an MSK APP from primary care had a 5.1 year shorter time to diagnosis than the previous reported UK average of 8.5 years. APPs identified relevant AxSpA features in referring to Rheumatology, and supported effective implementation of the local secondary care pathway.

Title: Antibiotic stewardship knowledge and belief differences among healthcare professionals in hospitals: A survey study

Journal: Heliyon

Volume: 7

Issue: 6

Date: Jun

Short Title: Antibiotic stewardship knowledge and belief differences among healthcare professionals in hospitals: A survey study

DOI: 10.1016/j.heliyon.2021.e07377

Article Number: e07377

Accession Number: WOS:000669225500005

Abstract: Background: Collaborative practice in healthcare has been recommended to improve the quality of antimicrobial stewardship interventions, a behavioral change in antimicrobial use. Insufficient knowledge regarding antibiotic resistance, the fear of complications from infections, and how providers perceive antibiotic use and resistance are likely to influence prescribing behavior. This study's objective was to identify the knowledge and belief healthcare professionals' differences about antibiotic stewardship. Methods: This cross-sectional survey study of three hospitals in the East Java province, Indonesia utilized a 43item questionnaire to assess antimicrobial stewardship knowledge and belief. There were 12 knowledge questions (total possible score: 12) and 31 belief questions (total possible score: 155). The Kuder Richardson 20 (KR20) and Cronbach alpha values of the questionnaire were 0.54 and 0.92, respectively. Results: Out of the 257 respondents, 19% (48/257) had a low scores of knowledge, and 39% (101/257) had low scores on belief about antibiotic stewardship (101/257). Most midwives had a low scores on knowledge (25/61) and low scores on belief (46/61). Respondents with high scores on belief were 17% (10/59) physicians, 15% (4/ 27) pharmacists, 8% (5/65) nurses, and 3% (2/61) midwives. Conclusion: Among healthcare professionals, knowledge and belief differences concerning antibiotic stewardship vary widely. These differences will affect their capability, behavior, and contribution to the healthcare team collaboration and performance. Further studies are needed to evaluate the correlation between the level of interprofessional collaboration and the quality of the antibiotic stewardship implementation.

Title: The needs and preferences of pregnant smokers regarding tailored Internet-based smoking cessation interventions: a qualitative interview study

Journal: BMC Public Health

Volume: 14

Date: Oct

Short Title: The needs and preferences of pregnant smokers regarding tailored Internet-based smoking cessation interventions: a qualitative interview study

DOI: 10.1186/1471-2458-14-1070

Article Number: 1070

Accession Number: WOS:000343287600001

Abstract: Background: Internet-based Smoking Cessation Interventions (ISCIs) may help pregnant smokers who are unable, or unwilling, to access face-to-face stop smoking support. Targeting ISCIs to specific groups of smokers could increase their uptake and effectiveness. The current study explored the needs and preferences of pregnant women seeking online stop smoking support with an aim to identify features and components of ISCIs that might be most attractive to this population. Methods: We conducted qualitative interviews with thirteen pregnant women who completed the intervention arm of a pilot randomized controlled trial of a novel ISCI for pregnant smokers ('MumsQuit'). The interviews explored women's views towards MumsQuit and online support with quitting smoking in general, as well as their suggestions for how ISCIs could be best targeted to pregnancy. Interview transcripts were analyzed using Framework Analysis. Results: Participants expressed preferences for an accessible, highly engaging and targeted to pregnancy smoking cessation website, tailored to individuals' circumstances as well as use of cessation medication, offering comprehensive and novel information on smoking and quitting smoking in pregnancy, ongoing support with cravings management, as well as additional support following relapse to smoking. Participants also viewed as important targeting of the feedback and progress reports to baby's health and development, offering personal support from experts, and providing a discussion forum allowing for communication with other pregnant women wanting to quit. Conclusions: The present study has identified a number of potential building blocks for ISCIs targeted to quitting smoking in pregnancy. Pregnant smokers willing to try using ISCI may particularly value an engaging intervention offering a high degree of targeting of comprehensive information to them as a group and tailoring support and advice to their individual needs, as well as one providing post-relapse support, peer-to-peer communication and personal support from experts.

Short Title: Perceived risk factors for severe Covid-19 symptoms and their association with health behaviours: Findings from the HEBECO study

ISSN: 0001-6918

DOI: 10.1016/j.actpsy.2021.103458

Article Number: 103458

Accession Number: WOS:000800911500001

Abstract: Risk perceptions are important influences on health behaviours. We used descriptive statistics and multivariable logistic regression models to assess cross-sectionally risk perceptions for severe Covid-19 symptoms and their health behaviour correlates among 2206 UK adults from the HEBECO study. The great majority (89–99%) classified age 70+, having comorbidities, being a key worker, overweight, and from an ethnic minority as increasing the risk. People were less sure about alcohol drinking, vaping, and nicotine replacement therapy use (17.4–29.5% responding 'don't know'). Relative to those who did not, those who engaged in the following behaviours had higher odds of classifying these behaviours as (i) decreasing the risk: smoking cigarettes (adjusted odds ratios, aORs, 95% CI = 2.26, 1.39–3.37), and using e-cigarettes (aORs = 5.80, 3.25–10.34); (ii) having no impact: smoking cigarettes (1.98; 1.42–2.76), using e-cigarettes (aORs = 2.63, 1.96–3.50), drinking alcohol (aORs = 1.75, 1.31–2.33); and lower odds of classifying these as increasing the risk: smoking cigarettes (aORs: 0.43, 0.32–0.56), using e-cigarettes (aORs = 0.25, 0.18–0.35). Similarly, eating more fruit and vegetables was associated with classifying unhealthy diet as 'increasing risk' (aOR = 1.37, 1.12–1.69), and exercising more with classifying regular physical activity as 'decreasing risk' (aOR = 2.42, 1.75–3.34). Risk perceptions for severe Covid-19 among UK adults were lower for their own health behaviours, evidencing optimism bias. These risk perceptions may form barriers to changing people's own unhealthy behaviours, make them less responsive to interventions that refer to the risk of Covid-19 as a motivating factor, and exacerbate inequalities in health behaviours and outcomes.

Short Title: Development of a Digital Lifestyle Modification Intervention for Use after Transient Ischaemic Attack or Minor Stroke: A Person-Based Approach

DOI: 10.3390/ijerph18094861

Article Number: 4861

Accession Number: WOS:000650277700001

Abstract: This paper describes the development of the 'Brain-Fit' app, a digital secondary prevention intervention designed for use in the early phase after transient ischaemic attack (TIA) or minor stroke. The aim of the study was to explore perceptions on usability and relevance of the app in order to maximise user engagement and sustainability. Using the theory- and evidence-informed person-based approach, initial planning included a scoping review of qualitative evidence to identify barriers and facilitators to use of digital interventions in people with cardiovascular conditions and two focus groups exploring experiences and support needs of people (N = 32) with a history of TIA or minor stroke. The scoping review and focus group data were analysed thematically and findings were used to produce guiding principles, a behavioural analysis and explanatory logic model for the intervention. Optimisation included an additional focus group (N = 12) and individual think-aloud interviews (N = 8) to explore perspectives on content and usability of a prototype app. Overall, thematic analysis highlighted uncertainty about increasing physical activity and concerns that fatigue might limit participation. Realistic goals and progressive increases in activity were seen as important to improving self-confidence and personal control. The app was seen as a useful and flexible resource. Participant feedback from the optimisation phase was used to make modifications to the app to maximise engagement, including simplification of the goal setting and daily data entry sections. Further studies are required to examine efficacy and cost-effectiveness of this novel digital intervention.

Short Title: Physical Activity after Cardiac Events (PACES) – a group education programme with subsequent text-message support designed to increase physical activity in individuals with diagnosed coronary heart disease: study protocol for a randomised controlled trial

DOI: 10.1186/s13063-018-2923-x

Article Number: 537

Accession Number: WOS:000446371200002

Abstract: Background: Coronary heart disease (CHD) represents approximately 13% of deaths worldwide and is the leading cause of death in the UK with considerable associated health care costs. After a CHD event, timely cardiac rehabilitation optimises patient outcomes. However, a high percentage of these services do not meet necessary performance indicators such as course length and follow-up attendance. Uptake of such services is only 50% in UK patients and support provided 12 months after an event is often limited. To delay and prevent further CHD events leading to hospitalisation, supplementary self-management strategies such as group education, are necessary. Methods: This is a single-centre, randomised controlled trial (RCT) recruiting participants (n = 290) aged ≥ 18 years who are 12 to 48 months post diagnosis of a CHD-related cardiac event (myocardial infarction, angina and any other acute coronary syndrome). The study aims to implement a structured education programme, with text-message support over 12 months, and identify whether delivery of the programme, to individuals who have a history of a cardiac event, would be an effective and cost-effective strategy for increasing walking. The primary outcome, objectively measured average daily physical activity, specifically step count through walking activity, is assessed using the wrist-worn GENEActiv accelerometer at baseline, 6 and 12 months. Secondary outcomes at 12 months include cardiovascular risk factors such as smoking status, blood pressure, lipid profile, glycated haemoglobin (HbA1c), obesity, self-efficacy, quality of life, physical activity and physical function. Participants are randomised to either the control group receiving standard care and a physical activity information leaflet, or the intervention group whose participants receive the leaflet and are invited to attend two group-based structured education sessions. These encourage participants to adopt and maintain healthy behaviours and self-manage their lifestyle. They are delivered approximately 2 weeks apart by trained facilitators and reinforced via subsequent text-message support. Discussion: To our knowledge, this is the first trial designed to assess the effectiveness of a group education programme 12 to 48 months after a CHD event diagnosis. If successful, the PACES programme could be translated into effective post-operative cardiac care and complement the current post-operative services available.

Article Number: adv00445

Accession Number: WOS:000654751700018

Abstract: The Psoriasis and Well-being (PsoWell)(TM) training programme, incorporating motivational interviewing, improves clinicians' knowledge and skills to manage complex psoriasis, including behaviour change. The aims of this study were to deliver the PsoWell (TM) training programme to dermatology specialists, and to evaluate the acceptability and feasibility of implementing the PsoWell (TM) model across dermatology services. Framework analysis of 19 qualitative semi-structured interviews was performed, following delivery of nine, 1-day PsoWell (TM) training days involving 119 participants. Two themes were identified: "Perceptions and Priorities" and "Awareness", sub-divided into: "Awareness Not Competence" and "Increasing Awareness". The PsoWell (TM) model was found to be acceptable and feasible to implement across dermatology settings. Participants were more skilled and motivated to address psychological issues, including behaviour change, but wanted further training to ensure competency. The trainees claimed that scepticism among some colleagues regarding whole-patient management might prevent uptake. Data showing the impact on health outcomes are needed and might overcome scepticism. Remote consultation could adopt the PsoWell (TM) approach.

Title: A mixed methods systematic review of digital interventions to support the psychological health and well-being of people living with dermatological conditions

Journal: Frontiers in Medicine

Volume: 9

Date: Nov

Short Title: A mixed methods systematic review of digital interventions to support the psychological health and well-being of people living with dermatological conditions

DOI: 10.3389/fmed.2022.1024879

Article Number: 1024879

Accession Number: WOS:000886142000001

Abstract: Background: Dermatological conditions can have a substantial impact on psychological as well as physical health yet dedicated face-to-face psychological support for patients is lacking. Thus, individuals may require additional support to self-manage dermatological conditions effectively. Digital technology can contribute to long-term condition management, but knowledge of the effectiveness of digital interventions addressing psychological (cognitive, emotional, and behavioural) aspects of dermatological conditions is limited. Objectives: To identify, determine the effectiveness, and explore people's views and experiences of digital interventions supporting the psychological health of people with dermatological conditions. Methods: A mixed methods systematic review informed by JBI methodology. The protocol was registered on PROSPERO. Eight electronic databases were searched for papers written between January 2002 and October 2021. Data screening and extraction were conducted in Covidence. The methodological quality of studies were scrutinised against JBI critical appraisal tools. Intervention characteristics were captured using the Template for Intervention Description and Replication checklist and guide. Data were synthesised using a convergent segregated approach. The results were reported in a narrative summary. Results: Twenty-three papers were identified from 4,883 references, including 15 randomised controlled trials. Nineteen interventions were condition-specific, 13 were delivered online, 16 involved an educational component, and 7 endorsed established, evidence-based therapeutic approaches. Improvements in knowledge, mood, quality of life, the therapeutic relationship, and reduced disease severity in the short to medium term, were reported, although there was substantial heterogeneity within the literature. Thirteen studies captured feedback from users, who considered various digital interventions as convenient and helpful for improving knowledge, emotion regulation, and personal control, but technical and individual barriers to use were reported. Use of established qualitative methodologies was limited

and, in some cases, poorly reported. Conclusion: Some web-based digital psychological interventions seem to be acceptable to people living with mainly psoriasis and eczema. Whilst some digital interventions benefitted cognitive and emotional factors, heterogeneity and inconsistencies in the literature meant definitive statements about their effectiveness could not be drawn. Interdisciplinary and patient-centred approaches to research are needed to develop and test quality digital interventions supporting the psychological health of adults living with common and rare dermatological conditions.

Title: The Shared Safety Net Action Plan (SSNAP): a co-designed intervention to reduce delays in cancer diagnosis

Journal: British Journal of General Practice

Volume: 72

Issue: 721

Pages: E581-E591

Date: Aug

Short Title: The Shared Safety Net Action Plan (SSNAP): a co-designed intervention to reduce delays in cancer diagnosis

ISSN: 0960-1643

DOI: 10.3399/bjgp.2021.0476

Accession Number: WOS:000888618000006

Abstract: Background Safety netting in primary care may help diagnose cancer earlier, but it is unclear what the format and content of an acceptable safety-netting intervention would be. This project aimed to co-design a safety-netting intervention with and for primary care patients and staff. Aim This work sought to address how a safety-netting intervention would be implemented in practice; and, if and how a safety-netting intervention would be acceptable to all stakeholders. Design and setting Patient representatives, GPs, and nurse practitioners were invited to a series of co-design workshops. Patients who had and had not received a diagnosis of cancer and primary care practices took part in separate focus groups. Method Three workshops using creative co-design processes developed the format and content of the intervention prototype. The COM-B Framework underpinned five focus groups to establish views on capability, opportunity, and motivation to use the intervention to assist with prototype refinement. Results Workshops and focus groups suggested the intervention format and

content should incorporate visual and written communication specifying clear timelines for monitoring symptoms and when to present back; be available in paper and electronic forms linked to existing computer systems; and be able to be delivered within a 10-minute consultation. Intervention use themes included 'building confidence through partnership', 'using familiar and current procedures and systems', and 'seeing value'. Conclusion The Shared Safety Net Action Plan (SSNAPI – a safety-netting intervention to assist the timely diagnosis of cancer in primary care, was successfully co-designed with and for patients and primary care staff.

Abstract: Background: Off-the-shelf digital gaming technology has been shown to support the well-being of people with dementia. Yet, to date, it is rarely adopted within dementia care practice, particularly within care homes. Drawing on a descriptive, qualitative approach, this is the first study that has sought to explore care home practitioners' perceptions of the barriers and facilitators for using gaming technology within their workplace. Method: Data were collected across eight focus groups in the south of England with a total of 39 care home workers. These were analysed inductively following the 6-stage thematic process as outlined by Braun and Clarke (2006). Findings: Three themes, constructed from the data suggested, the care environment, staff knowledge and skills for inclusive gaming, and staff perceptions about capabilities (their own and those of people with dementia) inhibited or facilitated the use of gaming technology in care homes. The findings were interpreted through a combination of the Capability, Opportunity, Motivation and Behaviour model and the Theoretical

Domains Framework to provide theory-based insights into the mechanisms for supporting behaviour change and implementation within the care home context. Conclusions: We argue for the need to target wider institutional barriers alongside providing inclusive training for care staff on incorporating gaming technology within their person-centred care approaches. Through these mechanisms, they can be provided with the capabilities, opportunities and motivation to integrate gaming technology within their practice, and thus facilitate the process of culture change within care homes.

Abstract: Encouraging meat eaters to eat more vegetarian foods benefits public health and environment. This study examined whether changes in menu design, specifically in the labeling of a dish, increases vegetarian food choice. In an online survey experiment involving a representative sample of Danish meat eaters (n = 955) we investigated the frequency with which dishes are chosen when they have a neutral vegetarian label (with no explicit indication that the dish does not contain meat), an explicit label (as vegetarian, meat-free, vegan, or plant-based), or a label referring to meat. We also examined the role of individual characteristics of the diner (food neophobia, meat-eating identity, meat intake and ethical concern). We found that neutral labeling out-performed explicit labeling among all meat eaters (neutral 17%, meat 10%, explicit labels 5%-7%) and in two sub-groups, namely, non-reducers (who are not actively reducing their meat intake: explicit 3.4%, neutral 10.2%) and meat-reducers (explicit 14.4%, neutral 30.1%). We found no significant differences between the four explicit labels. We show that non-reducers with low meat-eating identity can be nudged to choose a neutrally labeled vegetarian dish, and that, among ethically concerned meat-reducers, the vegetarian dish is chosen more often when the dish is neutrally rather than explicitly

labeled. Finally, we show that meat-avoiders (additional convenience sample, n = 148) were as likely to choose a neutrally labeled vegetarian dish as an explicitly labeled one. Our results suggest that neutral labeling sidesteps reactance and moral licensing effects in both meat-reducers and non-reducers, and that food outlets with meat-eating customers should carefully consider their use of explicit labeling and use neutral labeling for vegetarian dishes where possible.

Article Number: 104675

Accession Number: WOS:000830249900004

Abstract: Reduced meat intake by Western consumers would benefit public health and the environment. However, meat consumption is notoriously difficult to change, among other things because it is often the outcome of automatic and habitual behavior. Interventions that make use of automatic decision-making processes are therefore promising, but these too vary in their success. The effectiveness of interventions may be improved if different types of meat-eaters are separated. Thus, the aim of this study was to test the effectiveness of two kinds of intervention (namely, changing to a vegetarian default on a menu and changing the attractiveness of a food label) on vegetarian food choice for two distinct groups: meat-eaters who are not reducing their meat intake (non-reducers) and meat-reducers. We also explored whether the effect of these interventions could be strengthened by activating different roles (i.e. a consumer role versus a citizen role). The online study included two European countries, Denmark (n = 740) and the Netherlands (n = 749), and involved two experiments. It was found that a vegetarian default significantly increased vegetarian food choice among the non-reducers but did not significantly do so among meat-reducers. Attractive labeling marginally increased vegetarian food choice for non-reducers but had no impact on meat-reducers. The activation of

roles did not influence food choice. We conclude that meat-reducing interventions, especially where the menu default is concerned, could benefit from increased focus on a more specific target audience (i.e. non-reducers). More generally, we recommend that future meat-reducing interventions should consider different groups of meat-eaters.

Article Number: e63450

Accession Number: WOS:000319435600015

Abstract: Background: The aims of the study were to evaluate the effect of providing tailored falls prevention education in hospital on: i) engagement in targeted falls prevention behaviors in the month after discharge: ii) patients' self-perceived risk and knowledge about falls and falls prevention strategies after receiving the education. Methods: A pilot randomized controlled trial (n = 50): baseline and outcome assessments conducted by blinded researchers. Participants: hospital inpatients 60 years or older, discharged to the community. Participants were randomized into two groups. The intervention was a tailored education package consisting of multimedia falls prevention information with trained health professional follow-up, delivered in addition to usual care. Outcome measures were engagement in falls prevention behaviors in the month after discharge measured at one month after discharge with a structured survey, and participants' knowledge, confidence and motivation levels before and after receiving the education. The feasibility of providing the intervention was examined and falls outcomes (falls, fall-related injuries) were also collected. Results: Forty-eight patients (98%) provided follow-up data. The complete package was provided to 21 (84%) intervention group participants. Participants in the intervention group were significantly more likely to plan how to safely restart functional

activities [Adjusted odds ratio 3.80, 95% CI (1.07, 13.52), $p = 0.04$] and more likely to complete other targeted behaviors such as completing their own home exercise program [Adjusted odds ratio 2.76, 95% CI (0.72, 10.50), $p = 0.14$] than the control group. The intervention group was significantly more knowledgeable, confident and motivated to engage in falls prevention strategies after receiving the education than the control group. There were 23 falls ($n = 5$ intervention; $n = 18$ control) and falls rates were 5.4/1000 patient days (intervention); 18.7/1000 patient days (control). Conclusion: This tailored education was received positively by older people, resulted in increased engagement in falls prevention strategies after discharge and is feasible to deliver to older hospital patients.

Article Number: e013931

Accession Number: WOS:000397872400110

Abstract: Introduction: Older adults frequently fall after discharge from hospital. Older people may have low self-perceived risk of falls and poor knowledge about falls prevention. The primary aim of the study is to evaluate the effect of providing tailored falls prevention education in addition to usual care on falls rates in older people after discharge from hospital compared to providing a social intervention in addition to usual care. Methods and analyses: The 'Back to My Best' study is a multisite, single blind, parallel-group randomised controlled trial with blinded outcome assessment and intention-to-treat analysis, adhering to CONSORT guidelines. Patients ($n = 390$) (aged 60 years or older; score more than 7/10 on the Abbreviated Mental Test Score; discharged to community settings) from aged care rehabilitation wards in three hospitals will be

recruited and randomly assigned to one of two groups. Participants allocated to the control group shall receive usual care plus a social visit. Participants allocated to the experimental group shall receive usual care and a falls prevention programme incorporating a video, workbook and individualised follow-up from an expert health professional to foster capability and motivation to engage in falls prevention strategies. The primary outcome is falls rates in the first 6 months after discharge, analysed using negative binomial regression with adjustment for participant's length of observation in the study. Secondary outcomes are injurious falls rates, the proportion of people who become fallers, functional status and health-related quality of life. Healthcare resource use will be captured from four sources for 6 months after discharge. The study is powered to detect a 30% relative reduction in the rate of falls (negative binomial incidence ratio 0.70) for a control rate of 0.80 falls per person over 6 months. Ethics and dissemination: Results will be presented in peer-reviewed journals and at conferences worldwide. This study is approved by hospital and university Human Research Ethics Committees.

Article Number: e012363

Accession Number: WOS:000382252100058

Abstract: Objectives: The aim of the study was to determine how providing individualised falls prevention education facilitated behaviour change from the perspective of older hospital patients on rehabilitation wards and what barriers they identified to engaging

in preventive strategies. Design: A prospective qualitative survey. Methods: Older patients (n= 757) who were eligible (mini-mental state examination score>23/30) received falls prevention education while admitted to eight rehabilitation hospital wards in Western Australia. Subsequently, 610 participants were surveyed using a semistructured questionnaire to gain their response to the in-hospital education and their identified barriers to engaging in falls prevention strategies. Deductive content analysis was used to map responses against conceptual frameworks of health behaviour change and risk taking. Results: Participants who responded (n= 473) stated that the education raised their awareness, knowledge and confidence to actively engage in falls prevention strategies, such as asking for assistance prior to mobilising. Participants' thoughts and feelings about their recovery were the main barriers they identified to engaging in safe strategies, including feeling overconfident or desiring to be independent and thinking that staff would be delayed in providing assistance. The most common task identified as potentially leading to risk-taking behaviour was needing to use the toilet. Conclusions: Individualised education assists older hospital rehabilitation patients with good levels of cognition to engage in suitable falls prevention strategies while on the ward. Staff should engage with patients to understand their perceptions about their recovery and support patients to take an active role in planning their rehabilitation.

Accession Number: WOS:000368839100134

Abstract: Objectives Falls are the most frequent adverse event reported in hospitals. Patient and staff education delivered by trained educators significantly reduced falls and injurious falls in an older rehabilitation population. The purpose of the study was to explore the educators' perspectives of delivering the education and to conceptualise how the programme worked to prevent falls among older patients who received the education. Design A qualitative exploratory study. Methods Data were gathered from three sources: conducting a focus group and an interview (n=10 educators), written educator notes and reflective researcher field notes based on interactions with the educators during the primary study. The educators delivered the programme on eight rehabilitation wards for periods of between 10 and 40 weeks. They provided older patients with individualised education to engage in falls prevention and provided staff with education to support patient actions. Data were thematically analysed and presented using a conceptual framework. Results Falls prevention education led to mutual understanding between staff and patients which assisted patients to engage in falls prevention behaviours. Mutual understanding was derived from the following observations: the educators perceived that they could facilitate an effective three-way interaction between staff actions, patient actions and the ward environment which led to behaviour change on the wards. This included engaging with staff and patients, and assisting them to reconcile differing perspectives about falls prevention behaviours. Conclusions Individualised falls prevention education effectively provides patients who receive it with the capability and motivation to develop and undertake behavioural strategies that reduce their falls, if supported by staff and the ward environment.

Short Title: Fall rates in hospital rehabilitation units after individualised patient and staff education programmes: a pragmatic, stepped-wedge, cluster-randomised controlled trial

ISSN: 0140-6736

DOI: 10.1016/s0140-6736(14)61945-0

Accession Number: WOS:000356930000026

Abstract: Background Falls are the most frequent adverse events that are reported in hospitals. We examined the effectiveness of individualised falls-prevention education for patients, supported by training and feedback for staff, delivered as a ward-level programme. Methods Eight rehabilitation units in general hospitals in Australia participated in this stepped-wedge, cluster-randomised study, undertaken during a 50 week period. Units were randomly assigned to intervention or control groups by use of computer-generated, random allocation sequences. We included patients admitted to the unit during the study with a Mini-Mental State Examination (MMSE) score of more than 23/30 to receive individualised education that was based on principles of changes in health behaviour from a trained health professional, in addition to usual care. We provided information about patients' goals, feedback about the ward environment, and perceived barriers to engagement in falls-prevention strategies to staff who were trained to support the uptake of strategies by patients. The coprimary outcome measures were patient rate of falls per 1000 patient-days and the proportion of patients who were fallers. All analyses were by intention to treat. This trial is registered with the Australian New Zealand Clinical Trials registry, number ACTRN12612000877886). Findings Between Jan 13, and Dec 27, 2013, 3606 patients were admitted to the eight units (n=1983 control period; n=1623 intervention period). There were fewer falls (n=196, 7.80/1000 patient-days vs n=380, 13.78/1000 patient-days, adjusted rate ratio 0.60 [robust 95% CI 0.42-0.94], p=0.003), injurious falls (n=66, 2.63/1000 patient-days vs 131, 4.75/1000 patient-days, 0.65 [robust 95% CI 0.42-0.88], p=0.006), and fallers (n=136 [8.38%] vs n=248 [12.51%] adjusted odds ratio 0.55 [robust 95% CI 0.38 to 0.81], p=0.003) in the intervention compared with the control group. There was no significant difference in length of stay (intervention median 11 days [IQR 7-19], control 10 days [6-18]). Interpretation Individualised patient education programmes combined with training and feedback to staff added to usual care reduces the rates of falls and injurious falls in older patients in rehabilitation hospital-units.

Article Number: e013414

Accession Number: WOS:000391303600062

Abstract: Objectives: The purpose of this study was to understand how staff responded to individualised patient falls prevention education delivered as part of a cluster randomised trial, including how they perceived the education contributed to falls prevention on their wards. Design: A qualitative explanatory study. Methods: 5 focus groups were conducted at participatory hospital sites. The purposive sample of clinical staff (including nurses, physiotherapists and quality improvement staff) worked on aged care rehabilitation wards when a cluster randomised trial evaluating a patient education programme was conducted. During the intervention period, an educator, who was a trained health professional and not a member of staff, provided individualised falls prevention education to patients with good levels of cognition (Mini-Mental State Examination >23/30). Clinical staff were provided with training to support the programme and their feedback was sought after the trial concluded, to understand how they perceived the programme impacted on falls prevention. Data were thematically analysed using NVivo qualitative data analysis software. Results: 5 focus groups were conducted at different hospitals (n=30 participants). Staff perceived that the education created a positive culture around falls prevention and further, facilitated teamwork, whereby patients and staff worked together to address falls prevention. The educator was perceived to be a valuable member of the team. Staff reported that they developed increased knowledge and awareness about creating a safe ward environment. Patients being proactive and empowered to engage in falls prevention strategies, such as ringing the bell for assistance, was viewed as supporting staff falls prevention efforts and motivating staff to change practice. Conclusions: Staff responded positively to patient falls prevention education being delivered on their wards. Providing individualised patient education to older patients with good levels of cognition can empower staff and patients to work as a team to address falls prevention on hospital rehabilitation wards.

Accession Number: WOS:000822597700001

Abstract: Preconception health is a key determinant of pregnancy and offspring outcomes, but challenges reaching people during preconception are frequently cited by health professionals. This article highlights the workplace as an important setting for promoting equitable access to preconception health-related information and education to support optimal well-being before pregnancy. Workplaces can support equitable access to education and knowledge for preconception health: (1) due to the high engagement of reproductive-age women in the workforce and (2) by reaching vulnerable or high-risk population groups who may otherwise face barriers to accessing preconception health information. Literature that explicitly investigates workplace delivery of preconception health promotion programs is scarce. However, workplace health promotion more broadly is associated with improved corporate competitiveness, productivity, and strengthened employee-employer relationships. Workplace health promotion activities may also address social determinants of health and improve employee well-being outcomes. The opportunity for workplaces to benefit from an increase in the bottom line makes workplace health promotion programs more attractive, but organizational support and stakeholder engagement are needed to facilitate the design and delivery of successful workplace preconception health education programs. Such programs have the potential to facilitate health gains for women and their families.

Short Title: Risk-based stratified primary care for common musculoskeletal pain presentations (STarT MSK): a cluster-randomised, controlled trial

ISSN: 2665-9913

DOI: 10.1016/s2665-9913(22)00159-x

Accession Number: WOS:000898624300010

Abstract: Background Risk-based stratified care shows clinical effectiveness and cost-effectiveness versus usual primary care for non-specific low back pain but is untested for other common musculoskeletal disorders. We aimed to test the clinical effectiveness and cost-effectiveness of point-of-care risk stratification (using Keele's STarT MSK Tool and risk-matched treatments) versus usual care for the five most common musculoskeletal presentations (back, neck, knee, shoulder, and multi-site pain). Methods In this cluster-randomised, controlled trial in UK primary care with embedded qualitative and health economic studies we recruited patients from 24 general practices in the West Midlands region of England. Eligible patients were those aged 18 years or older whose general practitioner (GP) confirmed a consultation for a musculoskeletal presentation. General practices that consented to participate via a representative of the cluster were randomly assigned (1:1) to intervention or usual care, using stratified block randomisation. Researchers involved in data collection, outcome data entry, and statistical analysis were masked at both the cluster and individual participant level. Participating patients were told the study was examining GP treatment of common aches and pains and were not aware they were in a randomised trial. GPs in practices allocated to the intervention group were supported to deliver risk-based stratified care using a bespoke computer-based template, including the risk-stratification tool, and risk-matched treatment options for patients at low, medium, or high risk of poor disability or pain outcomes. There were 15 risk-matched treatment options. In the usual care group, patients with musculoskeletal pain

consulting their GP received treatment as usual, typically including advice and education, medication, referral for investigations or tests, or referral to other services. The primary outcome was time-averaged pain intensity over 6 months. All analyses were done by intention to treat. The trial is registered with ISRCTN, ISRCTN15366334. Findings Between May 1, 2018, and April 30, 2019, 104 GPs from 24 practices (12 per study group) identified 2494 patients with musculoskeletal pain. 1211 (49%) participants consented to questionnaires (534 in the intervention group and 677 in the usual care group), with 1070 (88%) completing the follow-up questionnaire at 6 months. We found no significant difference in time-averaged pain intensity (mean(SD) mean 4.4 [SD 2.3] in the intervention group vs 4.6 [2.5] in the control group; adjusted mean difference -0.16, 95% CI -0.65 to 0.34) or in standardised function score (mean -0.06 [SD 0.94] in the intervention group vs 0.05 [1.04]; adjusted mean difference -0.07, 95% CI -0.22 to 0.08). No serious adverse events or adverse events were reported. Risk stratification received positive patient and clinician feedback. Interpretation Risk stratification for patients in primary care with common musculoskeletal presentations did not lead to significant improvements in pain or function, although some aspects of GP decision making were affected, and GP and patients had positive experiences. The costs of risk-based stratified care were similar to usual care, and such a strategy only offers marginal changes in cost-effectiveness outcomes. The clinical implications from this trial are largely inconclusive.

Title: Encouraging healthy spine habits to prevent low back pain in children: an observational study of adherence to exercise

Journal: Physiotherapy

Volume: 102

Issue: 3

Pages: 229-235

Date: Sep

Short Title: Encouraging healthy spine habits to prevent low back pain in children: an observational study of adherence to exercise

ISSN: 0031-9406

DOI: 10.1016/j.physio.2015.05.005

Accession Number: WOS:000382257300006

Abstract: Background Low back pain (LBP) in adolescence is a predictor of adult LBP. Strategies to educate children and encourage healthy spine habits may prevent LBP. Poor adherence to health programmes can be a barrier to their success. This study addresses the potential for habituation of a short daily exercise programme that draws attention to factors thought to keep the spine healthy. Objectives To describe adherence to a 9-month exercise programme, and analyse factors that may influence adherence. Design Observational cohort study. Setting Four primary schools in New Zealand. Outcome measures Outcomes included self-evaluation of adherence to exercise, and self-reported incidence and severity of LBP. Participants Children (n = 469) aged 8 to 11 years. Methods Participants were taught four simple spine movements for daily practice as part of a health programme that emphasised 'back awareness' and self-care of the spine. Strategies to encourage adherence were implemented. Data on self-reported adherence and episodes of LBP during the previous week were collected through an online survey completed on trial days 7, 21, 49, 105, 161 and 270 over a 9-month period. Results Daily exercise adherence was 34% on day 7 and dropped to 9% by day 270. Exercise adherence of at least once per week was 84% on day 7 and 47% by day 270. Frequency of exercise was not associated with episodes of LBP [odds ratio (OR) 1.16, 95% confidence interval (CI) 0.92 to 1.47, P=0.21], previous history of LBP (OR 0.97, 95% CI 0.77 to 1.23, P=0.77), lifetime first episode of LBP (defined as the first episode of LBP in the study period for participants with no previous history of LBP) (OR 0.39, 95% CI 0.15 to 1.34, P=0.14) or severity of LBP (OR 1.59, 95% CI 0.99 to 2.52, P=0.05). Conclusion This study applied a comprehensive set of strategies considered to be important in encouraging adherence, but was not successful in sustaining the interest of more than half of the cohort. Innovative strategies are needed to develop new exercise habits in children. (C) 2015 Chartered Society of Physiotherapy. Published by Elsevier Ltd. All rights reserved.

Short Title: Comparison of facilitators and barriers to providing oral hygiene measures in dependent older people and young children: A systematic review

ISSN: 0734-0664

DOI: 10.1111/ger.12684

Accession Number: WOS:000950297600001

Abstract: ObjectiveThe objective of the study was to systematically compare barriers/facilitators providing oral hygiene to young children and dependent older people and to generate ideas to improve the implementation of oral hygiene measures. BackgroundMany older people, like children, rely on third-party assistance for teeth cleaning. Barriers/facilitators in providing oral care services have been described in recent works. The aim of our study was to compare these results for both groups and to increase knowledge on analogies/differences in barriers/intermediaries. MethodsWe performed a systematic review. Studies reporting on knowledge, attitudes and beliefs acting as barriers/facilitators for provision of teeth cleaning were included. Thematic analysis was used and identified themes translated to domains and constructs of the theoretical domains framework and aligned to the behaviour change wheel. Based on three published reviews in children or older people, our search (PubMed via Medline), Cochrane Central Register of Controlled Trials (CENTRAL) and Web of Science, Google Scholar, last search (21 January 2023) encompassed both populations dated from their last publication (28 February 2018). The review was registered (Prospero, CRD42021278944). For quality assessment, the Newcastle-Ottawa Scale (NOS) was used. ResultsSeventeen articles were identified (older people (n = 8), children (n = 9)). Deficits exist for both in terms of "knowledge/skills" among caregivers, with special difficulties in children with challenging behaviour and older people. "Capability" as one of the main elements of behavioural factors that are the basis for behaviour to take place (COM-B, Capability, Opportunity, Motivation-Behaviour) is most often mentioned for children and "opportunity" for older people. ConclusionsMost of the facilitators and barriers affecting oral care provision in children are also relevant in older people. Approaches for the development of strategies for better implementation of oral hygiene measures in older people are presented.

ISSN: 1467-7881

DOI: 10.1111/obr.12479

Accession Number: WOS:000397269500008

Abstract: Introduction: Ready-to-eat meals sold by food outlets that are accessible to the general public are an important target for public health intervention. We conducted a systematic review to assess the impact of such interventions. Methods: Studies of any design and duration that included any consumer-level or food-outlet-level before-and-after data were included. Results: Thirty studies describing 34 interventions were categorized by type and coded against the Nuffield intervention ladder: restrict choice = trans fat law (n = 1), changing pre-packed children's meal content (n = 1) and food outlet award schemes (n = 2); guide choice = price increases for unhealthier choices (n = 1), incentive (contingent reward) (n = 1) and price decreases for healthier choices (n = 2); enable choice = signposting (highlighting healthier/unhealthier options) (n = 10) and telemarketing (offering support for the provision of healthier options to businesses via telephone) (n = 2); and provide information = calorie labelling law (n = 12), voluntary nutrient labelling (n = 1) and personalized receipts (n = 1). Most interventions were aimed at adults in US fast food chains and assessed customer-level outcomes. More 'intrusive' interventions that restricted or guided choice generally showed a positive impact on food-outlet-level and customer-level outcomes. However, interventions that simply provided information or enabled choice had a negligible impact. Conclusion: Interventions to promote healthier ready-to-eat meals sold by food outlets should restrict choice or guide choice through incentives/disincentives. Public health policies and practice that simply involve providing information are unlikely to be effective.

Abstract: Background: Ready-to-eat meals (to eat in, to take away or to be delivered) sold by food outlets are often more energy dense and nutrient poor compared with meals prepared at home, making them a reasonable target for public health intervention. The aim of the research presented in this paper was to systematically identify and describe interventions to promote healthier ready-to-eat meals (to eat in, to take away, or to be delivered) sold by specific food outlets in England. Methods: A systematic search and sift of the literature, followed by evidence mapping of relevant interventions, was conducted. Food outlets were included if they were located in England, were openly accessible to the public and, as their main business, sold ready-to-eat meals. Academic databases and grey literature were searched. Also, local authorities in England, topic experts, and key health professionals and workers were contacted. Two tiers of evidence synthesis took place: type, content and delivery of each intervention were summarised (Tier 1) and for those interventions that had been evaluated, a narrative synthesis was conducted (Tier 2). Results: A total of 75 interventions were identified, the most popular being awards. Businesses were more likely to engage with cost neutral interventions which offered imperceptible changes to price, palatability and portion size. Few interventions involved working upstream with suppliers of food, the generation of customer demand, the exploration of competition effects, and/or reducing portion sizes. Evaluations of interventions were generally limited in scope and of low methodological quality, and many were simple assessments of acceptability. Conclusions: Many interventions promoting healthier ready-to-eat meals (to eat in, to take away, or to be delivered) sold by specific food outlets in England are taking place; award-type interventions are the most common. Proprietors of food outlets in England that, as their main business, sell ready-to-eat meals, can be engaged in implementing interventions to promote healthier ready-to-eat-food. These proprietors are generally positive about such interventions, particularly when they are cost neutral and use a health by stealth approach.

Abstract: Mobile health (mHealth) is an emerging field devoted to
the use of mobile and wireless devices to affect health outcomes,
health care services, and health research. Despite great promise,
little research has examined its effectiveness. It is the authors'
view that the full potential of mHealth has yet to be realized in
research and practice. This Perspective article explores when and
for whom mHealth approaches are effective, strengths and limitations
of commercially and academically generated apps, research design
considerations, and public-private partnerships. These topics have
implications for researchers and practitioners who wish to advance
the science and practice of mHealth.

DOI: 10.1186/s12891-020-03523-8

Article Number: 522

Accession Number: WOS:000560874400001

Abstract: Background: Knee osteoarthritis (OA) is a global problem that causes significant pain and physical dysfunction, substantially impacting on quality of life and imposing enormous cost to the healthcare system. Exercise is pivotal to OA management, yet uptake by people with knee OA is inadequate. Limited access to appropriately skilled health professionals, such as physiotherapists, for prescription of an exercise program and support with exercise is a major barrier to optimal care. Internet-enabled video consultations permit widespread reach. However, services offering video consultations with physiotherapists for musculoskeletal conditions are scant in Australia where there is typically no Government or private health insurer funding for such services. The paucity of robust evidence demonstrating video consultations with physiotherapists are clinically effective, safe and cost-effective for knee OA is hampering implementation of, and willingness of healthcare policymakers to pay for, these services.

Methods: This is an assessor- and participant-blinded, two-arm, pragmatic, comparative effectiveness non-inferiority randomised controlled trial (RCT) conducted in Australia. We are recruiting 394 people from the community with chronic knee pain consistent with a clinical diagnosis of knee OA. Participants are randomly allocated to receive physiotherapy care via i) video-conferencing or; ii) face-to-face consultations. Participants are provided five consultations (30-45 min each) with a physiotherapist over 3 months for prescription of a home-based strengthening exercise program (to be conducted independently at home) and physical activity plan, as well as OA education. Participants in both groups are provided with educational booklets and simple exercise equipment via post. The co-primary outcomes are change in self-reported i) knee pain on walking; and ii) physical function, with a primary end-point of 3 months and a secondary end-point of 9 months. Secondary outcomes include changes in other clinical outcomes (health-related quality of life; therapeutic relationship; global ratings of change; satisfaction with care; self-efficacy; physical activity levels), time and financial costs of attending consultations, healthcare usage and convenience. Non-inferiority will be assessed using the per-protocol dataset. Discussion: Findings will determine if video consultations with physiotherapists are non-inferior to traditional face-to-face consultations for management of people with knee OA.

Issue: 1

Date: Sep

Short Title: Exercise adherence Mobile app for Knee Osteoarthritis: protocol for the MappKO randomised controlled trial

DOI: 10.1186/s12891-022-05816-6

Article Number: 874

Accession Number: WOS:000855775600002

Abstract: Background In people with knee osteoarthritis (OA), ongoing exercise participation, particularly with strengthening exercises, is central to management. Patient adherence to prescribed exercise typically declines once consultations with a clinician have ceased. Mobile applications (apps) can incorporate behaviour change techniques that may assist adherence, potentially optimising clinical outcomes. Methods This is a two-arm, pragmatic, superiority randomised trial. One hundred and eighty two Australians with chronic knee pain (clinical knee OA) and who have at least a mild level of physical dysfunction are being recruited. Participants are randomly allocated i) exercise (physiotherapist-prescribed exercise) or; ii) exercise plus app (physiotherapist-prescribed exercise plus access to the 'My Exercise Messages' mobile app). Exercise care comprises two videoconferencing consultations with a physiotherapist over two weeks (30 min each) for a strengthening exercise program, which is then conducted independently at home for 24 weeks without any further physiotherapist consultations. Participants are also provided with exercise resources to facilitate home-based exercise. Those randomised to exercise plus app will download the app after completing the two weeks of physiotherapy consultations and will be instructed by research staff to use the app for the 24 weeks of unsupervised home-based exercises. The app works by tracking completion of weekly exercise sessions, providing regular messages to facilitate weekly exercise and providing personalised messages to help overcome individual barriers to exercise participation. The two primary outcomes are i) self-reported physical function; and ii) number of days strengthening exercises were performed (previous fortnight), with a primary endpoint of 26 weeks and a secondary endpoint of 14 weeks. Secondary outcomes include knee pain severity; knee-related quality of life; global change; exercise program satisfaction; exercise self-efficacy; physical activity; sport and recreation function; another measure of exercise adherence; and willingness to undergo joint replacement. Process measures are also included. Discussion Findings will determine if a theory-informed

mobile app improves exercise adherence and physical function in people with knee OA who have received a home-based strengthening program.

Short Title: COVID-19 vaccination and changes in preventive behaviours: findings from the 2021 vaccine roll-out in Switzerland

ISSN: 1101-1262

DOI: 10.1093/eurpub/ckad050

Accession Number: WOS:000962990200001

Abstract: Background Behavioural, environmental, social and systems interventions (BESSIs) remain important for controlling the COVID-19 pandemic in addition to vaccination. However, people's adoption of BESSIs may decrease as vaccination rates increase due to reductions in the perceived threat of disease, and changes in risk perceptions of behaviours that increase the chance of infection. Thus, we examined predictors of and changes over time in reports of mask wearing and physical distancing and whether changes in mask wearing and physical distancing differed by vaccination status during the main 2021 COVID-19 vaccine roll-out period in Switzerland. Methods Weekly online cross-sectional surveys (26 April 2021 to 1 August 2021) among people 18-79 years old in Switzerland, N = 6308 observations and 5511 cases. Logistic regression models using generalized estimating equations. Results Reports of being vaccinated increased, while mask wearing and physical distancing decreased over time. This decrease was similar regardless of vaccination status. However, the level of reported mask wearing and physical distancing remained higher among vaccinated people. Older, female, and Italian language region respondents also had higher odds of reporting mask wearing and physical distancing. Conclusions Adoption of COVID-19 preventive behaviours is associated with demographics and vaccination status. Further research is needed to understand the reasons why people who are not vaccinated are less likely to adopt preventive behaviours, including that they may have fewer social and environmental opportunities to do so.

Short Title: Guiding healthier food choice: systematic comparison of four front-of-pack labelling systems and their effect on judgements of product healthiness

ISSN: 0007-1145

DOI: 10.1017/s0007114515000264

Accession Number: WOS:000355288500016

Abstract: Different front-of-pack (FOP) labelling systems have been developed in Europe by industry and organisations concerned with health promotion. A study (n 2068) was performed to establish the extent to which inclusion of the most prevalent FOP systems – guideline daily amounts (GDA), traffic lights (TL), GDA+TL hybrid (HYB) and health logos (HL) – impact consumer perceptions of healthiness over and above the provision of a FOP basic label (BL) containing numerical nutritional information alone. The design included within- and between-subjects factors. The within-subjects factors were: food (pizzas, yogurts and biscuits), healthiness of the food (high health, medium health and low health) and the repeated measurements under BL and test FOP label conditions. The between-subjects factors were: the system (GDA, TL, GDA+TL hybrid, HL), portion size (typical portion size and a 50% reduction of a typical portion) and country (the UK, Germany, Poland and Turkey). Although the FOP systems tested did result in small improvements for objective understanding under some conditions, there was little difference between the provision of an FOP label containing basic numerical nutritional information alone or between the various systems. Thus, any structured and legible presentation of key nutrient and energy information on the FOP label is sufficient to enable consumers to detect a healthier alternative within a food category when provided with foods that have distinctly different levels of healthiness. Future research should focus on developing greater understanding of the psychological and contextual factors that impact motivation and the opportunity to use the various FOP systems in real-world shopping settings.

DOI: 10.1016/j.jtrangeo.2012.01.011

Accession Number: WOS:000302845400009

Abstract: Background and aim: This paper was conceptualised and informed by discussions at the 2nd Workshop in a UKTRC funded series on 'Social Impacts and Equity in Transport'. Presentations made by a range of stakeholders as well as a specially commissioned play stimulated our thoughts on how to encourage better interaction between health and transport researchers. We chose school travel as a case study as it exemplifies two key aspects of the wider transport and health debates; (i) the increasing trend towards reliance on car travel, described here in the context of sedentary lifestyles, traffic congestion, pollution, and parental attitudes, and (ii) school travel occurs at a critical life-stage during which behaviour patterns are formed that are likely to be influential in later life, thus making it an important target point for interventions. Methods: We present evidence from four distinct, but complementary, theoretical perspectives: transport, exposure, behaviour and sustainability. We draw common lessons and identify challenges using a range of conceptual frameworks: integrated psychological model of transport choices, Dahlgren and Whitehead's 'layers of influence' model, Hosking et al.'s 'pathways from transport to health', and Hanlon et al.'s integral theory. We demonstrate the benefits and challenges of holistic interaction and collaboration between disciplines to better understand the key issues and develop policy interventions that are meaningful and

effective. Results and conclusions: None of the pre-existing conceptual models were fully able to encompass the societal and individual level influences on school travel. However, we present an interim model for further discussion and debate. (C) 2012 Published by Elsevier Ltd.

Date: Apr

Short Title: Towards environmentally sustainable food systems: decision-making factors in sustainable food production and consumption

ISSN: 2352-5509

DOI: 10.1016/j.spc.2020.12.009

Accession Number: WOS:000640771000022

Abstract: A transformation of the food system will require action and changes in decision making from individuals across the entire food system. This paper synthesises the literature and develops a framework for analysing the factors which influence decision making for sustainable food practices, with a focus on two key actors: primary producers and consumers. We draw on 66 review papers, which represent more than 5000 underlying studies, to derive those factors. The findings indicate that the inextricably intertwined factors in decision making are influenced by the characteristics of the person, in interaction with the characteristics of the more sustainable practice or product, which interacts with a particular context that includes the immediate environment (e.g., household, farm), the indirect environment (e.g., community) and macro-environment factors (e.g., political, financial and economic contexts). To influence people's decision making for sustainable food production or consumption, a wider perspective is needed on decisions and behaviour change, in which individuals are not targeted in isolation, but in interaction with this wider systemic environment. The paper ends by discussing what such a systematic

perspective can look like and its potential policy and governance implications. (C) 2020 Institution of Chemical Engineers. Published by Elsevier B.V. All rights reserved.

Abstract: Internationally, there is increasing recognition of the importance of multilevel policies and actions that address healthy and environmentally friendly food behaviours. However it is not yet clear which actions are most suitable to support consumers to adopt both behaviours concurrently. To this end, we undertook a qualitative study to assess consumer perceptions, experiences and attitudes towards healthy and environmentally friendly foods and four target behaviours: reducing overconsumption of food beyond energy needs, reducing consumption of low-nutrient energy dense foods, eating less animal- and more plant-derived foods, and reducing food waste. Online in-depth interviews were held with 29 Australian food shoppers representing different levels of involvement with health and environment in daily food choices. The results indicate that compared to health, the relationship between food and the environment is rarely considered by consumers. The four target food behaviours were primarily associated and motivated by an impact on health, except for not wasting foods. Participants had the most positive attitude and highest motivation for eating less processed and packaged foods, mostly to avoid excessive packaging and 'chemicals' in foods. This was followed by the behaviours reducing food waste and overconsumption. Conversely, there was a predominantly negative attitude towards, and low motivation for, eating less animal-derived products and more plant based foods. Overall, consumers found a joined concept of healthy and environmentally friendly foods an acceptable idea. We recommend that health should remain the overarching principle for policies and

actions concerned with shifting consumer behaviours, as this personal benefit appears to have a greater potential to support behaviour change. Future consumer focused work could pay attention to framing behavioural messages, providing intermediate behavioural goals, and a multiple target approach to change habitual behaviours. Abstract: ObjectivesThis project used a systematic and integrated knowledge translation (IKT) approach to co-create theory- and evidence-based best practices for physical activity counseling for adults with spinal cord injury (SCI).MethodsGuided by the IKT Guiding Principles, we meaningfully engaged research users throughout this project. A systematic approach was used. An international, multidisciplinary expert panel (n = 15), including SCI researchers, counselors, and people with SCI, was established. Panel members participated in two online meetings to discuss the best practices by drawing upon new knowledge regarding counselor-client interactions, current evidence, and members' own experiences. We used concepts from key literature on SCI-specific physical activity counseling and health behavior change theories. An external group of experts completed an online survey to test the clarity, usability and appropriateness of the best practices.ResultsThe best practices document includes an introduction, the best practices, things to keep in mind, and a glossary. Best practices focused on how to deliver a conversation and what to discuss during a conversation. Examples include: build rapport, use a client-centred approach following the spirit of motivational interviewing, understand your client's physical activity barriers, and share the SCI physical activity guidelines. External experts (n = 25) rated the best practices on average as clear, useful, and appropriate.ConclusionWe present the first systematically co-

developed theory- and evidence-based best practices for SCI physical activity counseling. The implementation of the best practices will be supported by developing training modules. These new best practices can contribute to optimizing SCI physical activity counseling services across settings.

DOI: 10.1177/10499091221123006

Accession Number: WOS:000891210700001

Abstract: Background: Although support for family caregivers is an essential component of palliative care, routine provision of such support is often lacking. To improve support for family caregivers, we assessed current practice and influencing factors as perceived by healthcare professionals. Methods: A two-phase study was conducted including a survey exploring healthcare professionals' practice of supporting family caregivers in Western urbanized Netherlands in 2017, and focus groups exploring facilitators and barriers to supporting family caregivers in 2018. Focus group data were thematically analyzed with deductive coding based on the COM-B system. Results: Of the 379 survey respondents (response 11%), 374 were eligible (physicians, 28%; nurses, 64%; nurse assistants, 9%). The respondents practiced in academic hospitals (52%), general hospitals (31%), nursing homes (11%) and hospices (5%). They reported to always (38%), most of the time (37%), sometimes (21%) or never (5%) provide support to family caregivers during the illness trajectory. Respondents reported to always (28%), sometimes (39%), or never (33%) provide support after death. Four focus group discussions with 22 healthcare professionals elicited motivational facilitators and barriers to supporting family caregivers (e.g., relationship with family caregivers, deriving satisfaction from supporting them), and factors related to capability (e.g., (lacking) conversational skills, knowledge) and opportunity (e.g.,

(un)availability of protocols and time). Conclusions: Support for family caregivers, especially after the patient's death, is not systematically integrated in working procedures of healthcare professionals. The barriers and facilitators identified in this study can inform the development of an intervention aiming to enhance support for family caregivers.

Accession Number: WOS:000698211200009

Abstract: Although efficiency is a core concept in health economics, its impact on health care practice still is modest. Despite an increased pressure on resource allocation, a widespread use of low-value care is identified. Nonetheless, disinvestments are rare. Why is this so? This is the key question of this paper: why are disinvestments not more prevalent and improving the efficiency of the health care system, given their sound foundation in health economics, their morally important rationale, the significant evidence for a long list of low-value care and available alternatives? Although several external barriers to disinvestments have been identified, this paper looks inside us for mental mechanisms that hamper rational assessment, implementation, use and disinvestment of health technologies. Critically identifying and assessing internal inclinations, such as cognitive biases, affective biases and imperatives, is the first step toward a more rational handling of health technologies. In order to provide accountable and

efficient care we must engage in the quest against the figments of our minds; to disinvest in low-value care in order to provide high-value health care.

Short Title: Altering micro-environments to change population health behaviour: towards an evidence base for choice architecture interventions

DOI: 10.1186/1471-2458-13-1218

Article Number: 1218

Accession Number: WOS:000329315300004

Abstract: Background: The idea that behaviour can be influenced at population level by altering the environments within which people make choices (choice architecture) has gained traction in policy circles. However, empirical evidence to support this idea is limited, especially its application to changing health behaviour. We propose an evidence-based definition and typology of choice architecture interventions that have been implemented within small-scale micro-environments and evaluated for their effects on four key sets of health behaviours: diet, physical activity, alcohol and tobacco use. Discussion: We argue that the limitations of the evidence base are due not simply to an absence of evidence, but also to a prior lack of definitional and conceptual clarity concerning applications of choice architecture to public health intervention. This has hampered the potential for systematic assessment of existing evidence. By seeking to address this issue, we demonstrate how our definition and typology have enabled systematic identification and preliminary mapping of a large body of available evidence for the effects of choice architecture interventions. We discuss key implications for further primary research, evidence synthesis and conceptual development to support the design and evaluation of such interventions. Summary: This conceptual groundwork provides a foundation for future research to investigate the effectiveness of choice architecture interventions within micro-environments for changing health behaviour. The approach we used may also serve as a template for mapping other under-explored fields of enquiry.

Title: What Does All This Data Mean for My Future Mood? Actionable
Analytics and Targeted Reflection for Emotional Well-Being

Journal: Human-Computer Interaction

Volume: 32

Issue: 5-6

Pages: 208-267

Short Title: What Does All This Data Mean for My Future Mood?
Actionable Analytics and Targeted Reflection for Emotional Well-
Being

ISSN: 0737-0024

DOI: 10.1080/07370024.2016.1277724

Accession Number: WOS:000411711600002

Abstract: We explore the Examined Life, informing the design of
reflective systems to promote emotional well-being, a critical
health issue. People now have increasingly rich, digital records of
highly personal data about what they said, did, and felt in the
past. But social science research shows that people have difficulty
in tracking and regulating their emotions. New reflective
technologies that promote constructive analysis of rich personal
data potentially offer transformative ways that individuals might
better understand themselves and improve well-being. However, there
are important system design challenges in supporting effective
reflection about personal data. We explore fidelity in recording and
representing past personal mood data, and forecasting future
actions, feelings, and thoughts. Much prior personal informatics
work has been dedicated to past-centric tools for recording and
capture. In contrast, forecasting examines how we might use such
past data to inform and motivate our future selves, providing
recommendations about remedial actions to improve future well-being.
Fidelity addresses both how and what reflective systems should show
people about their pasts, in particular whether we should filter
negative past experiences. To inform reflective system design, we
examine forecasting and fidelity in controlled field trial
interventions that explore two novel system designs for presenting
and reflecting on mood data. We detail findings from 165
participants, 4,693 participant logfiles, 65 surveys, and 15 user
interviews. Our novel forecasting system, EmotiCal, uses past mood
data to model and visualize future user moods with the goal of

encouraging participants to adopt remedial new behaviors to regulate negative moods before they occur. Such forecasting both improved mood and subsequent emotional self-awareness compared with controls who simply monitored their past. Consistent with system goals, interview responses also indicated that participants generated important insights into behaviors that affect their moods. Our second intervention examined filtering; it assessed the impact on well-being of recording and revisiting past experiences containing negative emotions. We compared participants who were encouraged to record and reflect on positive versus negative experiences. Long-term measures of happiness and ruminative behaviors improved by recording and reflecting on positive but not negative experiences, although this depended on the intensity of the negative experience. We discuss general design and theory implications for future systems that support monitoring, reflection, and forecasting to facilitate productive examination of our emotional lives.

Title: Randomised controlled trial demonstrating the impact of behaviour change intervention provided by dental professionals to improve gingival health

Journal: Journal of Dentistry

Volume: 115

Date: Dec

Short Title: Randomised controlled trial demonstrating the impact of behaviour change intervention provided by dental professionals to improve gingival health

ISSN: 0300-5712

DOI: 10.1016/j.jdent.2021.103862

Article Number: 103862

Accession Number: WOS:000718382000001

Abstract: Aims: To determine impact of oral hygiene behaviour change intervention compared to the prevailing standard of oral hygiene advice provided in general dental practice, on bleeding on probing (BOP) in gingivitis patients, over 3-months. The effect of providing power-brushes was also evaluated. Materials and methods: NHS dental practices were cluster-randomised to intervention or control (2:1). Dentists at intervention sites received behaviour modification training. Participants were stratified to high ($\geq 20\%$ BOP) or low ($<20\%$ BOP) presence of gingivitis and a subset assigned a power-brush. BOP and plaque scores were assessed at baseline and 3-months. Results: A total of 538 participants (369:169; intervention: control) completed the study. BOP reduced in both gingivitis groups with significantly greater reduction in intervention compared to

control group (BOP:38% vs 19%, $p = 0.0236$); Borderline significance favouring the intervention was demonstrated for the low gingivitis group (BOP:37% vs 15%, $p = 0.0523$). A highly significant reduction in BOP (intervention vs control) was demonstrated for volunteers who swapped from manual to power-brush (44% vs 37%, $p = 0.0039$). Plaque score improved more in control than intervention group (P-laque:37% vs 44%, $p = 0.00215$). Conclusions: Behaviour change techniques were readily mastered by the dental professional researchers. The introduction of an oral hygiene behaviour change intervention significantly reduced gingivitis in volunteer patients compared to control at 3 months. Swapping to a power-brush significantly favoured BOP reduction compared to manual brush continuation although plaque reduction did not follow expectation in comparison to BOP scores. Behaviour change techniques should routinely be considered in patient care. Clinical significance: Plaque-induced gingivitis is highly prevalent in the UK despite being preventable with good oral hygiene. Its continuum, periodontitis, negative impacts quality of life. This study suggests oral hygiene behavioural interventions (GPS) significantly reduce gingivitis and that GPS introduction will improve oral health and may improve quality of life.

DOI: 10.2196/mhealth.3882

Article Number: e57

Accession Number: WOS:000209895200009

Abstract: Background: Self-management is crucial in the daily management of type 2 diabetes. It has been suggested that mHealth may be an important method for enhancing self-management when

delivered in combination with health counseling. Objective: The objective of this study was to test whether the use of a mobile phone-based self-management system used for 1 year, with or without telephone health counseling by a diabetes specialist nurse for the first 4 months, could improve glycated hemoglobin A(1c) (HbA(1c)) level, self-management, and health-related quality of life compared with usual care. Methods: We conducted a 3-arm prospective randomized controlled trial involving 2 intervention groups and 1 control group. Eligible participants were persons with type 2 diabetes with an HbA1c level $\geq 7.1\%$ (≥ 54.1 mmol/mol) and aged ≥ 18 years. Both intervention groups received the mobile phone-based self-management system Few Touch Application (FTA). The FTA consisted of a blood glucose-measuring system with automatic wireless data transfer, diet manual, physical activity registration, and management of personal goals, all recorded and operated using a diabetes diary app on the mobile phone. In addition, one intervention group received health counseling based on behavior change theory and delivered by a diabetes specialist nurse for the first 4 months after randomization. All groups received usual care by their general practitioner. The primary outcome was HbA1c level. Secondary outcomes were self-management (heiQ), health-related quality of life (SF-36), depressive symptoms (CES-D), and lifestyle changes (dietary habits and physical activity). Data were analyzed using univariate methods (t test, ANOVA) and multivariate linear and logistic regression. Results: A total of 151 participants were randomized: 51 to the FTA group, 50 to the FTA-health counseling (FTA-HC) group, and 50 to the control group. Follow-up data after 1 year were available for 120 participants (79%). HbA(1c) level decreased in all groups, but did not differ between groups after 1 year. The mean change in the heiQ domain skills and technique acquisition was significantly greater in the FTA-HC group after adjusting for age, gender, and education ($P=.04$). Other secondary outcomes did not differ between groups after 1 year. In the FTA group, 39% were substantial users of the app; 34% of the FTA-HC group were substantial users. Those aged ≥ 63 years used the app more than their younger counterparts did (OR 2.7; 95% CI 1.02–7.12; $P=.045$). Conclusions: The change in HbA(1c) level did not differ between groups after the 1-year intervention. Secondary outcomes did not differ between groups except for an increase in the self-management domain of skill and technique acquisition in the FTA-HC group. Older participants used the app more than the younger participants did.

Title: Understanding nurses' justification of restraint in a neurosurgical setting: A qualitative interview study

Journal: Nursing Ethics

Date: 2022 Oct

Short Title: Understanding nurses' justification of restraint in a neurosurgical setting: A qualitative interview study

ISSN: 0969-7330

DOI: 10.1177/09697330221111447

Accession Number: WOS:000871147200001

Abstract: Background Despite its negative impact on patients and nurses, the use of restraint in somatic health care continues in many settings. Understanding the reasons and justifications for the use of restraint among nurses is crucial in order to manage this challenge. Aim To understand nurses' justifications for restraint use in neurosurgical care. Research design A qualitative, descriptive design was used. Data were analysed with inductive qualitative content analysis. Participants and research context Semi-structured interviews with 15 nurses working in three neurosurgical departments in Sweden. Ethical considerations Approved by The Regional Ethics Committee, Stockholm, Sweden. Findings The analysis resulted in three categories. The category Patient factors influencing restraint use describes patient factors that trigger restraint, such as a diminished decision-making competence, restlessness, and need for invasive devices. The category Specific reasons for justifying restraint describes reasons for restraining patients, such as restraint being used for the sake of the patient or for the sake of others. The category General reasoning in justifying restraint describes how nurses reason when using restraint, and the decision to use restraint was often based on a consequentialist approach where the nurses' weighed the pros and cons of different alternatives. Discussion Nurses with experience of restraint use were engaged in a constant process of justifying and balancing different options and actions. Restraint was considered legitimate if the benefit exceeded the suffering, but decisions on which restraint measures to use and when to use them depended on the values of the individual nurse. Conclusion How nurses reason when justifying restraint, why they use restraint, and who they use restraint on must be considered when creating programs and guidelines to reduce the use of restraint and to ensure that when it is used it is used carefully, appropriately, and with respect.

DOI: 10.1186/s12961-022-00841-2

Article Number: 39

Accession Number: WOS:000782179500001

Abstract: Background In light of replication and translational failures, biomedical research practices have recently come under scrutiny. Experts have pointed out that the current incentive structures at research institutions do not sufficiently incentivise researchers to invest in robustness and transparency and instead incentivise them to optimize their fitness in the struggle for publications and grants. This cross-sectional study aimed to describe whether and how relevant policies of university medical centres in Germany support the robust and transparent conduct of research and how prevalent traditional metrics are. Methods For 38 German university medical centres, we searched for institutional policies for academic degrees and academic appointments as well as websites for their core facilities and research in general between December 2020 and February 2021. We screened the documents for mentions of indicators of robust and transparent research (study registration; reporting of results; sharing of research data, code and protocols; open access; and measures to increase robustness) and for mentions of more traditional metrics of career progression (number of publications; number and value of awarded grants; impact factors; and authorship order). Results While open access was mentioned in 16% of PhD regulations, other indicators of robust and transparent research were mentioned in less than 10% of institutional policies for academic degrees and academic appointments. These indicators were more frequently mentioned on the core facility and general research websites. Institutional policies for academic degrees and academic appointments had frequent mentions of traditional metrics. Conclusions References to robust and transparent research practices are, with a few exceptions, generally uncommon in institutional policies at German university medical centres, while traditional criteria for academic promotion and tenure still prevail.

Title: Promoting healthy lifestyle in fertility clinics; an Australian perspective

Journal: Human Reproduction Open

Volume: 2018

Issue: 1

Short Title: Promoting healthy lifestyle in fertility clinics; an Australian perspective

DOI: 10.1093/hropen/hox028

Article Number: hox028

Accession Number: WOS:000661867200002

Abstract: **STUDY QUESTION:** Are Australian fertility clinics adequately addressing unhealthy lifestyle in patients seeking fertility treatment? **SUMMARY ANSWER:** This study has highlighted deficiencies in practices and education around managing patients with unhealthy lifestyle undergoing fertility treatment. **WHAT IS KNOWN ALREADY:** The association between lifestyle and fertility is well documented, with obesity and smoking being of particular concern to fertility and pregnancy outcomes. Guidelines recommend that unhealthy lifestyle is addressed prior to conception, yet anecdotal experience suggests this is not being addressed. Lifestyle modification programmes can be effective in improving pregnancy rates and outcomes, however, recruitment to such programmes can be challenging. **STUDY DESIGN SIZE, DURATION:** A cohort study of Australian fertility clinics' attitudes and practices regarding lifestyle modification to augment reproductive treatment outcomes was conducted between August and October 2015. **PARTICIPANTS/MATERIALS, SETTING, METHOD:** An online survey was administered to senior fertility nurses, from all registered fertility clinics in Australia. Data were collated and subjected to a univariate data analysis, where frequency tables were produced for each question. A separate qualitative analysis was undertaken of data from open ended questions. **MAIN RESULTS AND THE ROLE OF CHANCE:** Fifty-three out of 85 potential respondents (62.4%), all from different clinics, completed the survey, with almost all acknowledging the importance of addressing unhealthy lifestyle before offering ART treatment. However, most clinics did not offer internal resources to assist with lifestyle modification. Whilst the promotion of healthy lifestyle was recognised as a key component of the role of a fertility nurse, participants did not feel that nurses were best equipped to provide lifestyle modification programmes, owing to a lack of resources and specific skills in this area. Suggested areas for improved practice included prioritising general health prior to offering treatment, and further utilising and upskilling nurses to assist with lifestyle modification programmes. **LIMITATIONS REASONS FOR CAUTION:** The survey was completed by only one nurse from each clinic and as such may not be entirely representative of all clinic practices. **WIDER IMPLICATIONS OF THE FINDINGS:** Fertility clinics are likely to see an increasing number of patients with unhealthy lifestyle, resulting in health concerns such as obesity. The results of this study provide an insight into how unhealthy lifestyle is currently being addressed in fertility clinics and suggested areas that could be targeted for improving practice and outcomes. **STUDY FUNDING/COMPETING INTERESTS:** No conflict of interest to declare. This research did not receive any specific grant from funding

agencies in the public, commercial, or not-for-profit sectors.

Title: Understanding the Role of Healthy Eating and Fitness Mobile
Apps in the Formation of Maladaptive Eating and Exercise Behaviors
in Young People

Journal: Jmir Mhealth and Uhealth

Volume: 7

Issue: 6

Date: Jun

Short Title: Understanding the Role of Healthy Eating and Fitness
Mobile Apps in the Formation of Maladaptive Eating and Exercise
Behaviors in Young People

ISSN: 2291-5222

DOI: 10.2196/14239

Article Number: e14239

Accession Number: WOS:000472605200001

Abstract: Background: Healthy eating and fitness mobile apps are
designed to promote healthier living. However, for young people,
body dissatisfaction is commonplace, and these types of apps can
become a source of maladaptive eating and exercise behaviors.
Furthermore, such apps are designed to promote continuous
engagement, potentially fostering compulsive behaviors. Objective:
The aim of this study was to identify potential risks around healthy
eating and fitness app use and negative experience and behavior
formation among young people and to inform the understanding around
how current commercial healthy eating and fitness apps on the market
may, or may not, be exasperating such behaviors. Methods: Our
research was conducted in 2 phases. Through a survey (n= 106) and 2
workshops (n= 8), we gained an understanding of young people's
perceptions of healthy eating and fitness apps and any potential
harm that their use might have; we then explored these further
through interviews with experts (n= 3) in eating disorder and body
image. Using insights drawn from this initial phase, we then
explored the degree to which leading apps are preventing, or indeed
contributing to, the formation of maladaptive eating and exercise
behaviors. We conducted a review of the top 100 healthy eating and
fitness apps on the Google Play Store to find out whether or not
apps on the market have the potential to elicit maladaptive eating
and exercise behaviors. Results: Participants were aged between 18
and 25 years and had current or past experience of using healthy
eating and fitness apps. Almost half of our survey participants
indicated that they had experienced some form of negative

experiences and behaviors through their app use. Our findings indicate a wide range of concerns around the wider impact of healthy eating and fitness apps on individuals at risk of maladaptive eating and exercise behavior, including (1) guilt formation because of the nature of persuasive models, (2) social isolation as a result of personal regimens around diet and fitness goals, (3) fear of receiving negative responses when targets are not achieved, and (4) feelings of being controlled by the app. The app review identified logging functionalities available across the apps that are used to promote the sustained use of the app. However, a significant number of these functionalities were seen to have the potential to cause negative experiences and behaviors. Conclusions: In this study, we offer a set of responsibility guidelines for future researchers, designers, and developers of digital technologies aiming to support healthy eating and fitness behaviors. Our study highlights the necessity for careful considerations around the design of apps that promote weight loss or body modification through fitness training, especially when they are used by young people who are vulnerable to the development of poor body image and maladaptive eating and exercise behaviors.

Short Title: Community mobilisation in the framework of supportive social environment to prevent family violence in Solomon Islands

ISSN: 0305-750X

DOI: 10.1016/j.worlddev.2021.105799

Article Number: 105799

Accession Number: WOS:000820602100022

Abstract: Community mobilisation is one of the promising approaches to prevent Violence Against Women and Girls (VAWG). Yet, there is very little research on the social contextual factors of community mobilisation for violence prevention based on broader theoretical framework. Particularly, the South Pacific remains one of the most under-researched regions in the world. This paper aims to address this and attempts to conduct process evaluation by elucidating the contexts that facilitated or hindered sustainable community mobilisation to prevent VAWG implemented by the Safe Families

programme in Solomon Islands where the prevalence of violence is significantly high. This study adopted the Social Environment Framework developed by Campbell & Cornish (2010) and Mannell & Dadswell (2017). They sought social contextual factors comprised of symbolic, material, relational and institutional dimensions that are of crucial importance to examine the mobilisation process, hence having influence on programme outcomes. Qualitative data were collected and analysed from 33 In-depth Interviews and 15 Focus Group Discussions with community and Oxfam staff members in 6 communities of Malaita and Temotu provinces and Honiara. A thematic analysis presented various contextual factors in the framework of Social Environment. Those include: (1) the symbolic context addressing social and gender norms that condone VAWG in the context of small and remote island communities; (2) the lack of consideration for a comprehensive programming that includes economic and material based support for sustainable interventions; (3) formation of long-term, trusting and mutually respectful relationships with communities and external stakeholders; and (4) strong demand for the institutional support through gender-responsive policy and legal systems as well as informal community by-laws that are instrumental in successful prevention interventions. Overall, the supportive Social Environment is of vital importance to achieve effective and sustainable community mobilisation, and is useful when policy makers and implementing agencies formulate community based violence prevention interventions. Accession Number: WOS:000363437300006

Abstract: We conceptualise a framework that incorporates psychological and non-psychological factors influencing pro-environmental behaviour. We conducted qualitative investigations in five sectors in South Africa, where individuals and groups are dealing with significant environmental issues, including climate

change, biodiversity loss and land-use change. We found three fundamental elements necessary for behavioural change to be realised: awareness (A) is defined as an understanding that society and earth systems are connected; motivation (M) involves the personal and operational drivers that encourage an individual or organisation to respond to new levels of awareness; and pathways (P) recognise the practical solutions and opportunities that facilitate actual change. AMP was built up from thirty-eight variables that cut across between three and five of the case studies, which were further grouped into fourteen categories. The inter-connectedness of AMP suggests that for pro-environmental behaviour to occur, attention cannot be focused on satisfying one of the elements in isolation. This is the first attempt to integrate theory from social psychology, sociology, organisational theory and management in a conceptual framework for pro-environmental behaviour. The AMP framework is useful for supporting practitioners or change-agents designing environmental sustainability initiatives.

Short Title: Effects of a Mindfulness-Based Weight Loss Intervention on Long-term Psychological Well-being Among Adults with Obesity: Secondary Analyses from the Supporting Health by Integrating Nutrition and Exercise (SHINE) Trial

ISSN: 1868-8527

DOI: 10.1007/s12671-022-01951-2

Accession Number: WOS:000840281300001

Abstract: Objectives This study tested whether a mindfulness-based intervention for obesity that included components aimed at emotion regulation and mindful eating improved psychological outcomes including stress, anxiety, positive emotion, and depression, during the intervention period and at longer-term follow-up. Methods Adults with obesity (N=194) were randomized to a 5.5-month diet-exercise

weight loss intervention with or without mindfulness training focused on emotion regulation and mindful eating. Participants completed self-report measures of mindfulness and psychological well-being, which were planned secondary outcomes, at baseline, at mid-intervention (3 months), and at 6, 12, and 18 months post-baseline (maintenance period). Mixed effects models and linear regression were used to test between- and within-group changes in psychological well-being. This study also explored whether changes in mindfulness (from baseline to each 6 and 18 months post-baseline) mediated the effects of intervention arm on changes in psychological outcomes during those respective time periods. Finally, this study explored whether changes in mindfulness from baseline to 6 months mediated the effects of intervention arm on changes in psychological outcomes from baseline to 18 months. Results Participants randomized to the mindfulness arm had significant increases in positive emotions at all follow-up times compared to controls. There were statistically significant increases in mindfulness, psychological flexibility, and reflection, as well as decreases in anxiety and depressive symptoms at 12 months compared to control participants. These changes remained significant for psychological flexibility and reflection at 18 months. There were no significant differences in perceived stress. Among mindfulness participants, greater increases in mindfulness from 6 to 18 months were associated with greater positive emotions and psychological flexibility as well as lower perceived stress, anxiety, depressive symptoms, and rumination at 18 months, adjusting for 6-month values. Mediation analyses indicated that randomization to the mindfulness intervention arm was associated with 6-month increases in mindfulness, and these increases were in turn associated with improved psychological outcomes at 6 months and 18 months. Changes from baseline to 18 months did not mediate 18-month changes in psychological outcomes. Conclusions Mindfulness training in emotion regulation and mindful eating may provide greater longer-term psychological well-being benefits in non-clinical populations with obesity compared to conventional diet-exercise interventions.

ISSN: 1525-8610

DOI: 10.1016/j.jamda.2022.07.011

Accession Number: WOS:000883629700016

Abstract: Objectives: To investigate factors that influence hearing aid use according to the Theoretical Domains Framework (TDF). The TDF is a behavioral science framework that aids understanding of factors that influence behavior. Design: Systematic review. Setting and Participants: People living in the community with dementia and age-related hearing loss who have air conduction hearing aids. Methods: Systematic literature review following PRISMA guidelines. We searched for studies in 9 databases, including Ovid MEDLINE, Scopus, and OpenGrey. We undertook an interpretive data synthesis by mapping findings onto the TDF. We assessed confidence in the findings according to the GRADE-CERQual approach. Results: Twelve studies (6 quantitative, 3 qualitative, and 3 mixed methods) were included in the review. The majority of these were rated low-moderate quality. We identified 27 component constructs (facilitators, barriers, or noncorrelates of hearing aid use) nested within the 14 domains of the TDF framework. Our GRADE-CERQual confidence rating was high for 5 findings. These suggest that hearing aid use for people living in the community with dementia and hearing loss is influenced by (1) degree of hearing aid handling proficiency, (2) positive experiential consequences, (3) degree of hearing aid comfort or fit, (4) person-environment interactions, and (5) social reinforcement. Conclusions and Implications: Hearing aid interventions should adopt a multifaceted approach that optimizes the capabilities of people with dementia to handle and use hearing aids; addresses or capitalizes on their motivation; and ensures their primary support network is supportive and encouraging of hearing aid use. The findings also emphasize the need for further high-quality research that investigates optimal hearing aid use, influencing factors, and interventions that support hearing aid use. Short Title: Implementation conditions for diet and physical activity interventions and policies: an umbrella review

DOI: 10.1186/s12889-015-2585-5

Article Number: 1250

Accession Number: WOS:000366552700004

Abstract: Background: This umbrella review aimed at identifying evidence-based conditions important for successful implementation of interventions and policies promoting a healthy diet, physical activity (PA), and a reduction in sedentary behaviors (SB). In particular, we examined if the implementation conditions identified were intervention-specific or policy-specific. This study was undertaken as part of the DEterminants of DIet and Physical Activity (DEDIPAC) Knowledge Hub, a joint action as part of the European Joint Programming Initiative a Healthy Diet for a Healthy Life.

Methods: A systematic review of reviews and stakeholder documents was conducted. Data from nine scientific literature databases were analyzed (95 documents met the inclusion criteria). Additionally, published documentation of eight major stakeholders (e.g., World Health Organization) were systematically searched (17 documents met the inclusion criteria). The RE-AIM framework was used to categorize elicited conditions. Across the implementation conditions 25 % were identified in at least four documents and were subsequently classified as having obtained sufficient support. **Results:** We identified 312 potential conditions relevant for successful implementation; 83 of these received sufficient support. Using the RE-AIM framework eight implementation conditions that obtained support referred to the reach in the target population; five addressed efficacy of implementation processes; 24 concerned adoption by the target staff, setting, or institutions; 43 referred to consistency, costs, and adaptations made in the implementation process; three addressed maintenance of effects over time. The vast majority of implementation conditions (87.9 %; 73 of 83) were supported by documents referring to both interventions and policies. There were seven policy-specific implementation conditions, which focused on increasing complexities of coexisting policies/legal instruments and their consequences for implementation, as well as politicians' collaboration in implementation. **Conclusions:** The use of the proposed list of 83 conditions for successful implementation may enhance the implementation of interventions and policies which pursue identification of the most successful actions aimed at improving diet, PA and reducing SB.

Title: Challenges of using e-health technologies to support clinical care in rural Africa: a longitudinal mixed methods study exploring primary health care nurses' experiences of using an electronic clinical decision support system (CDSS) in South Africa

Journal: BMC Health Services Research

Volume: 23

Issue: 1

Date: Jan

Short Title: Challenges of using e-health technologies to support clinical care in rural Africa: a longitudinal mixed methods study exploring primary health care nurses' experiences of using an electronic clinical decision support system (CDSS) in South Africa

DOI: 10.1186/s12913-022-09001-2

Article Number: 30

Accession Number: WOS:000912720500001

Abstract: Background Electronic decision-making support systems (CDSSs) can support clinicians to make evidence-based, rational clinical decisions about patient management and have been effectively implemented in high-income settings. Integrated Management of Childhood Illness (IMCI) uses clinical algorithms to provide guidelines for management of sick children in primary health care clinics and is widely implemented in low income countries. A CDSS based on IMCI (eIMCI) was developed in South Africa. Methods We undertook a mixed methods study to prospectively explore experiences of implementation from the perspective of newly-trained eIMCI practitioners. eIMCI uptake was monitored throughout implementation. In-depth interviews (IDIs) were conducted with selected participants before and after training, after mentoring, and after 6 months implementation. Participants were then invited to participate in focus group discussions (FGDs) to provide further insights into barriers to eIMCI implementation. Results We conducted 36 IDIs with 9 participants between October 2020 and May 2021, and three FGDs with 11 participants in October 2021. Most participants spoke positively about eIMCI reporting that it was well received in the clinics, was simple to use, and improved the quality of clinical assessments. However, uptake of eIMCI across participating clinics was poor. Challenges reported included lack of computer skills which made simple tasks, like logging in or entering patient details, time consuming. Technical support was provided, but was time consuming to access so that eIMCI was sometimes unavailable. Other challenges included heavy workloads, and the perception that eIMCI took longer and disrupted participant's work. Poor alignment between recording

requirements of eIMCI and other clinic programmes increased participant's administrative workload. All these factors were a disincentive to eIMCI uptake, frequently leading participants to revert to paper IMCI which was quicker and where they felt more confident. Conclusion Despite the potential of CDSs to increase adherence to guidelines and improve clinical management and prescribing practices in resource constrained settings where clinical support is scarce, they have not been widely implemented. Careful attention should be paid to the work environment, work flow and skills of health workers prior to implementation, and ongoing health system support is required if health workers are to adopt these approaches (350).

Article Number: 02692163211022183

Accession Number: WOS:000660929200001

Abstract: Background: Recent studies cast doubt on the net effect of antipsychotics for delirium. Aim: To investigate the influence of these studies and other factors on clinicians' delirium treatment practice and practice change in palliative care and other specialties using the Theoretical Domains Framework. Design: Australia-wide online survey of relevant clinicians. Setting/ participants: Registered nurses (72%), doctors (16%), nurse practitioners (6%) and pharmacists (5%) who cared for patients with delirium in diverse settings, recruited through health professionals' organisations. Results: Most of the sample (n = 475): worked in geriatrics/aged (31%) or palliative care (30%); in hospitals (64%); and saw a new patient with delirium at least weekly (61%). More (59%) reported delirium practice change since 2016, mostly by increased non-pharmacological interventions (53%). Fifty-five percent reported current antipsychotic use for delirium, primarily for patient distress (79%) and unsafe behaviour (67%).

Common Theoretical Domains Framework categories of influences on respondents' delirium practice were: emotion (54%); knowledge (53%) and physical (43%) and social (21%) opportunities. Palliative care respondents more often reported: awareness of any named key study of antipsychotics for delirium (73% vs 39%, $p < 0.001$); changed delirium treatment (73% vs 53%, $p = 0.017$); decreased pharmacological interventions (60% vs 15%, $p < 0.001$); off-label medication use (86% vs 51%, $p < 0.001$: antipsychotics 79% vs 44%, $p < 0.001$; benzodiazepines 61% vs 26%, $p < 0.001$) and emotion as an influence (82% vs 39%, $p < 0.001$). Conclusion: Clinicians' use of antipsychotic during delirium remains common and is primarily motivated by distress and safety concerns for the patient and others nearby. Supporting clinicians to achieve evidence-based delirium practice requires further work.

Title: Using Theoretical Domains Framework (TDF) to understand implementation of a pragmatic clinical trial in Public Dental Service in Norway

Journal: BMC Health Services Research

Volume: 21

Issue: 1

Date: Jul

Short Title: Using Theoretical Domains Framework (TDF) to understand implementation of a pragmatic clinical trial in Public Dental Service in Norway

DOI: 10.1186/s12913-021-06590-2

Article Number: 698

Accession Number: WOS:000675369300001

Abstract: Background Most dental research in Norway has traditionally been conducted by universities, and the involvement of clinicians in research projects has not been a common practice. The aim of the present study was to identify behavioral factors that influence effective implementation of a pragmatic clinical trial in the Public Dental Service (PDS) in Norway and to understand which of these factors result in higher patient recruitment. Methods Dentists, dental hygienists, and dental assistants at nine Public Dental Service clinics in three counties in Norway involved in an ongoing pragmatic clinical trial were asked to complete an electronically distributed questionnaire based on the Theoretical Domains Framework

(TDF). Results Thirty-seven out of 69 dentists and dental hygienists (54%) and seventeen out of 57 dental assistants (30%) answered the questionnaire. "Knowledge" was the domain with the highest mean response, suggesting strong confidence in personal knowledge and practical skills among the clinicians. Together with "beliefs about consequences," "organizational resources," and "environmental context," "knowledge" was the one of five domains identified as important behavioral determinants in patient recruitment to clinical trials by dental professionals. Conclusions The findings suggest that TDF was useful to understand factors affecting implementation of clinical trials in PDS and that several factors such as clinical relevance of trial to be implemented, organizational resources, and communication with the research team require more attention when planning and implementing clinical trials in PDS.

Short Title: The relations between age, face mask perceptions and face mask wearing

ISSN: 1741-3842

DOI: 10.1093/pubmed/fdab018

Accession Number: WOS:000764389600001

Abstract: Popular press outlets have proposed that older individuals are less likely to wear face masks despite health benefits of doing so during the COVID-19 pandemic. The current article investigates this notion in four separate studies, and we also assess the mediating effect of face mask perceptions between age and face mask wearing using the eight-dimension Face Masks Perceptions Scale (FMPS). The sample-size weighted average correlation between age and face mask wearing was $-.07$ (95% C.I. $[-.14, .001]$, Z -value = -1.928 , $P = .054$, $n = 824$), indicating that older individuals are slightly less likely to wear face masks compared to younger individuals. Age did not have significant relations with any face mask perceptions, and the mediating effect of face mask perceptions was not robust or consistent. This indicates that the relation between age and face mask wearing is not explained by face mask perceptions, and researchers must turn to other explanatory mechanisms to understand this relation. We propose possible avenues, such as dual-system theories, to further investigate this research question as well as others associated with face mask perceptions, face mask wearing and the COVID-19 pandemic.

Abstract: COVID-19 conspiracy beliefs have a powerful detrimental influence on COVID-19 vaccine perceptions and behaviors. We investigate an expanded range of outcomes for COVID-19 conspiracy beliefs, and we test which vaccine hesitancy dimensions mediate these relations. Our results show that COVID-19 conspiracy beliefs relate to COVID-19 vaccination willingness and receipt, flu vaccination willingness and receipt, as well as vaccine word-of-mouth. Many of these relations are mediated by vaccine hesitancy dimensions that represent perceptions that vaccines pose health risks as well as perceptions that vaccines are not needed because the respondent is healthy. Our discussion identifies directions for future research.

ISSN: 1090-7165

DOI: 10.1007/s10461-022-03681-x

Accession Number: WOS:000793049900003

Abstract: Poor engagement in HIV care is associated with poorer health outcomes and increased mortality. Our survey examined experiential and circumstantial factors associated with clinic attendance among women (n = 250) and men (n = 106) in London with heterosexually-acquired HIV. While no associations were found for women, among men, sub-optimal attendance was associated with insecure immigration status (25.6% vs. 1.8%), unstable housing (32.6% vs. 10.2%) and reported effect of HIV on daily activities (58.7% vs. 40.0%). Among women and men on ART, it was associated with missing doses of ART (OR = 2.96, 95% CI:1.74-5.02), less belief in the necessity of ART (OR = 0.56, 95% CI:0.35-0.90) and more concern about ART (OR = 3.63, 95% CI:1.45-9.09). Not wanting to think about being HIV positive was the top reason for ever missing clinic appointments. It is important to tackle stigma and the underlying social determinants of health to improve HIV prevention, and the health and well-being of people living with HIV.

Title: A randomised controlled trial of energetic activity for depression in young people (READY): a multi-site feasibility trial protocol

Journal: Pilot and Feasibility Studies

Volume: 7

Issue: 1

Date: Jan

Short Title: A randomised controlled trial of energetic activity for depression in young people (READY): a multi-site feasibility trial protocol

DOI: 10.1186/s40814-020-00734-7

Article Number: 6

Accession Number: WOS:000704715200004

Abstract: **Background:** Prevalence of depression is increasing in young people, and there is a need to develop and evaluate behavioural interventions which may provide benefits equal to or greater than talking therapies or pharmacological alternatives. Exercise could be beneficial for young people living with depression, but robust, large-scale trials of effectiveness and the impact of exercise intensity are lacking. This study aims to test whether a randomised controlled trial (RCT) of an intervention targeting young people living with depression is feasible by determining whether it is possible to recruit and retain young people, develop and deliver the intervention as planned, and evaluate training and delivery. **Methods:** The design is a three-arm cluster randomised controlled feasibility trial with embedded process evaluation. Participants will be help-seeking young people, aged 13-17 years experiencing mild to moderate low mood or depression, referred from three counties in England. The intervention will be delivered by registered exercise professionals, supported by mental health support workers, twice a week for 12 weeks. The three arms will be high-intensity exercise, low-intensity exercise, and a social activity control. All arms will receive a 'healthy living' behaviour change session prior to each exercise session and the two exercise groups are energy matched. The outcomes are referral, recruitment, and retention rates; attendance at exercise sessions; adherence to and ability to reach intensity during exercise sessions; proportions of missing data; adverse events, all measured at baseline, 3, and 6 months; resource use; and reach and representativeness. **Discussion:** UK National Health Service (NHS) policy is to provide young people with advice about using exercise to help depression but there is no evidence-based exercise intervention to either complement or as an alternative to medication or talking therapies. UK National Institute for Health and Care Excellence (NICE) guidelines suggest that exercise can be an effective treatment, but the evidence base is relatively weak. This feasibility trial will provide evidence about whether it is feasible to recruit and retain young people to a full RCT to assess the effectiveness and cost-effectiveness of an exercise intervention for depression.

Title: Adolescents' perceptions and user experiences with a virtual reality-based alcohol prevention tool in Germany: A focus group study

Journal: Frontiers in Public Health

Volume: 11

Date: Mar

Short Title: Adolescents' perceptions and user experiences with a virtual reality-based alcohol prevention tool in Germany: A focus group study

DOI: 10.3389/fpubh.2023.1054015

Article Number: 1054015

Accession Number: WOS:000951897700001

Abstract: Background Excessive alcohol consumption is a major public health problem, with substance use early in life contributing to higher levels of use later in life. Virtual reality (VR) is an innovative technology for alcohol prevention among adolescents that could solve the problem of insufficient outreach to the target group of young people. The co-created German Virtual LimitLab simulation is one of the few examples of VR-based alcohol prevention tools and consists of a virtual house party simulation. The aims of Virtual LimitLab are to increase the users' awareness of how social pressure can influence their own decision-making as well as to enable various actions and communication strategies in order to train competencies when dealing with alcohol. The present study thus aims to explore adolescents' content- and technique-specific perceptions of Virtual LimitLab in order to gain insights into user experiences and to test the prototype with the German target group. Methods Four semi-structured focus groups with adolescents aged 15–18 years (n = 13) were conducted and analyzed using thematic analyses. A user experience questionnaire (UEQ-S) was applied in order to quantitatively assess adolescents' satisfaction with Virtual LimitLab. Results Three main themes were identified (VR experience, content, and technical aspects). Participants positively assessed both the content and the technical aspects of Virtual LimitLab. This trend was also seen by the UEQ-S data, which yielded positive ratings for both pragmatic and hedonic quality. The broad variety of options in the simulation that allow the user to try new behaviors was perceived particularly positively. In general, Virtual LimitLab was regarded as an innovative tool that encourages adolescents to think critically about their personal alcohol consumption. Technical errors in the simulation and users' difficulties in identifying with the simulation were the main points of criticism.

Conclusions Feedback from adolescent users revealed positive and therefore promising results when using Virtual LimitLab as a gaming alcohol-prevention tool. Some technical aspects still need to be improved in order to further refine the prototype, and suggestions for expanding the content of the application have already been made.

Short Title: Facilitators and barriers of attending BaDuanJin experienced by breast cancer survivors during chemotherapy

ISSN: 0959-3985

DOI: 10.1080/09593985.2022.2135977

Accession Number: WOS:000870136600001

Abstract: Purpose This study aimed to identify facilitators and barriers to adherence to a Baduanjin program experienced by breast cancer survivors (BCSs) during chemotherapy. Methods Semi-structured interviews with 10 BCSs in an interprofessional BaDuanJin program were conducted to understand their experiences, including the facilitators and barriers concerning exercise. Content analysis was performed following the behaviour change wheel (BCW). Results The following five domains emerged from the analysis: 1) Capacity: Recovery of upper limb function, symptom relief, and emotional release are facilitators; periodic treatment and related symptoms and negative emotions are barriers; 2) Motivation: Reflection on health, positive belief, and weight control are facilitators; a doubtful attitude is a barrier; 3) Opportunity: Recuperating at home is a facilitator; 4) Intervention: Facilitators include simple and gentle exercise at home, comprehensive tutoring by an interprofessional team, treating exercise as a task occurring at a fixed time, and peer support. The hindrances are work and home duties prior to exercise and a lack of group activities; and 5) Policy: Social media promotion and less support from physicians are facilitators and barriers, respectively. Conclusion Identifying facilitators and barriers leads to improved support from health professionals, which is required to provide effective strategies to increase adherence to BaDuanJin exercise.

Short Title: Factors affecting Chinese people's intention to adopt the individual dining style

ISSN: 0959-6119

DOI: 10.1108/ijchm-12-2021-1553

Accession Number: WOS:000837284300001

Abstract: Purpose In light of the threat posed by the COVID-19 pandemic, Chinese authorities have called for the adoption of the individual dining style (IDS) as a preventive measure for the pandemic and a new norm for civilized code of conduct. Accordingly, this study aims to investigate the factors influencing the Chinese people's intention to adopt the IDS. Design/methodology/approach The authors applied the capability, opportunity and motivation model of behavior (COM-B) and identified potential predictors influencing the intention to adopt the IDS through a review of the literature. Data were collected through an online survey, and structural equation modeling was applied to test the hypotheses. Findings The results indicated that the most influential predictors were subjective norm, social norm, perceived benefit and past behavior, while the other predictors (including breaking habits, communal dining culture, perceived behavioral control, perceived health risk and social risk) had insignificant effects on the intention to adopt IDS. Practical implications First, educational public health messages should communicate the benefits of IDS. Second, persuasive public communication should focus on how people are implementing the target behavior rather than drawing attention to a minority who are disregarding it. Moreover, given the highly significant effects of subjective norm, public health campaigns should emphasize that adoption of the desired behavior expresses care for significant others. Originality/value The findings advance understanding of an underexplored topic, namely, how deeply ingrained ways of dining may be transformed in the current context. Applying the COM-B, the authors tested multiple variables to explain the intention to adopt IDS. The results suggest that some social influences (subjective norm and social norm) and reflective cognitive processes (perceived benefit) had the greatest impacts on behavior intentions. Moreover, the results indicate that threat of COVID-19 may not prompt people to change their dining styles. However, the benefits of IDS to prevent the spread of infectious diseases could lead to its wider adoption.

Short Title: IMPROVING DISTRESS IN DIALYSIS (iDiD): A TAILORED CBT SELF-MANAGEMENT TREATMENT FOR PATIENTS UNDERGOING DIALYSIS

ISSN: 1755-6678

DOI: 10.1111/jorc.12168

Accession Number: WOS:000391017100005

Abstract: Background: There is significant psychological distress in adults with end-stage kidney disease (ESKD). However, psychological treatments tailored to address the unique challenges of kidney failure are absent. We identified psychological correlates of distress in ESKD to develop a cognitive-behavioural therapy (CBT) treatment protocol that integrates the mental health needs of patients alongside their illness self-management demands. Methods: Studies which examined relationships between distress and psychological factors that apply in the context of ESKD including: health threats, cognitive illness representations and illness management behaviours were narratively reviewed. Review findings were translated into a CBT formulation model to inform the content of a renal-specific seven session CBT treatment protocol, which was commented on and refined by patient representatives. Results: Health threats related to distress were grouped into four themes including: acute ESKD events, loss of role, uncertainty and illness self-management. Having pessimistic illness and treatment perceptions were associated with elevated distress. Non-adherence and avoidance behaviours were related to feelings of distress, whereas cognitive reappraisal, acceptance, social support and assertiveness were associated with less distress. Conclusions: The dialysis-specific CBT formulation identifies the importance of targeting ESKD-specific correlates of distress to allow the delivery of integrated mental and physical health care. The 'Improving Distress in Dialysis (iDiD)' treatment protocol now requires further evaluation in terms of content, feasibility and potential efficacy.

Title: Engaging with selective dry cow therapy: understanding the barriers and facilitators perceived by Irish farmers

Journal: Irish Veterinary Journal

Volume: 74

Issue: 1

Date: Oct

Short Title: Engaging with selective dry cow therapy: understanding the barriers and facilitators perceived by Irish farmers

ISSN: 0368-0762

DOI: 10.1186/s13620-021-00207-0

Article Number: 28

Accession Number: WOS:000710127900001

Abstract: Background Selective dry cow therapy (SDCT) is widely promoted in dairy farming as a method to reduce antimicrobial usage. New legislation introduced by the European Union will restrict and regulate the prophylactic and metaphylactic use of antibiotics from January 2022. Blanket dry cow therapy continues to be a practice engaged in by many farmers in Ireland and for many of these farmers, moving towards SDCT would require a significant infrastructural, behavioural and/or cultural change on their farm. Existing research has reported the important need to understand farmers' motivations to initiate any substantial behaviour change. However, it is currently unknown what farmers know, think and believe about SDCT in Ireland. The aim of this study was to use qualitative methods to explore what barriers and facilitators farmers perceived to exist with SDCT and explore if they had chosen to implement SDCT after voluntarily participating in a funded dry cow consult with a trained veterinarian, with the objective of maximising the dry period under health performance and moving safely to SDCT. Results In this study, 19 farmers were contacted, and telephone interviews were conducted regarding farmers' beliefs about the consequences of SDCT. Audio recordings were professionally transcribed verbatim and analysed qualitatively using an inductive thematic analysis. The analysis identified 6 barriers and 6 facilitators to implementing SDCT. A significant fear of increasing mastitis incidence was evident that caused reluctance towards SDCT and reliance on antibiotics. Mixed perceptions on SDCT, infrastructure limitations, a perceived lack of preventive advice as well as peer influence were presented as barriers to SDCT. Farmers can build confidence when a graded approach to SDCT is implemented, which could help overcome the fear of SDCT and reliance on antibiotics. Regulatory pressure, high standards of farm hygiene and use of targeted veterinary consults were found to facilitate SDCT. Education was suggested to motivate farmers in the future uptake of SDCT. Despite cited negative influences, peer influence can be utilised to encourage the farming community. Conclusions This study prioritises areas to facilitate the major behaviour change required as a dairy industry in order to move from blanket dry cow therapy to SDCT.

DOI: 10.1016/j.jclinepi.2021.12.004

Accession Number: WOS:000786657100008

Abstract: Objective: This study aimed to investigate barriers and facilitators to core outcome set (COS) uptake in randomized controlled trials to inform the first steps in developing interventions to improve the uptake of COS. Study Design and Setting: Semi-structured qualitative interviews with a purposive sample of United Kingdom chief investigators were audio-recorded, transcribed and analyzed thematically. Where appropriate, barriers and facilitators were mapped to components of behavior informed by the COM-B model of behavior. Results: Thirteen chief investigators were interviewed. Facilitators to uptake included: the behavior of investigators, for example, their awareness and understanding of COS; and the wider research system, for example, recommendations to use COS from funders and journals. Barriers to uptake included: the perceived characteristics of COS, for example, increasing patient burden and recommendations becoming outdated; and the COS development process, for example, not including all specialties who will use the COS. Conclusion: Based on the barriers and facilitators identified, recommendations to improve COS uptake include ensuring engagement with the research community who will use the COS, involving patients in the development of COS and ensuring COS remain up to date. Title: Assessing the technical feasibility of a flexible, integrated Internet-of-things connected for asthma (C4A) system to support self-management: a mixed method study exploring patients and healthcare professionals perspectives

Journal: Jamia Open

Volume: 5

Issue: 4

Date: Oct

Short Title: Assessing the technical feasibility of a flexible, integrated Internet-of-things connected for asthma (C4A) system to support self-management: a mixed method study exploring patients and healthcare professionals perspectives

DOI: 10.1093/jamiaopen/ooac110

Article Number: ooac110

Accession Number: WOS:000905796100002

Abstract: Background A connected system with smart devices could transform patient care and empower patients control of their asthma. Objective To explore how a connected-for-asthma system (C4A) with smart devices from multiple companies (smart-inhaler; smart-watch; smart-peak-flow meter, manual digital thermometer during the Coronavirus disease (COVID)-pandemic) could support asthma self-management. Methods In a proof-of-concept mixed-methods study (Winter 2021/2022), we collected data from devices linked via the C4A app enabling patients to self-monitor and share a monitoring summary (in PDF format) with their clinician. Ten patients (range of age/gender, asthma experience, Apple/Android user) via social media, used C4A for a month. We conducted pre/post-interviews with patients, and a single post-interview with an asthma nurse and 3 general practitioners. Thematic analysis, informed by the Unified Theory of Acceptance and Use of Technology was triangulated with descriptive analysis of usage data. Results The system was perceived as "easy" to use. During the study, 7517 data points were collected from 10 patients; monitoring reduced over the month. Patients used devices if they trusted their "accuracy," and adopted the system to monitor new medication or assess troublesome symptoms. One patient lost contact (because of COVID), 8 wanted to keep using C4A to manage their asthma, though were selective about the most useful devices. Clinicians wanted the report to provide an asthma score/status and reliever usage. Conclusion A connected system could enable flexible digital care by linking data from several devices to support self-management. To promote adoption/adherence, setup has to be simple, and patients need to trust that the devices accurately reflect their condition. Lay Summary During the COVID pandemic, patients had to rely on remote consultations to help them to live with their conditions. We aimed to explore how a connected digital system (C4A) linking with smart devices (inhaler/watch/peak flow meter) and a manual thermometer, with an option to share a report with their clinician, could support patients to look after their asthma. We recruited 10 patients to use C4A, observed their usage over a month, and undertook pre/post-interviews. We also interviewed an asthma nurse and 3 general practitioners for their views on the report format. Most patients chose to monitor their reliever inhaler rather than the preventer. 7517 data were logged, though recording reduced over the month. Patients felt "positive," found it "easy" to

use the system and chose to use devices they thought were "accurate." Monitoring medication adjustments, having asthma (or COVID) symptoms motivated them to adopt/use the system. Clinicians wanted an overall asthma score/status and reliever usage on the report. A connected system could enable flexible digital approaches to care by providing on-going self-management data to support remote consultation. However, providing users with confidence in the "accuracy" of systems is needed to maintain patients' motivation to use the system.

Title: Assessing the effectiveness of the transformational coaching workshop using behavior change theory

Journal: International Journal of Sports Science & Coaching

Volume: 18

Issue: 1

Pages: 3-12

Date: Feb

Short Title: Assessing the effectiveness of the transformational coaching workshop using behavior change theory

ISSN: 1747-9541

DOI: 10.1177/17479541221122435

Accession Number: WOS:000847546400001

Abstract: The current study assessed how participation in the Transformational Coaching Workshop (TCW) influenced youth sport coaches' perceived capability, opportunity, and motivation to incorporate transformational coaching behaviors into their coaching practices. Sixty-three volunteer youth sport coaches participated in the study as part of an intervention (n = 31; M-age = 45.65 years; SDage = 8.82 years) or comparison group (n = 32; M-age = 44.59 years; SDage = 11.86 years). The study employed a two-arm, pre- and post-intervention, non-randomized intervention design. Dependent- and independent-sample t-tests were conducted to assess within and between-group differences. Results indicated that participants in the intervention group reported slight improvements in their perceived capability and opportunity to use transformational coaching behaviors post-intervention. There were no significant differences between groups post-intervention. This study provides support for the effectiveness of the TCW, and the application of behavior change frameworks to evaluate coach development programs.

Title: Do weight management programmes delivered at professional football clubs attract and engage high risk men? A mixed-methods study

Journal: BMC Public Health

Volume: 14

Date: Jan

Short Title: Do weight management programmes delivered at professional football clubs attract and engage high risk men? A mixed-methods study

DOI: 10.1186/1471-2458-14-50

Article Number: 50

Accession Number: WOS:000331292500001

Abstract: Background: The prevalence of obesity in men in the UK is amongst the highest in Europe but men are less likely than women to use existing weight loss programmes. Developing weight management programmes which are appealing and acceptable to men is a public health priority. Football Fans in Training (FFIT), a men-only weight management programme delivered to groups of men at top professional football clubs, encourages men to lose weight by working with, not against, cultural ideals of masculinity. To inform further development of interventions in football club settings, the current study explored who is attracted to FFIT and why overweight/obese men choose to take part. Methods: A mixed-methods study analysing baseline data on 747 men aged 35–65 years with BMI ≥ 28 kg/m² who were participants in a randomised controlled trial of FFIT, and data from 13 focus group discussions with 63 men who had attended the programme. Results: Objectively-measured mean body mass index was 35.3 kg/m² (sd 4.9). Overall over 90% of participants were at very high or extremely high risk of future ill-health. Around three-quarters of participants in all age groups were at 'very high' risk of type 2 diabetes, hypertension and cardiovascular disease (72%, 73% and 80% of men aged 35–44, 45–54 and 55–64 years respectively). A further 21%, 16% and 13% were at 'extremely high' risk.

Qualitative data revealed that the powerful 'draw' of the football club attracted men otherwise reluctant to attend existing weight management programmes. The location and style of delivery of early FFIT sessions fostered team spirit; men appreciated being with others 'like them' and the opportunity to undertake weight management in circumstances that enhanced physical and symbolic proximity to something they valued highly, the football club.

Conclusions: The delivery of a weight management intervention via professional football clubs attracted men at high risk of ill-health. The setting enabled men to join a weight management programme in circumstances that felt 'right' rather than threatening to themselves as men. FFIT is an example of how to facilitate health promotion activities in a way that is consistent with, rather than challenging to, common ideals of masculinity.

Short Title: Healthcare Professionals' Beliefs, Attitudes,
Knowledge, and Behavior Around Vaping in Pregnancy and Postpartum: A
Qualitative Study

ISSN: 1462-2203

DOI: 10.1093/ntr/ntaa126

Accession Number: WOS:000637321000008

Abstract: Introduction: Finding effective ways to help pregnant women quit smoking and maintain long-term abstinence is a public health priority. Electronic cigarettes (ie, vaping) could be a suitable cessation tool in pregnancy for those who struggle to quit; however, healthcare professionals (HCP) must be informed about these devices to offer appropriate advice. This study used the Capability, Opportunity, Motivation, and Behavior (COM-B) model and Theoretical Domains Framework (TDF) to explore HCP attitudes towards vaping in pregnancy and postpartum; beliefs about the health risks of vaping; perceived barriers and facilitators of vaping in pregnancy; knowledge of current guidelines and policies; and training needs. Methods: Interviews (n = 60) were conducted with midwives (n = 17), health visitors (n = 10), general practitioners (n = 15) and stop smoking specialists (n = 18) across the United Kingdom. Interview transcriptions were analyzed thematically using the framework approach and the COM-B. Results: Discussing vaping as a tool for quitting smoking in pregnancy was prevented by a lack of capability (limited knowledge of vaping, lack of training in smoking cessation); lack of opportunity (restricted by organizational policies and guidelines, lack of time and financial issues impacting on training), and negative social influences (sensationalist media and stigma associated with vaping in pregnancy); and lack of motivation (fear of future litigation and comebacks should adverse effects from vaping arise). Conclusions: Factors related to capability, opportunity, and motivation were identified that influence HCPs attitudes and behaviors towards vaping in pregnancy.

Gaps in knowledge and training needs were identified, which could inform the development of targeted vaping training.

Title: Rethinking early intervention rehabilitation services for children with motor difficulties: engaging stakeholders in the conceptualization of telerehabilitation primary care

Journal: Disability and Rehabilitation

Volume: 44

Issue: 22

Pages: 6749-6758

Date: Oct

Short Title: Rethinking early intervention rehabilitation services for children with motor difficulties: engaging stakeholders in the conceptualization of telerehabilitation primary care

ISSN: 0963-8288

DOI: 10.1080/09638288.2021.1972173

Accession Number: WOS:000692469500001

Abstract: Purpose Rehabilitation services for children with mild motor difficulties are limited. Telehealth could be a novel avenue through which to provide these services. With the input of various stakeholder groups, this study aimed to develop a logic model for a new primary care telerehabilitation intervention and to identify influencing implementation factors. Methods and materials A participatory research design was used. A logic model, developed in consultation with five healthcare managers, was discussed with four stakeholder groups. Focus groups were conducted with clinicians (n = 9), pediatric healthcare managers (n = 5), and technology information consultants (n = 2), while parents (n = 4) were interviewed to explore their perceptions of the proposed intervention, and factors influencing implementation. Transcribed discussions were analyzed using reflexive thematic analysis. Results Stakeholders supported the delivery of telerehabilitation services for children with mild motor difficulties. Although agreement was generated for each logic model component, important recommendations were voiced related to service relevance and sustainability, parent and community capacity building, and platform dependability, security, and support. Identified factors influencing the implementation encompassed consumer, provider, technological, systemic and contextual barriers and facilitators. Strategies to address them were also suggested. Conclusion This study demonstrates the value of, and a process to engage stakeholders in the designing of pediatric telerehabilitation services and its

implementation. IMPLICATIONS FOR PRACTICE Pediatric telerehabilitation service are complex interventions which operate in complicated systems. Designing telerehabilitation services with stakeholders is recommended, yet how to do so often not clear. This study demonstrated that the development of a logic model can provide a systematic framework to help guide the co-design process with stakeholders. Resulting recommendation underscored a broader vision for the intervention and identified crucial factors and strategies required for its successful implementation and sustainability.

Title: Evaluating the Effectiveness of the Computer-Based Education Platform, Pharmacy5in5, on Pharmacists' Knowledge of Anticholinergic Toxicity Using a Randomized Controlled Trial

Journal: Pharmacy

Volume: 10

Issue: 1

Date: Feb

Short Title: Evaluating the Effectiveness of the Computer-Based Education Platform, Pharmacy5in5, on Pharmacists' Knowledge of Anticholinergic Toxicity Using a Randomized Controlled Trial

DOI: 10.3390/pharmacy10010008

Article Number: 8

Accession Number: WOS:000765058200001

Abstract: Background: Computer-based education has been widely implemented in healthcare professional development education. However, there has been little examination of the potential for computer-based education to enhance pharmacists' knowledge. This study aims to assess the effectiveness of computer-based education on improving pharmacists' knowledge compared to printed education material. Methods: This study was a web-based randomized controlled trial. Participants were randomly allocated to either an intervention group where they had access to the computer-based education module on Pharmacy5in5.ca or to a control group where they had access to printed educational material. Knowledge gain was assessed using a pre- and post-knowledge test. Results: A total of 120 pharmacists were recruited and 101 completed the post-knowledge test (50/60 in the intervention group; 51/60 in the control group). Both groups showed a significant increase in knowledge gain (intervention group: pre-test mean score 19.35 +/- 3.56, post-test mean score 22.42 +/- 3.812, p value < 0.001; control group pre-test mean score 19.22 +/- 3.45, post-test mean score 23.29 +/- 3.087, p value < 0.001). However, the difference in knowledge change was not significant between the two groups (22.42 vs. 23.29, p value = 0.333). Conclusions: In this study, a computer-based education

module enhanced pharmacists' knowledge to a similar degree to printed education material. Efforts should be made to provide computer-based education as an option to support pharmacists' professional development.

Short Title: Health behavior interventions for university students measuring mental health outcomes: A scoping review

DOI: 10.3389/fpubh.2022.1063429

Article Number: 1063429

Accession Number: WOS:000901800700001

Abstract: Introduction: Many university students have poor mental health, and cooccurring health risk behaviors. Targeting health behavior change in this population may improve mental health outcomes. This scoping review describes the extent and range of randomized controlled trials (RCT) evaluating interventions targeting health risk behaviors and measuring a mental health outcome, among university students. Methods: Six electronic databases were searched for RCTs published until the 18th May 2021. Eligible RCTs included university students, evaluated interventions that promoted health behavior change (i.e., dietary intake, physical activity, sedentary behavior, alcohol and drug use, smoking, and sleep), and measured a mental health-related outcome. Results: Fifty-nine RCTs met the inclusion criteria that were published from 2000 to 2021, and over half (n = 33) were conducted in the United States. Interventions evaluated within the RCTs (n = 92) predominantly targeted changes to dietary intake (n = 41 interventions), physical activity (n = 39), or alcohol intake (n = 35). Most interventions targeted one (n = 51) or two (n = 27) health behaviors only. Included RCTs considered mental ill health outcomes (n = 24), psychological wellbeing outcomes (n = 20), or both (n = 15). Discussion: This scoping review identified a moderate volume of experimental research investigating the impact of health behavior interventions on university students' mental health. There is scope for further research examining health behavior interventions targeting university students, particularly interventions taking a multi-behavioral approach.

Short Title: Modelling Successful Self-Management in Adults With Cystic Fibrosis: Vicarious Self-Efficacy From Videos of 'People Like Me'

DOI: 10.7759/cureus.26511

Article Number: e26511

Accession Number: WOS:000828468400002

Abstract: Background Self-efficacy is an important determinant of treatment adherence, and peer modelling of success can provide vicarious self-efficacy. A series of patient stories ('talking heads' videos) were developed with people with cystic fibrosis (CF) as part of the CFHealthHub multi-component adherence intervention, aiming to demonstrate success with daily therapy in 'people like me'. Methodology One-to-one semi-structured interviews exploring patients' experiences, barriers and facilitators of nebuliser adherence were audio and video-recorded between October 2015 and August 2016. Interview transcripts were reviewed to identify descriptions of problem-solving and sustained treatment success. Positive stories potentially providing vicarious descriptions of success were selected as video clips. Results In total, 14 adults with CF were recruited from five UK CF centres. Each participant contributed a median of five (interquartile range: 3-6) video clips, and a total of 57 unique clips were uploaded onto the CFHealthHub digital platform. Nine of those clips spanned two categories, hence, there were 66 clips across 16 categories. Conclusions The videos were well received though some adults were concerned that comparisons with peers might create anxiety by highlighting the possibility of future decline or current relative underperformance. It is important to sensitively support choice when providing resources aiming to increase vicarious self-efficacy. Our experience may guide the development of similar videos for people with other long-term conditions.

DOI: 10.3390/su142013198
Article Number: 13198
Accession Number: WOS:000873468800001

Abstract: This research sets its sights on producing a precise and meticulous analysis in order to identify critical success factors (CSFs) of behavioral intention to adopt performance-based budgeting (BIA) during the COVID-19 pandemic. The statistical data employed in this study were drawn from repeated cross-sectional samples of accountants within public sector organizations in relation to BIA, spanning 3 years. In order to bring forth the hypothesized interlinks, the analytical techniques used comprised structural equation modeling and mean comparisons. The analyses of the results substantiated the positive interconnections among CSFs in terms of significance and effect size. On the basis of the degree of stability of the obtained findings, the most stable CSFs of BIA were ascertained. Beyond widening the frontier of knowledge on the benefits of performance-based budgeting (PBB) in public sector organizations and the CSFs of BIA, the obtained findings can guide leaders in public sector organizations to sense and seize how they can become efficient and effective in the journey towards PBB implementation and how they can formulate intense strategies for successfully managing the transformation process. The advantages of a more fine-grained understanding in this research can allow policymakers to promulgate laws and rules for the implementation of PBB.

Title: Beating Diabetes Together: A Mixed-Methods Analysis of a Feasibility Study of Intensive Lifestyle Intervention for Youth with Type 2 Diabetes

Journal: Canadian Journal of Diabetes

Volume: 39

Issue: 6

Pages: 484-490

Date: Dec

Short Title: Beating Diabetes Together: A Mixed-Methods Analysis of a Feasibility Study of Intensive Lifestyle Intervention for Youth with Type 2 Diabetes

ISSN: 1499-2671

DOI: 10.1016/j.jcjd.2015.09.093

Accession Number: WOS:000367040600008

Abstract: Objectives: The purpose of this study was to assess the feasibility and lived experiences of an intensive group-based lifestyle intervention for youth with type 2 diabetes (Beating Diabetes Together) (BDT). Methods: The study included 12 Indigenous youth with type 2 diabetes (mean age, 14 years; n=9 girls); they participated in a 16-week pilot study of an intensive, group-based lifestyle intervention. We conducted a mixed-methods investigation of the cardiometabolic responses and lived experiences in the intervention. Of the 12 youth with cardiometabolic risk data, 5 youth and 2 mothers participated in semistructured interviews.

Interview participants were purposely selected based on the frequency of attendance and availability. Results: The intervention was well attended (>75% retention), and youth perceived significant benefits from participation. Thematic analysis of the interviews revealed 3 major themes. First, youth and parents described living with type 2 diabetes as being emotionally challenging. They described this experience as being isolating and connected to feelings of guilt and defeat. Second, youth and parents discussed benefits of participating in BDT. They shared the significance of positive relationships and experiences and how those have helped to manage their illness. Third, youth described the aspects that they most enjoyed at BDT. Peer support was an important determinant of physical activity, but they considered dietary changes to be individual behaviours. Glycemic control, blood pressure and anthropometric measures were not different following the intervention. Conclusions: Our findings support the importance of maintaining an inclusive environment and relationship building when designing strategies to promote behaviour modification for Indigenous youth living with type 2 diabetes. Abstract: Purpose This study examined participant characteristics, particularly disease duration, in theory-based physical activity behavior change trials in multiple sclerosis (MS) and summarized theoretical frameworks and changes in physical activity outcomes. Materials and methods PubMed, CINAHL, Embase, and Scopus were searched to identify potential trials. One reviewer screened titles and abstracts, and two reviewers then independently screened full-text articles based on predetermined eligibility criteria. Data were extracted by one reviewer and checked by a second reviewer. Results Among 33 trials reviewed, only one trial reported a mean disease duration of less than five years (i.e., 4.5 years) for the sample. The remaining trials included samples with a mean disease duration of 6.7 years or longer. The most common theories used were Social Cognitive Theory, Trans-theoretical Model, and Motivational Interviewing. The effects on physical activity were heterogeneous; device-measured outcomes increased in 41.4% of studies, self-reported outcomes improved in 72.4%. Adherence ($\geq 80\%$) was reported in 34.5% of studies. Conclusions There is little focus on persons with MS in the early disease course in physical activity behavior change interventions. Future research should include comprehensive theoretical approaches for more homogeneous effects across outcome measures when targeting those in the early stage and all MS populations.

Article Number: 104432

Accession Number: WOS:000974625700001

Abstract: Background: Physical activity (PA) research in multiple sclerosis (MS) typically has not focused on persons newly diagnosed with the disease. This is noteworthy as PA might be most amenable for change in the early stages of MS and further yield long-term benefits over the disease course. Purpose: This study examined correlates of PA based on the Capability-Opportunity-Motivation-Behavior (COM-B) model in persons newly diagnosed with MS. Methods: Participants newly diagnosed with MS (i.e., ≤ 2 years; $n = 152$) completed an online Qualtrics survey that assessed PA levels and COM-B constructs. Multivariate Analysis of Variance and Discriminant Function Analysis identified the constructs that differentiated PA groups. Results: The results indicated that 39.5% and 34.2% of the sample were classified as Insufficiently Active and Not Regularly Active, respectively. The results further identified Intention, Action Control, Action Self-efficacy, Action Planning, Outcome Expectation, Goal Setting, and Recovery Self-efficacy, and Fatigue as the primary correlates of PA in persons newly diagnosed with MS. Conclusions: Our results identified COM-B constructs in the Capability and Motivation domains as the primary correlates of physical activity in persons newly diagnosed with MS. Such research might inform interventions for changing physical activity in this MS subpopulation.

Title: Piloting the Virtual PLAYshop Program: A Parent-Focused Physical Literacy Intervention for Early Childhood

Journal: Children-Basel

Volume: 10

Issue: 4

Date: Apr

Short Title: Piloting the Virtual PLAYshop Program: A Parent-Focused Physical Literacy Intervention for Early Childhood

DOI: 10.3390/children10040720

Article Number: 720

Accession Number: WOS:000983139500001

Abstract: The PLAYshop program is a parent-focused physical literacy intervention for early childhood. This single-group mixed-methods pilot study aimed to explore the feasibility of virtually delivering and assessing the PLAYshop program. The virtual PLAYshop program included a virtual workshop, resources/basic equipment, and two booster emails (3-week and 6-week follow-up). Data on 34 preschool-aged children (3-5 years) and their parents from Edmonton and Victoria, Canada, were collected via an online questionnaire, virtual assessment session, and interview at single or multiple time points (baseline, post-workshop, 2-month follow-up). Intraclass correlation coefficients (ICCs), paired t-tests, repeated measures ANOVAs, and thematic analyses were conducted. Regarding feasibility, most parents ($\geq 94\%$) were satisfied/extremely satisfied with the virtual workshop and planned to continue physical literacy activities post-workshop. The virtual assessment protocol for children's fundamental movement skills (FMS; overhand throw, underhand throw, horizontal jump, hop, one-leg balance) was feasible, with high completion rates ($>90\%$) and reliable scoring ($ICC = 0.79-0.99$). For positive changes in potential outcomes, a medium effect size was observed for children's hopping skills ($d = 0.54$), and large effect sizes were observed for several parental outcomes (partial $\eta^2 = 0.20-0.54$). The findings support the feasibility and potential positive outcomes of the virtual PLAYshop program. A larger randomized controlled efficacy trial is recommended.

Short Title: CRANIUM: a quasi-experimental study to improve

metabolic screening and HIV testing in community mental health clinics compared to usual care

DOI: 10.1186/s12888-022-04293-4

Article Number: 687

Accession Number: WOS:000880322900001

Abstract: Background Individuals with serious mental illness often do not receive guideline-concordant metabolic screening and human immunodeficiency virus (HIV) testing, contributing to increased morbidity and premature mortality. This study evaluates the effectiveness of CRANIUM (Cardiometabolic Risk Assessment and treatment through a Novel Integration model for Underserved populations with Mental illness), an intervention to increase metabolic screening and HIV testing among patients with serious mental illness in a community mental health clinic compared to usual care. **Methods** The study used a quasi-experimental design, prospectively comparing a preventive care screening intervention at one community mental health clinic (n = 536 patients) to usual care at the remaining clinics within an urban behavioural health system (n = 4,847 patients). Psychiatrists at the intervention site received training in preventive health screening and had access to a primary care consultant, screening and treatment algorithms, patient registries, and a peer support specialist. Outcomes were the change in screening rates of A1c, lipid, and HIV testing post-intervention at the intervention site compared to usual care sites. **Results** Rates of lipid screening and HIV testing increased significantly at the intervention site compared to usual care, with and without multivariable adjustment [Lipid: aOR 1.90, 95% CI 1.32–2.75, P = .001; HIV: aOR 23.42, 95% CI 5.94–92.41, P < .001]. While we observed a significant increase in A1c screening rates at the intervention site, this increase did not persist after multivariable adjustment (aOR 1.37, 95% CI .95–1.99, P = .09). **Conclusions** This low-cost, reverse integrated care model targeting community psychiatrist practices had modest effects on increasing preventive care screenings, with the biggest effect seen for HIV testing rates. Additional incentives and structural supports may be needed to further promote screening practices for individuals with serious mental illness.

Title: Pictorial versus written asthma action plans for youth: initial impact on regimen knowledge, medication adherence, symptom control, and family satisfaction

Journal: Journal of Asthma

Volume: 59

Issue: 9

Pages: 1885-1898

Date: Sep

Short Title: Pictorial versus written asthma action plans for youth: initial impact on regimen knowledge, medication adherence, symptom control, and family satisfaction

ISSN: 0277-0903

DOI: 10.1080/02770903.2021.1968427

Accession Number: WOS:000689669200001

Abstract: Objective Asthma action plans (AAP) are recommended to guide asthma management. Written AAPs (WAAPs) are under-utilized and can be difficult to understand. Our study designed and tested a simplified pictorial AAP (PAAP). We hypothesized that better outcomes would be obtained for youth with the PAAP. Methods One hundred and sixty-nine (169) youth (aged 8-17; AAP-naive) were screened for this pilot, 2-arm randomized controlled trial. Feasibility, usability and preliminary efficacy of PAAP compared to a WAAP, for improving outcomes (inhaled corticosteroid (ICS) adherence, symptom control, AAP knowledge, AAP satisfaction) were assessed quantitatively. Youth received an AAP from their physician after completing baseline measures and completed measures at three additional time points (1-, 3-, and 6-month). Results Forty-five youth were recruited (PAAP = 22; WAAP = 23). Youth AAP knowledge was higher for the PAAP group compared to the WAAP group ($p = .017$). ICS adherence did not differ between groups, over time, or based on prescribed dosing; however, for WAAP participants, adherence was lower with a higher daily prescription (4 puffs) relative to a lower dose ($p = .006$). Symptom control improved with both AAPs, but the change was not statistically significant. Lung function did not change significantly by AAP type or time, and literacy variables were not related significantly to outcomes. Youth satisfaction with AAP improved significantly for the PAAP group compared to the WAAP group ($p = .03$). Conclusions Higher AAP knowledge and satisfaction among youth in the PAAP group suggests that structured education from a physician using a PAAP is beneficial. Intervention and study design insights gained will guide future research.

Short Title: The Multimorbidity Collaborative Medication Review And Decision Making (MyComrade) study: a protocol for a cross-border pilot cluster randomised controlled trial

DOI: 10.1186/s40814-022-01018-y

Article Number: 73

Accession Number: WOS:000773932500001

Abstract: Background: While international guidelines recommend medication reviews as part of the management of multimorbidity, evidence on how to implement reviews in practice in primary care is lacking. The Multimorbidity Collaborative Medication Review And Decision Making (MyComrade) intervention is an evidence-based, theoretically informed novel intervention which aims to support the conduct of medication reviews for patients with multimorbidity in primary care. Our aim in this pilot study is to evaluate the feasibility of a trial of the intervention with unique modifications accounting for contextual variations in two neighbouring health systems (Republic of Ireland (ROI) and Northern Ireland (NI)).

Methods: A pilot cluster randomised controlled trial will be conducted, using a mixed-methods process evaluation to investigate the feasibility of a trial of the MyComrade intervention based on pre-defined progression criteria. A total of 16 practices will be recruited (eight in ROI; eight in NI), and four practices in each jurisdiction will be randomly allocated to intervention or control. Twenty people living with multimorbidity and prescribed ≥ 10 repeat medications will be recruited from each practice prior to practice randomisation. In intervention practices, the MyComrade intervention will be delivered by pairs of general practitioners (GPs) in ROI, and a GP and practice-based pharmacist (PBP) in NI. The GPs/GP and PBP will schedule the time to review the medications together using a checklist. Usual care will proceed in practices in the control arm. Data will be collected via electronic health records and postal questionnaires at recruitment and 4 and 8 months after randomisation. Qualitative interviews to assess the feasibility and acceptability of the intervention and explore experiences related to multimorbidity management will be conducted with a purposive sample of GPs, PBPs, practice administration staff and patients in intervention and control practices. The feasibility of conducting a health economic evaluation as part of a future definitive trial will be assessed. Discussion: The findings of this pilot study will assess the feasibility of a trial of the MyComrade intervention in two different health systems. Evaluation of the progression criteria will guide the decision to progress to a definitive trial and inform trial design. The findings will also contribute to the growing evidence-base related to intervention

development and feasibility studies.

Title: A Scoping Review and Field Guide of Theoretical Approaches and Recommendations to Studying the Decision to Adopt Hearing Aids

Journal: Ear and Hearing

Volume: 44

Issue: 3

Pages: 460-476

Date: May-Jun

Short Title: A Scoping Review and Field Guide of Theoretical Approaches and Recommendations to Studying the Decision to Adopt Hearing Aids

ISSN: 0196-0202

DOI: 10.1097/aud.0000000000001311

Accession Number: WOS:000970898500004

Abstract: Objectives: Given the low rates of hearing aid adoption among individuals with hearing loss, it is imperative to better understand the decision-making processes leading to greater hearing aid uptake. A careful analysis of the existing literature on theoretical approaches to studying these processes is needed to help researchers frame hypotheses and methodology in studies on audiology. Therefore, we conducted a scoping review with two aims. First, we examine theories that have been used to study research on hearing aid adoption. Second, we propose additional theories from the behavioral sciences that have not yet been used to examine hearing aid uptake but that can inform future research. Design: We identified peer-reviewed publications whose research was driven by one or more theoretical approaches by searching through PubMed, ProQuest PsycINFO, CINHAI Plus, Web of Science, Scopus, and OVID Medline/Embase/PsycINFO. The publications were examined by two researchers for eligibility. Results: Twenty-three papers were included in the analysis. The most common theoretical approaches studied include the Health Belief Model, the Transtheoretical Model of Behavior Change, Self-Determination Theory, and the COM-B Model. Seven other theoretical frameworks based on cognitive psychology and behavioral economics have also appeared in the literature. In addition, we propose considering nudge theory, framing effect, prospect theory, social learning theory, social identity theory,

dual process theories, and affective-based theories of decision making when studying hearing aid adoption. Conclusions: We conclude that, although a number of theories have been considered in research on hearing aid uptake, there are considerable methodological limitations to their use. Furthermore, the field can benefit greatly from the inclusion of novel theoretical approaches drawn from outside of audiology.

DOI: 10.2196/23461

Article Number: e23461

Accession Number: WOS:000853669900038

Abstract: Background: Governments promote behavioral policies such as social distancing and phased reopening to control the spread of COVID-19. Digital phenotyping helps promote the compliance with these policies through the personalized behavioral knowledge it produces. Objective: This study investigated the value of smartphone-derived digital phenotypes in (1) analyzing individuals' compliance with COVID-19 policies through behavioral responses and (2) suggesting ways to personalize communication through those policies. Methods: We conducted longitudinal experiments that started before the outbreak of COVID-19 and continued during the pandemic. A total of 16 participants were recruited before the pandemic, and a smartphone sensing app was installed for each of them. We then assessed individual compliance with COVID-19 policies and their impact on habitual behaviors. Results: Our results show a significant change in people's mobility ($P < .001$) as a result of COVID-19 regulations, from an average of 10 visited places every week to approximately 2 places a week. We also discussed our results within the context of nudges used by the National Health Service in the United Kingdom to promote COVID-19 regulations. Conclusions: Our findings show that digital phenotyping has substantial value in understanding people's behavior during a pandemic. Behavioral features extracted from digital phenotypes can facilitate the personalization of and compliance with behavioral policies. A rule-based messaging system can be implemented to deliver nudges on the

basis of digital phenotyping.

Title: Opportunities for nurse involvement in surgical antimicrobial stewardship strategies: A qualitative study

Journal: International Journal of Nursing Studies

Volume: 128

Date: Apr

Short Title: Opportunities for nurse involvement in surgical antimicrobial stewardship strategies: A qualitative study

ISSN: 0020-7489

DOI: 10.1016/j.ijnurstu.2022.104186

Article Number: 104186

Accession Number: WOS:000820366100010

Abstract: Background Multi-disciplinary antimicrobial stewardship teams are a common strategy employed to optimise antimicrobial prescribing. Nurses play a pivotal role in patient care and safety; however, their role and potential opportunities across surgical antimicrobial stewardship are not well-established. This study aims to highlight health professional perspectives of the nurse's role and relevant opportunities for nurses to engage in and lead surgical antimicrobial stewardship initiatives. Methods An exploratory, multi-site, collective qualitative case study. Transcribed audio-recordings of focus groups with health professionals underwent thematic analysis, with mapping to established frameworks. Results: Four key themes were identified; surgical antimicrobial prophylaxis is not prioritised for quality improvement, but nurses perceive benefits from surgical antimicrobial prophylaxis education and training; professional hierarchy hinders nurse engagement and leadership in antimicrobial stewardship; nurses are consistently engaged with patient care throughout the surgical journey; and clarity of roles and accountability for surgical antimicrobial prophylaxis review and follow-up can bolster quality improvement initiatives. Discussion: Many opportunities exist for nurse engagement in surgical antimicrobial stewardship. Identification of barriers and enablers support theoretically informed strategies i.e., education and guideline accessibility; multidisciplinary collaborations; executive support for nursing capacity building and the standardisation of surgical antimicrobial prophylaxis workflow and documentation. Conclusions: Nurses are critical to patient safety and to supporting antimicrobial stewardship, in the operating

theatre, and throughout the patient's surgical journey. Applying theoretical frameworks to understand barriers and enablers to nurses' contribution to antimicrobial stewardship has given insights to inform interventions to support nurse engagement. Tweetable abstract: Nurses are critical for patient safety. Many opportunities exist to support them as surgical antimicrobial stewards. (C) 2022 Elsevier Ltd. All rights reserved.

Title: Effective components of exercise and physical activity-related behaviour-change interventions for chronic non-communicable diseases in Africa: protocol for a systematic mixed studies review with meta-analysis

Journal: Bmj Open

Volume: 5

Issue: 8

Short Title: Effective components of exercise and physical activity-related behaviour-change interventions for chronic non-communicable diseases in Africa: protocol for a systematic mixed studies review with meta-analysis

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2015-008036

Article Number: e008036

Accession Number: WOS:000363479100035

Abstract: Introduction: Chronic non-communicable diseases (NCDs) account for a high burden of mortality and morbidity in Africa. Evidence-based clinical guidelines recommend exercise training and promotion of physical activity behaviour changes to control NCDs. Developing such interventions in Africa requires an understanding of the essential components that make them effective in this context. This is a protocol for a systematic mixed studies review that aims to determine the effective components of exercise and physical activity-related behaviour-change interventions for chronic diseases in Africa, by combining quantitative and qualitative research evidence from studies published until July 2015. Methods and analysis: We will conduct a detailed search to identify all published and unpublished studies that assessed the effects of exercise and physical activity-related interventions or the experiences/perspectives of patients to these interventions for NCDs from bibliographic databases and the grey literature. Bibliographic databases include MEDLINE, EMBASE, CENTRAL (Cochrane Central Register of Controlled Trials), PsycINFO, CINAHL and Web of Science.

We will include the following African regional databases: African Index Medicus (AIM) and AFROLIB, which is the WHO's regional office database for Africa. The databases will be searched from inception until 18 July 2015. Appraisal of study quality will be performed after results synthesis. Data synthesis will be performed independently for quantitative and qualitative data using a mixed methods sequential explanatory synthesis for systematic mixed studies reviews. Meta-analysis will be conducted for the quantitative studies, and thematic synthesis for qualitative studies and qualitative results from the non-controlled observational studies. The primary outcome will include exercise adherence and physical activity behaviour changes. This review protocol is reported according to Preferred Reporting Items for Systematic reviews and Meta-Analysis protocols (PRISMA-P) 2015 guidelines. Ethics and dissemination: There is no ethical requirement for this study, as it utilises published data. This review is expected to inform the development of exercise and physical activity-related behaviour-change interventions in Africa, and will be presented at conferences, and published in peer reviewed journals and a PhD thesis at King's College London.

Accession Number: WOS:000432293900001

Abstract: Background: Physical activity improves physiological, cognitive and psychosocial functioning in chronic non-communicable diseases (NCDs). This study reviewed papers on the effects and patients' experiences of physical activity interventions for chronic NCDs in Africa. Methods: We conducted a systematic review of clinical and qualitative studies by searching eight bibliographic databases and grey literature until 19 April 2017. The mixed-methods appraisal and Cochrane Collaboration's tools were used for quality

and risk of bias assessments. Three-stage sequential explanatory syntheses were done. Results: One randomized controlled trial (RCT), two non-controlled before and after studies and two qualitative studies of diabetic South African and Reunion patients were included. Exercise and sports unrelated to home and occupational activities were increased in the long term (1 year, moderate quality evidence) and short term immediately after a 4-week intervention (low quality evidence). There was conflicting evidence of intervention effects on home and occupational physical activities. Behaviour-change techniques improving chronic disease knowledge, addressing environmental barriers and stimulating/supporting physical activity were important to patients. Procedure-related components-health professional training and adequate health facilities-were important to patients, but were not addressed. Conclusion: High quality RCTs are needed to confirm the intervention components for improving physical activity for chronic NCD management in Africa.

Abstract: In recent years, increased attention has been devoted to intergenerational physical activity (PA) programs because they may have several benefits for both children and older adults (e.g., the reduction of ageism). An intergenerational PA program focusing on grandchildren and grandparents in a 'standard' family setting that combines PA and cognitive function is innovative and may hold potential for promoting PA and improving cognitive functioning in both grandchildren and grandparents. The aim of this study is to

describe the protocol of the GRANDPACT (GRANDparents and GRANDchildren improve their Physical Activity and Cognitive functions using co-creaTion) Project, focusing on the development of an intergenerational, cognitively enriched, movement program for grandchildren and grandparents using the theoretical framework of the "Behaviour Change Wheel" in combination with a co-creation approach. Two co-creation trajectories will be organized to develop the program, followed by a pilot study to refine the program and an RCT with a pre-test (at baseline), a post-test (after 24 weeks), and a follow-up (after 36 weeks) to measure the outcomes of co-PA, cognitive functions, psychosocial well-being, and the quality of the family relationship ingrandchildren and grandparents. The outcomes will be measured using accelerometry for PA, the Cambridge Neuropsychological Test Automated Battery (CANTAB) for cognitive functions, and questionnaires for the psychological well-being and quality of the family relationship. Co-development with end-users and stakeholders during both co-creation trajectories is expected to result in an effective, attractive, and feasible program. Co-PA is expected to improve PA, cognitive functioning, psychosocial well-being, and the quality of the family relationships between grandchildren and grandparents.

Short Title: Effect Evaluation of a School-Based Intervention Promoting Sleep in Adolescents: A Cluster-Randomized Controlled Trial

ISSN: 0022-4391

DOI: 10.1111/josh.13175

Accession Number: WOS:000771140400001

Abstract: BACKGROUND This study evaluated the effect of the school-based intervention Charge Your Brainzzz on adolescents' social-cognitive determinants, sleep hygiene and sleep duration and quality. METHODS A cluster-randomized controlled trial was conducted with 972 students from 10 Dutch high schools. Schools were randomly allocated to the intervention (N = 5) or control condition (N = 5). Outcomes were measured with the digital Consensus Sleep Diary and

via a digital questionnaire, based on valid measures. Data were collected at baseline (T0), +/- 1.5 weeks post-intervention (T1) and +/- 3 months post-intervention (T2). Mixed model analyses were performed to estimate the effects on social-cognitive determinants, sleep hygiene, and sleep outcomes. RESULTS The intervention increased sleep knowledge post-intervention (b = 1.91; 95%CI: 1.22-2.60) and at follow up (b = 1.40; 95%CI: 0.70-2.10). The intervention was also effective in changing adolescents' attitudes (b = 0.10; 95%CI: 0.01-0.19) and perceived behavioral control (b = 0.11; 95%CI: 0.01-0.22) post-intervention. No positive changes were found regarding subjective norms, behavioral intentions, sleep hygiene, or sleep outcomes. CONCLUSIONS The intervention improved adolescents' sleep knowledge, attitude, and perceived behavioral control. To significantly impact sleep health, theoretically sound and systematically developed interventions are needed which take into account the interplay between sleep, sleep-related behaviors, and adolescents' social and physical environment. CLINICAL TRIAL REGISTRATION Trial name: Evaluation of the school-based intervention Charge Your Brainzzz promoting sleep in adolescents; URL: ; ID: ISRCTN36701918.

Pages: 893-909

Date: Dec

Short Title: How animal agriculture stakeholders define, perceive, and are impacted by antimicrobial resistance: challenging the Wellcome Trust's Reframing Resistance principles

ISSN: 0889-048X

DOI: 10.1007/s10460-021-10197-y

Accession Number: WOS:000618123200001

Abstract: Humans, animals, and the environment face a universal crisis: antimicrobial resistance (AR). Addressing AR and its multi-disciplinary causes across many sectors including in human and veterinary medicine remains underdeveloped. One barrier to AR efforts is an inconsistent process to incorporate the plenitude of

stakeholders about what AR is and how to stifle its development and spread—especially stakeholders from the animal agriculture sector, one of the largest purchasers of antimicrobial drugs. In 2019, The Wellcome Trust released Reframing Resistance: How to communicate about antimicrobial resistance effectively (Reframing Resistance), which proposed the need to establish a consistent and harmonized messaging effort that describes the AR crisis and its global implications for health and wellbeing across all stakeholders. Yet, Reframing Resistance does not specifically engage the animal agriculture community. This study investigates the gap between two principles recommended by Reframing Resistance and animal agriculture stakeholders. For this analysis, the research group conducted 31 semi-structured interviews with a diverse group of United States animal agriculture stakeholders. Participants reported attitudes, beliefs, and practices about a variety of issues, including how they defined AR and what entities the AR crisis impacts most. Exploration of Reframing Resistance's Principle 2, "explain the fundamentals succinctly" and Principle 3, "emphasis that this is universal issue; it can affect anyone, including you" reveals disagreement in both the fundamentals of AR and consensus of "who" the AR crisis impacts. Principle 2 may do better to acknowledge that animal agriculture stakeholders espouse a complex array of perspectives that cannot be summed up in a single perspective or principle. As a primary tool to combat AR, behavior change must be accomplished first through outreach to stakeholder groups and understanding their perspectives.

Title: Effectiveness of Mobile Apps to Promote Health and Manage Disease: Systematic Review and Meta-analysis of Randomized Controlled Trials

Journal: Jmir Mhealth and Uhealth

Volume: 9

Issue: 1

Date: Jan

Short Title: Effectiveness of Mobile Apps to Promote Health and Manage Disease: Systematic Review and Meta-analysis of Randomized Controlled Trials

ISSN: 2291-5222

DOI: 10.2196/21563

Accession Number: WOS:000635284400001

Abstract: Background: Interventions aimed at modifying behavior for promoting health and disease management are traditionally resource intensive and difficult to scale. Mobile health apps are being used for these purposes; however, their effects on health outcomes have been mixed. Objective: This study aims to summarize the evidence of rigorously evaluated health-related apps on health outcomes and explore the effects of features present in studies that reported a statistically significant difference in health outcomes. Methods: A literature search was conducted in 7 databases (MEDLINE, Scopus, PsycINFO, CINAHL, Global Index Medicus, Cochrane Central Register of Controlled Trials, and Cochrane Database of Systematic Reviews). A total of 5 reviewers independently screened and extracted the study characteristics. We used a random-effects model to calculate the pooled effect size estimates for meta-analysis. Sensitivity analysis was conducted based on follow-up time, stand-alone app interventions, level of personalization, and pilot studies. Logistic regression was used to examine the structure of app features. Results: From the database searches, 8230 records were initially identified. Of these, 172 met the inclusion criteria. Studies were predominantly conducted in high-income countries (164/172, 94.3%). The majority had follow-up periods of 6 months or less (143/172, 83.1%). Over half of the interventions were delivered by a stand-alone app (106/172, 61.6%). Static/one-size-fits-all (97/172, 56.4%) was the most common level of personalization. Intervention frequency was daily or more frequent for the majority of the studies (123/172, 71.5%). A total of 156 studies involving 21,422 participants reported continuous health outcome data. The use of an app to modify behavior (either as a stand-alone or as part of a larger intervention) confers a slight/weak advantage over standard care in health interventions (standardized mean difference=0.38 [95% CI 0.31-0.45]; I²=80%), although heterogeneity was high. Conclusions: The evidence in the literature demonstrates a steady increase in the rigorous evaluation of apps aimed at modifying behavior to promote health and manage disease. Although the literature is growing, the evidence that apps can improve health outcomes is weak. This finding may reflect the need for improved methodological and evaluative approaches to the development and assessment of health care improvement apps. Title: Factors Influencing Motivation and Engagement in Mobile Health Among Patients With Sickle Cell Disease in Low-Prevalence, High-Income Countries: Qualitative Exploration of Patient Requirements

Journal: Jmir Human Factors

Volume: 7

Issue: 1

Date: Jan-Mar

Short Title: Factors Influencing Motivation and Engagement in Mobile Health Among Patients With Sickle Cell Disease in Low-Prevalence, High-Income Countries: Qualitative Exploration of Patient Requirements

ISSN: 2292-9495

DOI: 10.2196/14599

Article Number: e14599

Accession Number: WOS:000787608100006

Abstract: Background: Sickle cell disease (SCD) is a hematological genetic disease affecting over 25 million people worldwide. The main clinical manifestations of SCD, hemolytic anemia and vaso-occlusion, lead to chronic pain and organ damages. With recent advances in childhood care, high-income countries have seen SCD drift from a disease of early childhood mortality to a neglected chronic disease of adulthood. In particular, coordinated, preventive, and comprehensive care for adults with SCD is largely underresourced. Consequently, patients are left to self-manage. Mobile health (mHealth) apps for chronic disease self-management are now flooding app stores. However, evidence remains unclear about their effectiveness, and the literature indicates low user engagement and poor adoption rates. Finally, few apps have been developed for people with SCD and none encompasses their numerous and complex self-care management needs. Objective: This study aimed to identify factors that may influence the long-term engagement and user adoption of mHealth among the particularly isolated community of adult patients with SCD living in low-prevalence, high-income countries. Methods: Semistructured interviews were conducted. Interviews were audiotaped, transcribed verbatim, and analyzed using thematic analysis. Analysis was informed by the Braun and Clarke framework and mapped to the COM-B model (capability, opportunity, motivation, and behavior). Results were classified into high-level functional requirements (FRs) and nonfunctional requirements (NFRs) to guide the development of future mHealth interventions. Results: Overall, 6 males and 4 females were interviewed (aged between 21 and 55 years). Thirty FRs and 31 NFRs were extracted from the analysis. Most participants (8/10) were concerned about increasing their physical capabilities being able to stop pain symptoms quickly. Regarding the psychological capability aspects, all interviewees desired to receive trustworthy feedback on their self-care management practices. About their physical opportunities, most (7/10) expressed a strong desire to receive alerts when they would reach their own physiological limitations (ie, during physical activity). Concerning social opportunity, most (9/10) reported wanting to learn about the self-care practices of other patients. Relating to motivational aspects, many interviewees (6/10) stressed

their need to learn how to avoid the symptoms and live as normal a life as possible. Finally, NFRs included inconspicuousness and customizability of user experience, automatic data collection, data shareability, and data privacy. Conclusions: Our findings suggest that motivation and engagement with mHealth technologies among the studied population could be increased by providing features that clearly benefit them. Self-management support and self-care decision aid are patients' major demands. As the complexity of SCD self-management requires a high cognitive load, pervasive health technologies such as wearable sensors, implantable devices, or inconspicuous conversational user interfaces should be explored to ease it. Some of the required technologies already exist but must be integrated, bundled, adapted, or improved to meet the specific needs of people with SCD.

Short Title: Engagement in perinatal depression treatment: a qualitative study of barriers across and within racial/ethnic groups

DOI: 10.1186/s12884-021-03969-1

Article Number: 512

Accession Number: WOS:000675365200003

Abstract: Background To better understand previously observed racial/ethnic disparities in perinatal depression treatment rates we examined care engagement factors across and within race/ethnicity. Methods Obstetric patients and women's health clinician experts from a large healthcare system participated in this qualitative study. We conducted focus groups with 30 pregnant or postpartum women of Asian, Black, Latina, and White race/ethnicity with positive depression screens. Nine clinician experts in perinatal depression (obstetric, mental health, and primary care providers) were interviewed. A semi-structured format elicited treatment barriers, cultural factors, and helpful strategies. Discussion transcripts were coded using a general inductive approach with themes mapped to the Capability-Opportunity-Motivation-Behavior (COM-B) theoretical

framework. Results Treatment barriers included social stigma, difficulties recognizing one's own depression, low understanding of treatment options, and lack of time for treatment. Distinct factors emerged for non-White women including culturally specific messages discouraging treatment, low social support, trauma history, and difficulty taking time off from work for treatment. Clinician factors included knowledge and skill handling perinatal depression, cultural competencies, and language barriers. Participants recommended better integration of mental health treatment with obstetric care, greater treatment convenience (e.g., telemedicine), and programmatic attention to cultural factors and social determinants of health. Conclusions Women from diverse backgrounds with perinatal depression encounter individual-level, social, and clinician-related barriers to treatment engagement, necessitating care strategies that reduce stigma, offer convenience, and attend to cultural and economic factors. Our findings suggest the importance of intervention and policy approaches effecting change at multiple levels to increase perinatal depression treatment engagement.

Title: Best strategies to implement clinical pathways in an emergency department setting: study protocol for a cluster randomized controlled trial

Journal: Implementation Science

Volume: 8

Date: May

Short Title: Best strategies to implement clinical pathways in an emergency department setting: study protocol for a cluster randomized controlled trial

ISSN: 1748-5908

DOI: 10.1186/1748-5908-8-55

Article Number: 55

Accession Number: WOS:000319990700001

Abstract: Background: The clinical pathway is a tool that operationalizes best evidence recommendations and clinical practice guidelines in an accessible format for 'point of care' management by multidisciplinary health teams in hospital settings. While high-quality, expert-developed clinical pathways have many potential benefits, their impact has been limited by variable implementation strategies and suboptimal research designs. Best strategies for implementing pathways into hospital settings remain unknown. This

study will seek to develop and comprehensively evaluate best strategies for effective local implementation of externally developed expert clinical pathways. Design/methods: We will develop a theory-based and knowledge user-informed intervention strategy to implement two pediatric clinical pathways: asthma and gastroenteritis. Using a balanced incomplete block design, we will randomize 16 community emergency departments to receive the intervention for one clinical pathway and serve as control for the alternate clinical pathway, thus conducting two cluster randomized controlled trials to evaluate this implementation intervention. A minimization procedure will be used to randomize sites. Intervention sites will receive a tailored strategy to support full clinical pathway implementation. We will evaluate implementation strategy effectiveness through measurement of relevant process and clinical outcomes. The primary process outcome will be the presence of an appropriately completed clinical pathway on the chart for relevant patients. Primary clinical outcomes for each clinical pathway include the following: Asthma—the proportion of asthmatic patients treated appropriately with corticosteroids in the emergency department and at discharge; and Gastroenteritis—the proportion of relevant patients appropriately treated with oral rehydration therapy. Data sources include chart audits, administrative databases, environmental scans, and qualitative interviews. We will also conduct an overall process evaluation to assess the implementation strategy and an economic analysis to evaluate implementation costs and benefits. Discussion: This study will contribute to the body of evidence supporting effective strategies for clinical pathway implementation, and ultimately reducing the research to practice gaps by operationalizing best evidence care recommendations through effective use of clinical pathways.

Short Title: Improving mental health care transitions for children and youth: a protocol to implement and evaluate an emergency department clinical pathway

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0456-9

Article Number: 90

Accession Number: WOS:000381661300002

Abstract: Background: While the emergency department (ED) is often a first point of entry for children and youth with mental health (MH) concerns, there is a limited capacity to respond to MH needs in this setting. Child MH systems are typically fragmented among multiple ministries, organizations, and providers. Communication among these groups is often poor, resulting in gaps, particularly in transitions of care, for this vulnerable population. The evidence-based Emergency Department Mental Health Clinical Pathway (EDMHCP) was created with two main goals: (1) to guide risk assessment and disposition decision-making for children and youth presenting to the ED with MH concerns and (2) to provide a streamlined transition to follow-up services with community MH agencies (CMHAs) and other providers. The purpose of this paper is to describe our study protocol to implement and evaluate the EDMHCP. Methods/design: This mixed methods health services research project will involve implementation and evaluation of the EDMHCP in four exemplar ED-CMHA dyads. The Theoretical Domains Framework will be used to develop a tailored intervention strategy to implement the EDMHCP. A multiple baseline study design and interrupted time-series analysis will be used to determine if the EDMHCP has improved health care utilization, medical management of the MH problems, and health sector coordination. The primary process outcome will be the proportion of patients with MH-specific recommendations documented in the health record. The primary service outcome will be the proportion of patients receiving the EDMHCP-recommended follow-up at 24-h or at 7 days. Data sources will include qualitative interviews, health record audits, administrative databases, and patient surveys. A concurrent process evaluation will be conducted to assess the degree of variability and fidelity in implementation across the sites. Discussion: This paper presents a novel model for measuring the effects of the EDMHCP. Our development process will identify how the EDMHCP is best implemented among partner organizations to deliver evidence-based risk management of children and youth presenting with MH concerns. More broadly, it will contribute to the body of evidence supporting clinical pathway implementation within novel partnerships.

DOI: 10.1007/s10943-023-01803-w

Accession Number: WOS:000964114100001

Abstract: The COVID-19 response introduced legal restrictions on social distancing globally, affecting healthcare staff personally and professionally. These restrictions suspended routine hospital visiting, which may have left staff feeling they had to compromise on the care they provided. Such conflict may be experienced as moral injury. This scoping review aimed to synthesise international evidence, to answer this question: "Have COVID-19 restrictions affected healthcare staff's experiences of moral injury? If so, how?" Nine studies met the search criteria. Although healthcare staff seemed to be aware of the risks and effects of moral injury, they were still reluctant to "name" it. Healthcare staff's own emotional and spiritual needs were mostly ignored. Although psychological support is often the recommended approach by organisations, a greater focus on spiritual and emotional support is recommended.

ISSN: 1075-2730

DOI: 10.1176/appi.ps.202100421

Accession Number: WOS:000863306000021

Abstract: The collaborative care model (CoCM) is a strategy of integrating behavioral health into primary care to expand access to high-quality mental health services in areas with few psychiatrists. CoCM is multifaceted, and its implementation is accelerating in high-resource settings. However, in low-resource settings, it may not be feasible to implement all CoCM components. Guidance is lacking on CoCM implementation when only some of its components are feasible. In this column, the authors used a cost-benefit approach to refine strategies for addressing common implementation challenges, incorporating the authors' experiences in what was gained and what was lost at each implementation step in three CoCM programs in diverse clinical settings in rural Nepal.

Abstract: As a strategy for early childhood obesity prevention, a variety of dietary behavior and physical activity policies and guidelines published by leading health agencies and early childhood education and care (ECEC) licensing and accreditation bodies exist. Given the potential diversity in recommendations from these policies, this narrative review sought to synthesize, appraise and describe the various policies and guidelines made by organizational and professional bodies to highlight consistent recommendations and identify opportunities to strengthen such policies. An electronic bibliographic search of seven online databases and grey literature sources was undertaken. Records were included if they were policies or guidelines with specific recommendations addressing dietary behavior and/or physical activity practice implementation within the ECEC setting; included children aged >12 months and <6 years and were developed for high income countries. Recommended dietary behavior and physical activity policies and practices were synthesized into broad themes using the Analysis Grid for

Environments Linked to Obesity framework, and the quality of included guidelines appraised. Our search identified 38 eligible publications mostly from the US and Australia. Identified guidelines were largely consistent in their recommendation and frequently addressed the physical and sociocultural environment and were well-aligned with research evidence. Broader consideration of policy and economic environments may be needed to increase the impact of such policies and guidelines within the ECEC setting.

Short Title: Negative Vaccine Attitudes and Intentions to Vaccinate Against Covid-19 in Relation to Smoking Status: A Population Survey of UK Adults

ISSN: 1462-2203

DOI: 10.1093/ntr/ntab039

Accession Number: WOS:000730596600015

Abstract: Introduction: We examined differences in negative attitudes toward vaccines in general, and intentions to vaccinate against Covid-19 specifically, by smoking status in a large sample of adults in the UK. Method: Data were from 29 148 adults participating in the Covid-19 Social Study in September-October 2020. Linear regression analyses examined associations between smoking status (current/former/never) and four types of general negative vaccine attitudes: mistrust of vaccine benefit, worries about unforeseen effects, concerns about commercial profiteering, and preference for natural immunity. Multinomial logistic regression examined associations between smoking status and uncertainty and unwillingness to be vaccinated for Covid-19. Covariates included sociodemographic characteristics and diagnosed health conditions. Results: Relative to never and former smokers, current smokers reported significantly greater mistrust of vaccine benefit, were more worried about unforeseen future effects, had greater concerns about commercial profiteering, and had a stronger preference for natural immunity (B-adj s 0.16-0.36, p < .001). Current smokers were more likely to be uncertain (27.6% vs. 22.7% of never smokers, RRadj

1.43 [95% confidence interval = 1.31–1.56]; vs. 19.3% of former smokers, RRadj 1.55 [1.41–1.73]) or unwilling (21.5% vs. 11.6% of never smokers, RRadj 2.12 [1.91–2.34]; vs. 14.7% of former smokers, RRadj 1.53 [1.37–1.71]) to receive a Covid-19 vaccine. Conclusions: Current smokers hold more negative attitudes toward vaccines in general, and are more likely to be undecided or unwilling to vaccinate against Covid-19, compared with never and former smokers. With a disproportionately high number of smokers belonging to socially clustered and disadvantaged socioeconomic groups, lower vaccine uptake in this group could also exacerbate health inequalities.

Title: Australasian Genetic Counselors' Perceptions of Their Role in Supporting Clients' Behavior Change

Journal: Journal of Personalized Medicine

Volume: 13

Issue: 1

Date: Jan

Short Title: Australasian Genetic Counselors' Perceptions of Their Role in Supporting Clients' Behavior Change

DOI: 10.3390/jpm13010030

Article Number: 30

Accession Number: WOS:000915068600001

Abstract: Genetic testing does not always change health behavior. Effective behavior change requires a theory-driven coordinated set of activities (behavior change techniques). Genetic counselors are ideally positioned to facilitate behavior change. We aimed to explore genetic counselors' perceptions of their role in supporting clients' behavior change to inform the design of an intervention. Recruitment was via a professional organization and genetics services. Data were collected from 26 genetic counselors via qualitative focus groups/interview. Transcripts were analyzed using thematic analysis and mapped to the COM-B model. We identified three behaviors genetic counselors wanted clients to change: attend appointments, access information, and share information with family members. Strategies for changing clients' behavior included: assessing needs and capabilities, providing information and support, enabling and monitoring behavior change. Barriers included lack of behavior change skills and knowledge, lack of time, and beliefs about ownership of healthcare, directiveness of behavior change, and scope of practice. Equipping genetic counselors to deliver behavior change requires (i) education in behavior change theory and behavior

change techniques, (ii) integration of capability, opportunity and motivation assessment into existing practice, and (iii) development of evidence-based strategies using behavior change tools to focus discussions and promote clients' agency to change their behavior.

Title: Improving Pelvic Floor Muscle Training Adherence Among Pregnant Women: Validation Study

Journal: Jmir Human Factors

Volume: 9

Issue: 1

Date: Jan-Mar

Short Title: Improving Pelvic Floor Muscle Training Adherence Among Pregnant Women: Validation Study

ISSN: 2292-9495

DOI: 10.2196/30989

Article Number: e30989

Accession Number: WOS:000787631400017

Abstract: Background: Mobile health apps, for example, the Tat, have been shown to be potentially effective in improving pelvic floor muscle training (PFMT) among women, but they have not yet been studied among pregnant women. Adherence to daily PFMT will improve pelvic floor muscle strength leading to urinary incontinence (UI) improvement during the pregnancy. Objective: This study aims to document the validation process in developing the Kegel Exercise Pregnancy Training app, which was designed to improve the PFMT adherence among pregnant women. Methods: We utilized an intervention mapping approach incorporated within the mobile health development and evaluation framework. The framework involved the following steps: (1) conceptualization, (2) formative research, (3) pretesting, (4) pilot testing, (5) randomized controlled trial, and (6) qualitative research. The user-centered design-11 checklist was used to evaluate the user-centeredness properties of the app.

Results: A cross-sectional study was conducted to better understand PFMT and UI among 440 pregnant women. The study reported a UI prevalence of 40.9% (180/440), with less than half having good PFMT practice despite their good knowledge. Five focus group discussions were conducted to understand the app design preferred by pregnant women. They agreed a more straightforward design should be used for better app usability. From these findings, a prototype was designed and developed accordingly, and the process conformed to the user-centered design-11 (UCD-11) checklist. A PFMT app was developed

based on the mHealth development and evaluation framework model, emphasizing higher user involvement in the application design and development. The application was expected to improve its usability, acceptability, and ease of use. Conclusions: The Kegel Exercise Pregnancy Training app was validated using a thorough design and development process to ensure its effectiveness in evaluating the usability of the final prototype in our future randomized control trial study.

Short Title: Process evaluation of five tailored programs to improve the implementation of evidence-based recommendations for chronic conditions in primary care

ISSN: 1748-5908

DOI: 10.1186/s13012-016-0473-8

Article Number: 123

Accession Number: WOS:000382916600003

Abstract: Background: Although there is evidence that tailored implementation strategies can be effective, there is little evidence on which methods of tailoring improve the effect. We designed and evaluated five tailored programs (TPs) each consisting of various strategies. The aim of this study was to examine (a) how determinants of practice prioritized in the design phase of the TPs were perceived by health care professionals who had been exposed to the TPs and whether they suggested other important determinants of practice and (b) how professionals used the offered strategies and whether they suggested other strategies that might have been more effective. Methods: We conducted a mixed-method process evaluation linked to five cluster-randomized trials carried out in five European countries to implement recommendations for five chronic conditions in primary care settings. The five TPs used a total of 28 strategies which aimed to address 38 determinants of practice.

Interviews of professionals in the intervention groups and a survey

of professionals in the intervention and control groups were performed. Data collection was conducted by each research team in the respective national language. The interview data were first analyzed inductively by each research team, and subsequently, a meta-synthesis was conducted. The survey was analyzed descriptively. Results: We conducted 71 interviews; 125 professionals completed the survey. The survey showed that 76 % (n = 29) of targeted determinants of practice were perceived as relevant and 95 % (n = 36) as being modified by the implementation interventions by 66 to 100 % of professionals. On average, 47 % of professionals reported using the strategies and 51 % considered them helpful, albeit with substantial variance between countries and strategies. In the interviews, 89 determinants of practice were identified, of which 70 % (n = 62) had been identified and 45 % (n = 40) had been prioritized in the design phase. The interviewees suggested 65 additional strategies, of which 54 % (n = 35) had been identified and 20 % (n = 13) had been prioritized, but not selected in the final programs. Conclusions: This study largely confirmed the perceived relevance of the targeted determinants of practice. This contrasts with the fact that no impact of the trials on the implementation of the recommendations could be observed. The findings suggest that better methods for prioritization of determinants and strategies are needed.

Abstract: Background: Hypertension control is falling in the US yet efficacious interventions exist. Poor patient reach has limited the ability of pragmatic trials to demonstrate effectiveness. This paper

uses quantitative and qualitative data to understand factors influencing reach in Hyperlink 3, a pragmatic hypertension trial testing an efficacious pharmacist-led Telehealth Care intervention in comparison to a physician-led Clinic-based Care intervention. Referrals to both interventions were ordered by physicians. Methods: A sequential-explanatory mixed methods approach was used to understand barriers and facilitators to reach. Reach was assessed quantitatively using EHR data, defined as the proportion of eligible patients attending intended follow-up hypertension care and qualitatively, via semi-structured interviews with patients who were and were not reached. Quantitative data were analyzed using descriptive and inferential statistics. Qualitative data were analyzed via combined deductive and inductive content analysis. Results: Of those eligible, 27% of Clinic-based (n = 532/1945) and 21% of Telehealth patients (n = 385/1849) were reached. In both arms, the largest drop was between physician-signed orders and patients attending initial intended follow-up care. Qualitative analyses uncovered patient barriers related to motivation, capability, and opportunity to attend follow-up care. Conclusions: Although the proportion of eligible patients with signed orders was high in both arms, the proportion ultimately reached was lower. Patients described barriers related to the influence of one's own personal beliefs or priorities, decision making processes, logistics, and patient perceptions on physician involvement on reach. Addressing these barriers in the design of pragmatic interventions is critical for future effectiveness. Trial Registration: NCT02996565

Article Number: 101864

Accession Number: WOS:000583846900019

Abstract: Introduction: Sedentary lifestyles and physical inactivity have been shown to increase during pregnancy and are a cause of

obstetric comorbidity. The objective of this study was to conduct a systematic review of interventions aiming to promote physical activity during pregnancy. Material and methods: Databases were searched from January 2008 to September 2019. Selection criteria included randomized controlled trials evaluating the efficacy of interventions promoting physical activity during pregnancy. Results: In total, 256 articles were extracted from databases. 202 articles were excluded. Finally, 15 articles were included in the study. 5633 patients were included from various populations. Six studies rated physical activity (PA) as the primary outcome. Five studies suggested promoting physical activity through individual interviews which in two studies showed an increase in PA. Three studies evaluated an intervention based on group interviews and one of these reported a significant increase in PA. Two studies evaluated the use of a Smartphone application to promote physical activity but they did not conclude that they were effective because they were designed with low statistical power. Conclusion: The practice of regular PA during pregnancy reduces obstetrical comorbidity. However, interventions seem to have a low impact on the promotion of PA during pregnancy. New intervention strategies need to be assessed, such as the use of mobile health interventions. (C) 2020 Elsevier Masson SAS. All rights reserved.

Title: Web-Based Questionnaire for Healthcare Professionals on Psychosocial Support for Adolescents and Young Adults with Type 1 Diabetes

Journal: Diabetes Therapy

Volume: 13

Issue: 2

Pages: 355-365

Date: Feb

Short Title: Web-Based Questionnaire for Healthcare Professionals on Psychosocial Support for Adolescents and Young Adults with Type 1 Diabetes

ISSN: 1869-6953

DOI: 10.1007/s13300-022-01202-6

Accession Number: WOS:000749411500001

Abstract: Introduction Adolescence and young adulthood is a challenging period, particularly for those living with chronic disease such as type 1 diabetes (T1D). Effective professional support is associated with better diabetes outcomes, but little is known about what determines healthcare professionals' decision-

making for therapeutic intervention, and how to support this. Our study aimed to determine healthcare professionals' (HCPs) self-rated awareness, capability, opportunity and motivation to provide support for psychosocial issues in the management of T1D with adolescents and young adults; and to identify factors independently predictive of HCPs' perceptions of their confidence in, and perceived importance of, addressing psychosocial issues in this population. Methods Survey design was used, and data collected using an anonymous web-based questionnaire based on the Capability-Opportunity-Motivation Behaviour (COM-B) framework. The study was advertised to members of the Australian Diabetes Society, and National Association of Diabetes Centres. Results Of 98 respondents, 57 (58.2%) were female. Confidence and perceived importance summary scores were not significantly associated with demographic characteristics. HCPs agreed that both diabetes-dependent and external non-diabetes-specific influences were important components of psychosocial management, but self-rated themselves as less confident in their ability to provide care for these aspects. Few respondents regularly encountered psychosocial issues that they believed would lead to improved outcomes if addressed and not all HCPs knew how to access psychosocial support for their adolescent patients. Conclusion Our findings indicate discrepancies between HCPs' self-rated capability and perceived motivation to provide support relating to psychosocial issues in the management of T1D for adolescents and young adults. Equitable opportunities are needed for training and support, to increase HCPs' understanding and hence their perceptions of the importance and of their confidence in addressing psychosocial issues, especially considering the high levels of risk of these young people for such problems.

Article Number: 5025

Accession Number: WOS:000650272400001

Abstract: Presenting attractive and useful health education materials in waiting rooms can help improve an organization's health literacy responsiveness. However, it is unclear to what extent patients may be interested in health education materials, such as brochures. We conducted a three-week field study in waiting rooms of three primary care centers in Groningen. Three versions of a brochure on doctor-patient communication were randomly distributed, 2250 in total. One version contained six short photo stories, another version was non-narrative but contained comparable photos, and the third version was a traditional brochure. Each day we counted how many brochures were taken. We also asked patients (N = 471) to participate in a brief interview. Patients who consented (N = 390) were asked if they had noticed the brochure. If yes (N = 135), they were asked why they had or had not browsed the brochure, and why they had or had not taken it. Interview responses were categorized by two authors. Only 2.9% of the brochures were taken; no significant association with brochure version was found. Analysis of the interview data showed that the version with the photo narrative was noticed significantly more often than the non-narrative version or the traditional version. These results suggest that designing attractive and comprehensible health materials is not enough. Healthcare organizations should also create effective strategies to reach their target population.

Title: Exercise barriers contributing to reduced physical activity in chronic stroke survivors in a multi-ethnic population: a cross-sectional study in Suriname

Journal: Medicina Balear

Volume: 37

Issue: 6

Pages: 49-56

Date: Nov-Dec

Short Title: Exercise barriers contributing to reduced physical activity in chronic stroke survivors in a multi-ethnic population: a cross-sectional study in Suriname

ISSN: 1579-5853

DOI: 10.3306/ajhs.2022.37.06.49

Accession Number: WOS:000891600800008

Abstract: Objectives: Despite all the recommendations physical activity (PA) and participation in structured PA programs remains

low among the stroke survivors. Compared to high-income societies, these patients face unequal socio-economic challenges in countries with low-and middle- income and in multi-ethnic populations. We therefore aimed to explore factors associated with reduced PA levels in chronic stroke patients living in a middle-income country with a multi-ethnic population, Suriname. Furthermore, we explored possible barriers that may prevent participation in exercise programs.

Methods: We recruited participants from the general population and the Academic Hospital, and used energy expenditure (EE) and step count, measured with the GARMIN Forerunner 225 for seven consecutive days to evaluate PA. With the Barriers to Physical Activity and Disability (BPAD) questionnaire we identified exercise barriers and obtained demographic and socio-economic characteristics. We used regression analyses to assess associations with reduced PA levels, and descriptive analyses to assess exercise barriers based on socio-economic diversity. Results: The mean age of the 44 participants was 58.2 +/- 10.0 years and 21 were men. The median EE and steps were 24.2 (min-max: 16.1-53.7) Cal/kg/day and 3165.5 (min-max: 1093.0-9727.00) steps/day, respectively. Reduced PA levels were not related to demographic or socio-economic variables. Overall, patient-reported environmental exercise barriers were (1) "cost of the program" (45%) followed by (2) "lack of transportation" (34%). Personal barriers were (1) "feeling that an exercise instructor is incapable to set up an exercise program to meet their needs" (88%) and (2) "not willing to spend money" (40%). Different personal exercise barriers between ethnic groups were reported, but environmental barriers were the same. Conclusions: Reduced PA levels in chronic stroke survivors were not explained by demographic or socio-economic variables. The participants reported several exercise barriers. In addition to the most common occurring barriers, future research should also evaluate feasibility and (cost-) effectiveness of tailored PA programs.

Title: Digital Interventions to Enhance Readiness for Psychological Therapy: Scoping Review

Journal: Journal of Medical Internet Research

Volume: 24

Issue: 8

Date: Aug

Short Title: Digital Interventions to Enhance Readiness for Psychological Therapy: Scoping Review

ISSN: 1438-8871

DOI: 10.2196/37851

Article Number: e37851

Accession Number: WOS:000862887700008

Abstract: Background: Psychological therapy is an effective treatment method for mental illness; however, many people with mental illness do not seek treatment or drop out of treatment early. Increasing client uptake and engagement in therapy is key to addressing the escalating global problem of mental illness. Attitudinal barriers, such as a lack of motivation, are a leading cause of low engagement in therapy. Digital interventions to increase motivation and readiness for change hold promise as accessible and scalable solutions; however, little is known about the range of interventions being used and their feasibility as a means to increase engagement with therapy. Objective: This review aimed to define the emerging field of digital interventions to enhance readiness for psychological therapy and detect gaps in the literature. Methods: A literature search was conducted in PubMed, PsycINFO, PsycARTICLES, Scopus, Embase, ACM Guide to Computing Literature, and IEEE Xplore Digital Library from January 1, 2006, to November 30, 2021. The PRISMA-ScR (Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews) methodology was applied. Publications were included when they concerned a digitally delivered intervention, a specific target of which was enhancing engagement with further psychological treatment, and when this intervention occurred before the target psychological treatment. Results: A total of 45 publications met the inclusion criteria. The conditions included depression, unspecified general mental health, comorbid anxiety and depression, smoking, eating disorders, suicide, social anxiety, substance use, gambling, and psychosis. Almost half of the interventions (22/48, 46%) were web-based programs; the other formats included screening tools, videos, apps, and websites. The components of the interventions included psychoeducation, symptom assessment and feedback, information on treatment options and referrals, client testimonials, expectation management, and pro-con lists. Regarding feasibility, of the 16 controlled studies, 7 (44%) measuring actual behavior or action showed evidence of intervention effectiveness compared with controls, 7 (44%) found no differences, and 2 (12%) indicated worse behavioral outcomes. In general, the outcomes were mixed and inconclusive owing to variations in trial designs, control types, and outcome measures. Conclusions: Digital interventions to enhance readiness for psychological therapy are broad and varied. Although these easily accessible digital approaches show potential as a means of preparing people for therapy, they are not without risks. The complex nature of stigma, motivation, and individual emotional responses toward engaging in treatment for mental health difficulties suggests that a careful approach is needed when developing and evaluating digital readiness interventions. Further qualitative, naturalistic, and longitudinal research is needed to deepen our knowledge in this area.

Title: A Web-Based, Population-Based Cirrhosis Identification and Management System for Improving Cirrhosis Care: Qualitative Formative Evaluation

Journal: Jmir Formative Research

Volume: 5

Issue: 11

Date: Nov

Short Title: A Web-Based, Population-Based Cirrhosis Identification and Management System for Improving Cirrhosis Care: Qualitative Formative Evaluation

DOI: 10.2196/27748

Article Number: e27748

Accession Number: WOS:000853674900016

Abstract: Background: Cirrhosis, or scarring of the liver, is a debilitating condition that affects millions of US adults. Early identification, linkage to care, and retention of care are critical for preventing severe complications and death from cirrhosis.

Objective: The purpose of this study is to conduct a preimplementation formative evaluation to identify factors that could impact implementation of the Population-Based Cirrhosis Identification and Management System (P-CIMS) in clinics serving patients with cirrhosis. P-CIMS is a web-based informatics tool designed to facilitate patient outreach and cirrhosis care management. Methods: Semistructured interviews were conducted between January and May 2016 with frontline providers in liver disease and primary care clinics at 3 Veterans Health Administration medical centers. A total of 10 providers were interviewed, including 8 physicians and midlevel providers from liver-related specialty clinics and 2 primary care providers who managed patients with cirrhosis. The Consolidated Framework for Implementation Research guided the development of the interview guides. Inductive consensus coding and content analysis were used to analyze transcribed interviews and abstracted coded passages, elucidated themes, and insights. Results: The following themes and subthemes emerged from the analyses: outer setting: needs and resources for patients with cirrhosis; inner setting: readiness for implementation (subthemes: lack of resources, lack of leadership support), and implementation climate (subtheme: competing priorities); characteristics of individuals: role within clinic; knowledge and beliefs about P-CIMS (subtheme: perceived and realized benefits; useful features; suggestions for improvement); and perceptions of current practices in managing cirrhosis cases (subthemes: preimplementation process for identifying and linking patients to cirrhosis care; structural and social barriers to follow-up). Overall, P-CIMS was viewed as a powerful tool for improving linkage and retention, but its integration in the clinical workflow required leadership support, time, and staffing. Providers also cited the need for more intuitive

interface elements to enhance usability. Conclusions: P-CIMS shows promise as a powerful tool for identifying, linking, and retaining care in patients living with cirrhosis. The current evaluation identified several improvements and advantages of P-CIMS over current care processes and provides lessons for others implementing similar population-based identification and management tools in populations with chronic disease.

Title: Facilitators and Barriers Influencing Antipsychotic Medication Prescribing and Deprescribing Practices in Critically Ill Adult Patients: a Qualitative Study

Journal: Journal of General Internal Medicine

Date: 2023 Apr

Short Title: Facilitators and Barriers Influencing Antipsychotic Medication Prescribing and Deprescribing Practices in Critically Ill Adult Patients: a Qualitative Study

ISSN: 0884-8734

DOI: 10.1007/s11606-023-08042-5

Accession Number: WOS:000974834400002

Abstract: BackgroundAntipsychotic medications do not alter the incidence or duration of delirium, but these medications are frequently prescribed and continued at transitions of care in critically ill patients when they may no longer be necessary or appropriate.ObjectiveThe purpose of this study was to identify and describe relevant domains and constructs that influence antipsychotic medication prescribing and deprescribing practices among physicians, nurses, and pharmacists that care for critically ill adult patients during and following critical illness.DesignWe conducted qualitative semi-structured interviews with critical care and ward healthcare professionals including physicians, nurses, and pharmacists to understand antipsychotic prescribing and deprescribing practices for critically ill adult patients during and following critical illness.ParticipantsTwenty-one interviews were conducted with 11 physicians, five nurses, and five pharmacists from predominantly academic centres in Alberta, Canada, between July 6 and October 29, 2021.Main MeasuresWe used deductive thematic analysis using the Theoretical Domains Framework (TDF) to identify and describe constructs within relevant domains.Key ResultsSeven TDF domains were identified as relevant from the analysis: Social/ Professional role and identity; Beliefs about capabilities; Reinforcement; Motivations and goals; Memory, attention, and decision processes; Environmental context and resources; and Beliefs

about consequences. Participants reported antipsychotic prescribing for multiple indications beyond delirium and agitation including patient and staff safety, sleep management, and environmental factors such as staff availability and workload. Participants identified potential antipsychotic deprescribing strategies to reduce ongoing antipsychotic medication prescriptions for critically ill patients including direct communication tools between prescribers at transitions of care. Conclusions Critical care and ward healthcare professionals report several factors influencing established antipsychotic medication prescribing practices. These factors aim to maintain patient and staff safety to facilitate the provision of care to patients with delirium and agitation limiting adherence to current guideline recommendations.

Title: Antipsychotic prescribing practices and patient, family member and healthcare professional perceptions of antipsychotic prescribing in acute care settings: a scoping review protocol

Journal: Bmj Open

Volume: 12

Issue: 6

Date: Jun

Short Title: Antipsychotic prescribing practices and patient, family member and healthcare professional perceptions of antipsychotic prescribing in acute care settings: a scoping review protocol

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2021-057585

Article Number: e057585

Accession Number: WOS:000819498100004

Abstract: Introduction Antipsychotic medications are commonly prescribed off-label in acutely ill patients for non-psychiatric clinical indications such as delirium or insomnia. New prescription initiation of antipsychotics in acute care settings increases the proportion of patients discharged home on antipsychotics without approved clinical indication. Long-term use of antipsychotics is associated with increased risk of sudden cardiac death, falls and cognitive impairment. An understanding of acute care off-label antipsychotic prescribing practices and healthcare professional, patient and family perceptions related to antipsychotic prescribing and deprescribing is necessary to facilitate in-hospital deprescribing initiatives. Methods and analysis We present the protocol for a scoping review following the methodology proposed by Arksey and O'Malley and the Scoping Review Methods Manual by the

Joanna Briggs Institute. We will search five databases including MEDLINE, EMBASE, CINAHL, PsycINFO and Web of Science from inception to 3 July 2021 (ie, planned search date). We will include both peer-reviewed and non-peer-reviewed qualitative and quantitative studies to identify antipsychotic prescribing practices, and to describe healthcare professional, patient and family perceptions towards antipsychotic prescribing and deprescribing in the acute care setting. Protocols, systematic and scoping reviews will be excluded. Two reviewers will calibrate and perform study screening and data abstraction for quantitative and qualitative outcomes of eligible studies. Quantitative outcomes will include study identifiers, demographics and descriptive statistics of antipsychotic prescribing practices. Qualitative synthesis describing perceptions on antipsychotic prescribing practices will include deductive thematic analysis with mapping of themes to the domains of the Theoretical Domains Framework, a 14-domain behaviour and behaviour change framework. Ethics and dissemination No ethical approval will be required for this study as only data from published studies in which informed consent was obtained by primary investigators will be retrieved and analysed. The results of this scoping review will inform integrated knowledge translation initiatives aimed at in-hospital antipsychotic medication deprescribing.

Title: Why some do but too many don't? Barriers and enablers to physical activity in regional Tasmania - an exploratory, mixed-methods study

Journal: BMC Public Health

Volume: 22

Issue: 1

Date: Mar

Short Title: Why some do but too many don't? Barriers and enablers to physical activity in regional Tasmania - an exploratory, mixed-methods study

DOI: 10.1186/s12889-022-13001-6

Article Number: 627

Accession Number: WOS:000775999800001

Abstract: Background The interconnectedness of physical inactivity and sedentarism, obesity, non-communicable disease (NCD) prevalence, and socio-economic costs, are well known. There is also strong research evidence regarding the mutuality between well-being outcomes and the neighbourhood environment. However, much of this

evidence relates to urban contexts and there is a paucity of evidence in relation to regional communities. A better understanding of available physical activity (PA) infrastructure, its usage, and community perceptions regarding neighbourhood surroundings, could be very important in determining requirements for health improvement in regional communities. The aims of this research were to 1. Explore and evaluate the public's perception of the PA environment; and 2. Evaluate the quantity, variety, and quality of existing PA infrastructure in regional Northwest (NW) Tasmania. Methods A mixed methods approach guided data collection, analysis, and presentation. Quality of PA infrastructure was assessed using the Physical Activity Resource Assessment (PARA) instrument and public perception about PA environment was evaluated using the International Physical Activity Questionnaire – Environmental (IPAQ-E) module. Quantitative data were analysed using descriptive summative methods and a team-based researcher triangulation approach was utilised for qualitative data. Results Overall, a wide array of high-quality PA infrastructure (with minimal incivilities such as auditory annoyance, litter, graffiti, dog refuse, and vandalism etc.) was available. Survey respondents rated neighbourhoods positively. The overall quality of PA infrastructure, rated on a scale from 0 to 3, was assessed as high (all rated between 2 to 3) with minimal incivilities (rated between 0 and 1.5). Of note, survey respondents confirmed the availability of numerous free-to-access recreational tracks and natural amenities across the 3 local government areas (LGAs) studied. Importantly, most respondents reported minimal disruption to their routine PA practices due to the COVID-19 pandemic. Conclusion This exploratory research confirmed the availability of a wide range of high-quality PA infrastructure across all three LGAs and there was an overwhelming public appreciation of this infrastructure. The challenge remains to implement place-based PA interventions that address extant barriers and further increase public awareness and utilisation of high-quality PA infrastructure.

DOI: 10.1016/j.ijmedinf.2021.104654

Article Number: 104654

Accession Number: WOS:000821051100005

Abstract: Background: Electronic medical record system implementations impact nurses, their work and workflows. The aim of this study was to understand nurses' perceptions of barriers and enablers to using a new electronic medical record in an acute hospital environment. Methods: Data were collected just prior to an organisation-wide new electronic medical record implementation at a large tertiary healthcare organization in Victoria, Australia. Sixty-three nurses from five hospital sites participated in 12 focus group interviews. Transcripts were transcribed and deductive content analysis used the 14-domain Theoretical Domains Framework to identify barriers and enablers. Results: Coded data mapped to 13 of the 14 domains. Nurse motivation emerged as a dominant theme among both barriers and enablers. Nurses' most common perceived barriers related to emotions (24.1%) and environmental context and resources (21.3%). Conversely, the most common enablers related to social influences (21%) and reinforcement (20.8%). Discussion: In addition to effecting changes in their work and workflows, the dominance of nurses' emotional responses reveals the potential for implementation of a new electronic medical record to negatively affect nurses' psychological well-being. Using data aligned to the Theoretical Domains Framework assisted identification of behavior change strategies to target the barriers and enablers perceived by nurses. Strategies aligned with nine behavioral intervention categories are recommended for successful implementation and optimization of an electronic medical record by nurses. Conclusions: Multifaceted strategies targeting multiple behaviors are required to support adoption of the electronic medical record by nurses, and reduce the risk for nurse attrition in the workforce.

Title: Care-seeking and managing diabetes in rural Bangladesh: a mixed methods study

Journal: BMC Public Health

Volume: 21

Issue: 1

Date: Jul

Short Title: Care-seeking and managing diabetes in rural Bangladesh: a mixed methods study

DOI: 10.1186/s12889-021-11395-3

Article Number: 1445

Accession Number: WOS:000680419900005

Abstract: Background Type 2 diabetes mellitus poses a major health challenge worldwide and in low-income countries such as Bangladesh, however little is known about the care-seeking of people with diabetes. We sought to understand the factors that affect care-seeking and diabetes management in rural Bangladesh in order to make recommendations as to how care could be better

delivered. Methods Survey data from a community-based random sample of 12,047 adults aged 30 years and above identified 292 individuals with a self-reported prior diagnosis of diabetes. Data on health seeking practices regarding testing, medical advice, medication and use of non-allopathic medicine were gathered from these 292 individuals.

Qualitative semi-structured interviews and focus group discussions with people with diabetes and semi-structured interviews with health workers explored care-seeking behaviour, management of diabetes and perceptions on quality of care. We explore quality of care using the WHO model with the following domains: safe, effective, patient-centred, timely, equitable and efficient. Results People with diabetes who are aware of their diabetic status do seek care but access, particularly to specialist diabetes services, is hindered by costs, time, crowded conditions and distance. Locally available services, while more accessible, lack infrastructure and expertise. Women are less likely to be diagnosed with diabetes and attend specialist services. Furthermore costs of care and dissatisfaction with health care providers affect medication adherence. Conclusion People with diabetes often make a trade-off between seeking locally available accessible care and specialised care which is more difficult to access. It is vital that health services respond to the needs of patients by building the capacity of local health providers and consider practical ways of supporting diabetes care. Trial registration ISRCTN41083256. Registered on 30/03/2016.

Issue: 3

Pages: 321-327

Date: May

Short Title: Critical care pharmacist research activity, experience and interests: a 2021 United Kingdom survey

ISSN: 0961-7671

DOI: 10.1093/ijpp/riad009

Accession Number: WOS:000934488000001

Abstract: Background Research and innovation are essential for effective healthcare service delivery, leading to improvements in patient health and wellbeing. National policy dictates that research delivery is embedded into daily practice of United Kingdom (UK) healthcare professionals, including pharmacists. There is a limited understanding of critical care pharmacist research activities, experiences and interests. It is, therefore, important to describe current practice including barriers and facilitators to enable increased engagement. Objectives To describe UK critical care pharmacist research activity, experiences, interests and barriers to better engagement. Method An electronic survey was developed, piloted and distributed (June to October 2021) to all critical care pharmacists via UK professional organisations. Key findings The survey was completed by 126 pharmacists, providing a 54% response rate. Few pharmacists reported research capability (postgraduate qualification with a research component, 31% (39/126)) and opportunity (dedicated research time, 28.6% (36/126)), only 12.7% (16/126) have both these influencers. Those that did, produced significantly more research outputs (median 4 (0,9) versus 0 (0,1), $P = 0.023$) and undertook grant funding applications ($X-2 (1, n = 126) = 25.8, P < 0.001$), compared to those without. The most frequently reported barrier to research was the time (opportunity), (71.4%, 90/126). Few pharmacists reported having a research mentor (13.3%, 16/120). Most pharmacists reported an interest in collaborating on research projects across a broad range of areas. Conclusions Critical care pharmacists are motivated to participate in the evaluation continuum including research, although most report capability and opportunity barriers to delivery. We suggest policy recommendations to address limitations and increase pharmacist research involvement.

Short Title: Changing micronutrient intake through (voluntary) behaviour change. The case of folate

ISSN: 0195-6663

DOI: 10.1016/j.appet.2012.03.004

Accession Number: WOS:000304336800037

Abstract: The objective of this study was to relate behaviour change mechanisms to nutritionally relevant behaviour and demonstrate how the different mechanisms can affect attempts to change these behaviours. Folate was used as an example to illuminate the possibilities and challenges in inducing behaviour change. The behaviours affecting folate intake were recognised and categorised. Behaviour change mechanisms from "rational model of man", behavioural economics, health psychology and social psychology were identified and aligned against folate-related behaviours. The folate example demonstrated the complexity of mechanisms influencing possible behavioural changes, even though this only targets the intake of a single micronutrient. When considering possible options to promote folate intake, the feasibility of producing the desired outcome should be related to the mechanisms of required changes in behaviour and the possible alternatives that require no or only minor changes in behaviour. Dissecting the theories provides new approaches to food-related behaviour that will aid the development of batteries of policy options when targeting nutritional problems. (C) 2012 Elsevier Ltd. ISSN: 0941-4355

DOI: 10.1007/s00520-020-05970-4

Accession Number: WOS:000604179900004

Abstract: Purpose This study explores healthcare professionals (HCPs)' perception and current management of sleep disturbance (SD) in people with malignant brain tumours and their caregivers. We aimed to identify barriers to effective management of SD in neuro-oncology care. Methods We conducted semi-structured interviews with 11 HCPs involved in neuro-oncology care. The study was underpinned by the Capability Opportunity Motivation-Behaviour (COM-B) model within the Behavioural Change Wheel (BCW) guiding topic selection for the exploration of underlying processes of HCPs' behaviours and care decisions for SD management. Data were analysed thematically using a framework synthesis, and subsequently mapped onto the BCW to identify barriers for effective management and recommend potential interventions. Results We identified four themes: HCPs' clinical opinions about SD, the current practice of SD management in neuro-oncology clinics, gaps in the current practice, and suggested areas for improvements. HCPs perceived SD as a prevalent yet secondary issue of low priority in neuro-oncology care. SD was unrecognised, and inadequately managed in usual clinical settings. Interventional options included modifying the use of corticosteroids or prescribing sedatives. When mapped onto the BCW, themes identified main barriers as a lack of awareness among HCPs about SD warranting care, due to the absence of screening tools and limited knowledge and resources for therapeutic interventions. Conclusions Multidisciplinary HCPs need training in the routine use of appropriate sleep assessment tools, and access to clear management pathways. More professional resources are needed to educate staff in implementing appropriate interventions for people with malignant brain tumours who are experiencing SD.

Title: Therapists' perspectives on using brain-computer interface-triggered functional electrical stimulation therapy for individuals living with upper extremity paralysis: a qualitative case series study

Journal: Journal of Neuroengineering and Rehabilitation

Volume: 19

Issue: 1

Date: Nov

Short Title: Therapists' perspectives on using brain-computer interface-triggered functional electrical stimulation therapy for individuals living with upper extremity paralysis: a qualitative case series study

DOI: 10.1186/s12984-022-01107-2

Article Number: 127

Accession Number: WOS:000886995100001

Abstract: Background Brain computer interface-triggered functional electrical stimulation therapy (BCI-FEST) has shown promise as a therapy to improve upper extremity function for individuals who have had a stroke or spinal cord injury. The next step is to determine whether BCI-FEST could be used clinically as part of broader therapy practice. To do this, we need to understand therapists' opinions on using the BCI-FEST and what limitations potentially exist.

Therefore, we conducted a qualitative exploratory study to understand the perspectives of therapists on their experiences delivering BCI-FEST and the feasibility of large-scale clinical implementation. Methods Semi-structured interviews were conducted with physical therapists (PTs) and occupational therapists (OTs) who have delivered BCI-FEST. Interview questions were developed using the COM-B (Capability, Opportunity, Motivation-Behaviour) model of behaviour change. COM-B components were used to inform deductive content analysis while other subthemes were detected using an inductive approach. Results We interviewed PTs (n = 3) and OTs (n = 3), with 360 combined hours of experience delivering BCI-FEST. Components and subcomponents of the COM-B determined deductively included: (1) Capability (physical, psychological), (2) Opportunity (physical, social), and (3) Motivation (automatic, reflective). Under each deductive subcomponent, one to two inductive subthemes were identified (n = 8). Capability and Motivation were perceived as strengths, and therefore supported therapists' decisions to use BCI-FEST. Under Opportunity, for both subcomponents (physical, social), therapists recognized the need for more support to clinically implement BCI-FEST. Conclusions We identified facilitating and limiting factors to BCI-FEST delivery in a clinical setting according to clinicians. These factors implied that education, training, a support network or mentors, and restructuring the physical environment (e.g., scheduling) should be targeted as interventions. The results of this study may help to inform future development of new technologies and interventions.

Short Title: What is a clinical practice guideline? A roadmap to their development. Special report from the Guidelines Task Force of the International League Against Epilepsy

ISSN: 0013-9580

DOI: 10.1111/epi.17312

Accession Number: WOS:000812934900001

Abstract: Clinical practice guidelines (CPGs) are statements that provide evidence-based recommendations aimed at optimizing patient care. However, many other documents are often published as "guidelines" when they are not; these documents, although also important in clinical practice, are usually not systematically produced following rigorous processes linking the evidence to the recommendations. Specifically, the International League Against Epilepsy (ILAE) guideline development toolkit aims to ensure that high-quality CPGs are developed to fill knowledge gaps and optimize the management of epilepsy. In addition to adhering to key methodological processes, guideline developers need to consider that effective CPGs should lead to improvements in clinical processes of care and health care outcomes. This requires monitoring the effectiveness of epilepsy-related CPGs and interventions to remove the barriers to epilepsy CPG implementation. This article provides an overview of what distinguishes quality CPGs from other documents and discusses their benefits and limitations. We summarize the recently revised ILAE CPG development process and elaborate on the barriers and facilitators to guideline dissemination, implementation, and adaptation.

Abstract: Background Malnutrition, sarcopenia and cachexia are clinical wasting syndromes characterised by muscle loss. Systematic monitoring by body composition assessment (BCA) is recommended for the diagnosis, treatment and monitoring of the syndrome(s). This study investigated practices, competency, and attitudes of Australian dietitians regarding BCA, to inform a local implementation process. Methods Applying the Action cycle in the Knowledge to Action framework, surveys were distributed to the 26 dietitians of an 800-bed tertiary hospital. The survey assessed barriers and enablers to performing routine BCA in clinical care. Results were categorised using the Theoretical Domains Framework (TDF) and suitable interventions mapped using the Behaviour Change Wheel. Results Twenty-two dietitians (84.6%) completed the survey. Barriers to BCA were identified in all TDF domains, particularly in Knowledge, Skills, Social/professional role and identity, Beliefs

about capabilities, and Environmental context and resources. Enablers existed in domains of: Skills; Beliefs about consequences; Goals; Environmental context and resources; Social influences; Intentions; Optimism; Reinforcement. Conclusions This study showed that hospital dietitians experience individual, team, and organisational barriers to adopt BCAs in clinical practice. We were able to formulate targeted implementation strategies to overcome these barriers to assist BCA adoption into routine practice.

Title: A self-management support intervention for patients with atrial fibrillation: a randomized controlled pilot trial

Journal: Pilot and Feasibility Studies

Volume: 6

Issue: 1

Short Title: A self-management support intervention for patients with atrial fibrillation: a randomized controlled pilot trial

DOI: 10.1186/s40814-020-00624-y

Article Number: 87

Accession Number: WOS:000729238200085

Abstract: Background Atrial fibrillation (AF) is the most common arrhythmia worldwide. Despite effective treatment, it is characterized by frequent recurrences. Optimal therapeutic management of AF requires active participation and self-management from patients. Two major components of self-management are self-monitoring and sign-and-symptom management. Pulse self-palpation (PSP) is a method of self-monitoring; however, not all AF patients are capable of successfully performing PSP. Due to a lack of interventions on this topic, a nurse-led intervention for patients with AF (PSPAF intervention) was developed to foster self-monitoring and to enhance self-management through PSP. The purpose of this pilot study was to test the acceptability, feasibility, and potential effects of this intervention on the capability of patients' PSP and sign-and-symptom management. Moreover, we aimed at gathering data on the feasibility of applied research methods to aid in the design of future studies. Methods The pilot trial involved 20 adult patients with AF, randomized to an intervention or usual care group. At baseline and during a home visit 3-5 weeks later, we collected data using questionnaires, checklists, field notes, a mobile ECG device, and a diary. Acceptability and feasibility measures were validated through predefined cut-off points. Effect size estimates were expressed as relative risks (RR) and the number needed to treat (NNT). Results The PSPAF intervention seemed feasible, but only partly acceptable. There were limitations in terms of

potential effectiveness, suitability, addressing participants' willingness to implement its content in daily life, and adherence. Estimations of effect sizes suggest a large effect of the intervention on patients' PSP capability (RR = 6.0; 95% CI = [0.83, 43.3]; NNT = 2.4), but almost no effect on sign-and-symptom management (RR = 1.5; 95% CI = [0.7, 3.1]; NNT = 4.0). The feasibility of applied research methods showed minor limitations on recruitment and participant burden. Conclusions Despite some limitations, the intervention seemed to be applicable and promising. Taking into account the suggestions and amendments we have made, we recommend conducting a full-scale trial to examine the efficacy of the PSPAF intervention. Trial registration This pilot study was registered in the German Clinical Trials Register at September 4, 2017 (Main ID: DRKS00012808).

Title: Physical Activity and Sedentary Behavior in Relation to Cancer Survival: A Narrative Review

Journal: Cancers

Volume: 14

Issue: 7

Date: Apr

Short Title: Physical Activity and Sedentary Behavior in Relation to Cancer Survival: A Narrative Review

DOI: 10.3390/cancers14071720

Article Number: 1720

Accession Number: WOS:000783108100001

Abstract: Simple Summary Globally, cancer is a major issue and an increasing number of people live with cancer. Lifestyle-associated factors play a major role in cancer prevention. Being physically active and limiting the amount of time spent sitting reduce the risk of developing several types of cancer. Furthermore, physical activity before, during, and after cancer diagnosis has been found to improve cancer outcomes. In addition, reduced levels of time spent sedentary may lead to improved outcomes in cancer survivors as well. This narrative review summarizes the existing evidence on the relationship of physical activity and sedentary behavior to cancer survival and other health outcomes in cancer survivors. The review provides an overview on the barriers, facilitators, and other factors that determine the levels of physical activity and sedentary behavior in cancer survivors as well as on the current recommendations on physical activity and sedentary behavior for cancer survivors. From a public health perspective, cancer is a major issue, and it contributes to a high economic and societal

burden. Lifestyle-associated risk factors play a crucial role in cancer prevention. The present narrative review aims to summarize the existing evidence on the relationship of physical activity and sedentary behavior to cancer survival, including the evidence on mortality and other health-related outcomes. There is strong evidence that physical activity before, during, and after cancer diagnosis improves outcomes for breast and colorectal cancers. In addition, there is emerging evidence that reduced levels of sedentary behavior in cancer survivors are associated with improved outcomes. Future studies are needed to strengthen the evidence and to provide details on additional cancer sites. In the meantime, existing recommendations for physical activity and sedentary behavior in cancer survivors should be followed to improve the health status of cancer survivors.

Short Title: How to increase earthquake and home fire preparedness: the fix-it intervention

ISSN: 0921-030X

DOI: 10.1007/s11069-016-2528-1

Accession Number: WOS:000388187900022

Abstract: Published, evaluated community intervention studies concerning natural hazard preparedness are rare. Most lack a rigorous methodology, thereby hampering the development of evidence-based interventions. This paper describes the rationale and methodology of a cross-cultural, longitudinal intervention study on earthquake and home fire preparedness, termed fix-it. The aim is to evaluate whether and how the intervention brings about behaviour change in the targeted communities in two coastal cities with high seismic risk: Seattle, USA and Izmir, Turkey. Participants are adult residents of these cities. The intervention group attends a 6-h workshop, which focuses on securing items in the household. The control group does not attend the workshop. All participants complete baseline and post-intervention, as well as 3- and 12-month follow-up assessments. The primary outcome measure is an observational measure of nine preparedness items for earthquake and fire in participants' homes. This is evaluated alongside participants' self-reports concerning their preparedness levels. Secondary outcomes are changes in levels of self-efficacy, perceived

outcome, trust, corruption, empowerment, anxiety and social cohesion. Results from the first of the studies, conducted in Seattle in September 2015, indicate that while the fix-it intervention is effective, in the longer term, multi-hazard preparedness is increased by the mere act of going into people's homes to observe their preparedness levels along with assessing self-reported preparedness and sociopsychological orientation towards natural hazards. This protocol and study aim to augment the empirical literature on natural hazard preparedness, informing national and international policy on delivery of evidence-based community interventions to promote multi-hazard preparedness in households.

Title: Understanding the influence of physical resources and social supports on primary food providers' snack food provision: a discrete choice experiment

Journal: International Journal of Behavioral Nutrition and Physical Activity

Volume: 17

Issue: 1

Date: Nov

Short Title: Understanding the influence of physical resources and social supports on primary food providers' snack food provision: a discrete choice experiment

DOI: 10.1186/s12966-020-01062-y

Article Number: 155

Accession Number: WOS:000596488000001

Abstract: Background: Snack eating occasions contribute approximately a third of children's energy intake, with approximately half of all unhealthy foods consumed during snack times. Therefore, it is critical to understand the drivers of primary food providers' snack provision. The study aims were to determine the relative importance of physical resources and social supports when primary food providers are choosing snacks to provide to their child, and to investigate how these attributes differ in social versus non-social occasions, and between subgroups of primary food providers based on socio-economic position. Methods: Primary food providers of three to seven-year olds completed an online discrete choice experiment, by making trade-offs when completing repeated, hypothetical choice tasks on the choice of snacks to provide to their child in: 1) non-social and 2) social condition.

Choice tasks included two alternatives consisting of varying attribute (i.e. factor) levels, and an opt-out option. The order of conditions shown were randomized across participants. Multinomial logit model analyses were used to determine utility weights for each attribute. Results: Two-hundred and twenty-five primary food providers completed the study, providing 1125 choice decisions per condition. In the non-social condition, the top three ranked attributes were type of food (utility weight 1.94, $p < 0.001$), child resistance (-1.62 , $p < 0.001$) and co-parent support (0.99 , $p < 0.001$). In the social condition, top ranking attributes were child resistance (utility weight -1.50 , $p < 0.001$), type of food (1.38 , $p < 0.001$) and co-parent support (1.07 , $p < 0.001$). In both conditions, time was not a significant influence and cost was of lowest relative importance. Subgroup analyses revealed cost was not a significant influence for families from higher socio-economic backgrounds. Conclusions: Type of food, child resistance and co-parent support were of greatest relative importance in primary food providers' snack provision decision-making, regardless of social condition or socio-economic position. In designing future interventions to reduce unhealthy snacks, researchers should prioritize these influences, to better support primary food providers in changing their physical and social opportunity.

Title: Protocol for the implementation and evaluation of a community-based behavior change intervention to reduce dietary salt intake in India

Journal: Journal of Clinical Hypertension

Volume: 25

Issue: 2

Pages: 175-182

Date: Feb

Short Title: Protocol for the implementation and evaluation of a community-based behavior change intervention to reduce dietary salt intake in India

ISSN: 1524-6175

DOI: 10.1111/jch.14628

Accession Number: WOS:000915631200001

Abstract: Excess dietary salt intake is well established as a leading cause of high blood pressure and associated cardiovascular disease, yet current salt intake in India is nearly 11 g per day, more than twice World Health Organization maximum recommended intake of 5 g per day. Although dietary survey data from India indicate that the main sources of dietary salt are salt added during cooking at home, and few salt reduction efforts have focused on interventions at the household level. As a result, there is little evidence of the effectiveness of behavior change programs to reduce salt intake at the household level. The study aims to develop and implement a community based behavioral change intervention to reduce salt intake delivered by front line community-based health volunteers; and evaluate the preliminary effectiveness, acceptability, and feasibility of delivering a salt reduction behavior change program and potential to support future scale-up. The study is a pre-post intervention design, and outcomes will be evaluated from a random sample of 1500 participants from 28 villages in two primary health centers in Siddipet, Telangana. Primary outcome is change in salt-related KAB (knowledge, attitude, and behavior) score, and secondary outcomes will be changes in salt intake measured by 24 h urinary sodium excretion and change in scores using the subscales of the COM-B ("capability", "opportunity", "motivation" and "behavior") tool. Findings will be used to inform future public health policies to support implementation of scalable community-based interventions to reduce salt intake and control hypertension, the leading-cause of death in India.

Title: Identifying mechanisms of change in a conversation therapy for aphasia using behaviour change theory and qualitative methods

Journal: International Journal of Language & Communication Disorders

Volume: 52

Issue: 3

Pages: 374-387

Date: May-Jun

Short Title: Identifying mechanisms of change in a conversation therapy for aphasia using behaviour change theory and qualitative methods

ISSN: 1368-2822

DOI: 10.1111/1460-6984.12279

Accession Number: WOS:000404933400010

Abstract: Background: Conversation therapy for aphasia is a complex intervention comprising multiple components and targeting multiple outcomes. UK Medical Research Council (MRC) guidelines published in 2008 recommend that in addition to measuring the outcomes of complex interventions, evaluation should seek to clarify how such outcomes are produced, including identifying the hypothesized mechanisms of change. Aims: To identify mechanisms of change within a conversation therapy for people with aphasia and their partners. Using qualitative methods, the study draws on behaviour change theory to understand how and why participants make changes in conversation during and after therapy. Methods & Procedures: Data were derived from 16 participants (eight people with aphasia; eight conversation partners) who were recruited to the Better Conversations with Aphasia research project and took part in an eight session conversation therapy programme. The dataset consists of in-therapy discussions and post-therapy interviews, which are analysed using Framework Analysis. Outcomes & Results: Seven mechanisms of conversational behaviour change are identified and linked to theory. These show how therapy can activate changes to speakers' skills and motivation for using specific behaviours, and to the conversational opportunities available for strategy use. Conclusions & Implications: These clinically relevant findings offer guidance about the processes involved in producing behavioural change via conversation therapy. A distinction is made between the process involved in motivating change and that involved in embedding change. Differences are also noted between the process engaged in reducing unhelpful behaviour and that supporting new uses of compensatory strategies. Findings are expected to have benefits for those seeking to replicate therapy's core processes both in clinical practice and in future research.

Abstract: Objective Personal health applications have the potential to help patients with chronic disease by improving medication adherence, self-efficacy, and quality of life. The goal of this study was to assess the impact of MyMediHealth (MMH) – a website and a short messaging service (SMS)-based reminder system – on medication adherence and perceived self-efficacy in adolescents with asthma. **Methods** We conducted a block-randomized controlled study in academic pediatric outpatient settings. There were 98 adolescents enrolled. Subjects who were randomized to use MMH were asked to create a medication schedule and receive SMS reminders at designated medication administration times for 3 weeks. Control subjects received action lists as a part of their usual care. Primary outcome measures included MMH usage patterns and self-reports of system usability, medication adherence, asthma control, self-efficacy, and quality of life. **Results** Eighty-nine subjects completed the study, of whom 46 were randomized to the intervention arm. Compared to controls, we found improvements in self-reported medication adherence ($P = .011$), quality of life ($P = .037$), and self-efficacy ($P = .016$). Subjects reported high satisfaction with MMH; however, the level of system usage varied widely, with lower use among African American patients. **Conclusions** MMH was associated with improved medication adherence, perceived quality of life, and self-efficacy.

Title: Operationalising outpatient antimicrobial stewardship to reduce system-wide antibiotics for acute bronchitis

Journal: Bmj Open Quality

Volume: 10

Issue: 3

Short Title: Operationalising outpatient antimicrobial stewardship to reduce system-wide antibiotics for acute bronchitis

DOI: 10.1136/bmjopen-2020-001275

Article Number: e001275

Accession Number: WOS:000671784600002

Abstract: Background Antibiotics are not recommended for treatment of acute uncomplicated bronchitis (AUB), but are often prescribed (85% of AUB visits within the Veterans Affairs nationally). This quality improvement project aimed to decrease antibiotic prescribing for AUB in community-based outpatient centres from 65% to Methods From January to December 2018, community-based outpatient clinics' 6 months' average of prescribed antibiotics for AUB and upper

respiratory infections was 63% (667 of 1054) and 64.6% (314 of 486) when reviewing the last 6 months. Seven plan-do-study-act (PDSA) cycles were implemented by an interprofessional antimicrobial stewardship team between January 2019 and March 2020. Balancing measures were a return patient phone call or visit within 4 weeks for the same complaint. X-2 tests and statistical process control charts using Western Electric rules were used to analyse intervention data. Results The AUB antibiotic prescribing rate decreased from 64.6% (314 of 486) in the 6 months prior to the intervention to 36.8% (154 of 418) in the final 6 months of the intervention. No change was seen in balancing measures. The largest reduction in antibiotic prescribing was seen after implementation of PDSA 6 in which 14 high prescribers were identified and targeted for individualised reviews of encounters of patients with AUB with an antimicrobial steward. Conclusions Operational implementation of successful stewardship interventions is challenging and differs from the traditional implementation study environment. As a nascent outpatient stewardship programme with limited resources and no additional intervention funding, we successfully reduced antibiotic prescribing from 64.6% to 36.8%, a reduction of 43% from baseline. The most success was seen with targeted education of high prescribers.

DOI: 10.1080/21679169.2020.1804616

Accession Number: WOS:000561468300001

Abstract: Objective: Breast cancer survivors who are physically active have lower recurrence and all-cause mortality. Breast cancer survivors often struggle to initiate and maintain physically active lifestyles. Barriers include psychosocial, environmental, and musculoskeletal factors. An individualised physical activity

intervention, informed by physiotherapy and behaviour change principles, may comprehensively address these barriers. This study tests the feasibility of this intervention. Methods: Following ethical approval and informed consent, stage-I and stage-II breast cancer survivors within 18 months of diagnosis were recruited from a secondary care NHS breast cancer unit. The intervention used tools combining musculoskeletal dysfunction, self-efficacy measurement and the COM-B model to allow personal tailoring of intervention techniques. The feasibility of recruitment, retention, acceptability and practicality of delivery of the physical activity intervention was tested using a single arm study. Results: Nine of 36 (25%) potential participants were recruited. Seven (77%) were retained to the study end. All participants reported that the intervention was acceptable. Eight would recommend the intervention and reported that their physical activity level increased due to the intervention. The intervention was practical to deliver within routine physiotherapy appointments. Conclusions: This small feasibility study has promising findings and will now need to be tested with more participants.

DOI: 10.1080/09638288.2022.2029959

Accession Number: WOS:000750764700001

Abstract: Purpose Long-term needs of stroke survivors (especially psychosocial needs and stroke prevention) are not adequately addressed. Self-management programmes exist but the optimal content and delivery approach is unclear. We aim to describe the process undertaken to develop a structured self-management programme to address these unmet needs. Materials and methods Based on the Medical Research Council framework for complex interventions, the development involved three phases: "Exploring the idea": Evidence synthesis and patient and public involvement (PPI) with stroke

survivors, carers and healthcare professionals. "The iterative phase": Development and iterative refinement of the format, content, underpinning theories and philosophy of the self-management programme My Life After Stroke (MLAS), with PPI. MLAS consists of two individual appointments and four group sessions over nine weeks, delivered interactively by two trained facilitators. It aims to build independence, confidence and hope and focusses on stroke prevention, maximising physical potential, social support and managing emotional responses. MLAS is grounded in the narrative approach and social learning theory. "Ready for research": The refinement of a facilitator curriculum and participant resources to support programme delivery. Results Through a systematic process, we developed an evidence- and theory-based self-management programme for stroke survivors Conclusions MLAS warrants evaluation in a feasibility study.

Title: De-escalation of conflict in forensic mental health inpatient settings: a Theoretical Domains Framework-informed qualitative investigation of staff and patient perspectives

Journal: BMC Psychology

Volume: 10

Issue: 1

Date: Feb

Short Title: De-escalation of conflict in forensic mental health inpatient settings: a Theoretical Domains Framework-informed qualitative investigation of staff and patient perspectives

DOI: 10.1186/s40359-022-00735-6

Article Number: 30

Accession Number: WOS:000755845000001

Abstract: Background Violence and other harms that result from conflict in forensic inpatient mental health settings are an international problem. De-escalation approaches for reducing conflict are recommended, yet the evidence-base for their use is limited. For the first time, the present study uses implementation science and behaviour change approaches to identify the specific organisational and individual behaviour change targets for enhanced de-escalation in low and medium secure forensic inpatient settings. The primary objective of this study was to identify and describe individual professional, cultural and system-level barriers and enablers to the implementation of de-escalation in forensic mental health inpatient settings. The secondary objective was to identify

the changes in capabilities, opportunities and motivations required to enhance de-escalation behaviours in these settings. Methods Qualitative design with data collection and analysis informed by the Theoretical Domains Framework (TDF). Two medium secure forensic mental health inpatient wards and one low secure mental health inpatient ward participated. 12 inpatients and 18 staff participated across five focus groups and one individual interview (at participant preference) guided by a semi-structured interview schedule informed by the TDF domains. Data were analysed via Framework Analysis, organised into the 14 TDF domains then coded inductively within each domain. Results The capabilities required to enhance de-escalation comprised relationship-building, emotional regulation and improved understanding of patients. Staff opportunities for de-escalation are limited by shared beliefs within nursing teams stigmatising therapeutic intimacy in nurse-patient relationships and emotional vulnerability in staff. These beliefs may be modified by ward manager role-modelling. Increased opportunity for de-escalation may be created by increasing service user involvement in antipsychotic prescribing and modifications to the physical environment (sensory rooms and limiting restrictions on patient access to ward spaces). Staff motivation to engage in de-escalation may be increased through reducing perceptions of patient dangerousness via post-incident debriefing and advanced de-escalation planning. Conclusions Interventions to enhance de-escalation in forensic mental health settings should enhance ward staff's understanding of patients and modify beliefs about therapeutic boundaries which limit the quality of staff-patient relationships. The complex interactions within the capabilities-opportunities-motivation configuration our novel analysis generated, indicates that de-escalation behaviour is unlikely to be changed through knowledge and skills-based training alone. De-escalation training should be implemented with adjunct interventions targeting: collaborative antipsychotic prescribing; debriefing and de-escalation planning; modifications to the physical environment; and ward manager role-modelling of emotional vulnerability and therapeutic intimacy in nurse-patient relationships.

Title: Developing an integrated biomedical and behavioural theory of functioning and disability: adding models of behaviour to the ICF framework

Journal: Health Psychology Review

Volume: 8

Issue: 4

Pages: 381-403

Short Title: Developing an integrated biomedical and behavioural theory of functioning and disability: adding models of behaviour to the ICF framework

ISSN: 1743-7199

DOI: 10.1080/17437199.2013.855592

Accession Number: WOS:000342294400001

Abstract: The International Classification of Functioning Disability and Health (ICF) offers an agreed language on which a scientific model of functional outcomes can be built. The ICF defines functional outcomes as activity and activity limitations (AL) and defines both in behavioural terms. The ICF, therefore, appears to invite explanations of AL as behaviours. Studies of AL find that psychological variables, especially perceptions of control, add to biomedical variables in predicting AL. Therefore, two improved models are proposed, which integrate the ICF with two psychological theories, the theory of planned behaviour (TPB) and social cognitive theory (SCT). These models have a sound evidence base as good predictors of behaviour, include perceived control constructs and are compatible with existing evidence about AL. When directly tested in studies of community and clinic-based populations, both integrated models (ICF/TPB and ICF/SCT) outperform each of the three basic models (ICF, TPB and SCT). However, when predicting activity rather than AL, the biomedical model of the ICF does not improve prediction of activity by TPB and SCT on their own. It is concluded that these models offer a better explanation of functional outcomes than the ICF alone and could form the basis for the development of improved models.

Title: What Is Behavioural Medicine? Commentary on Definition

Proposed by Dekker, Stauder and Penedo

Journal: International Journal of Behavioral Medicine

Volume: 24

Issue: 1

Pages: 8-11

Date: Feb

Short Title: What Is Behavioural Medicine? Commentary on Definition

Proposed by Dekker, Stauder and Penedo

ISSN: 1070-5503

DOI: 10.1007/s12529-016-9611-6

Accession Number: WOS:000394151800003

Abstract: Purpose Dekker et al. (2016) propose an updated definition of behavioural medicine. In this commentary, we discuss how the field and the disciplines involved have changed over time before suggesting small amendments to the proposed definition. We suggest that the range of medicine which might be considered 'behavioural' is increasing to encompass virtually all medical practice. In addition, the role of behaviour and the potential for behaviour change as a means of improving health have become increasingly important. A defining characteristic of behavioural medicine is the involvement of multiple disciplines, working together or in parallel and, as the extent of the field expands, more disciplines are likely to be involved. We therefore propose that the definition should represent the full width of the research, practice and disciplines involved in behavioural medicine.

Title: Human-Centered Design of a Digital Health Tool to Promote Effective Self-care in Patients With Heart Failure: Mixed Methods Study

Journal: Jmir Formative Research

Volume: 6

Issue: 5

Date: May

Short Title: Human-Centered Design of a Digital Health Tool to Promote Effective Self-care in Patients With Heart Failure: Mixed Methods Study

DOI: 10.2196/34257

Article Number: e34257

Accession Number: WOS:000854077500026

Abstract: Background: Effective self-care is an important factor in the successful management of patients with heart failure (HF). Despite the importance of self-care, most patients with HF are not adequately taught the wide range of skills required to become proficient in self-care. Digital health technology (DHT) may provide a novel solution to support patients at home in effective self-care, with the view to enhancing the quality of life and ultimately improving patient outcomes. However, many of the solutions developed to date have failed to consider users' perspectives at the point of design, resulting in poor effectiveness. Leveraging a human-centered design (HCD) approach to the development of DHTs may lead to the successful promotion of self-care behaviors in patients with HF.

Objective: This study aimed to outline the HCD, development, and

evaluation process of a DHT designed to promote effective self-care in patients with HF. Methods: A design thinking approach within the HCD framework was undertaken, as described in the International Organization for Standardization 9241-210:2019 regulations, using a 5-step process: empathize, ideate, design, develop, and test. Patients with HF were involved throughout the design and evaluation of the system. The designed system was grounded in behavior change theory using the Theoretical Domains Framework and included behavior change techniques. Mixed methods were used to evaluate the DHT during the testing phase. Results: Steps 1 to 3 of the process resulted in a set of evidence- and user-informed design requirements that were carried forward into the iterative development of a version 1 system. A cross-platform (iOS and Android) mobile app integrated with Fitbit activity trackers and smart scales was developed. A 2-week user testing phase highlighted the ease of use of the system, with patients demonstrating excellent adherence. Qualitative analysis of semistructured interviews identified the early potential for the system to positively influence self-care. Specifically, users perceived that the system increased their confidence and motivation to engage in key self-care behaviors, provided them with skills and knowledge that made them more aware of the importance of self-care behaviors, and might facilitate timely help seeking. Conclusions: The use of an HCD methodology in this research has resulted in the development of a DHT that may engage patients with HF and potentially affect their self-care behaviors. This comprehensive work lays the groundwork for further development and evaluation of this solution before its implementation in health care systems. A detailed description of the HCD process used in this research will help guide the development and evaluation of future DHTs across a range of disease use cases.

Abstract: Introduction Antimicrobial resistance is a growing global health threat, driven by increasing inappropriate use of antimicrobials. High prevalence of unnecessary use of antimicrobials in residential aged care facilities (RACFs) has driven demand for the development and implementation of antimicrobial stewardship (AMS) programmes. The Stepped-wedge Trial to increase antibiotic Appropriateness in Residential aged care facilities and model Transmission of antimicrobial resistance (START) will implement and evaluate the impact of a nurse-led AMS programme on antimicrobial use in 12 RACFs. Methods and analysis The START trial will implement and evaluate a nurse-led AMS programme via a stepped-wedge cluster randomised controlled trial design in 12 RACFs over 16 months. The AMS programme will incorporate education, aged care-specific treatment guidelines, documentation forms, and audit and feedback strategies that will target aged care staff, general practitioners, pharmacists, and residents and their families. The intervention will primarily focus on urinary tract infections, lower respiratory tract infections, and skin and soft tissue infections. RACFs will transition from control to intervention phases in random order, two at a time, every 2 months, with a 2-month transition, wash-in period. The primary outcome is the cumulative proportion of residents within each facility prescribed an antibiotic during each month and total days of antibiotic use per 1000 occupied bed days. Secondary outcomes include the number of courses of systemic antimicrobial therapy, antimicrobial appropriateness, antimicrobial resistant organisms, Clostridioides difficile infection, change in antimicrobial susceptibility profiles, hospitalisations and all-cause mortality. Analyses will be conducted according to the intention-to-treat principle. Ethics and dissemination Ethics approval has been granted by the Alfred Hospital Human Research Ethics Committee (HREC/18/Alfred/591). Research findings will be

disseminated through peer-reviewed publications, conferences and summarised reports provided to participating RACFs.

Abstract: Background: Cardiovascular disease is chronic and often a sign of long-standing unhealthy lifestyle habits. Patients need support to reach lifestyle changes, well-being, join in social and vocational activity. Thus, patient responsibility should to be encouraged to provide quality as well as longevity. Cardiac rehabilitation programs aid patients in the attainment of these objectives. However, research shows that behavioral change following the diagnosis of a chronic disease is a challenge. Objectives: We sought to determine behavioral change challenges in patients with cardiovascular disease to improve intervention programs. Patients and Methods: Using a descriptive qualitative approach, we collected the data using 30 in-depth semi-structure interviews. Thematic analysis was conducted to identify themes from the data. Results: Three sources of behavioral change challenges emerged regarding the nature of cardiac disease and the role of the individual and the family in the recovery process. These challenges acted at two levels: intra- and interpersonal. The intrapersonal factors comprised value, knowledge and judgment about cardiovascular disease, and self-efficacy to fulfill the rehabilitation task. Family overprotection constituted the principal component of the interpersonal level. Conclusions: Behaviors are actually adopted and sustained by patients are so far from that recommended by health professionals. This gap could be reduced by identifying behavioral change challenges, rooted in the beliefs of the individual and the family. Therefore, culturally-based interventions to enhance disease

self-management should be considered.

Article Number: e019142

Accession Number: WOS:000431743500098

Abstract: Introduction Breast feeding improves the health of mothers and infants; the UK has low rates, with marked socioeconomic inequalities. While trials of peer support services have been effective in some settings, UK trials have not improved breast feeding rates. Qualitative research suggests that many women are alienated by the focus on breast feeding. We propose a change from breast feeding-focused interactions to respecting a woman's feeding choices, inclusion of behaviour change theory and an increased intensity of contacts in the 2weeks after birth when many women cease to breast feed. This will take place alongside an assets-based approach that focuses on the positive capability of individuals, their social networks and communities. We propose a feasibility study for a multicentre randomised controlled trial of the Assets feeding help Before and After birth (ABA) infant feeding service versus usual care. Methods and analysis A two-arm, non-blinded randomised feasibility study will be conducted in two UK localities. Women expecting their first baby will be eligible, regardless of feeding intention. The ABA infant feeding intervention will apply a proactive, assets-based, woman centred, non-judgemental approach, delivered antenatally and postnatally tailored through face-to-face contacts, telephone and SMS texts. Outcomes will test the feasibility of delivering the intervention with recommended

intensity and duration to disadvantaged women; acceptability to women, feeding helpers and professionals; and feasibility of a future randomised controlled trial (RCT), detailing recruitment rates, willingness to be randomised, followup rates at 3 days, 8 weeks and 6 months, and level of outcome completion. Outcomes of the proposed full trial will also be collected. Mixed methods will include qualitative interviews with women/partners, feeding helpers and health service staff; feeding helper logs; and review of audio-recorded helper women interactions to assess intervention fidelity. Ethics and dissemination Study results will inform the design of a larger multicentre RCT. The National Research Ethics Service Committee approved the study protocol.

Article Number: e000701

Accession Number: WOS:000672549200052

Abstract: Background and aims Summarising quality improvement (QI) research through systematic literature review has great potential to improve patient care. However, heterogeneous terminology, poor definition of QI concepts and overlap with other scientific fields can make it hard to identify and extract data from relevant literature. This report examines the compromises and pragmatic decisions that undertaking literature review in the field of QI requires and the authors propose recommendations for literature review authors in similar fields. Methods Two authors (EJ and JF)

provide a reflective account of their experiences of conducting a systematic literature review in the field of QI. They draw on wider literature to justify the decisions they made and propose recommendations to improve the literature review process. A third collaborator, (WC) co-created the paper challenging author's EJ and JF views and perceptions of the problems and solutions of conducting a review of literature in QI. Results Two main challenges were identified when conducting a review in QI. These were defining QI and selecting QI studies. Strategies to overcome these problems include: select a multi-disciplinary authorship team; review the literature to identify published QI search strategies, QI definitions and QI taxonomies; Contact experts in related fields to clarify whether a paper meets inclusion criteria; keep a reflective account of decision making; submit the protocol to a peer reviewed journal for publication. Conclusions The QI community should work together as a whole to create a scientific field with a shared vision of QI to enable accurate identification of QI literature. Our recommendations could be helpful for systematic reviewers wishing to evaluate complex interventions in both QI and related fields.

Accession Number: WOS:000385600100068

Abstract: Achieving sustainable development requires the decoupling of economic growth from the use of non-renewable resources. This depends on industry adopting unconventional approaches to production. This research explores the root causes of barriers to the adoption of such approaches in the construction industry, and applies a behavioural model to assess whether companies are hindered by capability, opportunity or motivation. The long history of lowest-cost tendering in construction has led to a path-dependent lock-in to conventional market-driven objectives of cost and risk reduction; it is suggested that locked-in companies lack the commercial opportunity and hence motivation, rather than the capability, to adopt approaches perceived to increase cost or risk. Such companies will therefore tend to resist unconventional approaches, restricting the physical opportunity for other project

participants. This theory is explored in a case study of first adoptions of cross-laminated timber (CLT) in UK projects, using a survey and series of semi-structured interviews. The case study found that project contexts created market niches. This provided designers, who were motivated to use CLT, the opportunity to promote its use in the project. CLT was seen as key to successful resolution of project constraints, thereby providing motivation to other project participants to adopt the material. (C) 2016 The Authors. Published by Elsevier Ltd. Abstract: Objectives To evaluate the asymptomatic coronavirus testing programme at Durham University by exploring students' barriers and facilitators to taking part and provide recommendations to improve the programme. Design Qualitative interviews. Setting Online. Participants 30 students enrolled at Durham University were interviewed in March 2021. Main outcome measures Attitudes towards testing, experiences of testing and barriers and facilitators to engaging in testing at Durham University. Results Key motivations for testing included protecting oneself and others and accessing facilities and events. The process of booking, accessing and doing a test was mostly easy and convenient, although some may prefer home testing. There were concerns about the accuracy of tests and the implications of a positive result. Some highlighted they might be less likely to engage in testing if vaccinated. A negative test result provided confidence to engage in their daily activities, while encouraging some to socialise more. Conclusions The findings show that the testing programme at Durham University is convenient and well organised, with testing as a potential requirement to access social events, and self-isolation support being key contributor to uptake. These findings provide insights into young

adults' attitudes towards testing and can inform testing programmes in other universities and settings with asymptomatic testing programmes.

Short Title: Promoting adherence to nebulized therapy in cystic fibrosis: poster development and a qualitative exploration of adherence

ISSN: 1177-889X

DOI: 10.2147/ppa.S82896

Accession Number: WOS:000358875500002

Abstract: Background: Cystic fibrosis (CF) health care professionals recognize the need to motivate people with CF to adhere to nebulizer treatments, yet little is known about how best to achieve this. We aimed to produce motivational posters to support nebulizer adherence by using social marketing involving people with CF in the development of those posters. Methods: The Sheffield CF multidisciplinary team produced preliminary ideas that were elaborated upon with semi-structured interviews among people with CF to explore barriers and facilitators to the use of nebulized therapy. Initial themes and poster designs were refined using an online focus group to finalize the poster designs. Results: People with CF preferred aspirational posters describing what could be achieved through adherence in contrast to posters that highlighted the adverse consequences of nonadherence. A total of 14 posters were produced through this process. Conclusion: People with CF can be engaged to develop promotional material to support adherence, providing a unique perspective differing from that of the CF multidisciplinary team. Further research is needed to evaluate the effectiveness of these posters to support nebulizer adherence.

Title: Application of Intervention Mapping to the Development of a Complex Physical Therapist Intervention

Journal: Physical Therapy

Volume: 96

Issue: 12

Pages: 1994-2004

Date: Dec

Short Title: Application of Intervention Mapping to the Development of a Complex Physical Therapist Intervention

ISSN: 0031-9023

DOI: 10.2522/ptj.20150387

Accession Number: WOS:000389399100014

Abstract: Background. Physical therapist interventions, such as those designed to change physical activity behavior, are often complex and multifaceted. In order to facilitate rigorous evaluation and implementation of these complex interventions into clinical practice, the development process must be comprehensive, systematic, and transparent, with a sound theoretical basis. Intervention Mapping is designed to guide an iterative and problem-focused approach to the development of complex interventions. Purpose. The purpose of this case report is to demonstrate the application of an Intervention Mapping approach to the development of a complex physical therapist intervention, a remote self-management program aimed at increasing physical activity after acquired brain injury. Case Description. Intervention Mapping consists of 6 steps to guide the development of complex interventions: (1) needs assessment; (2) identification of outcomes, performance objectives, and change objectives; (3) selection of theory-based intervention methods and practical applications; (4) organization of methods and applications into an intervention program; (5) creation of an implementation plan; and (6) generation of an evaluation plan. The rationale and detailed description of this process are presented using an example of the development of a novel and complex physical therapist intervention, myMoves a program designed to help individuals with an acquired brain injury to change their physical activity behavior. Conclusion. The Intervention Mapping framework may be useful in the development of complex physical therapist interventions, ensuring the development is comprehensive, systematic, and thorough, with a sound theoretical basis. This process facilitates translation into clinical practice and allows for greater confidence and transparency when the program efficacy is investigated.

Date: Apr

Short Title: The development of PAT-HD: A co-designed tool to promote physical activity in people with Huntington's disease

ISSN: 1369-6513

DOI: 10.1111/hex.13210

Accession Number: WOS:000617554100001

Abstract: Background Huntington's disease (HD) is a genetic condition resulting in movement, behavioural and cognitive impairments. People with HD have low levels of physical activity which may be compounded by insufficient support from health-care professionals. Objective To evaluate the initial acceptability of a co-designed tool used within a HD clinic to promote physical activity. Design Co-design of a physical activity tool; acceptability evaluation. Setting and participants Co-design included people with HD and health-care professionals. Acceptability was evaluated in a HD clinic in the UK. Main variables studied A physical activity tool was co-designed and used within a HD clinic. Main outcome measure Acceptability as assessed by semi-structured interviews with members of the HD clinic. Results Forty people visited the HD clinic; 19 were given physical activity advice. Themes around who, where and how promotion of physical activity could take place were identified; concepts of benefits and barriers were threads through each theme. Discussion We describe for the first time the co-design of a HD specific physical activity tool. Our associated acceptability study emphasizes the importance of individualized planning of physical activities in complex neurodegenerative conditions. Perceived barriers were time and lack of knowledge of local resources. Conclusions A simple tool can support conversations about physical activity with people with HD and is an aid to individualized goal setting. Exploring the use of PAT-HD within a community setting and development of support systems for health-care professionals and support workers who are in regular contact with people with HD is required.

DOI: 10.1016/j.jclinepi.2017.01.004

Accession Number: WOS:000401683100009

Abstract: Objectives: Meta-analyses using individual patient data (IPD) rather than aggregated data are increasingly applied to analyze sources of heterogeneity between trials and have only recently been applied to unravel multicomponent, complex interventions. This study reflects on methodological challenges encountered in two IPD meta-analyses on self-management interventions in patients with heart failure or chronic obstructive pulmonary disease. Study Design and Setting: Critical reflection on prior IPD meta-analyses and discussion of literature. Results: Experience from two IPD meta-analyses illustrates methodological challenges. Despite close collaboration with principal investigators, assessing the effect of characteristics of complex interventions on the outcomes of trials is compromised by lack of sufficient details on intervention characteristics and limited data on fidelity and adherence. Furthermore, trials collected baseline variables in a highly diverse way, limiting the possibilities to study subgroups of patients in a consistent manner. Possible solutions are proposed based on lessons learnt from the methodological challenges. Conclusion: Future researchers of complex interventions should pay considerable attention to the causal mechanism underlying the intervention and conducting process evaluations. Future researchers on IPD meta-analyses of complex interventions should carefully consider their own causal assumptions and availability of required data in eligible trials before undertaking such resource-intensive IPD meta-analysis. Title: A population survey on beliefs around cervical cancer screening: determining the barriers and facilitators associated with attendance
Journal: BMC Cancer
Volume: 22
Issue: 1
Date: May
Short Title: A population survey on beliefs around cervical cancer screening: determining the barriers and facilitators associated with attendance
DOI: 10.1186/s12885-022-09529-w
Article Number: 522
Accession Number: WOS:000792647300004
Abstract: Background Cervical screening saves approximately 5000 lives annually in England. However, screening rates have been falling continuously, and coverage in London is particularly low (64.7%). While demographic predictors of uptake have been well researched, there has been less thorough investigation of the individual barriers and facilitators which predict cervical screening attendance. Understanding modifiable factors influencing attendance can guide the design of effective interventions to increase cervical screening uptake. The aim of this study was to understand the demographic, and individual factors associated with self-reported attendance at cervical screening in London. Methods The study used an online survey of 500 women in London (June-July 2017). The survey included self-reported measures of past attendance, demographic variables (including age, household income, ethnicity), past experience variables, and individual variables (list of potential barriers and facilitators developed based on the Theoretical Domains Framework and existing literature, which included: environmental context and resources, perceived risk, anticipated pain/embarrassment). Participants were categorised into regular attenders and non-regular attenders. Backwards stepwise logistic regression investigated the barriers and facilitators predicting past attendance. Demographic variables with significant

differences between regular and non-regular attenders were added to the final regression model. Results Of women who had previously been invited (n = 461, age range: 25-65), 34.5% (n = 159) were classified as non-regular attenders, and 65.5% (n = 302) as regular attenders. The individual barriers and facilitators predicting attendance were: cervical screening priority, memory, environmental context and resources, and intention. The only demographic variables related to regular attendance were relationship status (married/civil partnership having higher rates than single) and higher household income. Relationship status was not significant when adjusting for barriers and facilitators. Those who have ever been sexually active or who have had an STI in the past were significantly more likely to be regular attenders. Conclusions The study shows the importance of individual barriers and facilitators in predicting self-reported cervical screening attendance. Household income was the only significant demographic variable when combined with the individual variables. Interventions targeting priority, memory, and practical barriers affecting environmental context may be expected to be effective an increasing attendance.

Short Title: STOP- a training intervention to optimise treatment for smoking cessation in community pharmacies: cluster randomised controlled trial

ISSN: 1741-7015

DOI: 10.1186/s12916-022-02412-2

Article Number: 212

Accession Number: WOS:000817287300001

Abstract: Background: Community pharmacies serve people with high levels of tobacco-related illness, but throughput in NHS Stop Smoking Services in pharmacies remains relatively low. We investigated the effectiveness of a complex intervention to increase service uptake and retention. Methods: We randomised 60 pharmacies in England and Wales to the STOP intervention or usual practice in a pragmatic, parallel-group, controlled trial over 11 months. Smokers were blind to the allocation. The intervention was theory-based consultation skills training for pharmacy staff with environmental

prompts (badges, calendars and behavioural cues). The primary outcome was the number of smokers attending an initial consultation and setting a quit date. Results: The intervention made no significant difference in setting a quit date, retention or quit rate. A total of 631 adult smokers (service users) enrolled and set a quit date in intervention pharmacies compared to 641 in usual practice pharmacies, a rate ratio of 0.75 (95% CI 0.46 to 1.23) adjusted for site and number of prescriptions. A total of 432 (68%) service users were retained at 4 weeks in intervention and 500 (78%) in usual practice pharmacies (odds ratio 0.80, 0.41 to 1.55). A total of 265 (42%) service users quit smoking at 4 weeks in intervention and 276 (43%) in usual practice pharmacies (0.96, 0.65 to 1.43). The pharmacy staff were positive about the intervention with 90% (56/62) stating that it had improved their skills. Sixty-eight per cent would strongly recommend the training to others although there was no difference in self-efficacy for service delivery between arms. Seventy of 131 (53%) service users did not complete the 6-month follow-up assessment. However, 55/61 (90%) service users who completed follow-up were satisfied or very satisfied with the service. All usual practice arm service users (n = 33) and all but one in the intervention arm (n = 27) would recommend the service to smokers. Conclusions: We found high levels of retention and acceptable quit rates in the NHS pharmacy stop smoking service. Despite pharmacy staff providing positive feedback on the STOP intervention, it made no difference to service throughput. Thus, other factors may currently limit service capacity to help smokers to quit.

Short Title: Implementation of immunochemical faecal occult blood test in general practice: a study protocol using a cluster-randomised stepped-wedge design

DOI: 10.1186/s12885-016-2477-9

Article Number: 445

Accession Number: WOS:000379908500001

Abstract: Background: Colorectal cancer is a common malignancy and a leading cause of cancer-related death. Half of patients with colorectal cancer initially present with non-specific or vague symptoms. In the need for a safe low-cost test, the immunochemical faecal occult blood test (iFOBT) may be part of the evaluation of such patients in primary care. Currently, Danish general practitioners have limited access to this test. The aim of this article is to describe a study that will assess the uptake and clinical use of iFOBT in general practice. Furthermore, it will investigate the diagnostic value and the clinical implications of using iFOBT in general practice on patients presenting with non-alarm symptoms of colorectal cancer. Methods/Design: The study uses a cluster-randomised stepped-wedge design and is conducted in the Central Denmark Region among 836 GPs in 381 general practices. The municipalities of the Region and their appertaining general practitioners will be included sequentially in the study during the first 7 months of the 1-year study period. The following intervention has been developed for the study: a mandatory intervention providing all general practitioners with a starting package of 10 iFOBTs, a clinical instruction on iFOBT use in general practice and online information material from the date of inclusion, and an optional intervention consisting of a continuous medical education on colorectal cancer diagnostics and use of iFOBT. Discussion: This study is among the first and largest trials to investigate the diagnostic use and the clinical value of iFOBT on patients presenting with non-alarm symptoms of colorectal cancer. The findings will be of national and international importance for the future planning of colorectal cancer diagnostics, particularly for 'low-risk-but-not-no-risk' patients with non-alarm symptoms of colorectal cancer.

Abstract: OBJECTIVES: In fall 2020, community hubs opened in San Francisco, California, to support vulnerable groups of students in remote learning. Our objectives were to (1) describe adherence to coronavirus disease 2019 (COVID-19) mitigation policies in these urban, low-income educational settings; (2) assess associations between policy adherence and in-hub COVID-19 transmission; and (3) identify barriers to and facilitators of adherence. METHODS: We conducted a mixed-methods study from November 2020 to February 2021. We obtained COVID-19 case data from the San Francisco Department of Public Health, conducted field observations to observe adherence to COVID-19 mitigation policies, and surveyed hub leaders about barriers to and facilitators of adherence. We summarized quantitative data using descriptive statistics and qualitative data using thematic content analysis. RESULTS: A total of 1738 children were enrolled in 85 hubs (39% Hispanic, 29% Black). We observed 54 hubs (n = 1175 observations of children and 295 observations of adults). There was high community-based COVID-19 incidence (2.9–41.2 cases per 100 000 residents per day), with 36 cases in hubs and only 1 case of hub-based transmission (adult to adult). Sixty-seven percent of children and 99% of adults were masked. Fifty-five percent of children and 48% of adults were distanced \geq 6 ft. Facilitators of mitigation policies included the following: for masking, reminders, adequate supplies, and "unmasking zones"; for distancing, reminders and distanced seating. CONCLUSIONS: We directly observed COVID-19 mitigation in educational settings, and we found variable adherence. However, with promotion of multiple policies, there was minimal COVID-19 transmission (despite high community incidence). We detail potential strategies for increasing adherence to COVID-19 mitigation.

Short Title: Content analysis of antiretroviral adherence enhancing

interview reports

ISSN: 0738-3991

DOI: 10.1016/j.pec.2018.05.013

Accession Number: WOS:000439373300020

Abstract: Objective: To identify factors associated with low or high antiretroviral (ARV) adherence through computational text analysis of an adherence enhancing programme interview reports. Methods: Using text from 8428 interviews with 522 patients, we constructed a term-frequency matrix for each patient, retaining words that occurred at least ten times overall and used in at least six interviews with six different patients. The text included both the pharmacist's and the patient's verbalizations. We investigated their association with an adherence threshold (above or below 90%) using a regularized logistic regression model. In addition to this data-driven approach, we studied the contexts of words with a focus group. Results: Analysis resulted in 7608 terms associated with low or high adherence. Terms associated with low adherence included disruption in daily schedule, side effects, socio-economic factors, stigma, cognitive factors and smoking. Terms associated with high adherence included fixed medication intake timing, no side effects and positive psychological state. Conclusion: Computational text analysis helps to analyze a large corpus of adherence enhancing interviews. It confirms main known themes affecting ARV adherence and sheds light on new emerging themes. Practice implications: Health care providers should be aware of factors that are associated with low or high adherence. This knowledge should reinforce the supporting factors and try to resolve the barriers together with the patient. (C) 2018 Elsevier B.V. All rights reserved.

Short Title: Enablers and barriers to women's lifestyle behavior change during the preconception period: A systematic review

ISSN: 1467-7881

DOI: 10.1111/obr.13235

Accession Number: WOS:000631247700001

Abstract: Healthy lifestyle behaviors during the preconception period are important to optimize maternal and child outcomes, including weight. However, the majority of women do not have optimal preconception lifestyle behaviors. This systematic review explored enablers and barriers to women's preconception lifestyle behaviors using the Capability, Opportunity, Motivation, Behaviour (COM-B) model and Theoretical Domains Framework (TDF). Preconception was defined as the time before conception, capturing planned and unplanned pregnancies. Medline Complete, EMBASE, PsycINFO, and CINAHL were searched for peer-reviewed, quantitative and qualitative primary studies (English, 2006-2020) that explored enablers and barriers to lifestyle behaviors (diet, physical activity, smoking, alcohol use, supplement intake). Forty-two studies (of 3406) were included, assessing supplement use (n = 37), diet (n = 10), smoking (n = 10), alcohol use (n = 8), and physical activity (n = 5). All three COM-B components were identified only for diet and supplement use. Of the 14 TDF domains, 7 were identified: knowledge, beliefs about capabilities, beliefs about consequences, goals, intentions, social support, and environmental context and resources. The presence/absence of knowledge on healthy behaviors was the most commonly assessed enabler/barrier. Future studies should explore a wider range of factors influencing preconception women's capability, opportunity, and motivation to modify their lifestyle behaviors. Abstract: Background: Goals of managing patients with acute kidney

injury (AKI) are mitigating disease progression and ensuring safety while providing supportive care because no effective treatment exists. One strategy recommended in guidelines to meet these goals is optimizing medication management. Unfortunately, guideline implementation appears to be lacking as observed by the frequent occurrence of medication errors and adverse drug events. Objective: To address this performance gap in the care of hospitalized patients receiving nephrotoxins and renally eliminated drugs, we sought to provide a potential intervention based on theory-informed behavior change. Methods: Formative research with a qualitative analysis identifying what needs to change in patient care was completed by obtaining clinician opinion and expert opinion and reviewing the published literature. Frontline providers, including 8 physicians, 4 pharmacists, and a multiprofessional group of authors, provided insight into possible barriers to appropriate prescribing. Capability, Opportunity, Motivation and Behavior model and Theoretical Domain Framework were applied to characterize behavior change interventions and inform a potential implementation intervention for changing inappropriate prescribing behaviors. Results: Lack of knowledge about appropriate drug management in patients at risk for adverse outcomes was provided as a major barrier. Other reported barriers included a lack of: (1) tools to assist with drug management, (2) motivation to make changes, (3) routinization, and (4) an accountable clinician. Conclusions and Relevance: Assigning a designated clinician to execute a stepwise, routine care process following the checklist provided is a recommended intervention to overcome barriers. The intended impact is behavior change that reduces inappropriate prescribing. Notes: Kane-Gill, Sandra L. Barreto, Erin F. Bihorac, Azra Kellum, John A. Abstract: PurposeTo evaluate the efficacy of environment-based intervention on participation outcomes and parent efficacy in autistic children.Materials and methodsTwenty-one autistic children

6–10 years old and their parents were randomized to environment-based intervention (n = 11) or usual care (n = 10). The environment-based intervention targets individualized participation goals in leisure and community activities through changing environment and activity demands. The study outcomes were Canadian Occupational Performance Measure (COPM), Goal attainment scaling (GAS), and Parent Empowerment and Efficacy Measure (PEEM). Assessments included baseline, 12 weeks (post-test), and 24 weeks (follow-up). Mixed ANOVAs were used to examine within-group and between-group effects in outcome variables. Results The COPM performance and satisfaction scores and GAS T-scores increased after environment-based intervention from baseline to 12 weeks and 24 weeks ($p < 0.001$) but did not significantly differ from usual care. The medium to large effect sizes of COPM performance and GAS T-scores favored the environment-based intervention. For the PEEM scores, no significant differences were found. Conclusions Environment-based intervention may support school-age autistic children to participate in self-chosen activities over time. The intervention effects on participation goals and parent efficacy, however, were inconclusive and need further research.

Abstract: The purpose of the present study is to examine the deviant behaviors of young athletes the using extended theory of planned behavior (TPB) and impulsivity. About 536 middle and high school athletes in South Korea answered a set of questionnaires that measured their attitude, subjective norms, perceived behavioral control, intention, ethical obligation, and impulsivity. Structural equation model (SEM) analysis revealed that the extended TPB model is adequate to explain deviant behaviors in sports. Further, the underlying intentions that motivate the deviant behaviors of athletes in sports were significantly predicted by perceived behavioral control and moral obligation. Findings also suggested that the intention for deviant behaviors in sports more readily manifests as an actual act when the impulsivity scores are high. Theoretical contributions and practical implications are addressed

in the Discussion section.</p>

DOI: 10.9745/ghsp-d-16-00411

Accession Number: WOS:000406250500008

Abstract: Shifting childbirth into facilities has not improved health outcomes for mothers and newborns as significantly as hoped. Improving the quality and safety of care provided during facility-based childbirth requires helping providers to adhere to essential birth practices-evidence-based behaviors that reduce harm to and save lives of mothers and newborns. To achieve this goal, we developed the BetterBirth Program, which we tested in a matched-pair, cluster-randomized controlled trial in Uttar Pradesh, India. The goal of this intervention was to improve adoption and sustained use of the World Health Organization Safe Childbirth Checklist (SCC), an organized collection of 28 essential birth practices that are known to improve the quality of facility-based childbirth care. Here, we describe the BetterBirth Program in detail, including its 4 main features: implementation tools, an implementation strategy of coaching, an implementation pathway (Engage-Launch-Support), and a sustainability plan. This coaching-based implementation of the SCC motivates and empowers care providers to identify, understand, and resolve the barriers they face in using the SCC with the resources already available. We describe important lessons learned from our experience with the BetterBirth Program as it was tested in the BetterBirth Trial. For example, the emphasis on relationship building and respect led to trust between coaches and birth attendants and helped influence change. In addition, the cloud-based data collection and feedback system proved a valuable asset in the coaching process. More research on coaching-based interventions is required to refine our understanding of what works best to improve quality and safety of care in various settings. Note: At the time of

publication of this article, the results of evaluation of the impact of the BetterBirth Program were pending publication in another journal. After the impact findings have been published, we will update this article with a reference to the impact findings.

Accession Number: WOS:000855658300003

Abstract: A misalignment between safety interventions and the workplace context of their application could lead to diminished effectiveness or failure. This paper is the first of three of an umbrella study that aimed to understand whether and how researchers and organisations consider contextual factors in safety interventions. Through Rapid Evidence Assessment (REA) process, we searched and selected scholarly work indexed in the bibliographic databases Medline, APA PsycArticles, Web of Science and Scopus between January 2011 and June 2021. The studies were analysed using a framework developed according to translation theory about (de)contextualisation of knowledge. The framework was enriched to consider psychosocial factors at the organisational level and physical, cognitive and emotional factors of the interventions' recipients. We identified 73 eligible studies, of which 47 described safety interventions that had not been deployed in workplaces (e.g., pilot studies and concepts) and 26 studies referred to those deployed. No study considered all factors of the framework. Communication and support from management and colleagues were the most considered psychosocial factors, whereas conflicting demands and job security were the least considered. Moreover, cognitive factors of workers were mentioned in 77% of the sample, with only one study considering inclusively cognitive, emotional and physical factors of recipients. About 62% of the implemented interventions were functional (e.g., training, education and communication-related interventions), with only four studies reporting physical interventions. Also, most of the interventions were sourced from the literature and introduced as 'new practice' at the targeted

workplaces, with only one article reporting a failed intervention. Overall, the findings of this research indicated that intervention studies did not visibly follow a translation-transformation path between sources and recipients, did not systematically consider contextual factors at the workplaces targeted, and all interventions represented administrative controls, contrary to the widely accepted principle of the hierarchy of controls.

Abstract: The Serious Illness Care Program (SICP), designed by Ariadne Labs, is a multicomponent intervention to improve conversations about values and goals for patients with a life-limiting illness. In oncology, implementation of the SICP achieved more, earlier, and better-quality conversations and reduced anxiety and depression among patients with advanced cancer. In this commentary, we describe the SICP, including results from the cluster-randomized trial, provide examples of real-world implementation of this program, and highlight ongoing challenges and barriers that are preventing widespread adoption of this intervention into routine practice. For the SICP to be successfully embedded into routine patient care, it will require significant effort, including ongoing leadership support and training opportunities, champions from all sectors of the interdisciplinary team, and adaptation of the program to a wider range of patients. Future research should also investigate how early conversations can be translated into personalized care plans for patients.

ISSN: 1367-2223

DOI: 10.1111/ajsp.12454

Accession Number: WOS:000606396500001

Abstract: Low carbon readiness (LCR) is an aspect of environmental identity, an individual citizen's willingness to reduce carbon emissions and transition to low carbon lifestyle as a personal striving. Nevertheless, individuals' personal strivings are strongly influenced by the social context in which they are situated. We propose the social context of environmental identity model, which postulates that social contexts for LCR have a nested structure. The micro-level Home is linked with other households through social networks at the meso-level Community, which are further embedded in a macro-level Society. These contexts are likely to influence LCR through different mechanisms. Home can exert direct influences by monitoring and reminding each other of the need to engage in low carbon behaviours. Community affects individuals' readiness by providing social capital. The macro-level Society exerts social influence through societal norms not only its current descriptive norm but also through its dynamic norms about the changing trends into the future. We have tested and found support for these propositions in three national cross-sectional data sets from Australia. Our discussions will centre around a need to investigate social and cultural processes involved in climate change mitigation, and to link these insights to public policies.

Short Title: Training general practitioners in the ABC versus 5As method of delivering stop-smoking advice: a pragmatic, two-arm cluster randomised controlled trial

DOI: 10.1183/23120541.00621-2020

Article Number: 00621-2020

Accession Number: WOS:000684273900040

Abstract: This study assessed the effectiveness of a 3.5-h training session for general practitioners (GPs) in providing brief stop-smoking advice and compared two methods of giving advice – ABC versus 5As – on the rates of delivery of such advice and of recommendations of evidence-based smoking cessation treatment during routine consultations. A pragmatic, two-arm cluster randomised controlled trial was carried out including a pre-/post-design for the analyses of the primary outcome in 52 GP practices in Germany. Practices were randomised (1:1) to receive a 3.5-h training session (ABC or 5As). In total, 1937 tobacco-smoking patients, who consulted trained GPs in these practices in the 6 weeks prior to or following the training, were included. The primary outcome was patient-reported rates of GP-delivered stop-smoking advice prior to and following the training, irrespective of the training method. Secondary outcomes were patient-reported receipt of recommendation/prescription of behavioural therapy, pharmacotherapy or combination therapy for smoking cessation, and the effectiveness of ABC versus 5As regarding all outcomes. GP-delivered stop-smoking advice increased from 13.1% (n=136 out of 1039) to 33.1% (n=297 out of 898) following the training (adjusted odds ratio (aOR) 3.25, 95% CI 2.34–4.51). Recommendation/prescription rates of evidence-based treatments were low (<2%) pre-training, but had all increased after training (e.g. behavioural support: aOR 7.15, 95% CI 4.02–12.74). Delivery of stop-smoking advice increased non-significantly (p=0.08) stronger in the ABC versus 5As group (aOR 1.71, 95% CI 0.94–3.12). A single training session in stop-smoking advice was associated with a three-fold increase in rates of advice giving and a seven-fold increase in offer of support. The ABC method may lead to higher rates of GP-delivered advice during routine consultations.

Short Title: Quit attempts and tobacco abstinence in primary care patients: follow-up of a pragmatic, two-arm cluster randomised controlled trial on brief stop-smoking advice - ABC versus 5As

DOI: 10.1183/23120541.00224-2021

Article Number: 00224-2021

Accession Number: WOS:000684273900031

Abstract: We developed a 3.5-h training for general practitioners (GPs) in delivering brief stop-smoking advice according to different methods (ABC, 5As). In a pragmatic, cluster randomised controlled trial our training proved effective in increasing GP-delivered rates of such advice (from 13% to 33%). In this follow-up analysis we examined the effect of the training and compared ABC versus 5As on patient-reported quit attempts and point prevalence abstinence at weeks 4, 12 and 26 following GP consultation. Follow-up data were collected in 1937 smoking patients - independently of the receipt of GP advice - recruited before or after the training of 69 GPs. At week 26, similar to 70% of the patients were lost to follow-up. All 1937 patients were included in an intention-to-treat analysis; missing outcome data were imputed. Quit attempts and abstinence rates did not differ significantly from pre- to post-training or between patients from the ABC versus the 5As group. However, ancillary analyses showed that patients who received GP advice compared to those who did not had two times higher odds of reporting a quit attempt at all followups and abstinence at week 26. We reported that our training increases GP-delivered rates of stop-smoking advice, and the present analysis confirms that advice is associated with increased quit attempts and abstinence rates in patients. However, our training did not further improve these rates, which might be related to patients' loss to follow-up or to contextual factors, e.g. access to free evidence-based cessation treatment, which can hamper the transfer of GPs' advice into patients' behaviour change.

Title: Parent-level barriers to uptake of childhood vaccination: a
global overview of systematic reviews

Journal: Bmj Global Health

Volume: 6

Issue: 9

Date: Sep

Short Title: Parent-level barriers to uptake of childhood
vaccination: a global overview of systematic reviews

ISSN: 2059-7908

DOI: 10.1136/bmjgh-2021-006860

Article Number: e006860

Accession Number: WOS:000700901700001

Abstract: Introduction Understanding barriers to childhood
vaccination is crucial to inform effective interventions for
maximising uptake. Published systematic reviews include different
primary studies, producing varying lists of barriers. To make sense
of this diverse body of literature, a comprehensive level of summary
and synthesis is necessary. This overview of systematic reviews maps
all potential parent-level barriers to childhood vaccination
identified in systematic reviews. It synthesises these into a
conceptual framework to inform development of a vaccine barriers
assessment tool. Methods We applied Joanna Briggs methodology,
searching the Epistemonikos review database and reference lists of
included reviews to June 2020. Systematic reviews of qualitative or
quantitative data on parent-level barriers to routine vaccination in
preschool-aged children were included. Reviews addressing influenza,
reporting non-modifiable determinants or reporting barriers not
relevant to parents were excluded. Where possible, we extracted
review details, barrier descriptions and the number, setting and
design of primary studies. Two authors independently screened search
results and inductively coded barrier descriptions. Results We
screened 464 papers, identifying 30 relevant reviews with minimal
overlap. Fourteen reviews included qualitative and quantitative
primary studies, seven included quantitative and seven included
qualitative studies only. Two did not report included study designs.
Two-thirds of reviews (n=20; 67%) only included primary studies from
high-income countries. We extracted 573 barrier descriptions and
inductively coded these into 64 unique barriers in six overarching
categories: (1) Access, (2) Clinic or Health System Barriers, (3)
Concerns and Beliefs, (4) Health Perceptions and Experiences, (5)

Knowledge and Information and (6) Social or Family Influence.
Conclusions A global overview of systematic reviews of parent-level barriers to childhood vaccine uptake identified 64 barriers to inform development of a new comprehensive survey instrument. This instrument will assess both access and acceptance barriers to more accurately diagnose the reasons for under-vaccination in children in different settings.

Short Title: Behaviour in sustainability transitions: A mixed methods literature review

ISSN: 2210-4224

DOI: 10.1016/j.eist.2021.10.010

Accession Number: WOS:000718147500006

Abstract: Sustainability transitions require changing many behaviours embedded in production and consumption systems. Simultaneously, behavioural public policy is now a significant site of research-policy translation globally. Links between behaviour and system change are underdeveloped in both fields. Systematic review of current transitions literature found 4% of papers focused on behaviour. Two prominent perspectives on behaviour (labelled: 'everyday' and 'strategic') are critical of a focus on individuals, preferring broader analysis. Two additional perspectives were identified - 'automatic' and 'reflective' - which highlight immediate and local influences on behaviour but underemphasise context. All four perspectives on behaviour draw on different conceptualisations, causality, methods and disciplinary foundations, and yet all have value and application to transitions. We argue that a complimentary and flexible approach to behaviour would benefit the field, considering the diversity of phases, scales and contexts of sustainability transitions. Transitions' own behavioural perspectives could also help address behavioural public policy's challenges.

Short Title: Health promotion intervention to prevent risk factors of chronic diseases: Protocol for a cluster randomized controlled trial among adolescents in school settings of Chandigarh (India)

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0263584

Article Number: e0263584

Accession Number: WOS:000777505200024

Abstract: Background Chronic diseases like diabetes, cardiovascular diseases and cancers are on the rise. Most of the risk factors of these diseases commence in Adolescence. Therefore, a cluster randomised controlled trial is designed to evaluate the effect of school-based health promotion intervention on the risk factors of chronic diseases. Methodology Considering school as a cluster, twelve schools will be randomly selected from the public schools of Chandigarh, a city in India. After baseline assessment, six schools will be randomly allocated to intervention and six to the control arm. Study participants will be students of 8 th grade (age 10-16 years), their parents and teachers. A sample of 360 students (12 clusters x 30 students) has been estimated to provide statistically valid inference. The PRECEDE PROCEED Model will be used to develop health promotion interventions to prevent the use of an unbalanced diet, physical inactivity, alcohol, and tobacco. Interventions will be implemented for six-months in the school setting. For students, the intervention will comprise interactive learning sessions of 30 minutes duration per week and physical activity sessions of 30 minutes duration four times every week. Educational sessions will be conducted for parents and teachers for 30 minutes, four times during the intervention period. Primary outcomes will be changes in the prevalence of behavioural risk factors from pre- to post-intervention. Changes in anthropometric, physiological, and biochemical measures will be the secondary outcomes. The difference-in-difference (DID) method will be used to measure the net change in the outcomes. Discussion It is essential to understand whether health promotion interventions implemented in the school setting simultaneously targeting adolescents, teachers, and parents are effective. Using the PRECEDE-PROCEED model for planning, implementing, and evaluating the intervention as part of a cluster Randomized Controlled Trial design with DID analysis, could objectively assess the impact.

Title: Digital Engagement of Older Adults: Scoping Review

Journal: Journal of Medical Internet Research

Volume: 24

Issue: 12

Date: Dec

Short Title: Digital Engagement of Older Adults: Scoping Review

ISSN: 1438-8871

DOI: 10.2196/40192

Article Number: e40192

Accession Number: WOS:000966483100004

Abstract: Background: Digital technologies facilitate everyday life, social connectedness, aging at home, well-being, and dignified care. However, older adults are disproportionately excluded from these benefits. Equal digital opportunities, access, and meaningful engagement require an understanding of older adults' experience across different stages of the technological engagement life cycle from nonuse and initial adoption to sustained use, factors influencing their decisions, and how the experience changes over time. Objective: Our objectives were to identify the extent and breadth of existing literature on older adults' perspective on digital engagement and summarize the barriers to and facilitators for technological nonuse, initial adoption, and sustained digital technology engagement. Methods: We used the Arksey and O'Malley framework for the scoping review process. We searched MEDLINE, PsycINFO, CINAHL, Web of Science, and ACM digital library for primary studies published between 2005 and 2021. The inclusion and exclusion criteria were developed based on the Joanna Briggs Institute (participants, content, and context) framework. Studies that investigated the digital engagement experience as well as barriers to and facilitators of older adults' digital technology engagement were included. The characteristics of the study, types of digital technology, and digital engagement levels were analyzed descriptively. Content analysis was used to generate tentative elements using a congruent theme, and barriers and facilitators were mapped over the capability, opportunity, and motivation behavior change model (COM-B) and the theoretical domain framework. The findings were reported in accordance with the PRISMA-ScR (Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews). Results: In total, 96 publications were eligible for the final charting and synthesis. Most of the studies were published over the past 5 years, investigated the initial adoption stage of digital engagement, and focused on everyday technologies. The most cited barriers and facilitators across the engagement stages from each COM-B component were capability (eg, physical and psychological changes and lack of skill), opportunity

(eg, technological features, environmental context, and resources), and motivation (eg, optimism from perceived usefulness and beliefs about capability). Conclusions: The COM-B model and theoretical domain framework provide a guide for identifying multiple and intertwined barriers and facilitators at each stage of digital engagement. There are limited studies looking into the whole spectrum of older adults' digital technology experience; in particular, studies on technological nonuse and sustained use stages are rare. Future research and practice should focus on tailored interventions accounting for the barriers to older adults' digital engagement and addressing capabilities, motivation, and opportunities; affordable, usable, and useful digital technologies, which address the changes and capability requirements of older adults and are cocreated with a value framework; and lifelong learning and empowerment to develop older adults' knowledge and skills to cope with digital technology development.

Short Title: Working From Home: Experiences of Home-Working, Health Behavior and Well-Being During the 2020 UK COVID-19 Lockdown

ISSN: 1076-2752

DOI: 10.1097/jom.0000000000002757

Accession Number: WOS:000967958600020

Abstract: Objective: The Spring 2020 UK COVID-19 lockdown required normally office-based workers to modify their work-related practices to work at home. This study explored workers' experiences of adapting to home working, health behaviors and well-being. Methods: Twenty-seven home working employees (19 women; aged 23-57 years), from various industry sectors, gave individual semi-structured interviews. Topics focused on home working experiences, routine adaptations, and changes in health behaviors and well-being.

Results: Four themes were extracted: changes to the work interface; adaptations to a new workspace; changes to work-life balance; and adjustments to a new social context. Notably, participants reported greater reliance on computer-based interactions, which they felt discouraged physical activity and increased sitting. Working in a domestic environment reportedly challenged work-home boundaries.

Conclusions: Work practices can incidentally detrimentally impact

health-related behaviors and well-being. Organizations should develop policies and procedures to promote health-conducive home working.

Title: An intervention to promote positive homeworker health and wellbeing through effective home-working practices: a feasibility and acceptability study

Journal: BMC Public Health

Volume: 23

Issue: 1

Date: Mar

Short Title: An intervention to promote positive homeworker health and wellbeing through effective home-working practices: a feasibility and acceptability study

DOI: 10.1186/s12889-023-15347-x

Article Number: 614

Accession Number: WOS:000982828700002

Abstract: Background In the wake of Covid-19, the prevalence of working from home ('home-working') is expected to rise. Yet, working from home can have negative health and wellbeing impacts.

Interventions are needed to promote effective ways of working that also protect workers' health and wellbeing. This study explored the feasibility and acceptability of an intervention intended to promote home-working practices that would protect and promote health behaviour and wellbeing.

Methods An uncontrolled, single-arm mixed-methods trial design was employed. Forty-two normally-office-based UK workers, working from home between January-February 2021 (during the Covid pandemic), consented to receive the intervention.

The intervention: a digital document offering evidence-based recommendations for home-working in ways conducive to health behaviour and wellbeing. Feasibility and acceptability were quantitatively indexed by: expressions of interest within 1 week (target threshold ≥ 35); attrition across the one-week study period (threshold $\leq 20\%$); and the absence of any apparent detriments in self-reported physical activity, sedentary behaviour, snacking, and work-related wellbeing prior to and one week after receiving the intervention.

Qualitative think-aloud data, obtained while participants read through the intervention, and analysed using reflexive thematic analysis, explored acceptability. Semi-structured interviews conducted one week after intervention exposure were content-analysed to identify whether and which behaviour changes were adopted.

Results Two feasibility criteria were met: 85 expressions of interest indicated satisfactory intervention demand, and no detriments were observed in health behaviours or wellbeing. Forty-two participants (i.e., maximum capacity for the study; 26

females, 16 males, aged 22–63) consented to take part. 31% dropped out over the one-week study period leaving a final sample of 29 (18 females, 11 males, aged 22–63), exceeding identified attrition thresholds. Think-aloud data showed that participants concurred with intervention guidance, but felt it lacked novelty and practicality. Follow-up interviews produced 18 (62%) participant reports of intervention adherence, where nine recommendations reportedly prompted behaviour change in at least one participant. Conclusions Mixed evidence was found for intervention feasibility and acceptability. Whilst the information was deemed relevant and of value, further development is required to increase its novelty. It may also be more fruitful to provide this information via employers, to encourage and emphasise employer endorsement.

Short Title: Prevalence of current nutrition care practices for disease-related malnutrition in Canadian hospitals

ISSN: 1715-5312

DOI: 10.1139/apnm-2022-0425403

Accession Number: WOS:000985576400006

Abstract: Disease-related malnutrition is common in hospital patients. The Health Standards Organization Canadian Malnutrition Prevention, Detection, and Treatment Standard was published in 2021. The purpose of this study was to determine the current state of nutrition care in hospitals prior to implementation of the Standard. An online survey was distributed to hospitals across Canada via email. A representative reported on nutrition best practices based on the Standard at the hospital level. Descriptive and bivariate statistics were completed for selected variables based on size and type of hospital. One hundred and forty-three responses from nine provinces were received (56% community, 23% academic, and 21% other). Malnutrition risk screening was being completed on admission in 74% (n = 106/142) of hospitals, although not all units participated in screening all patients. Nutrition-focused physical exam is completed as part of a nutrition assessment in 74% (n = 101/139) of sites. Flagging a malnutrition diagnosis (n = 38/104) and physician documentation (18/136) were sporadic. Academic and

medium (100–499 beds) and large hospitals (500+ beds) were more likely to have a physician document a malnutrition diagnosis. Some, but not all, best practices are occurring in Canadian hospitals on a regular basis. This demonstrates a need for continued knowledge mobilization of the Standard.

Short Title: 'Doing' or 'using' intersectionality? Opportunities and challenges in incorporating intersectionality into knowledge translation theory and practice

DOI: 10.1186/s12939–021–01509–z

Article Number: 187

Accession Number: WOS:000687156800001

Abstract: Intersectionality is a widely adopted theoretical orientation in the field of women and gender studies.

Intersectionality comes from the work of black feminist scholars and activists. Intersectionality argues identities such as gender, race, sexuality, and other markers of difference intersect and reflect large social structures of oppression and privilege, such as sexism, racism, and heteronormativity. The reach of intersectionality now extends to the fields of public health and knowledge translation. Knowledge translation (KT) is a field of study and practice that aims to synthesize and evaluate research into an evidence base and move that evidence into health care practice. There have been increasing calls to bring gender and other social issues into the field of KT. Yet, as scholars outline, there are few guidelines for incorporating the principles of intersectionality into empirical research. An interdisciplinary, team-based, national health research project in Canada aimed to bring an intersectional lens to the field of knowledge translation. This paper reports on key moments and resulting tensions we experienced through the project, which reflect debates in intersectionality: discomfort with social justice, disciplinary divides, and tokenism. We consider how our project advances intersectionality practice and suggests recommendations for using intersectionality in health research contexts. We argue that while we encountered many challenges, our process and the resulting co-created tools can serve as a valuable starting point and example of how intersectionality can transform fields and practices.

Title: Doctors' experience of the contraceptive consultation: a qualitative study in Australia

Journal: Journal of Family Planning and Reproductive Health Care

Volume: 43

Issue: 2

Pages: 119-125

Date: Apr

Short Title: Doctors' experience of the contraceptive consultation: a qualitative study in Australia

ISSN: 1471-1893

DOI: 10.1136/jfprhc-2015-101356

Accession Number: WOS:000404162200010

Abstract: Background Contraception is a field in which good doctor-patient communication is crucial and core to shared decision making. Despite the centrality of contraception to primary health care in Australia, little is known about how doctors manage the contraceptive consultation. In particular, little is known about how

doctors discuss sexual issues related to contraception. Methods Fifteen contraceptive providers participated in qualitative interviews averaging 45 min. Interviews were audio recorded, transcribed verbatim, and analysed using an inductive thematic approach. Results We found doctors were aware that they had to modify their illness-based 'scripts' in consultations about contraception, and said it was challenging always to adhere to a shared model of decision making. Prescribing behaviour reflected personal preferences in relation to some forms of contraception, and doctors were enthusiastic about the levonorgestrel-releasing intrauterine system. Doctors identified gaps in training in relation to sexuality and reported feeling tentative in raising sexual issues, even within contraceptive consultations. Conclusions A range of factors—including tendencies to use illness scripts, personal preferences, and discomfort with communications about sexuality—appear to influence doctors' approaches to contraceptive management. Medical training that enables doctors to move out of an illness-treating framework and to improve their understanding of and comfort in discussing sexuality issues will improve their management of healthy women seeking contraception.

Title: Do nurses' personal health behaviours impact on their health promotion practice? A systematic review

Journal: International Journal of Nursing Studies

Volume: 76

Pages: 62-77

Date: Nov-Dec

Short Title: Do nurses' personal health behaviours impact on their health promotion practice? A systematic review

ISSN: 0020-7489

DOI: 10.1016/j.ijnurstu.2017.08.008

Accession Number: WOS:000418627800006

Abstract: Background: There is a growing expectation in national and international policy and from professional bodies that nurses be role models for healthy behaviours, the rationale being that there is a relationship between nurses' personal health and the adoption of healthier behaviours by patients. This may be from patients being motivated by, and modelling, the visible healthy lifestyle of the

nurse or that nurses are more willing to promote the health of their patients by offering public health or health promotion advice and referring the patient to support services. Methods: An integrated systematic review was conducted to determine if nurses' personal health behaviour impacted on (1) their health promotion practices, and (2) patient responses to a health promotion message. Medline, CINAHL, SCOPUS, and PsycINFO databases were searched. A narrative synthesis was conducted. Results: 31 studies were included in the review. No consistent associations were noted between nurses' weight, alcohol use, or physical activity level and their health promotion practice, although smoking appeared to negatively impact on the likelihood of discussing and engaging in cessation counselling. Nurses who reported confidence and skills around health promotion practice were more likely to raise lifestyle issues with patients, irrespective of their own personal health behaviours. The two studies included in the review that examined patient responses noted that the perceived credibility of a public health message was not enhanced by being delivered by a nurse who reported adopting healthy behaviours. Conclusions: Although it is assumed that nurses' personal health behaviour influences their health promotion practice, there is little evidence to support this. The assertion in health care policy that nurses should be role models for healthy behaviours assumes a causal relationship between their health behaviours and the patient response and adoption of public health messages that is not borne out by the research evidence.

Article Number: e0145074

Accession Number: WOS:000369528200003

Abstract: Background With an ageing population, there is an increasing societal impact of ill health in later life. People who adopt healthy behaviours are more likely to age successfully. To engage people in health promotion initiatives in mid-life, a good understanding is needed of why people do not undertake healthy behaviours or engage in unhealthy ones. Methods Searches were

conducted to identify systematic reviews and qualitative or longitudinal cohort studies that reported mid-life barriers and facilitators to healthy behaviours. Mid-life ranged from 40 to 64 years, but younger adults in disadvantaged or minority groups were also eligible to reflect potential earlier disease onset. Two reviewers independently conducted reference screening and study inclusion. Included studies were assessed for quality. Barriers and facilitators were identified and synthesised into broader themes to allow comparisons across behavioural risks. Findings From 16,426 titles reviewed, 28 qualitative studies, 11 longitudinal cohort studies and 46 systematic reviews were included. Evidence was found relating to uptake and maintenance of physical activity, diet and eating behaviours, smoking, alcohol, eye care, and other health promoting behaviours and grouped into six themes: health and quality of life, sociocultural factors, the physical environment, access, psychological factors, evidence relating to health inequalities. Most of the available evidence was from developed countries. Barriers that recur across different health behaviours include lack of time (due to family, household and occupational responsibilities), access issues (to transport, facilities and resources), financial costs, entrenched attitudes and behaviours, restrictions in the physical environment, low socioeconomic status, lack of knowledge. Facilitators include a focus on enjoyment, health benefits including healthy ageing, social support, clear messages, and integration of behaviours into lifestyle. Specific issues relating to population and culture were identified relating to health inequalities. Conclusions The barriers and facilitators identified can inform the design of tailored interventions for people in mid-life.

Accession Number: WOS:000368204300014

Abstract: Objective: Maternal adiposity confers an increased risk of GDM in pregnancy. A low glycemic index (GI) dietary intervention has been found to improve glucose homeostasis and reduce gestational weight gain. Mobile Health (mHealth) Technology-assisted interventions are becoming commonplace as an aid to treating many chronic diseases. The aim of this study is to assess the impact of a 'healthy lifestyle package' with mHealth smart phone technology as support compared with usual care on the incidence of GDM in an overweight and obese pregnant population. Methods: We propose a randomized controlled trial of an mHealth assisted healthy lifestyle intervention package versus standard obstetric care in pregnant women with a BMI \geq 25 kg/m²–39.9 kg/m². Patients are randomized to control or intervention group in a 1:1 ratio. The intervention arm healthy lifestyle package includes a motivational counseling session to encourage behavior change, involving targeted, low GI nutritional advice and daily physical activity prescription delivered before 18 weeks gestation, as well as a smart phone app to provide ongoing healthy lifestyle advice and support throughout pregnancy. The primary outcome is the incidence of GDM at 29 weeks' gestation and power analysis indicates that 253 women are required in each group to detect a difference. Conclusion: This will be the first clinical trial to evaluate the effectiveness of a smart phone technology-assisted targeted healthy lifestyle intervention, which is grounded in behavior change theories and techniques, to support antenatal management of an overweight and obese pregnant population in preventing GDM. Short Title: Evaluation of a bespoke training to increase uptake by midwifery teams of NICE Guidance for membrane sweeping to reduce induction of labour: a stepped wedge cluster randomised design

DOI: 10.1186/s13063-017-2106-1

Article Number: 357

Accession Number: WOS:000406674200002

Abstract: Background: National guidance recommends pregnant women are offered membrane sweeping at term to reduce induction of labour. Local audit suggested this was not being undertaken routinely across two maternity units in the West Midlands, UK between March and November 2012. Methods: Bespoke training session for midwifery teams (nine community and one antenatal clinic) was developed to address identified barriers to encourage offer of membrane sweeping, together with an information leaflet for women and appointment of a champion within each team. The timing of training session on membrane sweeping to ten midwifery teams was randomly allocated using a stepped wedge cluster randomised design. All women who gave birth in the Trusts after 39 + 3/40 weeks gestation within the study time period were eligible. Relevant anonymised data were extracted from maternity notes for three months before and after training. Data were analysed using a generalised linear mixed model, allowing for clustering and adjusting for temporal effects. Primary outcomes were number of women offered and accepting membrane sweeping and average number of sweeps per woman. Sub-group comparisons were undertaken for adherence to Trust guidance and potential influence of pre-specified maternal characteristics. Data included whether sweeping was offered but declined and no record of membrane sweeping. Results: Training was given to all teams as planned. Analyses included data from 2787 of the 2864 (97%) eligible low-risk women over 39 + 4 weeks pregnant. Characteristics of the women were similar before and after training. No evidence of difference in proportion of women being offered and accepting membrane sweeping (44.4% before training versus 46.8% after training (adjusted relative risk [aRR] = 0.90, 95% confidence interval [CI] = 0.71-1.13), nor in average number of sweeps per woman (0.603 versus 0.627, aRR = 0.83, 95% CI = 0.67-1.01). No differences in any secondary outcomes nor influence of maternal characteristics were demonstrated. The midwives evaluated training positively. Conclusions: This stepped wedge cluster trial enabled randomised evaluation within a natural roll-out and demonstrates the importance of robust evaluation in circumstances in which it is rarely undertaken. While the midwives evaluated the training positively, it did not appear to change practice.

DOI: 10.1016/j.math.2015.03.014

Accession Number: WOS:000372196300007

Abstract: Background: Medical Research Council (MRC) guidelines recommend applying theory within complex interventions to explain how behaviour change occurs. Guidelines endorse self-management of chronic low back pain (CLBP) and osteoarthritis (OA), but evidence for its effectiveness is weak. Objective: This literature review aimed to determine the use of behaviour change theory and techniques within randomised controlled trials of group-based self-management programmes for chronic musculoskeletal pain, specifically CLBP and OA. Methods: A two-phase search strategy of electronic databases was used to identify systematic reviews and studies relevant to this area. Articles were coded for their use of behaviour change theory, and the number of behaviour change techniques (BCTs) was identified using a 93-item taxonomy, Taxonomy (v1). Results: 25 articles of 22 studies met the inclusion criteria, of which only three reported having based their intervention on theory, and all used Social Cognitive Theory. A total of 33 BCTs were coded across all articles with the most commonly identified techniques being 'instruction on how to perform the behaviour', 'demonstration of the behaviour', 'behavioural practice', 'credible source', 'graded tasks' and 'body changes'. Conclusion: Results demonstrate that theoretically driven research within group based self-management programmes for chronic musculoskeletal pain is lacking, or is poorly reported. Future research that follows recommended guidelines regarding the use of theory in study design and reporting is warranted. (C) 2015 Elsevier Ltd. All rights reserved.

Short Title: Item selection, scaling and construct validation of the Patient-Reported Inventory of Self-Management of Chronic Conditions (PRISM-CC) measurement tool in adults

ISSN: 0962-9343

DOI: 10.1007/s11136-022-03165-4

Accession Number: WOS:000817030100001

Abstract: Purpose To select and scale items for the seven domains of the Patient-Reported Inventory of Self-Management of Chronic Conditions (PRISM-CC) and assess its construct validity. Methods Using an online survey, data on 100 potential items, and other variables for assessing construct validity, were collected from 1055 adults with one or more chronic health conditions. Based on a validated conceptual model, confirmatory factor analysis (CFA) and item response models (IRT) were used to select and scale potential items and assess the internal consistency and structural validity of the PRISM-CC. To further assess construct validity, hypothesis testing of known relationships was conducted using structural equation models. Results Of 100 potential items, 36 (4-8 per domain) were selected, providing excellent fit to our hypothesized correlated factors model and demonstrating internal consistency and structural validity of the PRISM-CC. Hypothesized associations between PRISM-CC domains and other measures and variables were confirmed, providing further evidence of construct validity.

Conclusion The PRISM-CC overcomes limitations of assessment tools currently available to measure patient self-management of chronic health conditions. This study provides strong evidence for the internal consistency and construct validity of the PRISM-CC as an instrument to assess patient-reported difficulty in self-managing different aspects of daily life with one or more chronic conditions. Further research is needed to assess its measurement equivalence across patient attributes, ability to measure clinically important change, and utility to inform self-management support.

Short Title: A world of choices: preference elicitation methods for improving the delivery and uptake of HIV prevention and treatment

ISSN: 1746-630X

DOI: 10.1097/coh.0000000000000776

Accession Number: WOS:000897624700005

Abstract: Purpose of reviewDespite the growing availability of effective HIV prevention and treatment interventions, there are large gaps in their uptake and sustained use across settings. It is crucial to elicit and apply patients' and stakeholders' preferences to maximize the impact of existing and future interventions. This review summarizes quantitative preference elicitation methods (PEM) and how they can be applied to improve the delivery and uptake of HIV prevention and treatment interventions.Recent findingsPEM are increasingly applied in HIV implementation research; however, discrete choice experiments (DCEs) have predominated. Beyond DCEs, there are other underutilized PEM that may improve the reach and effectiveness of HIV prevention and treatment interventions among individuals by prioritizing their barriers to engagement and determining which attributes of interventions and delivery strategies are most valued. PEM can also enhance the adoption and sustained implementation of strategies to deliver HIV prevention and treatment interventions by assessing which attributes are the most acceptable and appropriate to key stakeholders.Greater attention to and incorporation of patient's and stakeholders' preferences for HIV prevention and treatment interventions and their delivery has the potential to increase the number of persons accessing and retained in HIV prevention and treatment services.

Title: Barriers and facilitators to colonoscopy following fecal immunochemical test screening for colorectal cancer: A key informant interview study

Journal: Patient Education and Counseling

Volume: 105

Issue: 6

Pages: 1652-1662

Date: Jun

Short Title: Barriers and facilitators to colonoscopy following fecal immunochemical test screening for colorectal cancer: A key informant interview study

ISSN: 0738-3991

DOI: 10.1016/j.pec.2021.09.022

Accession Number: WOS:000809970300001

Abstract: Objectives: People who are referred for colonoscopy, following an abnormal colorectal cancer (CRC) screening result, are at increased risk of CRC. Despite this, many individuals decline the procedure. The aim of this study was to investigate why. Methods: As little is currently known about non-attendance at follow-up colonoscopy, and follow-up of abnormal screening results is a nurse-led process, we decided to conduct key informant interviews with Specialist Screening Practitioners ([SSPs] nurses working in the English Bowel Cancer Screening Program). Interviews were conducted online. Transcripts were assessed using inductive and deductive coding techniques. Results: 21 SSPs participated in an interview. Five main types of barriers and facilitators to colonoscopy were described, namely: Sociocultural, Practical, Psychological, Health-related and COVID-related. Key psychological and sociocultural factors included: 'Fear of pain and discomfort associated with the procedure' and 'Lack of support from family and friends'. Key practical, health-related and COVID-related factors included: 'Family and work commitments', 'Existing health conditions as competing priorities' and 'Fear of getting COVID-19 at the hospital'. Conclusions: A range of barriers and facilitators to follow-up colonoscopy exist. Future studies conducted with patients are needed to further explore barriers to colonoscopy. Practice implications: Strategies to reduce non-attendance should adopt a

multifaceted approach.(c) 2021 The Author(s). Published by Elsevier B.V. CC_BY_4.0

Title: Brain-In-Hand technology for adults with acquired brain injury: A convergence of mixed methods findings

Journal: Journal of Rehabilitation and Assistive Technologies Engineering

Volume: 9

Date: Aug

Short Title: Brain-In-Hand technology for adults with acquired brain injury: A convergence of mixed methods findings

ISSN: 2055-6683

DOI: 10.1177/20556683221117759

Accession Number: WOS:000855286400001

Abstract: Introduction: Individuals with acquired brain injury may find it difficult to self-manage and live independently. Brain-inHand is a smartphone app designed to support psychological problems and encourage behaviour change, comprised of a structured diary, reminders, agreed solutions, and traffic light monitoring system. Aim: To evaluate the potential use and effectiveness of Brain-in-Hand for self-management in adults with acquired brain injury. Methods: A-B mixed-methods case-study design. Individuals with acquired brain injury (n = 10) received Brain-in-Hand for up to 12 months. Measures of mood, independence, quality of life, cognition, fatigue, goal attainment, participation administered at baseline, 6 and 12 months. Semi-structured interviews conducted with acquired brain injury participants (n = 9) and healthcare workers (n = 3) at 6 months. Results: Significant increase in goal attainment after 6 months use ($t(7) = 4.20, p = .004$). No significant improvement in other outcomes. Qualitative data suggested improvement in anxiety management. Contextual (personal/environmental) factors were key in influencing the use and effectiveness of Brain-in-Hand. Having sufficient insight, appropriate support and motivation facilitated use. Conclusions: Brain-in-Hand shows potential to support acquired brain injury, but further work is required to determine its effectiveness. Context played a pivotal role in the effectiveness and sustained use of Brain-in-Hand, and needs to be explored to support implementation.

DOI: 10.1016/j.ypmed.2021.106458

Article Number: 106458

Accession Number: WOS:000645622200022

Abstract: Adherence to government COVID-19-related instructions is reported to be high, but the psychosocial impacts of measures such as self-isolation and physical distancing could undermine long-term adherence to containment measures. The first step in designing interventions to mitigate the impacts of adhering to COVID-19-related instructions is to identify what are the most prevalent challenges and what characterises the people facing them. A cross-sectional survey was administered to a representative sample of the UK population (N = 2252), of whom n = 2139 (94.9%) reported adhering to the UK government's COVID-19-related instructions, and were included in the final analysis. Data were analysed using descriptive statistics and binary logistic regression. Of the people who reported adhering to UK government's COVID-19-related instructions, 80.3% reported experiencing challenges. Adults aged 55 years or over (OR = 1.939, 95%CI 1.331-2.825) and men (OR = 0.489, 95%CI 0.393-0.608) were least likely to report challenges. Adjusting to changes in daily routine (reported by 48.7% of the sample), mental health (reported by 41.4% of the sample) and physical health (reported by 31.5% of the sample) were the most prevalent challenges. For the first time, the present study quantifies the extent to which people experienced challenges when adhering to government COVID-19-related instructions. Few people reported experiencing no challenges when adhering to COVID-19-related instructions. Interventions to address the effects of changes in daily routine, mental health challenges, and physical health challenges should be prioritised, with a focus on key subgroups including women, younger adults, and people without care commitments.

DOI: 10.1186/s12913-015-0808-1

Article Number: 215

Accession Number: WOS:000355791800001

Abstract: Background: The influence of environmental factors in
shaping behaviour is becoming increasingly prominent in public
health policy, but whether health promotion strategies use this
knowledge is unknown. Health promotion is important in the
management of psoriasis, a long-term inflammatory skin condition,
and health centre waiting areas are ideal places to promote health
information to such patients. We systematically examined patient
information materials containing either general, or specific, health
messages for patients with psoriasis. Methods: An observation
schedule was used to record the frequency and quality of leaflets
and posters addressing lifestyle behaviour change in health centre
waiting areas. Content analysis was used to analyse: frequency,
characteristics and standard of the materials. Results: Across 24
health centres 262 sources of lifestyle information were recorded
(median per site = 10; range = 0-40). These were mainly: generic
posters/displays of lifestyle support (n = 113); and generic
materials in waiting areas (n = 98). Information quality was poor
and poorly displayed, with no high quality psoriasis-specific
patient materials evident. Conclusions: There is little attempt to
promote healthy lifestyle as an important aspect of psoriasis
management in the clinic environment. Evidence about using
environmental cues/techniques to prompt behaviour change in people
with psoriasis does not currently inform the design and display of
such information in standard health centre settings, which are prime
locations for communicating messages about healthy lifestyle. Future
research should test the efficacy and impact of theory-informed,
high quality health promotion messages on health outcomes for
patients with psoriasis.

Title: Teacher educators' perspectives on gender responsive pedagogy
in higher education
Journal: Irish Educational Studies
Date: 2023 Feb
Short Title: Teacher educators' perspectives on gender responsive
pedagogy in higher education
ISSN: 0332-3315
DOI: 10.1080/03323315.2023.2174575
Accession Number: WOS:000932185400001
Abstract: The enactment of gender responsive pedagogical approaches
has the potential to support learning for all students and foster
gender equality within and beyond education systems. This study
investigated teacher educators' perceptions of gender responsive
pedagogy in higher education in Palestine. Mixed methods were used
to explore the components of capability, opportunity and motivation
that influence teacher educators' behaviour when incorporating
gender responsive pedagogy in their teaching practices. Thirty-six
participants completed an online survey and subsequently 17 of these
took part in a semi-structured interview that used the COM-B model
as a framework to explore the educators' perceptions. Our findings
suggest that teacher educators do not have sufficient knowledge and
skills to incorporate gender responsive pedagogy into their teaching
practices due to misunderstandings regarding the approach and the
misconception between gender equality and gender responsive
pedagogy. This led to lower motivation to include gender responsive
practices, but increased their desire to engage in future learning
and professional development on gender responsive pedagogy. In
addition, the results revealed that social and cultural backgrounds
of the teacher educators in addition to the understanding of the
surrounding social cues and cultural norms are crucial in embedding
gender responsive pedagogy into teaching practices.

Article Number: e0167559
Accession Number: WOS:000392380100004
Abstract: Multi-drug-resistant tuberculosis (MDR-TB) poses a major threat to public health worldwide, particularly in low-income countries. The current long (20 month) and arduous treatment regime uses powerful drugs with side-effects that include mental ill-health. It has a high loss to-follow-up (25%) and higher case fatality and lower cure-rates than those with drug sensitive tuberculosis (TB). While some national TB programmes provide small financial allowances to patients, other aspects of psychosocial ill-health, including iatrogenic ones, are not routinely assessed or addressed. We aimed to develop an intervention to improve psychosocial well-being for MDR-TB patients in Nepal. To do this we conducted qualitative work with MDR-TB patients, health professionals and the National TB programme (NTP) in Nepal. We conducted semi-structured interviews (SSIs) with 15 patients (10 men and 5 women, aged 21 to 68), four family members and three frontline health workers. In addition, three focus groups were held with MDR-TB patients and three with their family members. We conducted a series of meetings and workshops with key stakeholders to design the intervention, working closely with the NTP to enable government ownership. Our findings highlight the negative impacts of MDR-TB treatment on mental health, with greater impacts felt among those

with limited social and financial support, predominantly married women. Michie et al's (2011) framework for behaviour change proved helpful in identifying corresponding practice- and policy-level changes. The findings from this study emphasise the need for tailored psycho-social support. Recent work on simple psychological support packages for the general population can usefully be adapted for use with people with MDR-TB.

Title: "We are all one together": peer educators' views about falls prevention education for community-dwelling older adults - a qualitative study

Journal: BMC Geriatrics

Volume: 15

Date: Mar

Short Title: "We are all one together": peer educators' views about falls prevention education for community-dwelling older adults - a qualitative study

DOI: 10.1186/s12877-015-0030-3

Article Number: 28

Accession Number: WOS:000351568500001

Abstract: Background: Falls are common in older people. Despite strong evidence for effective falls prevention strategies, there appears to be limited translation of these strategies from research to clinical practice. Use of peers in delivering falls prevention education messages has been proposed to improve uptake of falls prevention strategies and facilitate translation to practice. Volunteer peer educators often deliver educational presentations on falls prevention to community-dwelling older adults. However, research evaluating the effectiveness of peer-led education approaches in falls prevention has been limited and no known study has evaluated such a program from the perspective of peer educators involved in delivering the message. The purpose of this study was to explore peer educators' perspective about their role in delivering peer-led falls prevention education for community-dwelling older adults. Methods: A two-stage qualitative inductive constant comparative design was used. In stage one (core component) focus group interviews involving a total of eleven participants were conducted. During stage two (supplementary component) semi-structured interviews with two participants were conducted. Data were analysed thematically by two researchers independently. Key themes were identified and findings were displayed in a conceptual framework. Results: Peer educators were motivated to deliver educational presentations and importantly, to reach an optimal peer

connection with their audience. Key themes identified included both personal and organisational factors that impact on educators' capacity to facilitate their peers' engagement with the message. Personal factors that facilitated message delivery and engagement included peer-to-peer connection and perceived credibility, while barriers included a reluctance to accept the message that they were at risk of falling by some members in the audience. Organisational factors, including ongoing training for peer educators and formative feedback following presentations, were perceived as essential because they affect successful message delivery. Conclusions: Peer educators have the potential to effectively deliver falls prevention education to older adults and influence acceptance of the message as they possess the peer-to-peer connection that facilitates optimal engagement. There is a need to consider incorporating learnings from this research into a formal large scale evaluation of the effectiveness of the peer education approach in reducing falls in older adults.

Short Title: Mitigating antimicrobial resistance (AMR) using implementation research: a development funder's approach

DOI: 10.1093/jacamr/dlad031

Article Number: dlad031

Accession Number: WOS:000958948100002

Abstract: Despite the escalating burden of antimicrobial resistance (AMR), the global response has not sufficiently matched the scale and scope of the issue, especially in low- and middle-income countries (LMICs). While many countries have adopted national action plans to combat AMR, their implementation has lagged due to resource constraints, dysfunctional multisectoral coordination mechanisms

and, importantly, an under-recognized lack of technical capacity to adapt evidence-based AMR mitigation interventions to local contexts. AMR interventions should be tailored, context-specific, cost-effective and sustainable. The implementation and subsequent scale-up of these interventions require multidisciplinary intervention-implementation research (IIR). IIR involves both quantitative and qualitative approaches, occurs across a three-phase continuum (proof of concept, proof of implementation and informing scale-up), and across four context domains (inner setting, outer setting, stakeholders and the implementation process). We describe the theoretical underpinnings of implementation research (IR), its various components, and how to construct different IR strategies to facilitate sustainable uptake of AMR interventions. Additionally, we provide real-world examples of AMR strategies and interventions to demonstrate these principles in practice. IR provides a practical framework to implement evidence-based and sustainable AMR mitigation interventions.

Short Title: Treatment Adherence among HIV and TB Patients Using Single and Double Way Mobile Phone Text Messages: A Randomized Controlled Trial

ISSN: 1687-9686

DOI: 10.1155/2022/2980141

Article Number: 2980141

Accession Number: WOS:000843293800001

Abstract: Background. Research has shown that patients fail to adhere to ART and TB treatment due to the long duration of both therapies, side effects, and forgetfulness. Objective. To assess the

role of the double-way and single-way SMS on adherence to HIV and TB treatment. Materials and Methods. A randomized controlled trial among adult HIV and TB patients on treatment at the Buea Regional and Kumba District Hospitals, South West Region, Cameroon, was conducted. Participants were randomly allocated to the control, single-way, and double-way SMS intervention groups. HIV and TB participants were followed independently for a period of 6 months and 3 months, respectively. Baseline and post-intervention data were collected and analyzed using the chisquare and Student's t-tests with statistical significance set at $p < 0.05$. Results. A total of 210 HIV participants and 84 TB were recruited into the study with a mean age of 41.25 +/- 10 years and 37.89 +/- 13.27 years, respectively. Optimal adherence to ART and TB treatment at baseline was [65 (31%) CI: 0.247-0.372] and [35 (41.7%) CI: 0.311-0.522], respectively, and after the intervention, it increased to [72 (42.6%) CI: 0.347-0.495] and 41 (61.2%), respectively. There was an increase in adherence to ART among participants in the double-way SMS intervention group from 23 (32.9%) (RR: 1.04, CI: 0.8-1.31, $p = 0.716$) to 29 (48.3%) (RR: 1.06, CI: 0.75-1.50, $p = 0.746$). Combined single-way and double-way SMS significantly increased adherence to ART. Conclusions. The level of adherence was low among HIV and TB participants. The single-way and double-way SMS did not significantly increase adherence. However, a combination of both the double-way and single-way SMS intervention significantly improved adherence to ART.

Accession Number: WOS:000884229400001

Abstract: Much has been documented on the association between stress and health. Both direct and indirect pathways have been identified and explored extensively, helping us understand trajectories from healthy individuals to reductions in well-being, and development of preclinical and disease states. Some of these pathways are well established within the field; physiology, affect regulation, and social relationships. The purpose of this review is to push beyond what is known separately about these pathways and provide a means to

integrate them using one common mechanism. We propose that social touch, specifically affective touch, may be the missing active ingredient fundamental to our understanding of how close relationships contribute to stress and health. We provide empirical evidence detailing how affective touch is fundamental to the development of our stress systems, critical to the development of attachment bonds and subsequent social relationships across the life course. We will also explore how we can use this in applied contexts and incorporate it into existing interventions.

Short Title: Development of an Ecological Momentary Assessment-Triggered Text Message Library for Peripheral Artery Disease

ISSN: 0193-9459

DOI: 10.1177/01939459221150391

Accession Number: WOS:000922454900001

Abstract: This study developed an ecological momentary assessment (EMA)-triggered text message library based on the behavior change wheel framework to encourage exercise engagement in patients with peripheral artery disease (PAD). This study was conducted in three steps. In Step 1, semi-structured interviews were conducted with 15 patients with PAD. Their accounts of their exercise experiences revealed six barriers and three facilitators through thematic analysis. In Step 2, based on the findings from the prior step, the EMA survey was developed; its items included barriers to exercise, PAD-related leg symptoms, and general conditions. In Step 3, intervention functions to overcome exercise barriers were mapped, and 120 text messages were generated. Responses to the exercise barriers in the EMA survey triggered the automatic text messages. Additional studies are needed to examine the end-user acceptability of the text message library and the effectiveness of EMA-triggered text message interventions.

Title: Facilitators and barriers for harm reduction after first use of novel nicotine delivery devices: a qualitative investigation of cigarette smokers

Journal: BMC Psychology

Volume: 10

Issue: 1

Date: Jul

Short Title: Facilitators and barriers for harm reduction after first use of novel nicotine delivery devices: a qualitative investigation of cigarette smokers

DOI: 10.1186/s40359-022-00874-w

Article Number: 190

Accession Number: WOS:000833020400002

Abstract: Background Novel nicotine delivery devices (NNDDs) are a safer alternative to combustible tobacco smoking. Understanding what factors can facilitate people who smoke to use NNDDs can inform intervention design and public health messaging. This study aims to explore the facilitators and barriers to NNDD use from the perspective of smokers without prior use, after trialling two NNDDs. Method UK adults who smoke combustible cigarettes (n = 11) were recruited from a larger quantitative study after trialling two NNDDs, an electronic cigarette and a heated tobacco product (order randomly allocated). Semi-structured interviews were conducted, transcribed and thematically analysed, using the COM-B model of behaviour and NVivo12 pro software. Results Five main themes were identified: health knowledge, availability of and accessibility to NNDD products, cost, social acceptance, and NNDD use experience. There was curiosity and interest in the uptake and use of NNDDs, but the absence of centralised product information was identified as a barrier. Other themes were related to the design and functionality of the NNDD products. For example, the e-cigarette with its low maintenance was seen as easier to use than the heated tobacco product, which offered too short a single use duration and was described as 'cumbersome'. Throat discomfort and high anticipated cost were among additional barriers identified for both product types. Conclusion This study highlights the need for reliable objective information on the health effects of NNDDs compared with combustible cigarettes, which could facilitate their regular use. Product adjustment such as single use duration alignment with combustible cigarette smoking duration may encourage uptake. Interventions offering opportunity for experience of NNDD use and knowledge dissemination of NNDDs could increase motivation to adopt harm reducing behaviours as demonstrated in this study.

Title: Barriers to medication adherence in sickle cell disease: A comprehensive theory-based evaluation using the COM-B model

Journal: Pediatric Blood & Cancer

Date: 2023 May

Short Title: Barriers to medication adherence in sickle cell disease: A comprehensive theory-based evaluation using the COM-B model

ISSN: 1545-5009

DOI: 10.1002/pbc.30440

Accession Number: WOS:000995487400001

Abstract: BackgroundSickle cell disease (SCD) affects more than 100,000 Americans, with complications such as pain episodes and acute chest syndrome. Despite the efficacy of hydroxyurea in reducing these complications, adherence remains low. Study objectives were to examine barriers to hydroxyurea adherence, and to evaluate the relationship between barriers and their impact on adherence. MethodsIn this cross-sectional study, patients with SCD and their caregivers were enrolled if they were taking hydroxyurea. Study measures included demographics, self-report of adherence using visual analog scale (VAS), and the Disease Management and Barriers Interview (DMI)-SCD. The DMI-SCD was mapped to the Capability, Opportunity, Motivation, and Behavior (COM-B) model. ResultsForty-eight caregivers (females 83%, median age 38 [34-43]) and 19 patients (male 53%, median age 15 [13.5-18]) participated. Using VAS, many patients (63%) reported low hydroxyurea adherence, while most caregivers (75%) reported high adherence. Caregivers endorsed barriers across multiple COM-B components, with physical opportunity (e.g., cost) and reflective motivation (e.g., SCD perceptions) being the most identified categories (48% and 42%), respectively. Patients' most identified barriers included psychological capability (e.g., forgetfulness) and reflective motivation (84% and 68%), respectively. Patients' and caregivers' VAS scores negatively correlated with the number of barriers ($r(s) = -.53, p = .01$; $r(s) = -.28, p = .05$) and COM-B categories ($r(s) = -.51, p = .02$; $r(s) = -.35, p = .01$), respectively, suggesting lower adherence with more endorsed barriers. ConclusionsFewer barriers to hydroxyurea adherence were associated with higher adherence. Understanding barriers to adherence is essential to develop tailored interventions aimed at improving adherence.

DOI: 10.1111/ajr.12879

Accession Number: WOS:000799702600001

Abstract: Introduction and Objective Building rural health workforce research capacity is critical to addressing rural health inequalities. Research training is a mainstay research capacity building strategy. This paper describes the delivery and evaluation of a research training program for rural and regional allied health professions (AHPs). Design A mentored research training program was delivered to AHPs employed public health services in rural and regional Victoria, Australia. The program was evaluated using the Evidence-Based Practice Knowledge Attitudes and Practice (EBP-KAP) tool at baseline and 3 months post-training. Semi-structured interviews undertaken at 3 and 16 months post-training explored participants' perspectives of the training, their development and application of EBP and research skills. Survey data were analysed descriptively, and interview data were analysed using a framework approach. Findings Thirty-four individuals from 14 organisations attended the first workshop and 31 attended the second. Thirty-one participants completed the survey at baseline and nine at 3 months post-training. Sixteen interviews were undertaken with 11 participants, five participating at both time points. Participants had positive EBP attitudes at both time points. Overall, participants' knowledge and incorporation of EBP into their practice, and retrieval of evidence was unchanged 3 months post-training. Themes identified in the interview data were as follows: (1) individual research capacity enhanced through supported practice, (2) organisational factors influence individuals' progression of research and (3) individual contributions towards research capacity within the organisation. Conclusion A mentored rural research training program promoted the application of EBP skills at the individual level and contributed to organisational research capacity.

Article Number: e044200

Accession Number: WOS:000605320900009

Abstract: Objective Familial hypercholesterolaemia (FH) elevates low-density lipoprotein cholesterol (LDL-C) and increases cardiovascular disease (CVD) risk. This study aimed to provide evidence for the feasibility of conducting a randomised controlled trial to evaluate the efficacy of an intervention designed to improve diet and physical activity in families with FH. Design A parallel, randomised, waitlist-controlled, feasibility pilot trial. Setting Three outpatient lipid clinics in the UK. Participants Families that comprised children (aged 10-18 years) and their parent with genetically diagnosed FH. Intervention Families were randomised to either 12-week usual care or intervention. The behavioural change intervention aimed to improve dietary, physical activity and sedentary behaviours. It was delivered to families by dietitians initially via a single face-to-face session and then by four telephone or email follow-up sessions. Outcome measures Feasibility was assessed via measures related to recruitment, retention and intervention fidelity. Postintervention qualitative interviews were conducted to explore intervention acceptability. Behavioural (dietary intake, physical activity and sedentary time) and clinical (blood pressure, body composition and blood lipids) outcomes were collected at baseline and endpoint assessments to evaluate the intervention's potential benefit. Results Twenty-one families (38% of those approached) were recruited which comprised 22 children and 17 adults with FH, and 97% of families completed the study. The intervention was implemented with high fidelity and the qualitative data revealed it was well accepted. Between-group differences at the endpoint assessment were indicative of the intervention's potential for improving diet in children and adults. Evidence for potential benefits on physical activity and sedentary behaviours was less apparent. However, the intervention was associated with improvements in several CVD risk factors including LDL-C, with a within-group mean decrease of 8% (children) and 10% (adults). Conclusions The study's recruitment, retention, acceptability and potential efficacy support the development of a definitive trial, subject to identified refinements.

Title: Co-designing implementation strategies for the WALK-Cph intervention in Denmark aimed at increasing mobility in acutely hospitalized older patients: a qualitative analysis of selected strategies and their justifications

Journal: BMC Health Services Research

Volume: 22

Issue: 1

Date: Jan

Short Title: Co-designing implementation strategies for the WALK-Cph intervention in Denmark aimed at increasing mobility in acutely hospitalized older patients: a qualitative analysis of selected strategies and their justifications

DOI: 10.1186/s12913-021-07395-z

Article Number: 8

Accession Number: WOS:000737069900015

Abstract: Background: Selecting appropriate strategies to target barriers to implementing interventions represents a considerable challenge in implementation research and practice. The aim was to investigate what categories of implementation strategies were selected by health care practitioners and their managers in a co-design process and how they justified these strategies aimed at facilitating the implementation of the WALK-Cph intervention.

Methods: The study used a qualitative research design to explore what implementation strategies were selected and the justifications for selecting these strategies. Workshops were used because this qualitative method is particularly well suited for studying co-design processes that involve substantial attention to social interaction and the context. Data were 1) analyzed deductively based on the Proctor et al. taxonomy of implementation strategies, 2) categorized in accordance with the ERIC compilation of implementation strategies by Powell et al., and 3) analyzed to examine the justification for the selected strategies by the Proctor et al. framework for justifications of implementation strategies.

Results: Thirteen different types of implementation strategies were chosen across two hospitals. The deductive analysis showed that selection of implementation strategies was based on pragmatic and theoretical justifications. The contents of the two types of justifications were thematized into nine subthemes. Conclusion: This study contributes with knowledge about categories and justification of implementation strategies selected in a co-design process. In this study, implementation strategies were selected through pragmatic and theoretical justifications. This points to a challenge

in balancing strategies based on practice-based and research-based knowledge and thereby selection of strategies with or without proven effectiveness.

Title: Barriers and facilitators for implementing a new screening tool in an emergency department: A qualitative study applying the Theoretical Domains Framework

Journal: Journal of Clinical Nursing

Volume: 25

Issue: 19-20

Pages: 2786-2797

Date: Oct

Short Title: Barriers and facilitators for implementing a new screening tool in an emergency department: A qualitative study applying the Theoretical Domains Framework

ISSN: 0962-1067

DOI: 10.1111/jocn.13275

Accession Number: WOS:000388921200007

Abstract: Aim. The aim was to identify the factors that were perceived as most important as facilitators or barriers to the introduction and intended use of a new tool in the emergency department among nurses and a geriatric team. Background. A high incidence of functional decline after hospitalisation for acute medical illness has been shown in the oldest patients and those who are physically frail. In Denmark, more than 35% of older medical patients acutely admitted to the emergency department are readmitted within 90 days after discharge. A new screening tool for use in the emergency department aiming to identify patients at particularly high risk of functional decline and readmission was developed. Design. Qualitative study based on semistructured interviews with nurses and a geriatric team in the emergency department and semistructured single interviews with their managers. Methods. The Theoretical Domains Framework guided data collection and analysis. Content analysis was performed whereby new themes and themes already existing within each domain were described. Results. Six predominant domains were identified: (1) professional role and identity; (2) beliefs about consequences; (3) goals; (4) knowledge; (5) optimism and (6) environmental context and resources. The content analysis identified three themes, each containing two subthemes. The themes were professional role and identity, beliefs about consequences and

preconditions for a successful implementation. Conclusions. Two different cultures were identified in the emergency department. These cultures applied to different professional roles and identity, different actions and sense making and identified how barriers and facilitators linked to the new screening tool were perceived.

ISSN: 0969-1413

DOI: 10.1177/09691413221137852

Accession Number: WOS:000901549700001

Abstract: Objectives To explore barriers to cervical and colorectal cancer screening and attitudes to promotion of self-sampling kits upon attendance for breast cancer screening. Methods Interview study with women who had not responded to one or more invitations to cervical or colorectal cancer screening. A semi-structured interview guide was used and interviews were audio recorded and transcribed verbatim. Concepts from Temporal Motivation Theory were used to structure and analyse the data. Results Twenty-two women were interviewed. Screening was highly valued but the women perceived screening for cervical cancer and colorectal cancer as more troublesome to participate in, compared with participation in breast cancer screening. The lack of a pre-booked appointment or a suggested deadline attenuated the perceived value of cervical and colorectal cancer screening and this further increased procrastination. Promotion of self-sampling kits for cervical and colorectal cancer screening upon attendance for breast cancer screening was considered a feasible way to increase salience of both types of screening. Conclusion A high number of micro steps and absence of a deadline in cervical and colorectal cancer screening diverted attention away from screening participation in cervical and colorectal cancer screening. The main facilitator could be reduction of micro actions, proposing a suggested deadline, and promotion of

self-sampling kits when attending breast cancer screening to increase salience and a renewed attention to all three screening programmes.

Title: Bedtime Routines Intervention for Children (BRIC) using an automated text messaging system for behaviour change: study protocol for an early phase study

Journal: Pilot and Feasibility Studies

Volume: 6

Issue: 1

Short Title: Bedtime Routines Intervention for Children (BRIC) using an automated text messaging system for behaviour change: study protocol for an early phase study

DOI: 10.1186/s40814-020-0562-y

Article Number: 14

Accession Number: WOS:000729238200023

Abstract: BackgroundThis work concerns the activities in the last hour before bed for young children born to first-time parents, so called bedtime routines (BTR). These activities include amongst others tooth brushing, reading a book, having a bath and avoiding food and drinks before bed. Having a set bedtime at a suitable hour is also very important. Establishing good bedtime routines has been shown to be really important for a number of health, wellbeing, development and social outcomes. Currently, there is no evidence-based bedtime routine intervention for first-time parents using a novel design (i.e. text messages). Existing research has highlighted the importance of bedtime routines and the lack of appropriate mechanisms in place for parents who sought support.**Methods**The proposed study includes 2 work packages. Work package 1 focuses on the development of the intervention through a combination of qualitative work (1:1 interviews with parents on barriers and facilitators on bedtime routines using the Theoretical Domains Framework) and an expert group of key stakeholders. Work package 2 involves a small-scale (n = 50) feasibility and effectiveness study to examine proof of concept with first-time parents using text messages to communicate the intervention. Quantitative information relating to uptake, engagement, retention and effectiveness of the intervention as well as qualitative information (focus groups with parents who took part in the study) will be collected. Overall, the effectiveness of the intervention will be assessed through the APEASE criteria (acceptability, practicability, effectiveness, affordability, safety, equity).**Discussion**This study can provide

initial yet important support for further exploration in the field of bedtime routines in more complicated family structures (parents with more than 1 child, separated families etc.). Also, the implementation of a novel study design (i.e. text messages) could lead to considerable cost savings while maintaining high retention, uptake and engagement from the participants. Should the intervention meet the APEASE criteria, a more comprehensive intervention on bedtime routines for first-time parents will be explored in a more robust (RCT and longitudinal) approach. Trials registration Due to the nature of the study, no trial registration is currently in place.

Title: Theoretical and methodological approaches in designing, developing, and delivering interventions for oral health behaviour change

Journal: Community Dentistry and Oral Epidemiology

Volume: 51

Issue: 1

Pages: 91-102

Date: Feb

Short Title: Theoretical and methodological approaches in designing, developing, and delivering interventions for oral health behaviour change

ISSN: 0301-5661

DOI: 10.1111/cdoe.12817

Accession Number: WOS:000928846500001

Abstract: Oral health behaviour change interventions are gaining momentum on a global scale. After lagging behind other disciplines, oral health behaviour change is becoming an area of fast and important development. Theories used in medicine and healthcare more generally are now being applied to oral health behaviour change with varying results. Despite the importance of using theories when designing and developing interventions, the variety and variation of theories available to choose from create a series of dilemmas and potential hazards. Some theories, like the COM-B (Capability, Opportunity, Motivation-Behaviour) model, and frameworks, like the Behaviour Change Wheel might represent areas of opportunity for oral health behaviour change interventions with careful consideration vital. Different methodological approaches to intervention development are actively utilized in oral health with a wide host of potential opportunities. The issue of co-designing and co-developing interventions with intended users and stakeholders from the start is an important component for successful and effective interventions, one that oral health behaviour change interventions need to

consistently implement. Oral health behaviour change interventions are utilizing technology-based approaches as a major vehicle for intervention delivery and, innovative solutions are implemented across a wide host of oral health behaviour change interventions. With multiple options for designing, developing, and delivering interventions, careful selection of appropriate, user-inclusive, and adaptable approaches is essential. With a lot of available information and evidence from other disciplines, oral health behaviour change interventions need to reflect on lessons learned in other fields whilst also maximizing the potential of the wide variety of theories, frameworks, methodologies, and techniques available at present.

Short Title: Bedtime Routines Intervention for Children (BRIC) project: results from a non-randomised feasibility, proof-of concept study

DOI: 10.1186/s40814-022-01039-7

Article Number: 79

Accession Number: WOS:000778977200001

Abstract: Background Bedtime routines are highly recurrent family activities with implications for children's wellbeing, development and health. Aims The objective of this study is to co-develop and test in a feasibility, proof-of-concept study a bedtime routines intervention using text messages aimed at first-time parents with young children. Methods Fifty first-time parents with children aged 1-3 years were recruited for this study. Parents received a text message-based intervention for 7-consecutive nights which provided support and information on achieving optimal bedtime routines. Parents completed pre- and post-intervention questionnaires focusing on children's sleep, bedtime routines and parental mood disturbance. Feedback was provided at the end of the study. Results Recruitment target and high retention with 98%, or 49 out of 50 participants completing the study were achieved. Pre- and post-intervention, there were improvements in total children's sleep with children sleeping longer and having less disrupted sleep overall (MD = - 7.77 (SD = 17.91), $t(48) = - 3.03$, $p = .004$, CI (- 12.91, - 2.63) and in

overall quality of bedtime routines (MD = - 5.00, SD = 7.01, t(48) = - 4.98, p < .001, CI (- 7.01, - 2.98). Parental mood disturbance decreased pre- to post-intervention (MD = 5.87, SD = 15.43, t(48) = 2.66), p = .010, CI (1.44, 10.30). Parents provided positive feedback about the intervention and valued the support that was provided to them. Conclusions Bedtime routines were successfully altered with short-term benefits for children's sleep and parental mood. Future research will need to utilize a more robust, longitudinal approach for a definite exploration of sustained changes in bedtime routines and their long-term implications for children and parents.

Title: How and Why Context Matters: A Personal Reflection; Comment on "Stakeholder Perspectives of Attributes and Features of Context Relevant to Knowledge Translation in Health Settings: A Multi-Country Analysis"

Journal: International Journal of Health Policy and Management

Date: 2022 Mar

Short Title: How and Why Context Matters: A Personal Reflection; Comment on "Stakeholder Perspectives of Attributes and Features of Context Relevant to Knowledge Translation in Health Settings: A Multi-Country Analysis"

DOI: 10.34172/ijhpm.2022.6782

Accession Number: WOS:000783594200001

Abstract: This commentary acknowledges that the evidence-based practice (EBP) movement did not automatically or initially understand the impact of context on successful implementation. The subsequent work of research teams, such as the PARIHS team, and the Ottawa team led by Squires, have contributed to the ongoing refinement of the concept. However, still under discussion is whether having a more comprehensive set of contextual attributes will necessarily lead to more implementation success. Just as the strength of the evidence does not automatically lead to implementation success, so having a comprehensive understanding of contextual factors will not necessarily improve implementation uptake.

Title: Towards a unifying caring life-course theory for better self-care and caring solutions: A discussion paper

Journal: Journal of Advanced Nursing

Volume: 78

Issue: 1

Pages: E6-E20

Date: Jan

Short Title: Towards a unifying caring life-course theory for better self-care and caring solutions: A discussion paper

ISSN: 0309-2402

DOI: 10.1111/jan.14887

Accession Number: WOS:000651495600001

Abstract: Aim: To present the first iteration of the caring life-course theory. Background: Despite requiring care from birth to death, a person's universal or fundamental care needs and the subsequent care provision, either by self or others, has yet to be presented within a life-course perspective. Accurately describing the care people require across their lifespan enables us to identify who, what type, how and where this care should be provided. This novel perspective can help to legitimise a person's care needs and the support they require from wider care systems and contexts.

Design: Discussion paper outlines theory development. We adopted an inductive approach to theory development, drawing upon existing literature and the team's diverse experiences. Our theoretical insights were refined through a series of collaborative meetings to define the theory's constructs, until theoretical saturation was reached. Discussion: Fourteen constructs are identified as essential to the theory. We propose it is possible, using these constructs, to generate caring life-course trajectories and predict divergences in these trajectories. The novel contribution of the theory is the interplay between understanding a person's care needs and provision within the context of their lifespan and personal histories, termed their care biography, and understanding a person's care needs and provision at specific points in time within a given care network and socio-political context. Impact for Nursing: The caring life-course theory can provide a roadmap to inform nursing and other care industry sectors, providing opportunities to integrate and deliver care from the perspective of the person and their care history, trajectories and networks, with those of professional care teams. It can help to shape health, social and economic policy and involve individuals, families and communities in more constructive ways of talking about the importance of care for improved quality of life and healthy societies.

Short Title: Knowledge translation within a population health study:
how do you do it?

ISSN: 1748-5908

DOI: 10.1186/1748-5908-8-54

Article Number: 54

Accession Number: WOS:000319990300001

Abstract: Background: Despite the considerable and growing body of knowledge translation (KT) literature, there are few methodologies sufficiently detailed to guide an integrated KT research approach for a population health study. This paper argues for a clearly articulated collaborative KT approach to be embedded within the research design from the outset. Discussion: Population health studies are complex in their own right, and strategies to engage the local community in adopting new interventions are often fraught with considerable challenges. In order to maximise the impact of population health research, more explicit KT strategies need to be developed from the outset. We present four propositions, arising from our work in developing a KT framework for a population health study. These cover the need for an explicit theory-informed conceptual framework; formalizing collaborative approaches within the design; making explicit the roles of both the stakeholders and the researchers; and clarifying what counts as evidence. From our deliberations on these propositions, our own co-creating (co-KT) Framework emerged in which KT is defined as both a theoretical and practical framework for actioning the intent of researchers and communities to co-create, refine, implement and evaluate the impact of new knowledge that is sensitive to the context (values, norms and tacit knowledge) where it is generated and used. The co-KT Framework has five steps. These include initial contact and framing the issue; refining and testing knowledge; interpreting, contextualising and adapting knowledge to the local context; implementing and evaluating; and finally, the embedding and translating of new knowledge into practice. Summary: Although descriptions of how to incorporate KT into research designs are increasing, current theoretical and operational frameworks do not generally span a holistic process from knowledge co-creation to knowledge application and implementation within one project. Population health studies may have greater health impact when KT is incorporated early and

explicitly into the research design. This, we argue, will require that particular attention be paid to collaborative approaches, stakeholder identification and engagement, the nature and sources of evidence used, and the role of the research team working with the local study community.

DOI: 10.1002/jclp.23221

Accession Number: WOS:000673625000001

Abstract: Objective Exposure therapies (e.g., prolonged exposure [PE]), are first-line interventions for posttraumatic stress disorder but remain underutilized, partially due to providers' negative beliefs about these interventions. We examined two experimental strategies aimed at enhancing beliefs towards PE and subsequent utilization. Method Clinicians (N = 155) were randomized to one of three conditions presenting a PE rationale: basic, empirically-based, or emotionally-based description. Participants were rerandomized to write or not write arguments for utilizing PE. Before and after PE rationales and 1-month later, participants completed questions about PE beliefs and utilization. Results Participants reported small yet durable belief change across all rationale conditions, with greatest change following the empirically-based description. Across conditions, belief change was not impacted by writing condition or associated with utilization. Conclusion Addressing negative beliefs with empirical information may be a brief, cost-effective strategy to improve clinicians' beliefs toward PE. Complementary strategies that leverage belief modification to increase utilization are needed.

Short Title: A Library of Logic Models to Explain How Interventions to Reduce Diagnostic Errors Work

ISSN: 1549-8417

DOI: 10.1097/pts.0000000000000459

Accession Number: WOS:000723781400077

Abstract: Objectives We aimed to create a library of logic models for interventions to reduce diagnostic error. This library can be used by those developing, implementing, or evaluating an intervention to improve patient care, to understand what needs to happen, and in what order, if the intervention is to be effective. Methods To create the library, we modified an existing method for generating logic models. The following five ordered activities to include in each model were defined: preintervention; implementation of the intervention; postimplementation, but before the immediate outcome can occur; the immediate outcome (usually behavior change); and postimmediate outcome, but before a reduction in diagnostic errors can occur. We also included reasons for lack of progress through the model. Relevant information was extracted about existing evaluations of interventions to reduce diagnostic error, identified by updating a previous systematic review. Results Data were synthesized to create logic models for four types of intervention, addressing five causes of diagnostic error in seven stages in the diagnostic pathway. In total, 46 interventions from 43 studies were included and 24 different logic models were generated. Conclusions We used a novel approach to create a freely available library of logic models. The models highlight the importance of attending to what needs to occur before and after intervention delivery if the intervention is to be effective. Our work provides a useful starting point for intervention developers, helps evaluators identify intermediate outcomes, and provides a method to enable others to generate libraries for interventions targeting other errors.

Short Title: Development and validation of the Self-Regulation of Eating Behaviour Questionnaire for adults

DOI: 10.1186/s12966-016-0414-6

Article Number: 87

Accession Number: WOS:000381567400001

Abstract: Background: Eating self-regulatory capacity can help individuals to cope with the obesogenic environment and achieve, as well as maintain, a healthy weight and diet. At present, there is no comprehensive, reliable and valid questionnaire for assessing this capacity and measuring change in response to self-regulation interventions in adults. This paper reports the development of the Self-regulation of Eating Behaviour Questionnaire (SREBQ) for use in UK adults, and presents evidence for its reliability and construct validity. The development of the SREBQ involved generation of an item pool, followed by two pilot studies (Samples 1 and 2) and a test of the questionnaire's underlying factor structure (Sample 3). The final version of the SREBQ was then assessed for reliability and construct validity (Sample 4). Results: Development of the SREBQ resulted in a 5-item questionnaire. The face validity was satisfactory, as assessed by the pilot studies. The factor structure analysis (Sample 3) suggested that it has a single underlying factor, which was confirmed in a second sample (Sample 4). The SREBQ had strong construct validity, showing a positive correlation with general measures of self-regulation. It was also positively correlated with motivation and behavioural automaticity, and negatively correlated with food responsiveness and emotional over-eating ($p < 0.001$). It showed good discriminant validity, as it was only weakly associated with satiety responsiveness, food fussiness and slowness in eating. Conclusions: The SREBQ is a reliable and valid measure for assessment of eating self-regulatory capacity in the general UK adult population.

DOI: 10.3390/ijerph19031044

Article Number: 1044

Accession Number: WOS:000754515500001

Abstract: Novel coronavirus disease 2019 (COVID-19) pandemic restrictions have negatively impacted physical activity (PA) and sedentary time/behaviour. This integrative review systematically explored the socioecological factors that impacted and influenced these movement behaviours in children and adolescents during the pandemic. Five electronic databases were systematically searched in January 2021, with data extracted from 16 articles (n = 18,352; 5–17 years; 12 countries). Risk-of-bias was assessed using the Mixed Methods Assessment Tool (MMAT), with correlates identified, coded, and themed via thematic analysis. A socioecological model of during-pandemic PA and sedentary time/behaviour was conceptualised and mapped to the Capability, Opportunity, Motivation, and Behaviour (COM-B) model of behaviour-change mechanisms, illustrating influences over five levels: Individual (biological)—age and sex; Individual (psychological)—mental health, and cognition, motivation, and behaviour; Social—family factors, and structured support; Environmental—area of residence and resources; and Policy—COVID-19-related rules. For sedentary time/behaviour, individual—(age and sex), social—(family factors) and policy—(COVID-19-related rules) level factors may be important correlates. There were no age or sex associations with PA levels, though there was some indication that sedentary time/behaviour increased with age. Interventions seeking to enhance young people's movement behaviours during periods of enforced restrictions should focus on enhancing opportunities on a social and environmental level.

Title: Knowledge, attitudes, beliefs and behaviour intentions for three bowel management practices in intensive care: effects of a targeted protocol implementation for nursing and medical staff

Journal: BMC Nursing

Volume: 14

Short Title: Knowledge, attitudes, beliefs and behaviour intentions for three bowel management practices in intensive care: effects of a targeted protocol implementation for nursing and medical staff

ISSN: 1472-6955

DOI: 10.1186/s12912-015-0056-z

Article Number: 6

Accession Number: WOS:000210484900006

Abstract: Background: Bowel management protocols have the potential to minimize complications for critically ill patients. Targeted implementation can increase the uptake of protocols by clinicians into practice. The theory of planned behaviour offers a framework in which to investigate clinicians' intention to perform the behaviour of interest. This study aimed to evaluate the effect of implementing a bowel management protocol on intensive care nursing and medical staffs' knowledge, attitude, subjective norms, perceived behavioural control, behaviour intentions, role perceptions and past behaviours in relation to three bowel management practices. Methods: A descriptive before and after survey using a self-administered questionnaire sent to nursing and medical staff working within three intensive care units before and after implementation of our bowel management protocol (pre: May – June 2008; post: Feb – May 2009). Results: Participants had significantly higher knowledge scores post-implementation of our protocol (pre mean score 17.6; post mean score 19.3; $p = 0.004$). Post-implementation there was a significant increase in: self-reported past behaviour (pre mean score 5.38; post mean score 7.11; $p = 0.002$) and subjective norms scores (pre mean score 3.62; post mean score 4.18; $p = 0.016$) for bowel assessment; and behaviour intention (pre mean score 5.22; post mean score 5.65; $p = 0.048$) for administration of enema. Conclusion: This evaluation, informed by the theory of planned behaviour, has provided useful insights into factors that influence clinician intentions to perform evidence-based bowel management practices in intensive care. Addressing factors such as knowledge, attitudes and beliefs can assist in targeting implementation strategies to positively affect clinician behaviour change. Despite an increase in clinicians' knowledge scores, our implementation strategy did not, however, significantly change clinician behaviour intentions for all three bowel management practices. Further research is required to explore the influence of opinion leaders and organizational culture on clinicians' behaviour intentions related to bowel management for intensive care patients.

Abstract: Background: Children with Developmental Language Disorder
(DLD) have a significant deficit in spoken language ability which
affects their communication skills, education, mental health,
employment and social inclusion. Aim: The present study reports
findings from a survey by EU network COST ACTION 1406 and aims to
explore differences in service delivery and funding of SLT services
for children with DLD across Europe and beyond. Methods and
procedures: The survey was completed by 5024 European professionals.
COST countries were grouped into Nordic, Anglo-Saxon, Continental,
Mediterranean, Central/Eastern and Non-European categories. The use
of direct, indirect and mixed interventions, and their relationship
to funding available (public, private or mixed) were considered for
further analysis. Outcomes and results: The results revealed that
for direct therapy, there were more cases than expected receiving
private funding. For indirect therapy, fewer than expected received
private and more than expected public funding. For mixed therapy,
fewer cases than expected received private funding. Conclusions and
implications: The results implies that other factors than evidence-
based practices, practitioners experience, and patient preferences,
drive choices in therapy. More research is needed to gain a better
understanding of factors affecting the choice of therapy.

Short Title: Involving practice nurse and other assistant clinical staff members in the management of low back pain: A qualitative interview study from Danish general practice

ISSN: 2050-3121

DOI: 10.1177/20503121211039660

Accession Number: WOS:000693710700001

Abstract: Objectives: Involving practice nurse and other assistant clinical staff members in providing information and education to patients with low back pain at follow-up appointments may release more time and improve care in general practice. However, this requires a shift in the division of tasks, and general practitioners' barriers and facilitators for this are currently unknown. The objectives were to explore general practitioners' experiences and perceptions of including assistant clinical staff members in the management of low back pain. Methods: This is a semi-structured interview study in Danish general practice. General practitioners with a variation in demographics and experience with task-delegation to clinical staff were recruited for in-depth interviews. We used a phenomenological approach to guide the data collection and the analysis in order to gain insight into the subjective experiences of the general practitioners and to understand the phenomenon of 'delegating tasks to practice staff from the perspective of the general practitioners' lifeworld. Analysis was conducted using an inductive descriptive method. The sample size was guided by information power. Results: We conducted five interviews with general practitioners. All general practitioners had experience with task delegation, but there was a variation in which tasks the general practitioners delegated and to which types of clinical staff members. The following themes were derived from the analysis: general practice organisation, delegating to clinical staff members, doctor-patient relationship, exercise instruction, clinical pathway for patients and external support. Conclusion: General practitioners consider patients with low back pain to be a heterogeneous group with a variety of treatment needs and a patient group without any predetermined content or frequency of consultations; this can be a barrier for delegating these patients to clinical staff members.

ISSN: 0883-6612

DOI: 10.1007/s12160-015-9714-3

Accession Number: WOS:000364519500004

Abstract: Interventions using theory should change behavior and identify both mechanisms of effect and necessary conditions. To date, inconsistent description of "use of theory" has limited understanding of how theory improves intervention impact. The purpose of this study was to describe the use of theory in health behavior intervention development by coding grant proposals. We developed an abstraction tool to characterize investigators, interventions, and theory use and identified seven core elements describing both how and how much theory was used. We used the tool to review and code NCI's funded cancer screening intervention R01 proposals, 1998-2009. Of 116 proposals, 38 met criteria; all but one described a conceptual model unique to the proposed research. Few proposals included plans to identify mechanisms of effect or conditions necessary for intervention effectiveness. Cancer screening intervention grant proposals rarely use theory in ways that advance behavioral or theoretical sciences. Proposed core elements may classify and synthesize the use of theory in behavioral intervention research.

Title: Theory-driven development of a mobile phone supported intervention for adolescents with perinatal depression

Journal: Social Psychiatry and Psychiatric Epidemiology

Volume: 57

Issue: 6

Pages: 1201-1210

Date: Jun

Short Title: Theory-driven development of a mobile phone supported intervention for adolescents with perinatal depression

ISSN: 0933-7954

DOI: 10.1007/s00127-021-02198-3

Accession Number: WOS:000718740600002

Abstract: Purpose This paper describes the design of a theory-informed pragmatic intervention for adolescent perinatal depression in primary care in Nigeria. Methods We conducted Focus Group Discussions (FGDs) among 17 adolescent mothers and 25 maternal health care providers with experience in the receipt and provision of care for perinatal depression. The Consolidated Framework for Implementation Research (CFIR) was used to systematically examine the barriers and facilitators affecting adolescent mothers' use of an existing intervention package for depression. The Theoretical Domain Framework (TDF) and the Capability, Opportunity, Motivation, Behaviour (COM-B) model were used to analyze the results of the data across the five CFIR domains. Results FGD analysis revealed that care providers lacked knowledge on approaches to engage young mothers in treatment. Young mothers had poor treatment engagement, low social support, and little interest in parenting. A main characteristic of the newly designed intervention is the inclusion of age-appropriate psychoeducation supported with weekly mobile phone calls, to address treatment engagement and parenting behaviours of young mothers. Also in the outer setting, low social support from relatives was addressed with education, "as need arises" phone calls, and the involvement of "neighborhood mothers". In the inner settings, care providers' behaviour is addressed with training to increase their capacity to engage young mothers in treatment. Conclusion A theory-based approach helped develop an age-appropriate intervention package targeting depression and parenting skills deficit among perinatal adolescents in primary maternal care and in which a pragmatic use of mobile phone was key.

Title: Differential correlates for aerobic physical activity and resistance training: a systematic review

Journal: Psychology Health & Medicine

Date: 2022 Nov

Short Title: Differential correlates for aerobic physical activity and resistance training: a systematic review

ISSN: 1354-8506

DOI: 10.1080/13548506.2022.2142617

Accession Number: WOS:000883230200001

Abstract: Worldwide, physical inactivity is a major public health concern. Both aerobic physical activity (PA) and resistance training (RT) are forms of exercise that provide numerous health benefits. The present systematic review aimed to examine the evidence among studies that have formally compared the correlates of both aerobic PA and RT in the same sample. Literature searches were concluded in April 2022 using four common databases. Eligible studies were selected from English language peer-reviewed journals which reported at least a bivariate correlation between the correlate and aerobic PA and RT. Findings were grouped by the correlate in accordance with the capability, opportunity, motivation, behavior (COM-B) model. The analysis identified 18 studies with 16 independent samples. Overall, evidence suggest that there are many similarities between aerobic PA and RT participation. There were positive associations for both aerobic PA and RT for physical and psychological capabilities, reflective and reflexive motivation. There were mixed associations for environmental opportunities, and social opportunities had no association for aerobic PA but mixed evidence for RT. The analyses emphasized that comparative research is lacking in certain areas, principally for environmental opportunity and reflexive motivation.

Accession Number: WOS:000716799600001

Abstract: Despite a wealth of behavior change theories and techniques available, designers often struggle to apply theory in the design of behavior change technologies. We present the Behavior Change Design (BCD) cards, a design support tool that makes behavioral science theory accessible to interaction designers during design meetings. Grounded on two theoretical frameworks of behavior change, the BCD cards attempt to map 34 behavior change techniques to five stages of behavior change, thus assisting designers in

selecting appropriate techniques for given behavioral objectives. We present the design of the BCD cards along with the results of two formative and one summative study that aimed at informing the design of the cards and assessing their impact on the design process.

Title: Transmission of Vaccination Attitudes and Uptake Based on Social Contagion Theory: A Scoping Review

Journal: Vaccines

Volume: 9

Issue: 6

Date: Jun

Short Title: Transmission of Vaccination Attitudes and Uptake Based on Social Contagion Theory: A Scoping Review

DOI: 10.3390/vaccines9060607

Article Number: 607

Accession Number: WOS:000666492000001

Abstract: Vaccine hesitancy is a complex health problem, with various factors involved including the influence of an individual's network. According to the Social Contagion Theory, attitudes and behaviours of an individual can be contagious to others in their social networks. This scoping review aims to collate evidence on how attitudes and vaccination uptake are spread within social networks. Databases of PubMed, PsycINFO, Embase, and Scopus were searched with the full text of 24 studies being screened. A narrative synthesis approach was used to collate the evidence and interpret findings. Eleven cross-sectional studies were included. Participants held more positive vaccination attitudes and greater likelihood to get vaccinated or vaccinate their child when they were frequently exposed to positive attitudes and frequently discussing vaccinations with family and friends. We also observed that vaccination uptake was decreased when family and friends were hesitant to take the vaccine. Homophily—the tendency of similar individuals to be connected in a social network—was identified as a significant factor that drives the results, especially with respect to race and ethnicity. This review highlights the key role that social networks play in shaping attitudes and vaccination uptake. Public health authorities should tailor interventions and involve family and friends to result in greater vaccination uptake.

Title: Tensions and Paradoxes of Scaling Up: A Critical Reflection on Physical Activity Promotion

Journal: International Journal of Environmental Research and Public Health

Volume: 19

Issue: 21

Date: Nov

Short Title: Tensions and Paradoxes of Scaling Up: A Critical Reflection on Physical Activity Promotion

DOI: 10.3390/ijerph192114284

Article Number: 14284

Accession Number: WOS:000883600300001

Abstract: Background: Achieving system-level, sustainable 'scale-up' of interventions is the epitome of successful translation of evidence-based approaches in population health. In physical activity promotion, few evidence-based interventions reach implementation at scale or become embedded within systems for sustainable health impact. This is despite the vast published literature describing efficacy studies of small-scale physical activity interventions. Research into physical activity scale-up (through case-study analysis; evaluations of scale-up processes in implementation trials; and mapping the processes, strategies, and principles for scale-up) has identified barriers and facilitators to intervention expansion. Many interventions are implemented at scale by governments but have not been evaluated or have unpublished evaluation information. Further, few public health interventions have evaluations that reveal the costs and benefits of scaled-up implementation. This lack of economic information introduces an additional element of risk for decision makers when deciding which physical activity interventions should be supported with scarce funding resources. Decision-makers face many other challenges when scaling interventions which do not relate to formal research trials of scale-up; Methods: To explore these issues, a multidisciplinary two-day workshop involving experts in physical activity scale-up was convened by the University of Newcastle, Australia, and the University of Ottawa, Canada (February 2019); Results: In this paper we discuss some of the scale-up tensions (challenges and conflicts) and paradoxes (things that are contrary to expectations) that emerged from this workshop in the context of the current literature and our own experiences in this field. We frame scale-up tensions according to epistemology, methodology, time, and partnerships; and paradoxes as 'reach without scale', 'planned serendipity' and 'simple complexity'. We reflect on the implications of these scale-up tensions and paradoxes, providing considerations for future scale-up research and practice moving forward; Conclusions: In this

paper, we delve deeper into stakeholders' assumptions, processes and expectations of scaling up, and challenge in what ways as stakeholders, we all contribute to desired or undesired outcomes. Through a lens of 'tensions' and 'paradoxes', we make an original contribution to the scale-up literature that might influence current perspectives of scaling-up, provide future approaches for physical activity promotion, and contribute to understanding of dynamic of research-practice partnerships.

Title: Exploring deprescribing opportunities for community pharmacists using the Behaviour Change Wheel

Journal: Research in Social & Administrative Pharmacy

Volume: 16

Issue: 12

Pages: 1746-1753

Date: Dec

Short Title: Exploring deprescribing opportunities for community pharmacists using the Behaviour Change Wheel

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2020.01.019

Accession Number: WOS:000594634100015

Abstract: Background: Deprescribing, the planned and supervised process of stopping or reducing doses of medications, can reduce the use of harmful or unnecessary medications. However, deprescribing is challenging for patients and prescribers to implement. Community pharmacists have the potential to contribute to deprescribing, but whether they are well positioned to do so effectively remains unclear. Objectives: To explore community pharmacists' involvement with deprescribing, and identify strategies for enhancing this involvement. Methods: We conducted qualitative telephone interviews with 17 community pharmacists in Ontario, Canada. The Behaviour Change Wheel's COM-B model was used to inform the development of the interview guide. Four investigators coded three transcripts independently to develop the codebook. One investigator coded the remainder and generated themes relating to the first study objective using inductive thematic analysis. Two phases of analysis were then

used to satisfy the second study objective: the first without the explicit use of theory, and the second using the Behaviour Change Wheel as a theoretical framework. Results: Pharmacists' involvement in deprescribing was affected by: 1) their understanding of which medications should be stopped and by whom, 2) their access to patient information, and 3) competing clinical and business/technical demands of their daily activities. Findings support recommendations for optimizing community pharmacists' involvement in deprescribing by focusing on specific steps within deprescribing, expanding pharmacists' understanding of how to integrate deprescribing into their practices, and defining their deprescribing role with multi-stakeholder engagement. Conclusions: This study is the first to connect community pharmacists' real-world deprescribing challenges with theory-informed recommendations for enhancing their contributions to deprescribing. This study also explored the role of theory in pragmatically-oriented qualitative work by analyzing data without the explicit use of theory as the first step to analysis. Findings inform recommendations for enhancing community pharmacists' contributions to deprescribing.

Short Title: Selecting an intervention to prevent ketoacidosis at diabetes diagnosis in children using a behavior change framework

ISSN: 1399-543X

DOI: 10.1111/pedi.13314

Accession Number: WOS:000742712300001

Abstract: Objective The rate of diabetic ketoacidosis (DKA), a preventable, life-threatening complication of diabetes, at the time of diagnosis in children remains unacceptably high worldwide. We describe our initial approach to selecting a national DKA prevention strategy, to be implemented by the Canadian Pediatric Endocrine Group DKA Prevention Working Group, informed by a framework for behavior change interventions. Methods Existing interventions were identified from a systematic review and our own gray literature search. We then characterized interventions using the Behavior Change Wheel, a framework to inform and drive behavior change, and matched interventions to behavioral targets, audiences, and

identified barriers and facilitators. Feedback from the CPEG DKA prevention working group was incorporated into the intervention plan. Results We identified 27 interventions. Our proposed target behaviors are: (1) prompt recognition of symptoms of diabetes in children; (2) urgent attendance to medical care with a request for an office-based test for diabetes; and (3) rapid confirmation of diagnosis and urgent consultation with pediatric diabetes experts. We initially identified four possible intervention functions including education, training, environment restructuring, and enablement. Feedback from the working group favored education intervention functions including symptom recognition messages targeting parents, caregivers, teachers, and providers and messages about how to make a rapid diagnosis and need for urgent referral targeting providers. Conclusions The Behavior Change Wheel has been used successfully in selecting interventions in other clinical areas. We describe how we used this framework to provide a foundation for developing an intervention to prevent DKA at diabetes diagnosis in children.

Short Title: A principal components analysis of factors associated with successful implementation of an LVAD decision support tool

DOI: 10.1186/s12911-021-01468-z

Article Number: 106

Accession Number: WOS:000631143300002

Abstract: Background A central goal among researchers and policy makers seeking to implement clinical interventions is to identify key facilitators and barriers that contribute to implementation success. Despite calls from a number of scholars, empirical insights into the complex structural and cultural predictors of why decision aids (DAs) become routinely embedded in health care settings remains limited and highly variable across implementation contexts. Methods We examined associations between "reach", a widely used indicator (from the RE-AIM model) of implementation success, and multi-level site characteristics of nine LVAD clinics engaged over 18 months in implementation and dissemination of a decision aid for left ventricular assist device (LVAD) treatment. Based on data collected

from nurse coordinators, we explored factors at the level of the organization (e.g. patient volume), patient population (e.g. health literacy; average sickness level), clinician characteristics (e.g. attitudes towards decision aid; readiness for change) and process (how the aid was administered). We generated descriptive statistics for each site and calculated zero-order correlations (Pearson's r) between all multi-level site variables including cumulative reach at 12 months and 18 months for all sites. We used principal components analysis (PCA) to examine any latent factors governing relationships between and among all site characteristics, including reach. Results We observed strongest inclines in reach of our decision aid across the first year, with uptake fluctuating over the second year. Average reach across sites was 63% (s.d. = 19.56) at 12 months and 66% (s.d. = 19.39) at 18 months. Our PCA revealed that site characteristics positively associated with reach on two distinct dimensions, including a first dimension reflecting greater organizational infrastructure and standardization (characteristic of larger, more established clinics) and a second dimension reflecting positive attitudinal orientations, specifically, openness and capacity to give and receive decision support among coordinators and patients. Conclusions Successful implementation plans should incorporate specific efforts to promote supportive and mutually informative interactions between clinical staff members and to institute systematic and standardized protocols to enhance the availability, convenience and salience of intervention tool in routine practice. Further research is needed to understand whether "core predictors" of success vary across different intervention types.

Title: Using Nudges to Enhance Clinicians' Implementation of Shared Decision Making With Patient Decision Aids

Journal: Mdm Policy & Practice

Volume: 5

Issue: 1

Date: Jan-Jun

Short Title: Using Nudges to Enhance Clinicians' Implementation of Shared Decision Making With Patient Decision Aids

DOI: 10.1177/2381468320915906

Accession Number: WOS:000938229200009

Abstract: Background. Although effective interventions for shared decision making (SDM) exist, there is a lack of uptake of these tools into clinical practice. ``Nudges,' ' which draw on behavioral economics and target automatic thinking processes, are used by policy makers to influence population-level behavior change. Nudges have not been applied in the context of SDM interventions but have potential to influence clinician motivation, a primary barrier to long-term adoption of SDM tools. Objective. Describe, evaluate, and propose recommendations for the use of a behavioral economics framework (MINDSPACE) on clinician motivation and behavior during implementation of a validated decision aid (DA) for left ventricular assist device at nine hospitals. Methods. Qualitative thematic analysis of process notes from stakeholder meetings during the first 6 months of implementation to identify examples of how the MINDSPACE framework was operationalized. Quantitative implementation progress was evaluated using the REAIM framework. Results. MINDSPACE components were translated into concrete approaches that leveraged influential stakeholders, fostered ownership over the DA and positive emotional associations, spread desirable norms across sites, and situated the DA within established default processes. DA reach to eligible patients increased from 9.8% in the first month of implementation to 70.0% in the sixth month. Larger gains in reach were observed following meetings using MINDSPACE approaches. Limitations. The MINDSPACE framework does not capture all possible influences on behavior and responses to nudges may differ across populations. Conclusions. Behavioral economics can be applied to implementation science to foster uptake of SDM tools by increasing clinician motivation. Our recommendations can help other researchers effectively apply these approaches in real-world settings when there are often limited incentives and opportunities to change organizational- or structural-level factors.

Title: Do people know that cigarette filters are mainly composed of synthetic material? A representative survey of the German population (the DEBRA study)

Journal: Tobacco Control

Volume: 30

Issue: 3

Pages: 345-347

Date: May

Short Title: Do people know that cigarette filters are mainly composed of synthetic material? A representative survey of the German population (the DEBRA study)

ISSN: 0964-4563

DOI: 10.1136/tobaccocontrol-2019-055558

Accession Number: WOS:000645253900018

Abstract: Introduction Most cigarettes are smoked with filters made of synthetic plastic, which are not fully biodegradable. Littering used cigarette filters (butts) represents a substantial environmental hazard. It is unclear if people, in particular smokers, know that filters consist of synthetic plastic. Methods We used data collected in August/September 2019 from a representative household survey of the German population aged 14 years and over (wave 20 of the German Study on Tobacco Use; DEBRA). Respondents were asked: 'The majority of smokers use cigarettes with a filter. What do you think these filters are composed of? (1) Mainly of natural material; (2) Mainly of synthetic material; (3) I don't know what cigarette filters are composed of.' Response option 2 indicated correct knowledge. Results A total of 2066 people were interviewed, including 625 current smokers. The weighted response rate to option 2 ('mainly of synthetic material') was 34.8% (95%CI 32.7 to 36.9) in the total sample and 42.7% (95%CI=38.7 to 46.8) in the subgroup of current smokers. In the latter subgroup, smokers with low compared with those with high educational level were less likely to know that filters are mainly composed of synthetic material (OR=0.62, 95%CI=0.39 to 0.99). Conclusions The majority of smokers in Germany does not know that cigarette filters are mainly composed of synthetic material. Our findings suggest a need for promoting awareness as well as knowledge of environmental health hazards of cigarette filters to the general population, and specifically to current smokers.

ISSN: 1036-7314

DOI: 10.1016/j.aucc.2021.04.003

Accession Number: WOS:000768691300002

Abstract: Background: Ineffective intervention for patients with blunt chest wall injury results in high rates of morbidity and mortality. To address this, a blunt chest injury care bundle protocol (ChIP) was developed, and a multifaceted plan was implemented using the Behaviour Change Wheel. Objective: The purpose of this study was to evaluate the reach, fidelity, and dose of the ChIP intervention to discern if it was activated and delivered to patients as intended at two regional Australian hospitals. Methods: This is a pretest and post-test implementation evaluation study. The proportion of ChIP activations and adherence to ChIP components received by eligible patients were compared before and after intervention over a 4-year period. Sample medians were compared using the nonparametric median test, with 95% confidence intervals. Differences in proportions for categorical data were compared using the two-sample z-test. Results/Findings: Over the 19-month postimplementation period, 97.1% (n = 440) of eligible patients received ChIP (reach). The median activation time was 134 min; there was no difference in time to activation between business hours and after-hours; time to activation was not associated with comorbidities and injury severity score. Compared with the preimplementation group, the postimplementation group were more likely to receive evidence-based treatments (dose), including high-flow nasal cannula use (odds ratio [OR] = 6.8 [95% confidence interval {CI} = 4.8–9.6]), incentive spirometry in the emergency department (OR = 7.5, [95% CI = 3.2–17.6]), regular analgesia (OR = 2.4 [95% CI = 1.5–3.8]), regional analgesia (OR = 2.8 [95% CI = 1.5–5.3]), patient-controlled analgesia (OR = 1.8 [95% CI = 1.3–2.4]), and multiple specialist team reviews, e.g., surgical review (OR = 9.9 [95% CI = 6.1–16.1]). Conclusions: High fidelity of delivery was achieved and sustained over 19 months for implementation of a complex intervention in the acute context through a robust implementation plan based on theoretical frameworks. There were significant and sustained improvements in care practices known to result in better patient outcomes. Findings from this evaluation can inform future implementation programs such as ChIP and other multidisciplinary interventions in an emergency or acute care context. Short Title: Influences of early diagnostic suggestions on clinical reasoning

ISSN: 2365-7464

DOI: 10.1186/s41235-022-00453-y

Article Number: 103

Accession Number: WOS:000899567200001

Abstract: Previous research has highlighted the importance of physicians' early hypotheses for their subsequent diagnostic decisions. It has also been shown that diagnostic accuracy improves when physicians are presented with a list of diagnostic suggestions to consider at the start of the clinical encounter. The psychological mechanisms underlying this improvement in accuracy are hypothesised. It is possible that the provision of diagnostic suggestions disrupts physicians' intuitive thinking and reduces their certainty in their initial diagnostic hypotheses. This may encourage them to seek more information before reaching a diagnostic conclusion, evaluate this information more objectively, and be more open to changing their initial hypotheses. Three online experiments explored the effects of early diagnostic suggestions, provided by a hypothetical decision aid, on different aspects of the diagnostic reasoning process. Family physicians assessed up to two patient scenarios with and without suggestions. We measured effects on certainty about the initial diagnosis, information search and evaluation, and frequency of diagnostic changes. We did not find a clear and consistent effect of suggestions and detected mainly non-significant trends, some in the expected direction. We also detected a potential biasing effect: when the most likely diagnosis was included in the list of suggestions (vs. not included), physicians who gave that diagnosis initially, tended to request less information, evaluate it as more supportive of their diagnosis, become more certain about it, and change it less frequently when encountering new but ambiguous information; in other words, they seemed to validate rather than question their initial hypothesis. We conclude that further research using different methodologies and more realistic experimental situations is required to uncover both the beneficial and biasing effects of early diagnostic suggestions.

Title: Understanding Changes in Adolescent Physical Activity Behaviors and Cognitions Prior to and During the COVID-19 Pandemic

Journal: Frontiers in Sports and Active Living

Volume: 4

Date: Jul

Short Title: Understanding Changes in Adolescent Physical Activity Behaviors and Cognitions Prior to and During the COVID-19 Pandemic

DOI: 10.3389/fspor.2022.895097

Article Number: 895097

Accession Number: WOS:000830086900001

Abstract: Despite accumulating evidence that has found significant negative declines in physical activity (PA) as a result of the COVID-19 pandemic, little work has sought to understand how PA cognitions have changed during this period and in relation to behavior change during the pandemic. The purpose of the current study was to investigate the changes in adolescents' PA behaviors and cognitions associated with COVID-19 and prospective predictors of PA using the Multi-Process Action Control (M-PAC) framework.

Adolescents were recruited from a large school board and a total of 588 participants (M-age = 15.87 +/- 0.43 years, 60% female)

completed data collection in both Fall 2019 and 2020-prior to and during the COVID-19 pandemic. Participants completed self-reported measures of moderate-to-vigorous PA (MVPA), participation in organized activities, and variables derived from the M-PAC framework.

Mixed effects models were computed to examine longitudinal changes in MVPA and cognitions as well as whether cognitions prior to COVID-19 predict MVPA during COVID-19. A generalized estimating equations model was computed to examine longitudinal changes for participation in organized activities.

Findings indicated that MVPA ($B = -56.41$, $p < 0.01$) and participation in organized activities ($OR = 0.33$, $p < 0.01$) significantly decreased during the COVID-19 pandemic.

Correspondingly, there were significant decreases in intentions ($B = -0.34$), identity ($B = -0.19$), and habit ($B = -0.20$), though there were increases in behavioral regulation ($B = 0.18$). No significant changes were found in affective attitudes, instrumental attitudes, perceived opportunity, and perceived capability.

Among the baseline M-PAC cognitions, habit ($B = 46.28$) was the lone significant predictor of MVPA during COVID-19. Overall results suggest that adolescents' PA behaviors and cognitions were negatively impacted by the COVID-19 pandemic, along with promising evidence that

restrictions prompted adaptive utilization of behavioral regulation skills. Moreover, habit appears to play a salient role in predicting PA behaviors during uncertain times involving major life disruptions. These findings highlight the need to dedicate additional attention to PA promotion as COVID-19 moves toward an endemic phase, and that interventions targeting habit formation may be critical for helping adolescents better sustain healthy active lifestyles during major life changes.

Short Title: How to Motivate SARS-CoV-2 Convalescents to Receive a Booster Vaccination? Influence on Vaccination Willingness

DOI: 10.3390/vaccines10030455

Article Number: 455

Accession Number: WOS:000774544300001

Abstract: (1) Background: Booster vaccinations for SARS-CoV-2 convalescents are essential for achieving herd immunity. For the first time, this study examined the influencing factors of vaccination willingness among SARS-CoV-2 infected individuals and identified vaccination-hesitant subgroups. (2) Methods: Individuals with positive SARS-CoV-2 PCR results were recruited by telephone. They completed an online questionnaire during their home isolation in Germany. This questionnaire assessed the vaccination willingness and its influencing factors. (3) Results: 224 home-isolated individuals with acute SARS-CoV-2 infection were included in the study. Vaccination willingness of home-isolated SARS-CoV-2 infected individuals with asymptomatic or moderate course was 54%. The following factors were associated with significantly lower vaccination willingness: younger age, foreign nationality, low income, low trust in vaccination effectiveness, fear of negative vaccination effects, low trust in the governmental pandemic management, low subjective informativeness about SARS-CoV-2, support of conspiracy theories. (4) Conclusions: The vaccination willingness of homeisolated SARS-CoV-2 infected individuals with asymptomatic or moderate symptomatic course was low. Motivational vaccination campaigns should be adapted to individuals with acute SARS-CoV-2 infection and consider the vaccination-hesitant groups. Vaccination education should be demand-driven, low-threshold, begin during the acute infection phase, and be guided for example by the established 5C model ("confidence, complacency, constraints, calculation, collective responsibility").

Article Number: 6

Accession Number: WOS:000757582000001

Abstract: Antimicrobial resistance (AMR) is a significant problem in global health today, particularly in low- and middle-income countries (LMICs) where antimicrobial stewardship programmes are yet to be successfully implemented. We established a partnership between AMR pharmacists from a UK NHS hospital and in Ho Teaching Hospital with the aim of enhancing antimicrobial stewardship knowledge and practice among healthcare providers through an educational intervention. We employed a mixed-method approach that included an initial survey on knowledge and awareness before and after training, followed by qualitative interviews with healthcare providers conducted six months after delivery of training. This study was carried out in two phases in Ho Teaching Hospital with healthcare professionals, including pharmacists, medical doctors, nurses and medical laboratory scientists. Ethical approval was obtained prior to data collection. In the first phase, we surveyed 50 healthcare providers, including nurses (33%), pharmacists (29%) and biomedical scientists (23%). Of these, 58% of participants had engaged in continuous professional development on AMR/AMS, and above 95% demonstrated good knowledge on the general use of antibiotics. A total of 18 participants, which included four medical doctors, five pharmacists, four nurses, two midwives and three biomedical scientists, were interviewed in the second phase and demonstrated greater awareness of AMS practices, particularly the role of education for patients, as well as healthcare professionals. We found that knowledge and practice with AMS was markedly improved six months after the training session. There is limited practice of AMS in LMICs; however, through AMR-focused training, we demonstrated improved AMS skills and practice among healthcare providers in Ho Teaching Hospital. There is a need for continuous AMR training sessions for healthcare professionals in resource-limited settings.

ISSN: 1018-8827

DOI: 10.1007/s00787-020-01648-8

Accession Number: WOS:000574312400001

Abstract: As mental health systems move towards person-centred care, outcome measurement in clinical research and practice should track changes that matter to young people and their families. This study mapped the types of change described by three key stakeholder groups following psychotherapy for depression, and compared the salience of these outcomes with the frequency of their measurement in recent quantitative treatment effectiveness studies for adolescent depression. Using qualitative content analysis, this study identified and categorized outcomes across 102 semi-structured interviews that were conducted with depressed adolescents, their parents, and therapists, as part of a randomized superiority trial. Adolescents had been allocated to Cognitive-Behavioral Therapy, Short-Term Psychoanalytic Psychotherapy, or a Brief Psychosocial Intervention. The study mapped seven high-level outcome domains and 29 outcome categories. On average, participants discussed change in four domains and six outcome categories. The most frequently discussed outcome was an improvement in mood and affect (i.e., core depressive symptoms), but close to half of the participants also described changes in family functioning, coping and resilience, academic functioning, or social functioning. Coping had specific importance for adolescents, while parents and therapists showed

particular interest in academic functioning. There was some variation in the outcomes discussed beyond these core themes, across stakeholder groups and treatment arms. Of the outcomes that were frequently discussed in stakeholder narratives, only symptomatic change has been commonly reported in recent treatment studies for adolescent depression. A shift towards considering multiple outcome domains and perspectives is needed to reflect stakeholder priorities and enable more nuanced insights into change processes.

Article Number: e041720

Accession Number: WOS:000621082800011

Abstract: Introduction Multiple sclerosis (MS) is an inflammatory and degenerative disease of the central nervous system that mainly affects young adults. Uncertainty is a major psychological burden of the disease from diagnosis to prognosis, enhanced by the pressure to make early decisions on a diverse set of immunotherapies. Watchful waiting for 1-2 years while adapting goals and lifestyle habits to life with a chronic disease represents another reasonable option for persons with MS (PwMS). A behaviour change programme based on evidence-based patient information (EBPI) is not available in standard care. This randomised controlled trial (RCT) with an embedded process evaluation investigates the efficacy and cost-effectiveness of a web-based behavioural lifestyle programme to change lifestyle behaviour and reduce inflammatory disease activity in PwMS. Methods and analysis A web-based behavioural intervention will be evaluated in an RCT aiming to recruit 328 persons with clinically isolated syndrome, suspected MS or confirmed MS for less than 1 year, who have not yet started immunotherapy. Moreover, a mixed-methods process evaluation and a health economic evaluation will be carried out. Participants will be recruited in at least 16

MS centres across Germany and randomised to an intervention group with 12 months of access to EBPI about lifestyle factors in MS, combined with a complex behaviour change programme or to a control group (optimised standard care). The combined primary endpoint is the incidence of new T2 lesions on MRI or confirmed relapses. Ethics and dissemination The study has been approved by the Ethics Committee of the Hamburg Chamber of Physicians (PV6015). Trial results will be communicated at scientific conferences and meetings and presented on relevant patient websites and in patient education seminars. Trial registration number ClinicalTrials.gov Registry (NCT03968172); Pre-results.

ISSN: 1353-4505

DOI: 10.1093/intqhc/mzv115

Accession Number: WOS:000371239300019

Abstract: Introduction: Extensive research has been undertaken over the last 30 years on the methods underpinning clinical practice guidelines (CPGs), including their development, updating, reporting, tailoring for specific purposes, implementation and evaluation. This has resulted in an increasing number of terms, tools and acronyms. Over time, CPGs have shifted from opinion-based to evidence-informed, including increasingly sophisticated methodologies and implementation strategies, and thus keeping abreast of evolution in this field of research can be challenging. Methods: This article collates findings from an extensive document search, to provide a guide describing standards, methods and systems reported in the current CPG methodology and implementation literature. This guide is targeted at those working in health care quality and safety and

responsible for either commissioning, researching or delivering health care. It is presented in a way that can be updated as the field expands. Conclusion: CPG development and implementation have attracted the most international interest and activity, whilst CPG updating, adopting (with or without contextualization), adapting and impact evaluation are less well addressed.

Article Number: e031468

Accession Number: WOS:000738373200003

Abstract: Objectives Clinical guidelines support evidence-informed quality patient care. Our study explored perspectives of South African subnational health managers regarding barriers to and enablers for implementation for all available primary care guidelines. Design We used qualitative research methods, including semistructured, individual interviews and an interpretative perspective. Thematic content analysis was used to develop data categories and themes. Setting We conducted research in four of nine South African provinces with diverse geographic, economic and health system arrangements (Eastern Cape, Western Cape, KwaZulu-Natal, Limpopo). South Africa is a middle-income country with high levels of inequality. The settings represented public sector rural and peri-urban health facilities. Participants Twenty-two participants with provincial and district health management roles, that comprised implementation and/or training on primary care guidelines, were included. Results Participants recommended urgent consideration of health system challenges, particularly financial constraints, impacting on access to the guidelines themselves and to medical equipment and supplies necessary to adhere to guidelines. They suggested that overcoming service delivery gaps requires

strengthening of leadership, clarification of roles and enhanced accountability. Participants suggested that inadequate numbers of skilled clinical staff hampered guideline use and, ultimately, patient care. Quality assurance of training programmes for clinicians—particularly nurses—interdisciplinary training, and strengthening post-training mentorship were recommended. Furthermore, fit-for-purpose guideline implementation necessitates considering the unique settings of facilities, including local culture and geography. This requires guideline development to include guideline end users. Conclusions Guidelines are one of the policy tools to achieve evidence-informed, cost-effective and universal healthcare. But, if not effectively implemented, they have no impact. Subnational health managers in poorly resourced settings suggested that shortcomings in the health system, along with poor consultation with end users, affect implementation. Short-term improvements are possible through increasing access to and training on guidelines. However, health system strengthening and recognition of socio-cultural-geographic diversity are prerequisites for context-appropriate evidence-informed practice.

Title: Psychologically informed oral health interventions in pregnancy and type 2 diabetes: A scoping review

Journal: Frontiers in Oral Health

Volume: 3

Date: Dec

Short Title: Psychologically informed oral health interventions in pregnancy and type 2 diabetes: A scoping review

DOI: 10.3389/froh.2022.1068905

Article Number: 1068905

Accession Number: WOS:000993699500001

Abstract: Introduction Oral health is a critical aspect of gestational diabetes management. Gestational diabetes is high blood glucose levels during pregnancy and is managed like type 2 diabetes with diet and physical activity interventions. This scoping review sets out to discuss why oral health support should also become part of gestational diabetes management. Objectives The primary objective was to synthesise the existing psychologically informed oral health interventions for pregnant women and individuals with type 2 diabetes, and the extent to which these interventions map on to the COM-B Model. No literature exists on oral health interventions in gestational diabetes, why studies with type 2 diabetes populations were selected instead. The secondary objective was to identify the

precise outcomes targeted in the interventions. MethodologyThe Joanna Briggs Institute's Methodology for Scoping Reviews was used to conduct this review. The populations of interest were pregnant women and individuals with type 2 diabetes, and eligible concepts were psychologically informed oral health interventions. Quasi-experimental and experimental designs were considered. The Ovid Interface including Embase, Medline, Global Health, APA PsychInfo, Health Management Information, Maternity, Infant Care Database, the Cochrane Library, and CINAHL was used as information sources. The study selection followed the PRISMA guidelines. The first search was conducted on the week commencing the 25th of July 2022, with a follow-up search conducted on the 10th of October 2022. Results28 records were included for synthesis. The most frequently assessed psychological outcome was oral health knowledge and the most frequently assessed oral clinical outcome was Plaque Index. All studies used an educational intervention approach, while psychological capability in the COM-B Model was targeted in all interventions by increasing oral health knowledge among the participants. The Health Belief Model was the most frequently used theory in the interventions. ConclusionThe results demonstrate that oral health is a recognised aspect of pregnancy and type 2 diabetes. The findings from this review and a qualitative interview study which is under development will inform the first oral health intervention for women with gestational diabetes in the United Kingdom.

Article Number: e062591

Accession Number: WOS:000860227200047

Abstract: Introduction Periodontal health is becoming a recognised component in managing gestational diabetes. Gestational diabetes is characterised as raised blood glucose levels first discovered in pregnancy and managed similarly to type 2 diabetes. Currently, the standard intervention for gestational diabetes in the UK entails dietary modifications and physical activity interventions. However,

considering the literature discussed in this review, it is argued that oral health advice and support should also become an integrated part of gestational diabetes management. Objective The objective of this scoping review is to map out psychologically informed oral health interventions in pregnancy and type 2 diabetes. This will inform the development of a new behavioural intervention to promote oral health-related behaviours in women with gestational diabetes. As no literature exists on oral health interventions in gestational diabetes, it was deemed appropriate to synthesise the evidence on oral health interventions designed for pregnant women and individuals with type 2 diabetes. Methodology The scoping review will be conducted using the Joanna Briggs Institute's methodology for scoping reviews. Studies including pregnant women and individuals with type 2 diabetes over 18 years of age will be included. Only studies including a psychologically informed oral health intervention will be considered. The authors will consider experimental and quasi-experimental research designs. The Ovid Interface including EMBASE, Medline, Global Health, APA PsychInfo, Health Management Information, Maternity, Infant Care Database and the Cochrane Library will be used as information sources. The planned searches will commence on the week of the 25 July 2022. Only articles in Danish and English will be considered. The study selection will follow the Preferred Reporting Items for Scoping Reviews process. The data will be presented using narrative synthesis. Ethics and dissemination No ethical approval is needed for this review. The results will be published in a relevant scientific journal.

Short Title: User-centred development of an mHealth app for youth with type 1 diabetes: the challenge of operationalizing desired features and feasibility of offering financial incentives

ISSN: 2190-7188

DOI: 10.1007/s12553-022-00656-9

Accession Number: WOS:000768659600001

Abstract: Mobile health applications (mHealth apps) have the potential to support youth with type 1 diabetes (T1D) as they

transition to independence, but require sustained user-engagement if long-term health benefits, such as improved metabolic control, are to be observed. As such, it is important for mHealth apps to be developed using an evidence-based framework, with early involvement of end-users. Although financial incentives may further promote app engagement and improve health outcomes, few mHealth apps for youth with T1D have incorporated principles of behavioural economics into their design. In this hypothesis-generating, mixed-methods pilot study, we conducted focus groups with youth, parents, and healthcare providers (HCPs) to identify challenges related to self-management that could potentially be overcome by an innovative mHealth app offering user-selected financial rewards for youth participation in self-management behaviours. We developed and piloted the functionality of and satisfaction with a prototype of the Canadian Diabetes Incentives and Technology (CanDIT) app. Though rewards were earned and redeemed, and feedback on existing features was positive, we were unable to fully meet the needs of our target population. We present a summary of findings and discuss design features that app developers should consider in the future to optimize app usability and uptake by youth with T1D.

Title: Mindfulness and the clinical relationship: steps to a resilience in medicine

Journal: Revista Medica De Chile

Volume: 147

Issue: 5

Pages: 618-627

Date: May

Short Title: Mindfulness and the clinical relationship: steps to a resilience in medicine

ISSN: 0034-9887

DOI: 10.4067/s0034-98872019000500618

Accession Number: WOS:000478968700010

Abstract: Medical resilience is a dynamic capacity, which has the potential to improve the well-being of physicians and to enhance the quality of the clinical relationship. Strategies to promote resilience are important to achieve a sustainable medical practice and improve patient care. Mindfulness training has demonstrated to be an effective tool to promote resilience in physicians. This paper contextualizes the place of mindfulness in medical practice and describes the ways through which it can contribute to resilience in medicine. The concept of mindfulness, its relationship with health practice is reviewed and the benefits of the practice of mindfulness in the clinical relationship are described. We suggest that the

benefits achieved through a mindfulness-based medical practice are mediated by two axes. One is the nonspecific and specific effect of mindfulness-based practices and the other is the integration of explicit and implicit knowledge of clinical practice. We conclude that medical practice that integrates mindfulness can contribute to the challenge of achieving greater levels of individual, staff and institutional resilience. There is a need to have continuing mindfulness training programs for health professionals and to integrate this concept in the curriculum of health care professionals.

Pages: 423-433

Date: Sep

Short Title: Effectiveness of interventions aiming to reduce inappropriate drug prescribing: an overview of interventions

ISSN: 1759-8885

DOI: 10.1093/jphsr/rmab038

Accession Number: WOS:000700076300015

Abstract: Objective Inappropriate prescribing of drugs is associated with unnecessary harms for patients and healthcare costs.

Interventions to reduce these prescriptions are widely studied, yet the effectiveness of different types of interventions remains unclear. Therefore, we provide an overview regarding the

effectiveness of intervention types that aim to reduce inappropriate drug prescriptions, unrestricted by target drugs, population or setting. Methods For this overview, systematic reviews (SRs) were

used as the source for original studies. EMBASE and MEDLINE were searched from inception to August 2018. All SRs aiming to evaluate the effectiveness of interventions to reduce inappropriate

prescribing of drugs were eligible for inclusion. The SRs and their original studies were screened for eligibility. Interventions of the original studies were categorized by type of intervention. The

percentage of interventions showing a significant reduction of inappropriate prescribing were reported per intervention category.

Key findings Thirty-two SRs were included, which provided 319 unique interventions. Overall, 61.4% of these interventions showed a significant reduction in inappropriate prescribing of drugs.

percentage of interventions showing a significant reduction of inappropriate prescribing were reported per intervention category.

Key findings Thirty-two SRs were included, which provided 319 unique interventions. Overall, 61.4% of these interventions showed a significant reduction in inappropriate prescribing of drugs.

Strategies that were most frequently effective in reducing inappropriate prescribing were multifaceted interventions (73.2%), followed by interventions containing additional diagnostic tests (anti-biotics) (70.4%), computer interventions (69.2%), audit and feedback (66.7%), patient-mediated interventions (62.5%) and multidisciplinary (team) approach (57.1%). The least frequently effective intervention was an education for healthcare professionals (50.0%). Conclusion The majority of the interventions were effective in reducing inappropriate prescribing of drugs. Multifaceted interventions most frequently showed a significant reduction of inappropriate prescribing. Education for healthcare professionals is the most frequently included intervention in this overview, yet this category is least frequently effective.

Short Title: When behavioural science can make a difference in times of COVID-19

ISSN: 2398-063X

DOI: 10.1017/bpp.2020.48

Article Number: Pii s2398063x20000482

Accession Number: WOS:000865478900004

Abstract: In a large study that involved 2637 participants recruited from a representative UK and US sample, we tested the influence of four behavioural interventions (versus control) on a range of behaviours important for reducing the spread of COVID-19 a day after the interventions were administered. Even if people largely complied with social distancing measures, our analyses showed that for certain subgroups of the population the interventions made a positive difference. More specifically, for those who started practising social distancing relatively recently, an information-based intervention increased general compliance with social distancing and reduced both the number of times people went out and the number of hours they spent outside. However, for people who started practising social distancing relatively early, the

interventions tended to backfire and, in some cases, reduced compliance with social distancing. Overall, this research has various policy implications and shows that, although behavioural interventions can positively impact compliance with social distancing, their effect may depend on personal circumstances.

Short Title: Information sourcing by dog owners in the UK: Resource selection and perceptions of knowledge

ISSN: 0042-4900

DOI: 10.1002/vetr.1081

Article Number: e1081

Accession Number: WOS:000714908100001

Abstract: Background: Dogs are a popular pet in the UK. Information resources utilised by dog owners can influence welfare at acquisition and throughout a dog's lifetime. This study determined where UK dog owners source information, and how perceptions relating to pedigree dog breeding and health may influence this process.

Methods: This cross-sectional study used online questionnaires to explore the information resources used by dog owners and their perceptions of veterinary surgeons' and dog breeders' knowledge.

Results: Overall, 1336 responses were collected (useable responses: 1167). Data indicated most owners conducted research before getting a dog, with the internet, books, breeders and friends or family among the most popular resources used. Preferred sources of information during a dogs' lifetime included the internet, talking to veterinary surgeons and reading books. Veterinary surgeons were the most popular source for health advice. Pedigree dog owners perceived veterinary surgeons and breeders to be equally knowledgeable on canine inherited diseases. However, veterinary surgeons were perceived as being more knowledgeable on inherited disease screening programmes and breeders more knowledgeable on dog breeding. Conclusion: This study highlights the information resources preferred by dog owners, providing an opportunity to maximise access to reliable sources of information to improve dog welfare.

Abstract: Background Smoking cessation in pregnancy has unique challenges. Health providers (HP) may need support to successfully implement smoking cessation care (SCC) for pregnant women (PW). We aimed to synthesize qualitative data about views of HPs and PW on SCC during pregnancy using COM-B (Capability, Opportunity, Motivation, Behaviour) framework. Methods A systematic search of online databases (MEDLINE, EMBASE, PsycINFO and CINAHL) using PRISMA guidelines. PW's and HPs' quotes, as well as the authors' analysis, were extracted and double-coded (30%) using the COM-B framework. Results Thirty-two studies included research from 5 continents: twelve on HPs' perspectives, 16 on PW's perspectives, four papers included both. HPs' capability and motivation were affected by role confusion and a lack of training, time, and resources to provide interventions. HPs acknowledged that advice should be delivered while taking women's psychological state (capability) and stressors into consideration. Pregnant women's physical capabilities to quit (e.g., increased metabolism of nicotine and dependence) was seldom addressed due to uncertainty about nicotine replacement therapy (NRT) use in pregnancy. Improving women's motivation to quit depended on explaining the risks of smoking versus the safety of quit methods. Women considered advice from HPs during antenatal visits as effective, if accompanied by resources, peer support, feedback, and encouragement. Conclusions HPs found it challenging to provide effective SCC due to lack of training, time, and role confusion. The inability to address psychological stress in women and inadequate use of pharmacotherapy were additional barriers. These findings could aid in designing training programs that address HPs' and PW's attitudes and supportive campaigns for pregnant smokers.

Title: Lessons from the failure of implementing the 'Better Care Better Value' prescribing indicator for renin-angiotensin system drugs in England: a qualitative study of general practitioners' perceptions using behavioural change framework

Journal: Bmj Open

Volume: 10

Issue: 6

Date: Jun

Short Title: Lessons from the failure of implementing the 'Better Care Better Value' prescribing indicator for renin-angiotensin system drugs in England: a qualitative study of general practitioners' perceptions using behavioural change framework

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2019-035910

Article Number: e035910

Accession Number: WOS:000738458500088

Abstract: Objectives To explore reasons for the lack of uptake of 'Better Care Better Value (BCBV)' prescribing indicators for renin-angiotensin-aldosterone system (RAAS) inhibitors and identify learning lessons to inform the implementation of future prescribing policies. Design In-depth, semistructured interviews to explore: general practitioners' (GPs) experiences in prescribing RAAS, perceptions of the BCBV policy and potential barriers to policy implementation and suggestions for improving future policy implementation. Interviews were audio recorded, transcribed verbatim and analysed thematically, then mapped onto behavioural change frameworks (the Capability, Opportunity, Motivation and Behaviour) model and Behaviour Change Wheel (BCW)). Setting Primary care setting in England Participants Interviews were conducted with 16 GPs recruited from a purposive sample of 91 GP practices in three English counties. Results Four factors/barriers, related mainly to GPs' psychological capability and reflective motivation, emerged as the possible barriers for the BCBV's lack of uptake, including: lack of the policy awareness, negative attitude to the policy, lack of incentives and GPs' reluctance to switch patients from angiotensin receptor blockers (ARBs) to ACE inhibitors (ACEIs). The participating GPs proposed interventions to improve future BCBV implementation and they were related to six intervention/policy functions of the BCW, addressing the four identified barriers: education/communication (increase GPs' awareness) and environmental restructuring/regulations (provide GPs with reminding alerts); incentivisation/fiscal (provide GPs with financial incentives);

enablement/guidelines–regulations (provide GPs with benchmarking against peers) and enablement/regulations and education/guidelines (facilitate switching from ARBs to ACEIs). Conclusions The main reason underpinning the low uptake of the BCBV indicator appears to be lack of a proactive implementation strategy. This case study demonstrated that passively disseminating policy without an effective implementation strategy results in low uptake. Furthermore, multifaceted implementation strategies are necessary to influence complex clinical decision making in a time–limited environment, such as prescribing behaviours. These findings suggest that effective policy implementation requires the application of a systematic comprehensive behaviours change framework.

Short Title: From Raising Awareness to a Behavioural Change: A Case Study of Indoor Air Quality Improvement Using IoT and COM–B Model

DOI: 10.3390/s23073613

Article Number: 3613

Accession Number: WOS:000970124500001

Abstract: The topic of indoor air pollution has yet to receive the same level of attention as ambient pollution. We spend considerable time indoors, and poorer indoor air quality affects most of us, particularly people with respiratory and other health conditions. There is a pressing need for methodological case studies focusing on informing households about the causes and harms of indoor air pollution and supporting changes in behaviour around different indoor activities that cause it. The use of indoor air quality (IAQ) sensor data to support behaviour change is the focus of our research in this paper. We have conducted two studies–first, to evaluate the effectiveness of the IAQ data visualisation as a trigger for the natural reflection capability of human beings to raise awareness. This study was performed without the scaffolding of a formal behaviour change model. In the second study, we showcase how a behaviour psychology model, COM–B (Capability, Opportunity, and Motivation–Behaviour), can be operationalised as a means of digital intervention to support behaviour change. We have developed four digital interventions manifested through a digital platform. We have demonstrated that it is possible to change behaviour concerning

indoor activities using the COM-B model. We have also observed a measurable change in indoor air quality. In addition, qualitative analysis has shown that the awareness level among occupants has improved due to our approach of utilising IoT sensor data with COM-B-based digital interventions.

Short Title: Barriers to Guideline-Based Use of Proton Pump Inhibitors to Prevent Upper Gastrointestinal Bleeding

ISSN: 1544-1709

DOI: 10.1370/afm.2734

Accession Number: WOS:000748419000001

Abstract: PURPOSE Gastrointestinal (GI) bleeding is one of the most common serious adverse drug upper GI bleeding in high-risk patients, but this practice is underused. METHODS To explore prescribing practices and barriers to the use of PPI gastroprotection, including dynamics within and across specialties, we conducted semistructured interviews with physicians in 4 specialties at a single institution. We performed thematic analysis of barriers, organized around the theoretical domains framework. RESULTS The sample included 5 primary care physicians (PCPs), 4 cardiologists, 3 gastroenterologists, and 3 vascular surgeons. Most PCPs, gastroenterologists, and vascular surgeons seldom prescribed PPI gastroprotection. Cardiologists varied most in their use of PPI gastroprotection, with some prescribing it consistently and others never. Major barriers related to the following 3 themes: (1) knowledge, (2) decision processes, and (3) professional role. Knowledge of guidelines was greatest among cardiologists and gastroenterologists and low among PCPs and vascular surgeons, and PCPs tended to focus on adverse effects associated with PPIs, which made them reluctant to prescribe them. For cardiologists, prevention of bleeding was usually a priority, but they sometimes deferred prescribing to others. For the other 3 specialties, PPI gastroprotection was a low priority. There was unclear delineation of responsibility for prescribing gastroprotection between specialties. CONCLUSIONS Major barriers to PPI gastroprotection relate to knowledge, decision processes, and

professional role, which operate differentially across specialties. Multicomponent interventions will likely be necessary to improve guideline-based use of PPIs to prevent upper GI bleeding.

Abstract: Individual, car-based mobility contributes significantly to worldwide greenhouse gas emissions. Driving style accounts for up to 30% of fuel consumption and manufacturers have implemented technologies such as energy-efficient "eco" driving modes to reduce emissions. Here we report evidence from a field experiment with battery-electric vehicles. Two behavioral interventions, changing the mode's default to on and informing drivers about the frequency of other people's usage of the mode, i.e. providing a descriptive social norm, successfully increased eco mode usage. However, the cars' acceleration and energy consumption remained unaffected due to a behavioral rebound, and were instead predicted by a situational factor, trip distance. While behavioral interventions proved effective, the results suggest that technological interventions aiming to reduce the environmental impacts might focus more strongly on alterations of situational rather than dispositional factors of people or cars.

DOI: 10.1186/s13012-022-01230-7

Article Number: 59

Accession Number: WOS:000848744600002

Abstract: Background This study will explore implementation mechanisms through which a single implementation strategy and a multifaceted implementation strategy operate to affect the implementation outcome, which is fidelity to the Guideline For The Prevention of Mental Ill Health within schools. The guideline gives recommendations on how workplaces can prevent mental ill health among their personnel by managing social and organizational risks factors in the work environment. Schools are chosen as the setting for the study due to the high prevalence of mental ill health among teachers and other personnel working in schools. The study builds on our previous research, in which we compared the effectiveness of the two strategies on fidelity to the guideline. Small improvements in guideline adherence were observed for the majority of the indicators in the multifaceted strategy group. This study will focus on exploring the underlying mechanisms of change through which the implementation strategies may operate to affect the implementation outcome. Methods We will conduct a cluster-randomized-controlled trial among public schools (n=55 schools) in Sweden. Schools are randomized (1:1 ratio) to receive a multifaceted strategy (implementation teams, educational meeting, ongoing training, Plan-Do-Study-Act cycles) or a single strategy (implementation teams, educational meeting). The implementation outcome is fidelity to the guideline. Hypothesized mediators originate from the COM-B model. A mixed-method design will be employed, entailing a qualitative study of implementation process embedded within the cluster-randomized controlled trail examining implementation mechanisms. The methods will be used in a complementary manner to get a full understanding of the implementation mechanisms. Discussion This implementation study will provide valuable knowledge on how implementation strategies work (or fail) to affect implementation outcomes. The knowledge gained will aid the selection of effective implementation strategies that fit specific determinants, which is a priority for the field. Despite recent initiatives to advance the understanding of implementation mechanisms, studies testing these mechanisms are still uncommon.

Title: A Mobile Application to Improve Diabetes Self-Management Using Rapid Prototyping: Iterative Co-Design Approach in Asian Settings

Journal: Patient Preference and Adherence

Volume: 17

Pages: 1-11

Short Title: A Mobile Application to Improve Diabetes Self-Management Using Rapid Prototyping: Iterative Co-Design Approach in Asian Settings

ISSN: 1177-889X

DOI: 10.2147/ppa.S386456

Accession Number: WOS:000910404500001

Abstract: Background: Diabetes is a global public health issue, causing burden on healthcare system and increasing risk of mortality. Mobile applications (apps) can be a promising approach to facilitate diabetes self-management. An increasingly utilized approach to facilitate engagement with mobile health (mHealth) technology is to involve potential users in the creation of the technology. Objective: The aim of this study was to use co-design for type 2 diabetes mellitus (T2DM) self-management mHealth development. Methods: Three rounds of iterative rapid prototyping panel sessions were conducted with a total of 9 T2DM participants in an Asian setting between Oct 2020 and April 2021. The participants were recruited through convenience sampling. For each round, feedback was gathered through qualitative interviews, and the feedback was used as a reference by the development team to develop and test a more refined version of the app in the next round. Transcribed semi-structured interview data was analyzed thematically using an inductive approach. Results: Participants' ages ranged from 40 to 69 years. Data saturation was reached, with no new themes emerging from the data. During the sessions, the participants expressed a variety of concerns and feedback on T2DM self-management using EMPOWER app and raised suggestions on the features of ideal T2DM self-management app. Important features include 1) reminders and notifications for medications, 2) Bluetooth integration with glucometers and blood pressure machines to minimize manual entry, 3) enlarged local food database including information on sugar content and recommendations for healthier options, 4) one touch for logging of routine medications and favorite foods, 5) export function for data sharing with physicians. Overall inputs concerned aspects such as user-friendliness of the app, customization possibilities, and educational content for the features in the mobile app. Conclusion: In this study, we explored users' opinions on a T2DM self-management mobile app using co-design approach. This study adds to the growing

body of literature on co-designing behavioral mHealth interventions and can potentially guide researchers in mobile app design for other chronic conditions.

Title: EMPOWERing Patients With Diabetes Using Profiling and Targeted Feedbacks Delivered Through Smartphone App and Wearable (EMPOWER): Protocol for a Randomized Controlled Trial on Effectiveness and Implementation

Journal: Frontiers in Public Health

Volume: 10

Date: Feb

Short Title: EMPOWERing Patients With Diabetes Using Profiling and Targeted Feedbacks Delivered Through Smartphone App and Wearable (EMPOWER): Protocol for a Randomized Controlled Trial on Effectiveness and Implementation

DOI: 10.3389/fpubh.2022.805856

Article Number: 805856

Accession Number: WOS:000777762700001

Abstract: Introduction: Type 2 diabetes mellitus (T2DM) poses huge burden and cost on the healthcare system. Mobile health (mHealth) interventions that incorporate wearables may be able to improve diabetes self-management. The aim of this randomized controlled trial (RCT) is to investigate the clinical and cost-effectiveness of personalized educational and behavioral interventions delivered through an EMPOWER mobile application (app) among patients with T2DM. Methods: This is a parallel two-arm randomized controlled trial (RCT). Patients with T2DM recruited from primary care will be randomly allocated in a 1:1 ratio to either intervention or control group. The intervention group will receive personalized educational and behavioral interventions through the EMPOWER app in addition to their usual clinical care. The control group will receive the usual clinical care for their T2DM but will not have access to the EMPOWER app. Our primary outcome is patient activation score at 12 months. Secondary outcomes will include HbA1c, physical activity level and diet throughout 12 months; quality of life (QoL), medication adherence, direct healthcare cost and indirect healthcare cost at 6 and 12 months. Discussion: This RCT will provide valuable insights into the effectiveness and implementation of personalized educational and behavioral interventions delivered through mobile application in T2DM management. Findings from this study can help to achieve sustainable and cost-effective behavioral change in patients

with T2DM, and this can be potentially scaled to other chronic diseases such as hypertension and dyslipidemia.

Title: Factors influencing the success of telepractice during the COVID-19 pandemic and preferences for post-pandemic services: An interview study with clinicians and parents

Journal: International Journal of Language & Communication Disorders

Volume: 57

Issue: 6

Pages: 1354-1367

Date: Nov

Short Title: Factors influencing the success of telepractice during the COVID-19 pandemic and preferences for post-pandemic services: An interview study with clinicians and parents

ISSN: 1368-2822

DOI: 10.1111/1460-6984.12760

Accession Number: WOS:000829097800001

Abstract: Background There has been a significant uptake in the use of telepractice during the coronavirus SARS-CoV-2 (COVID-19) pandemic. This study explored the experiences of speech and language therapists (SLTs), assistants (SLTAs) and parents with telepractice during the COVID-19 pandemic. Aims (1) To identify factors that influenced success of telepractice; and (2) to describe clinicians' and parents' preferences for the future mode of service delivery for preschoolers with communication disorders. Methods & Procedures The study was conducted in partnership with one publicly funded programme in Ontario, Canada, that offered services to preschoolers with speech, language and communication needs at no cost. SLTs (N = 13), assistants (N = 3) and parents (N = 13) shared their experiences and perspectives during semi-structured videoconference interviews. Outcomes & Results Factors that influenced the success of telepractice were reported in three categories: the setting (i.e., where and how telepractice was being delivered); the nature of telepractice (i.e., the services that were provided via telepractice); and the individuals (i.e., who was involved in telepractice). These factors were reported to interact with each other. As the needs for each child and family are unique, parents and clinicians reported a preference for a hybrid and flexible service delivery model in the future. Conclusions & Implications The themes identified in this study can be used by clinicians and managers to consider factors that influence the success of telepractice for children and families. WHAT THIS PAPER ADDS What is

already known on the subject? Studies conducted before the COVID-19 pandemic showed that telepractice was an effective and acceptable service approach. However, some clinicians and parents reported wanting to resume in-person visits. The provision of telepractice services to families with children with communication disorders increased significantly during COVID-19. What this paper adds to existing knowledge? Parents and clinicians shared factors that influenced the success of telepractice during semi-structured interviews. Factors were identified in three categories: the setting (i.e., where and how telepractice was being delivered); the nature of telepractice (i.e., the services that were provided via telepractice); and the individuals (i.e., who were involved in telepractice). As each child's and family's needs are unique, parents and clinicians reported a preference for a hybrid and flexible service delivery model in the future. What are the potential or actual clinical implications of this work? SLTs and SLT managers can use the factors identified to discuss with parents and decide whether telepractice may be well suited to the needs of each child and family.

Title: Improving Heart Disease Risk Through Quality-Focused Diet

Logging: Pre-Post Study of a Diet Quality Tracking App

Journal: Jmir Mhealth and Uhealth

Volume: 8

Issue: 12

Date: Dec

Short Title: Improving Heart Disease Risk Through Quality-Focused

Diet Logging: Pre-Post Study of a Diet Quality Tracking App

ISSN: 2291-5222

DOI: 10.2196/21733

Article Number: e21733

Accession Number: WOS:000617704000001

Abstract: Background: Diet-tracking mobile apps have gained increased interest from both academic and clinical fields. However, quantity-focused diet tracking (eg, calorie counting) can be time-consuming and tedious, leading to unsustainable adoption. Diet quality-focusing on high-quality dietary patterns rather than quantifying diet into calories-has shown effectiveness in improving heart disease risk. The Healthy Heart Score (HHS) predicts 20-year cardiovascular risks based on the consumption of foods from quality-focused food categories, rather than detailed serving sizes. No studies have examined how mobile health (mHealth) apps focusing on

diet quality can bring promising results in health outcomes and ease of adoption. Objective: This study aims to design a mobile app to support the HHS-informed quality-focused dietary approach by enabling users to log simplified diet quality and view its real-time impact on future heart disease risks. Users were asked to log food categories that are the main predictors of the HHS. We measured the app's feasibility and efficacy in improving individuals' clinical and behavioral factors that affect future heart disease risks and app use. Methods: We recruited 38 participants who were overweight or obese with high heart disease risk and who used the app for 5 weeks and measured weight, blood sugar, blood pressure, HHS, and diet score (DS)-the measurement for diet quality-at baseline and week 5 of the intervention. Results: Most participants (30/38, 79%) used the app every week and showed significant improvements in DS (baseline: mean 1.31, SD 1.14; week 5: mean 2.36, SD 2.48; 2-tailed t test $t(29)=-2.85$; $P=.008$) and HHS (baseline: mean 22.94, SD 18.86; week 4: mean 22.15, SD 18.58; $t(29)=2.41$; $P=.02$) at week 5, although only 10 participants (10/38, 26%) checked their HHS risk scores more than once. Other outcomes, including weight, blood sugar, and blood pressure, did not show significant changes. Conclusions: Our study showed that our logging tool significantly improved dietary choices. Participants were not interested in seeing the HHS and perceived logging diet categories irrelevant to improving the HHS as important. We discuss the complexities of addressing health risks and quantity- versus quality-based health monitoring and incorporating secondary behavior change goals that matter to users when designing mHealth apps.

Title: Integrative oncology in cancer care - implementation factors: mixed-methods systematic review

Journal: Bmj Supportive & Palliative Care

Date: 2023 May

Short Title: Integrative oncology in cancer care - implementation factors: mixed-methods systematic review

ISSN: 2045-435X

DOI: 10.1136/spcare-2022-004150

Accession Number: WOS:000990691100001

Abstract: BackgroundIntegrative oncology (IO) appears to be beneficial to patients with cancer, but its implementation remains a challenge. Guided by the Theoretical Domains Framework (TDF) and the

Capability–Opportunity–Motivation–Behaviour (COM–B) model, this systematic review identified the barriers to and facilitators of IO implementation in conventional cancer care settings. Methods We searched eight electronic databases from their inception until February 2022 for qualitative, quantitative or mixed–methods empirical studies reporting the implementation outcomes for IO services. Critical appraisal approach was tailored according to study types. The identified implementation barriers and facilitators were mapped onto TDF domains and the COM–B model, and subsequently onto the behavioural change wheel (BCW) for formulating behavioural change interventions. Results We included 28 studies (11 qualitative, 6 quantitative, 9 mixed–methods and 2 Delphi studies) of satisfied methodological quality. The main implementation barriers were the lack of IO knowledge, the absence of funding and healthcare professionals' low level of IO receptiveness. The key implementation facilitators were the dissemination of evidence on IO clinical benefits, the equipping of professionals with IO service delivery skills and the provision of a supportive organisational climate. Conclusion Multifaceted implementation strategies are needed to address the determinants influencing IO service delivery. Based on our BCW–based analysis of the included studies, the key behavioural change techniques are: (1) educating healthcare professionals about the value and application of traditional and complementary medicine; (2) ensuring access to actionable clinical evidence on IO effectiveness and safety and (3) designing guidelines on communicating traditional and complementary medicine interventions with patients and caregivers for biomedically trained doctors and nurses.

ISSN: 1087–0792

DOI: 10.1016/j.smr.2015.02.003

Accession Number: WOS:000362148100008

Abstract: Sleep restriction therapy is a core element of

contemporary cognitive-behavioural therapy for insomnia and is also effective as a single-component therapeutic strategy. Since its original description, sleep restriction therapy has been applied in several different ways, potentially limiting understanding of key therapeutic ingredients, mode of action, evidence synthesis, and clinical implementation. We sought to examine the quality of reporting and variability in the application of sleep restriction therapy within the context of insomnia intervention trials.

Systematic literature searches revealed 88 trials of cognitive-behavioural therapy/sleep restriction therapy that met pre-defined inclusion/exclusion criteria. All papers were coded in relation to their description of sleep restriction therapy procedures. Findings indicate that a large proportion of papers (39%) do not report any details regarding sleep restriction therapy parameters and, for those papers that do, variability in implementation is present at every level (sleep window generation, minimum time-in-bed, sleep efficiency titration criteria, and positioning of sleep window). Only 7% of papers reported all parameters of sleep restriction treatment. Poor reporting and variability in the application of sleep restriction therapy may hinder progress in relation to evidence synthesis, specification of mechanistic components, and refinement of therapeutic procedures for patient benefit. We set out guidelines for the reporting of sleep restriction therapy as well as a research agenda aimed at advancing understanding of sleep restriction therapy. (C) 2015 Elsevier Ltd. Short Title: Profiling Hesitancy to COVID-19 Vaccinations in Six European Countries: Behavioral, Attitudinal and Demographic Determinants

ISSN: 0896-4289

DOI: 10.1080/08964289.2022.2071198

Accession Number: WOS:000794228700001

Abstract: Vaccination hesitancy is an important barrier for the effective control of the COVID-19 pandemic. Identifying determinants of COVID-19 vaccination hesitancy is essential in order to reduce mortality rates. Further, given the variability of the factors and the different recommendations used in each country, it is important to conduct cross-country research to profile individuals who are hesitant toward COVID-19 vaccinations. This cross-sectional study aimed to examine cross-country differences and the behavioral, attitudinal and demographic characteristics of vaccine hesitant individuals. Adults living in six European countries (Cyprus, France, Germany, Italy, Poland, and Spain) were eligible to participate. A total of 832 individuals completed the online survey, with 17.9% reporting being hesitant to COVID-19 vaccination. Vaccine accepters were significantly older ($M = 38.9$, $SD = 14.3$), more educated (master/postgraduate studies) and lived in a place with a higher number of residents ($>500,000$ people) compared to those hesitant to COVID-19 vaccination. Discriminant analysis confirmed that the hesitant profile includes a person of younger age, living alone in smaller communities, and without children. Additionally, hesitant participants reported COVID-19-specific characteristics such as lower institutional trust, less adherence to COVID-19 protective behaviors and higher pandemic fatigue. When tackling COVID-19 vaccination hesitancy both socio-demographic and behavioral/attitudinal aspects should be taken into account. Stakeholders are advised to implement targeted vaccination programs while at the same time building trust with population illness cognitions addressed in order to reduce hesitancy rates. Further, stakeholders and public health authorities in each country are suggested to target interventions according to different population characteristics as behavioral and attitudinal determinants of COVID-19 vaccination hesitancy differed between countries.

Title: Strategies to improve adherence to medications for cardiovascular diseases in socioeconomically disadvantaged populations: A systematic review

Journal: International Journal of Cardiology

Volume: 167

Issue: 6

Pages: 2430-2440

Date: Sep

Short Title: Strategies to improve adherence to medications for cardiovascular diseases in socioeconomically disadvantaged populations: A systematic review

ISSN: 0167-5273

DOI: 10.1016/j.ijcard.2013.01.049

Accession Number: WOS:000324478400024

Abstract: Medication non-adherence poses a major barrier to reducing cardiovascular disease (CVD) burden globally, and is increasingly recognised as a socioeconomically determined problem. Strategies promoting CVD medication adherence appear of moderate effectiveness and cost-effectiveness. Potentially, 'one-size-fits-all' measures are ill-equipped to address heterogeneous adherence behaviour between social groups. This review aims to determine the effects of strategies to improve adherence to CVD-related medications in socioeconomically disadvantaged groups. Randomised/quasi-randomised controlled trials (1996-June 2012, English), testing strategies to increase adherence to CVD-related medications prescribed to adult patients who may experience health inequity (place of residence, occupation, education, or socioeconomic position) were reviewed. 772 abstracts were screened, 111 full-text articles retrieved, and 16 full-text articles reporting on 14 studies, involving 7739 patients (age range 41-66 years), were included. Methodological and clinical heterogeneity precluded quantitative data synthesis. Studies were thematically grouped by targeted outcomes; underlying interventions and policies were classified using Michie et al.'s Behaviour Change Wheel. Contrasting with patient or physician/practice strategies, those simultaneously directed at patients and physicians/practices resulted in statistically significant improvements in relative adherence (16-169%). Comparative cost and cost-effectiveness analyses from three studies did not find cost-saving or cost-effective strategies. Unlike much current evidence in general populations, promising evidence exists about what strategies improve adherence in disadvantaged groups. These strategies were generally complex: simultaneously targeting patients and physicians; addressing social, financial, and treatment-related adherence barriers; and supported by broader guidelines, regulatory and communication-based policies. Given their complexity and potential resource implications, comprehensive process evaluations and cost and cost-effectiveness evidence are urgently needed. (C) 2013 Elsevier Ireland Ltd. Abstract: Consumption of animal products is an important greenhouse gas emitting behavior. However, perceived hindrances to incorporating more plant-based diets present challenges for the successful design of behavior-change interventions. Latent profile analysis of survey responses revealed three distinct groups. Meat-reducers perceive the fewest inhibitors and are the most willing to incorporate more meat-free days in their diets. Moderate-hindrance meat eaters perceive many more inhibitors, and are hindered by a lack of social support, attachment to meat, not wanting to change their routine, and less awareness of the health benefits of eating less meat. They are willing to incorporate new healthy foods in their diet and are somewhat willing to avoid meat on some days. Strong-hindrance meat eaters report weak self-efficacy and the most inhibitors but are somewhat willing to incorporate healthier foods in their diets. Implications for tailored meat-reduction interventions are discussed. For example, when targeting meat-attached individuals, it might be beneficial to focus on replacing red meats with less carbon-intensive protein sources.

Abstract: Background: Process evaluation within clinical trials provides an assessment of the study implementation's accuracy and quality to explain causal mechanisms and highlight contextual factors associated with variation in outcomes. Objectives: This study aimed to identify the barriers and facilitators of implementing early mobilisation (EM) within a trial. Methods: This is a qualitative process evaluation study within the Trial of Early Activity and Mobilisation (TEAM) phase 3 randomised controlled trial. Semistructured interviews were conducted remotely with multiprofessional clinicians (physiotherapists, medical staff, and nursing staff) involved in the delivery of the TEAM intervention at Australian hospitals participating in the TEAM study. Inductive coding was used to establish themes which were categorised into the Behaviour system involving domains of Capability, Opportunity, and Motivation (COM-B), which allowed barriers and enablers affecting EM to be identified. Findings: Semistructured interviews were conducted in three different states of Australia. There were 16 participants, including 10 physiotherapists, five physicians, and one nurse. The key themes that facilitated EM were mentoring, champions, additional staff, organisation of the environment, cultural changes, communication, and documented safety criteria. In contrast, the main factors that hindered EM were lack of expertise and confidence in delivering EM, heavy sedation, interdisciplinary conflicts, and perceived risks related to EM. Conclusion: A wide range of barriers and facilitators that influenced EM within the TEAM study were identified using the COM-B framework. Many of these have been previously identified in the literature; however, participation in the study was viewed positively by multidisciplinary team members. Article Number: 12186

Accession Number: WOS:000722923800001

Abstract: Tobacco use kills more than eight million individuals each year, and results in substantial economic and human capital loss across nations. While effective supply-side solutions to tobacco control exist, these approaches are less effective at promoting cessation among heavy smokers, and less feasible to implement in countries with weaker tobacco control policy environments. Thus, effective demand-side solutions are needed. Shifting social norms around tobacco use is one such promising approach. To this end, a systematic review and meta-analysis of social norms intervention studies to influence tobacco use will be conducted following PRISMA 2020 guidance. Tobacco intervention studies with at least two time points that explicitly mention social norms or social influence as part of an intervention or set of measured variables will be included. Literature sources will comprise PubMed, Scopus, PsycInfo, and the Cochrane Trial Registry, as well as several grey literature sources. Two reviewers will independently screen studies, and risk of bias will be assessed using the Cochrane Risk of Bias 2 and ROBINS-I tools. The primary outcomes will be change in tobacco use and change in social norms. A random-effects meta-analysis will be conducted for both outcomes. Sources of heterogeneity will be explored using meta-regression with key covariates. Non-reporting biases will be explored using funnel plots. PROSPERO: CRD42021251535.

DOI: 10.1016/j.nedt.2022.105436

Article Number: 105436

Accession Number: WOS:000824578300017

Abstract: Background: There is a widespread international agreement that healthcare should be based on high-quality evidence; however, bridging the gap from evidence to practice is still problematic. Although barriers to the implementation of evidence-based nursing practice have been identified, most studies have focused on clinical nurses' perceptions of the barriers to evidence-based nursing practice, with a lack of investigation into barriers from the hospitals' viewpoint. Objectives: To identify existing barriers to implementing evidence-based nursing practice from the hospitals' viewpoint. Design: A descriptive study employing a regional cross-sectional survey. Settings and participants: A convenience sample of 91 hospitals in Guangdong Province, China. Methods: The survey used an online questionnaire containing basic hospital information and an open-ended question. Descriptive statistics were used to analyse basic hospital data. Responses to the open-ended question were analysed with thematic analysis. Results: The sample consisted of 89 valid responses to the open-ended question. Five themes were identified: (1) knowledge (70.8 %); (2) environmental context and resources (42.7 %); (3) social influences (7.9 %); (4) intentions (7.9 %); and (5) beliefs about capabilities (1.1 %). Conclusion: Introduced early in 2001, China has embraced evidence-based nursing for more than 20 years. However, lack of knowledge is still the top barrier to implementing evidence-based nursing practice in hospitals in China. The findings indicate a need for more evidence-based nursing practice teaching strategies towards further enhancing clinical nurses' and nursing managers' evidence-based nursing practice beliefs, knowledge, and skills.

Title: Acceptability of Strategies to Reduce Student Sitting: A Mixed-Methods Study With College Teachers

Journal: Health Promotion Practice

Volume: 18

Issue: 1

Pages: 44-53

Date: Jan

Short Title: Acceptability of Strategies to Reduce Student Sitting:
A Mixed-Methods Study With College Teachers

ISSN: 1524-8399

DOI: 10.1177/1524839916677209

Accession Number: WOS:000397218400007

Abstract: Background. As school days among adolescents include long periods of prolonged sitting, teachers are key agents to deliver interventions to reduce youth sedentary behavior. To develop an intervention, acceptability and feasibility of alternative strategies should be tested. We aimed to examine teachers' current use and willingness to use various strategies to decrease student sitting and potential barriers and facilitators of use. Method. Mixed-methods design with college teachers using an online cross-sectional survey (n = 192) and focus group interviews (n = 13). Findings. Although a vast majority (87%) of the teachers found reducing prolonged sitting an important goal, only 47% were actually including practices to reduce sitting in their classroom. 89% of the teachers reported willingness to use at least one of the five alternative strategies presented. Focus groups revealed a discussion emphasis on environmental opportunity and motivation as key to implementation. Teachers also generated additional ideas for intervention content. Discussion. Despite low levels of current sitting reduction, teachers were willing to try at least one strategy to reduce sitting. Results informed intervention development regarding parameters of use for each strategy. When possible, interventions should provide teachers with a variety of alternative strategies that are easy to use to reduce prolonged sitting.

Title: Psychologically Informed Practice in Audiological Rehabilitation: Audiologist Perceived Barriers, Facilitators, and Preparedness

Journal: Ear and Hearing

Volume: 43

Issue: 6

Pages: 1853-1865

Date: Nov-Dec

Short Title: Psychologically Informed Practice in Audiological Rehabilitation: Audiologist Perceived Barriers, Facilitators, and Preparedness

ISSN: 0196-0202

DOI: 10.1097/aud.0000000000001257

Accession Number: WOS:000870068200025

Abstract: Objectives: Psychological factors, such as mental illness, mental health, attitudes, emotions, and coping styles, are known to impact the success of audiological rehabilitation. However, evidence suggests that audiologists are not sufficiently addressing client psychological factors. Psychologically informed practice, implemented in other healthcare professions, is a framework that guides clinicians in addressing both the physical and psychological factors of a condition throughout rehabilitation. Psychologically informed practice may also be an appropriate framework to improve client outcomes in audiology. The objectives of this study were (1) to determine the barriers and facilitators to audiologists addressing client mental health, psychological symptoms, emotions, and feelings, and (2) to determine audiologists' preparedness and willingness to implement aspects of psychologically informed practice in audiological rehabilitation. Design: A cross-sectional survey was conducted with a convenience sample of 118 Australian clinical audiologists (83.1%, n = 98 female) working in adult audiological rehabilitation. Results: Most participants (91.5%) reported at least one barrier to discussing mental health with clients, with the most common being insufficient knowledge and skills in mental health (39.8%). Applying the COM-B model of behavior change, audiologists reported that factors related to motivation were primarily facilitators, and factors related to opportunity (e.g., lack of time) and capabilities (e.g., insufficient knowledge) were barriers to discussing client mental health. Many participants (83.1%) reported willingness to incorporate a clear protocol, including when and how to refer to psychological services, within audiological rehabilitation. Conclusions: Audiologists were generally motivated to incorporate psychologically informed practice into audiological rehabilitation; however, lack of knowledge and organizational barriers would need to be overcome. The insights gained in this study provide a foundation for developing a viable approach to psychologically informed practice, which may ultimately encourage audiologists to engage in person-centered care more actively.

Short Title: Identifying barriers and enablers to rigorous conduct and reporting of preclinical laboratory studies

ISSN: 1544-9173

DOI: 10.1371/journal.pbio.3001932

Article Number: e3001932

Accession Number: WOS:000934625800001

Abstract: Use of rigorous study design methods and transparent reporting in publications are 2 key strategies proposed to improve the reproducibility of preclinical research. Despite promotion of these practices by funders and journals, assessments suggest uptake is low in preclinical research. Thirty preclinical scientists were interviewed to better understand barriers and enablers to rigorous design and reporting. The interview guide was informed by the Theoretical Domains Framework, which is a framework used to understand determinants of current and desired behavior. Four global themes were identified; 2 reflecting enablers and 2 reflecting barriers. We found that basic scientists are highly motivated to apply the methods of rigorous design and reporting and perceive a number of benefits to their adoption (e.g., improved quality and reliability). However, there was varied awareness of the guidelines and in implementation of these practices. Researchers also noted that these guidelines can result in disadvantages, such as increased sample sizes, expenses, time, and can require several personnel to operationalize. Most researchers expressed additional resources such as personnel and education/training would better enable the application of some methods. Using existing guidance (Behaviour Change Wheel (BCW); Expert Recommendations for Implementing Change (ERIC) project implementation strategies), we mapped and coded our interview findings to identify potential interventions, policies, and implementation strategies to improve routine use of the guidelines by preclinical scientists. These findings will help inform specific strategies that may guide the development of programs and resources to improve experimental design and transparent reporting in preclinical research.

Title: Psychosocial factors, but not professional practice skills, linked to self-perceived effectiveness of telepractice in school-

based speech and language therapists during COVID-19 pandemic
Journal: International Journal of Language & Communication Disorders
Volume: 58

Issue: 1

Pages: 111-123

Date: Jan

Short Title: Psychosocial factors, but not professional practice skills, linked to self-perceived effectiveness of telepractice in school-based speech and language therapists during COVID-19 pandemic
ISSN: 1368-2822

DOI: 10.1111/1460-6984.12773

Accession Number: WOS:000849861700001

Abstract: Background Face-to-face class suspensions during the coronavirus disease (COVID-19) pandemic in 2019 increased telepractice in speech and language therapy. However, little is known about speech and language therapists' (SLTs) perceived effectiveness of telepractice and its antecedents. Aims To examine the use of telepractice and the factors affecting its perceived effectiveness in Hong Kong mainstream schools during COVID-19. Methods & Procedures Seventy-two school-based Hong Kong SLTs completed a 110-item online survey with six structural components: (1) concerns, (2) adoption, (3) student selection criteria, (4) perceived effectiveness, (5) continuous professional development and (6) attitudes/beliefs. Outcomes & Results Over 90% of respondents adopted telepractice during the pandemic. Confirmatory factor analysis identified reliable constructs from their component measures. These participants reported great telepractice difficulties (especially in therapy preparation and managing students' attention and/or communication). Mixed-response analysis revealed that psychosocial factors (i.e., students' engagement and SLTs' attitudes towards telepractice) but not professional practice skill factors (i.e., student client selection criteria and SLTs' years of experience in school settings) contributed to SLTs' self-perceived effectiveness of telepractice. Conclusions & Implications Our findings suggest that psychosocial factors play a more important role than professional practice skill factors in the self-perceived effectiveness of telepractice. WHAT THIS PAPER ADDS What is already known on the subject Previous surveys reported that although SLTs were interested in using telepractice before the COVID-19 pandemic, they showed concern about its effectiveness, resulting in a low adoption rate. One critical question naturally arises: What factors may affect the perceived effectiveness of telepractice by SLTs? What this paper adds to existing knowledge This study demonstrates for the first time that despite the high adoption rate of telepractice during the COVID-19 pandemic, school-based SLTs exhibited great difficulties, and the SLTs' self-perceived effectiveness of telepractice was related to psychosocial factors instead of professional practice skill factors. What are the potential or actual clinical implications of this work Professional support is needed to alter the attitudes of SLTs towards telepractice for enhancing their self-perceived effectiveness and positive clinical practice experience.

Title: A Novel Method for Assessing Design Fidelity in Web-Based
Behavioral Interventions

Journal: Health Psychology

Volume: 40

Issue: 3

Pages: 217-225

Date: Mar

Short Title: A Novel Method for Assessing Design Fidelity in Web-
Based Behavioral Interventions

ISSN: 0278-6133

DOI: 10.1037/hea0001046

Accession Number: WOS:000623075300007

Abstract: Objective: Delivery is one of the most common ways of
assessing fidelity in behavioral interventions. However, there is a
lack of research reporting on how well an intervention protocol
reflects its proposed theoretical principles (design fidelity). This
study presents a systematic method for assessing design fidelity and
applies it to the eMotion web-based intervention targeting physical
activity and depression. Method: The eMotion intervention comprises
of 13 web-based modules, designed according to an underlying
intervention map. An independent rater with expertise in behavior
change coded the presence or absence of behavior change techniques
(BCTs) in the content of eMotion. Results of coding were compared to
the intervention designers' a priori specification for interrater
reliability. Results: After discussion, the independent rater and
the intervention designer had a high agreement for the presence of
BCTs relating to behavioral activation ($AC1 = 0.91$) with
"demonstration of behavior" and "monitoring of emotional
consequences" having the lowest agreement ($AC1 < 0.4$). There was
also high agreement for the presence of BCTs targeting physical
activity ($AC1 = 0.88$) with "demonstration of behavior" and
"monitoring, of emotional consequences" having the lowest agreement
($AC1 < 0.4$). The eMotion description was then amended to align the
interrater agreement. Conclusions: This study presents a novel
method for assessing design fidelity. Developers of behavioral (and
other multicomponent) interventions are encouraged to develop and
refine this method and assess design fidelity in future
interventions to ensure BCTs are operationalized as intended.

Short Title: Assessing potential local routine monitoring indicators of reach for the NHS health checks programme

ISSN: 0033-3506

DOI: 10.1016/j.puhe.2015.10.019

Accession Number: WOS:000368590100013

Abstract: Objectives: Success in reaching target populations is an important factor in determining the impact of public health programmes. The NHS Health Check (NHSCH) Programme is directed towards reducing excess cardiovascular mortality in England. As the programme is locally commissioned, local monitoring of programme reach is essential. This study aimed to assess indicators of programme reach available to local service commissioners. Study design: Ecological. Methods: The programme reach of NHSCH was assessed in three health districts in the North East of England. Local data returned from GP practices to commissioners on their NHSCH activities was collated for the period October 2010 to March 2013 together with related national published data. Three candidate indicators were chosen and the association between each of these and NHSCHs at GP practice level was examined by univariate logistic regression. Results: Data were available from 101 GP practices, together undertaking almost 20,000 health checks a year. Number of NHSCHs by practices explained most (77-92%) of the variance the numbers identified at high risk of cardiovascular disease (two for every ten NHSCHs). NHSCHs were not associated with growth in GP practice disease registers for either diabetes or hypertension. NHSCHs predicted practices identification of new cases of hypertension (with one case identified for every ten checks), albeit the proportion of variation explained was much more variable (2-60%) less consistent effect. Conclusions: Data routinely available to NHSCH commissioners can support monitoring programme reach, with numbers of new cases of hypertension being the most promising indicator of reach. Title: Computer-supported feedback message tailoring: theory-informed adaptation of clinical audit and feedback for learning and behavior change

Journal: Implementation Science

Volume: 10

Date: Jan

Short Title: Computer-supported feedback message tailoring: theory-informed adaptation of clinical audit and feedback for learning and behavior change

ISSN: 1748-5908

DOI: 10.1186/s13012-014-0203-z

Article Number: 12

Accession Number: WOS:000349184600001

Abstract: Background: Evidence shows that clinical audit and feedback can significantly improve compliance with desired practice, but it is unclear when and how it is effective. Audit and feedback is likely to be more effective when feedback messages can influence barriers to behavior change, but barriers to change differ across individual health-care providers, stemming from differences in providers' individual characteristics. Discussion: The purpose of this article is to invite debate and direct research attention towards a novel audit and feedback component that could enable interventions to adapt to barriers to behavior change for individual health-care providers: computer-supported tailoring of feedback messages. We argue that, by leveraging available clinical data, theory-informed knowledge about behavior change, and the knowledge of clinical supervisors or peers who deliver feedback messages, a software application that supports feedback message tailoring could improve feedback message relevance for barriers to behavior change, thereby increasing the effectiveness of audit and feedback interventions. We describe a prototype system that supports the provision of tailored feedback messages by generating a menu of graphical and textual messages with associated descriptions of targeted barriers to behavior change. Supervisors could use the menu to select messages based on their awareness of each feedback recipient's specific barriers to behavior change. We anticipate that such a system, if designed appropriately, could guide supervisors towards giving more effective feedback for health-care providers. Summary: A foundation of evidence and knowledge in related health research domains supports the development of feedback message tailoring systems for clinical audit and feedback. Creating and evaluating computer-supported feedback tailoring tools is a promising approach to improving the effectiveness of clinical audit and feedback.

Short Title: A real-world feasibility study of the PLAYshop: a brief intervention to facilitate parent engagement in developing their child's physical literacy

DOI: 10.1186/s40814-021-00849-5

Article Number: 113

Accession Number: WOS:000704717600001

Abstract: Background Development of physical literacy, defined as "the motivation, confidence, physical competence, knowledge and understanding to value and take responsibility for engagement in physical activities for life," can support children's physically active behaviors and consequent health benefits. Little research has explored interventions to improve children's physical literacy, although substantive evidence shows parents play a key role in children's physically active behaviors and development of fundamental movement skills. The purpose of this study was to explore the feasibility of a novel, physical literacy program (the PLAYshop) designed to build parents' self-efficacy to support their child's physical literacy. Methods A non-randomized, one-arm concurrent nested design was used. Thirty-five parents of young children (3-8 years of age) attended a 75-min workshop inclusive of interactive activities, educational messages, and the provision of resources focused on core physical literacy concepts. Pre- and post-workshop surveys used quantitative measures to assess parents' satisfaction, knowledge, confidence, and intention to adopt practices. Follow-up interviews qualitatively explored the implementation experiences of both parents and facilitators. Paired t tests and thematic analysis were undertaken. Results Of the 33 eligible parents, 23 completed both pre- and post-workshop surveys. Follow-up interviews were completed with 11 parents and four workshop facilitators. Parents' self-reported knowledge and confidence to support their child's physical literacy development significantly increased after PLAYshop participation. The majority of parents were satisfied with the workshop and motivated to apply learnings at home with their child. Workshop facilitators identified seven workshop strengths (e.g., workshop champions and skilled facilitators) and four challenges (e.g., recruitment and unfavorable spaces). Limitations include the lack of control group and recruitment challenges. Conclusions The PLAYshop was perceived positively by parents and facilitators and appeared to improve

parent self-efficacy and intention to promote physical literacy with their child. Recruitment and attendance were key implementation challenges. The findings from this real-world study support the preliminary feasibility of the PLAYshop intervention and highlight areas to improve the intervention and recruitment prior to efficacy testing in a more rigorous trial format.

Short Title: Attitudes, behaviours and barriers to public health measures for COVID-19: a survey to inform public health messaging

DOI: 10.1186/s12889-021-10790-0

Article Number: 765

Accession Number: WOS:000642621000003

Abstract: Background Public support of public health measures including physical distancing, masking, staying home while sick, avoiding crowded indoor spaces and contact tracing/exposure notification applications remains critical for reducing spread of COVID-19. The aim of our work was to understand current behaviours and attitudes towards public health measures as well as barriers individuals face in following public health measures. We also sought to identify attitudes persons have regarding a COVID-19 vaccine and reasons why they may not accept a vaccine. Methods A cross-sectional online survey was conducted in August 2020, in Alberta, Canada in persons 18 years and older. This survey evaluated current behaviours, barriers and attitudes towards public health measures and a COVID-19 vaccine. Cluster analysis was used to identify key patterns that summarize data variations among observations. Results Of the 60 total respondents, the majority of persons were always or often physically distancing (73%), masking (65%) and staying home while sick (67%). Bars/pubs/lounges or nightclubs were visited rarely or never by 63% of respondents. Persons identified staying home while sick to provide the highest benefit (83%) in reducing spread of COVID-19. There were a large proportion of persons who had not downloaded or

used a contact tracing/exposure notification app (77%) and who would not receive a COVID-19 vaccine when available (20%) or were unsure (12%). Reporting health authorities as most trusted sources of health information was associated with greater percentage of potential uptake of vaccine but not related to contact tracing app download and use. Individuals with lower concern of getting and spreading COVID-19 showed the least uptake of public health measures except for avoiding public places such as bars. Lower concern regarding COVID-19 was also associated with more negative responses to taking a potential COVID-19 vaccine. Conclusion These results suggest informational frames and themes focusing on individual risks, highlighting concern for COVID-19 and targeting improving trust for health authorities may be most effective in increasing public health measures. With the ultimate goal of preventing spread of COVID-19, understanding persons' attitudes towards both public health measures and a COVID-19 vaccine remains critical to addressing barriers and implementing targeted interventions and messaging to improve uptake.

Short Title: Nudging In MicroBiology Laboratory Evaluation (NIMBLE): A scoping review

ISSN: 0899-823X

DOI: 10.1017/ice.2019.293

Article Number: Pii s0899823x19002939

Accession Number: WOS:000511235500012

Abstract: Background: Nudging in microbiology is an antimicrobial stewardship strategy to influence decision making through the strategic reporting of microbiology results while preserving prescriber autonomy. The purpose of this scoping review was to

identify the evidence that demonstrates the effectiveness of nudging strategies in susceptibility result reporting to improve antimicrobial use. Methods: A search for studies in Ovid MEDLINE, Embase, PsycINFO, and All EBM Reviews was conducted. All simulated and vignette studies were excluded. Two independent reviewers were used throughout screening and data extraction. Results: Of a total of 1,346 citations screened, 15 relevant studies were identified. Study types included pre- and postintervention (n = 10), retrospective cohort (n = 4), and a randomized controlled trial (n = 1). Most studies were performed in acute-care settings (n = 13), and the remainder were in primary care (n = 2). Most studies used a strategy to alter the default antibiotic choices on the antibiotic report. All studies reported at least 1 outcome of antimicrobial use: utilization (n = 9), appropriateness (n = 7), de-escalation (n = 2), and cost (n = 1). Moreover, 12 studies reported an overall benefit in antimicrobial use outcomes associated with nudging, and 4 studies evaluated the association of nudging strategy with subsequent antimicrobial resistance, with 2 studies noting overall improvement. Conclusions: The number of heterogeneous studies evaluating the impact of applying nudging strategies to susceptibility result reports is small; however, most strategies do show promise in altering prescriber's antibiotic selection. Selective and cascade reporting of targeted agents in a hospital setting represent the majority of current research. Gaps and opportunities for future research identified from our scoping review include performing prospective randomized controlled trials and evaluating other approaches aside from selective reporting. Abstract: AimsTo characterize publically funded tobacco control campaigns in England between 2004 and 2010 and to explore if they were in line with recommendations from the literature in terms of their content and intensity. International evidence suggests that campaigns which warn of the negative consequences of smoking and feature testimonials from real-life smokers are most effective, and that four exposures per head per month are required to reduce smoking prevalence. DesignCharacterization of tobacco control advertisements using a theoretically based framework designed to describe advertisement themes, informational and emotional content and style. Study of the intensity of advertising and exposure to different types of advertisement using data on population-level exposure to advertisements shown during the study period. SettingEngland. MeasurementsTelevision Ratings (TVRs), a standard measure of advertising exposure, were used to calculate exposure to each different campaign type. FindingsA total of 89% of advertising was for smoking cessation; half of this advertising warned of the negative consequences of smoking, while half contained how-to-quit messages. Acted scenes featured in 72% of advertising, while only 17% featured real-life testimonials. Only 39% of months had at least four exposures to tobacco control campaigns per head. ConclusionsA theory-driven approach enabled a systematic characterization of tobacco control advertisements in England. Between 2004 and 2010 only a small proportion of tobacco control advertisements utilized the most effective strategiesnegative health effects messages and testimonials from real-life smokers. The intensity of campaigns was lower than international recommendations.

develop high impact food safety messages to consumers: Time for a revision of the WHO- Five keys to safer food?

ISSN: 0924-2244

DOI: 10.1016/j.tifs.2023.01.018

Accession Number: WOS:000934271700001

Abstract: Background: A significant part of foodborne infections is caused by food eaten at home, and food safety messages are given to help consumers mitigate risk. The World Health Organisation "Five Keys to Safer Food", developed about 20 years ago has been used with success worldwide to provide general advice on how to prepare food safely. Scope and approach: In this commentary, we discuss how food safety messages could be updated using a holistic approach built on implementation science, considering new food consumption patterns and insights from natural and social sciences. A stepwise approach for developing and evaluating food safety messages, performed in the European project SafeConsume, is presented. The top pathogen-food combinations associated with foodborne disease in Europe were combined with common consumer practices to identify risky behaviours. Food safety messages were suggested and assessed for understanding as well as capability, opportunity, and motivation in an expert survey. Key findings and conclusions: Overall, the food safety topics developed overlapped with those from WHO. The opportunity and motivation for changing behaviour, (e.g., choose pasteurised egg) were identified as important restrictions for uptake of messages. Also, understanding terminology, (e.g "thoroughly cooked") was a challenge. Therefore, there is a need to be specific, without excluding other safe alternatives or make lengthy explanations. The food safety messages suggested by the expert group were considered as more likely to be implemented among domestic cooks, resulting in safer practice than corresponding WHO messages. WHO should reconsider the preventive risk communication based on new knowledge and challenges.

Title: Sustainable-psycho-nutritional intervention programme for a sustainable diet (the 'NutriSOS' study) and its effects on eating behaviour, diet quality, nutritional status, physical activity, metabolic biomarkers, gut microbiota and water and carbon footprints in Mexican population: study protocol of an mHealth randomised controlled trial

Journal: British Journal of Nutrition

Date: 2023 Mar

Short Title: Sustainable-psycho-nutritional intervention programme for a sustainable diet (the 'NutriSOS' study) and its effects on eating behaviour, diet quality, nutritional status, physical activity, metabolic biomarkers, gut microbiota and water and carbon footprints in Mexican population: study protocol of an mHealth randomised controlled trial

ISSN: 0007-1145

DOI: 10.1017/s0007114523000843

Article Number: Pii s0007114523000843

Accession Number: WOS:000983732400001

Abstract: Mexico is going through an environmental and nutritional crisis related to unsustainable dietary behaviours. Sustainable diets could solve both problems together. This study protocol aims to develop a three-stage, 15-week mHealth randomised controlled trial of a sustainable-psycho-nutritional intervention programme to promote Mexican population adherence to a sustainable diet and to evaluate its effects on health and environmental outcomes. In stage 1, the programme will be designed using the sustainable diets, behaviour change wheel and capability, opportunity, motivation, and behaviour (COM-B) models. A sustainable food guide, recipes, meal plans and a mobile application will be developed. In stage 2, the intervention will be implemented for 7 weeks, and a 7-week follow-up period in a young Mexican adults (18-35 years) sample, randomly divided (1:1 ratio) into a control group (n 50) and an experimental group (n 50), will be divided into two arms at week 8. Outcomes will include health, nutrition, environment, behaviour and nutritional-sustainable knowledge. Additionally, socio-economics and culture will be considered. Thirteen behavioural objectives will be included using successive approaches in online workshops twice a week. The population will be monitored using the mobile application consisting of behavioural change techniques. In stage 3, the effects of the intervention will be assessed using mixed-effects models on dietary intake and quality, nutritional status, physical activity, metabolic biomarkers (serum glucose and lipid profile), gut microbiota composition and dietary water and carbon footprints of the evaluated population. Improvements in health outcomes and a decrease in dietary water and carbon footprints are expected.

Title: DASP: A Framework for Driving the Adoption of Software Security Practices

Journal: Ieee Transactions on Software Engineering

Volume: 49

Issue: 4
Pages: 2892-2919
Date: Apr
Short Title: DASP: A Framework for Driving the Adoption of Software Security Practices
ISSN: 0098-5589
DOI: 10.1109/tse.2023.3235684
Accession Number: WOS:000978723600084
Abstract: Implementing software security practices is a critical concern in modern software development. Industry practitioners, security tool providers, and researchers have provided standard security guidelines and sophisticated security development tools to ensure a secure software development pipeline. But despite these efforts, there continues to be an increase in the number of vulnerabilities that can be exploited by malicious hackers. There is thus an urgent need to understand why developers still introduce security vulnerabilities into their applications and to understand what can be done to motivate them to write more secure code. To understand and address this problem further, we propose DASP, a framework for diagnosing and driving the adoption of software security practices among developers. DASP was conceived by combining behavioral science theories to shape a cross-sectional interview study with 28 software practitioners. Our interviews lead to a framework that consists of a comprehensive set of 33 drivers grouped into 7 higher-level categories that represent what needs to happen or change so that the adoption of software security practices occurs. Using the DASP framework, organizations can design interventions suitable for developers' specific development contexts that will motivate them to write more secure code.

DOI: 10.1007/s00296-015-3292-3
Accession Number: WOS:000361556100003
Abstract: Research has shown that people who have rheumatoid arthritis (RA) do not usually participate in enough physical

activity to obtain the benefits of optimal physical activity levels, including quality of life, aerobic fitness and disease-related characteristics. Behaviour change theory underpins the promotion of physical activity. The aim of this systematic review was to explore behaviour change interventions which targeted physical activity behaviour in people who have RA, focusing on the theory underpinning the interventions and the behaviour change techniques utilised using specific behaviour change taxonomy. An electronic database search was conducted via EBSCOhost, PubMed, Cochrane Central Register of Controlled Trials and Web of Science databases in August 2014, using Medical Subject Headings and keywords. A manual search of reference lists was also conducted. Randomised control trials which used behaviour change techniques and targeted physical activity behaviour in adults who have RA were included. Two reviewers independently screened studies for inclusion. Methodological quality was assessed using the Cochrane risk of bias tool. Five studies with 784 participants were included in the review. Methodological quality of the studies was mixed. The studies consisted of behaviour change interventions or combined practical physical activity and behaviour change interventions and utilised a large variety of behaviour change techniques. Four studies reported increased physical activity behaviour. All studies used subjective methods of assessing physical activity with only one study utilising an objective measure. There has been varied success of behaviour change interventions in promoting physical activity behaviour in people who have RA. Further studies are required to develop and implement the optimal behaviour change intervention in this population.

Short Title: Promoting physical activity in rheumatoid arthritis: a narrative review of behaviour change theories

ISSN: 0963-8288

DOI: 10.3109/09638288.2015.1019011

Accession Number: WOS:000369746000007

Abstract: Purpose: Despite physical activity having significant

health benefits for people with rheumatoid arthritis (RA), current levels of physical activity in this population are suboptimal. Changing behaviour is challenging and interventions aimed at increasing physical activity in this context have had varying levels of success. This review provides an overview of common behaviour change theories used in interventions to promote physical activity and their application for promoting physical activity in people with RA. Method: A scoping, narrative review was conducted of English language literature, using the search terms physical activity/ exercise and keywords, which are associated with behaviour change interventions. The theoretical basis of such interventions in people with RA was assessed using the theory coding scheme. Results: Six theories which have been used in physical activity research are discussed. Further, four studies which aimed to increase physical activity levels in people with RA are explored in detail. Conclusions: To date, behaviour change interventions conducted in RA populations to increase physical activity levels have not had a strong theoretical underpinning. It is proposed that an intervention utilising the theory of planned behaviour is developed with the aim of increasing physical activity in people with RA. Implications for Rehabilitation Interventions to promote physical activity in the rheumatoid arthritis (RA) population have failed to change participants' behaviour. A small number of studies have used behaviour change theories in the development and delivery of interventions. The theory of planned behaviour is recommended as the theoretical basis for an intervention to promote physical activity in the RA population.

Short Title: The effectiveness of knowledge translation strategies used in public health: a systematic review

DOI: 10.1186/1471-2458-12-751

Article Number: 751

Accession Number: WOS:000313102000001

Abstract: Background: Literature related to the effectiveness of knowledge translation (KT) strategies used in public health is lacking. The capacity to seek, analyze, and synthesize evidence-based information in public health is linked to greater success in making policy choices that have the best potential to yield positive

outcomes for populations. The purpose of this systematic review is to identify the effectiveness of KT strategies used to promote evidence-informed decision making (EIDM) among public health decision makers. Methods: A search strategy was developed to identify primary studies published between 2000-2010. Studies were obtained from multiple electronic databases (CINAHL, Medline, EMBASE, and the Cochrane Database of Systematic Reviews). Searches were supplemented by hand searching and checking the reference lists of included articles. Two independent review authors screened studies for relevance, assessed methodological quality of relevant studies, and extracted data from studies using standardized tools. Results: After removal of duplicates, the search identified 64,391 titles related to KT strategies. Following title and abstract review, 346 publications were deemed potentially relevant, of which 5 met all relevance criteria on full text screen. The included publications were of moderate quality and consisted of five primary studies (four randomized controlled trials and one interrupted time series analysis). Results were synthesized narratively. Simple or single KT strategies were shown in some circumstances to be as effective as complex, multifaceted ones when changing practice including tailored and targeted messaging. Multifaceted KT strategies led to changes in knowledge but not practice. Knowledge translation strategies shown to be less effective were passive and included access to registries of pre-processed research evidence or print materials. While knowledge brokering did not have a significant effect generally, results suggested that it did have a positive effect on those organizations that at baseline perceived their organization to place little value on evidence-informed decision making. Conclusions: No singular KT strategy was shown to be effective in all contexts. Conclusions about interventions cannot be taken on their own without considering the characteristics of the knowledge that was being transferred, providers, participants and organizations.

Abstract: The new Canadian 24-Hour Movement Guidelines for Children and Youth emphasize the integration of all movement behaviours that occur over a whole day (i.e., light, moderate, and vigorous physical activity, sedentary behaviour, and sleep). These guidelines shift the paradigm away from considering each behaviour in isolation. This concept of the "whole day matters" not only calls for a change in thinking about movement but also for redevelopment of dissemination and implementation practice. Past guideline launch activities largely have aimed to create awareness through passive dissemination strategies (e.g., Website posts, distribution of print resources). For the integrated guidelines to have public health impact, we must move beyond dissemination and raising of awareness to implementation and behaviour change. Shifting this focus requires new, innovative approaches to intervention, including interdisciplinary collaboration, policy change, and refocused service provision. The purpose of this paper is to identify practitioners, professionals, and organizations with potential to disseminate and/or implement the guidelines, discuss possible implementation strategies for each of these groups, and describe the few resources being developed and those needed to support dissemination and implementation efforts. This discussion makes readily apparent the need for a well-funded, comprehensive, long-term dissemination, implementation, and evaluation plan to ensure uptake and activation of the guidelines.

Title: Effects of a family-based lifestyle intervention on co-physical activity and other health-related outcomes of fathers and their children: the 'Run Daddy Run' intervention

Journal: BMC Public Health

Volume: 23

Issue: 1

Date: Feb

Short Title: Effects of a family-based lifestyle intervention on co-physical activity and other health-related outcomes of fathers and their children: the 'Run Daddy Run' intervention

DOI: 10.1186/s12889-023-15191-z

Article Number: 342

Accession Number: WOS:000934877600001

Abstract: Background:Fathers are important in establishing healthy behaviors in their children, but are rarely engaged in lifestyle programs. Focusing on physical activity (PA) of both fathers and their children by engaging them together in PA (i.e. "co-PA") is therefore a promising novel strategy for interventions. The study aim was to investigate the effect of the 'Run Daddy Run' on co-PA and PA of fathers and their children, and secondary outcomes such as weight status and sedentary behaviour (SB).Methods:This study is a non-randomized controlled trial (nRCT), including 98 fathers and one of their 6 to 8 years old children (intervention = 35, control = 63). The intervention was implemented over a 14-week period, and consisted of six (inter)active father-child sessions and an online component. Due to COVID-19, only 2/6 sessions could be implemented as planned, the remaining sessions were delivered online. In November 2019-January 2020 pre-test measurements took place, and post-test measurements in June 2020. Additional follow-up test was conducted in November 2020. PA (i.e. LPA, MPA, VPA and volume) of fathers and children were objectively measured using accelerometry, co-PA and the secondary outcomes were questioned using an online questionnaire.Results:Significant intervention effects were found for co-PA (+ 24 min./day in the intervention compared to the control group, $p = 0.002$), and MPA of the father (+ 17 min./day, $p = 0.035$). For children, a significant increase in LPA (+ 35 min./day, $p < 0.001$) was found. However, an inverse intervention effect was found for their MPA and VPA (-15 min./day, $p = 0.005$ and - 4 min./day, $p = 0.002$, respectively). Also decreases in fathers' and children's SB were found (-39 min./day, $p = 0.022$ and - 40 min./day, $p = 0.003$, respectively), but no changes in weight status, the father-child

relationship, and the PA-family health climate (all $p > 0.05$). Conclusion: The Run Daddy Run intervention was able to improve co-PA, MPA of fathers and LPA of children, and decreasing their SB. Inverse intervention effects were however found for MPA and VPA of children. These results are unique given their magnitude and clinical relevance. Targeting fathers together with their children might be a novel and potential intervention strategy to improve overall physical activity levels, however, further efforts should however be made to target children's MPA and VPA. Last, replicating these findings in a randomized controlled trial (RCT) is recommended for future research.

Short Title: A Family-Based Lifestyle Intervention Focusing on Fathers and Their Children Using Co-Creation: Study Protocol of the Run Daddy Run Intervention

DOI: 10.3390/ijerph18041830

Article Number: 1830

Accession Number: WOS:000623595700001

Abstract: Fathers play a unique and important role in shaping their children's physical activity (PA), independent from the mother. Lifestyle interventions focusing simultaneously on PA of fathers and their children ("co-PA") are therefore a novel and promising way to improve PA of both. A theory-based lifestyle intervention was co-created with fathers (i.e., the Run Daddy Run intervention), using the behavior change wheel as a theoretical framework. The aim of the present study is to describe the protocol of the Run Daddy Run intervention study, focusing on improving (co-)PA of fathers and children, and the prospecting outcomes. The developed intervention consists of six (inter)active father-child sessions and an eHealth component, delivered over a 14-week intervention period. Baseline measurements will be conducted between November 2019-January 2020, post-test measurements in June 2020, and follow-up measurements in November 2020, with (co-)PA as the primary outcome variable. Outcomes will be measured using accelerometry and an online

questionnaire. To evaluate the intervention, multilevel analyses will be conducted. This study will increase our understanding on whether a theory-based, co-created lifestyle intervention focusing exclusively on fathers and their children can improve their (co-)PA behavior and has important implications for future research and health policy, where targeting fathers might be a novel and effective approach to improve (co-)PA and associated health behaviors of both fathers and their children.

Abstract: Background: Knowledge translation (KT) is an important means of improving the health service quality. Most research on the effectiveness of KT strategies has focused on individual strategies, i.e., those directly targeting the modification of allied health professionals' knowledge, attitudes, and behaviors, for example. In general, these strategies are moderately effective in changing practices (maximum 10% change). Effecting change in organizational contexts (e.g., change readiness, general and specific organizational capacity, organizational routines) is part of a promising new avenue to service quality improvement through the implementation of evidence-based practices. The objective of this study will be to identify why, how, and under what conditions organizational KT strategies have been shown to be effective or ineffective in changing the (a) knowledge, (b) attitudes, and (c) clinical behaviors of allied health professionals in traumatology settings. Methods: This is a realist review protocol involving four

iterative steps: (1) Initial theory formulation, (2) search for Evidence search, (3) knowledge extraction and synthesis, and (4) recommendations. We will search electronic databases such as PubMed, Embase, CINAHL, Cochrane Library, and Conference Proceedings Citation Index Science. The studies included will be those relating to the use of organizational KT strategies in trauma settings, regardless of study designs, published between January 1990 and October 2020, and presenting objective measures that demonstrate change in allied health professionals' knowledge, attitudes, and clinical behaviors. Two independent reviewers will select, screen, and extract the data related to all relevant sources in order to refine or refute the context-mechanism-outcome (CMO) configurations developed in the initial theory and identify new CMO configurations. Discussion: Using a systematic and rigorous method, this review will help guide decision-makers and researchers in choosing the best organizational strategies to optimize the implementation of evidence-based practices.

Short Title: Assessment of digital risks in child and adolescent mental health services: A mixed-method, theory-driven study of clinicians' experiences and perspectives

ISSN: 1359-1045

DOI: 10.1177/13591045221098896

Article Number: 13591045221098896

Accession Number: WOS:000797528500001

Abstract: Children and adolescents in the UK spend increasingly more time in the digital world, raising societal fears about digital risks in this age group. Professionals are not always aware of the ever-developing research or guidance available around digital safety. This gap underscores the need to understand current experiences and determinants of digital risk assessment, including clinicians' views on barriers and facilitators. A mixed-method design was used. Fifty-three clinicians working in child and adolescent mental health services (CAMHS) in South England took part in a survey; of these 12 took part in semi-structured interviews. A

psychological model of behavioural change (COM-B: capabilities, opportunities, motivation and behaviour) guided the analyses. Survey data revealed that clinicians showed awareness and concerns for several digital risk issues but there appeared to be gaps in their knowledge and practice. Interview data revealed different factors influencing staff enquiry about digital risks in CAMHS. These included aspects of capabilities (knowledge and skills), opportunities (resources, organisational context and empowerment of youth), and motivations (habit change, emotional experiences, and professional identity/role). Targeting both staff-level and organisation-level barriers to digital risk assessments in CAMHS is crucial. This study informs service improvement to ensure that children and young people safely navigate the digital world.

Article Number: 111650

Accession Number: WOS:000797077300001

Abstract: Globally, the prevalence of overweight and obesity, including among pregnant women, has substantially increased in the past three decades. This has been fueled by, among other factors, an increase in the consumption of high energy-dense foods and a decrease in physical activity. Additionally, global prevalence of anemia among pregnant women remains a public health concern.

Overweight/obesity as well as anemia in pregnancy are independently associated with adverse health outcomes for the mother and offspring. In some pregnant women, the two conditions coexist. Yet current knowledge in this field, including prevalence rates, risk factors, and health consequences for mother and offspring being exposed to these conditions, is staggeringly sparse. In this review we describe the current evidence on prevalence rates, risk factors, and effects for mother and offspring regarding coexistence of overweight/obesity and anaemia in pregnant women based on a

systematic literature search. We also highlight research gaps and suggest avenues for future research.(c) 2022 The Author(s).

Short Title: Becoming Food Aware in Hospital: A Narrative Review to Advance the Culture of Nutrition Care in Hospitals

DOI: 10.3390/healthcare3020393

Accession Number: WOS:000439434400015

Abstract: The Nutrition Care in Canadian Hospitals (2010-2013) study identified the prevalence of malnutrition on admission to medical and surgical wards as 45%. Nutrition practices in the eighteen hospitals, including diagnosis, treatment and monitoring of malnourished patients, were ad hoc. This lack of a systematic approach has demonstrated the need for the development of improved processes and knowledge translation of practices aimed to advance the culture of nutrition care in hospitals. A narrative review was conducted to identify literature that focused on improved care processes and strategies to promote the nutrition care culture. The key finding was that a multi-level approach is needed to address this complex issue. The organization, staff, patients and their families need to be part of the solution to hospital malnutrition. A variety of strategies to promote the change in nutrition culture have been proposed in the literature, and these are summarized as examples for others to consider. Examples of strategies at the organizational level include developing policies to support change, use of a screening tool, protecting mealtimes, investing in food and additional personnel (healthcare aides, practical nurses and/or diet technicians) to assist patients at mealtimes. Training for hospital

staff raises awareness of the issue, but also helps them to identify their role and how it can be modified to improve nutrition care. Patients and families need to be aware of the importance of food to their recovery and how they can advocate for their needs while in hospital, as well as post-hospitalization. It is anticipated that a multi-level approach that promotes being " food aware" for all involved will help hospitals to achieve patient-centred care with respect to nutrition.

Short Title: Changing nutrition care practices in hospital: a thematic analysis of hospital staff perspectives

DOI: 10.1186/s12913-017-2409-7

Article Number: 498

Accession Number: WOS:000406055900001

Abstract: Background: Many patients are admitted to hospital and are already malnourished. Gaps in practice have identified that care processes for these patients can be improved. Hospital staff, including management, needs to work towards optimizing nutrition care in hospitals to improve the prevention, detection and treatment of malnutrition. The objective of this study was to understand how staff members perceived and described the necessary ingredients to support change efforts required to improve nutrition care in their hospital. Methods: A qualitative study was conducted using purposive sampling techniques to recruit participants for focus groups (FG) (n = 11) and key informant interviews (n = 40) with a variety of hospital staff and management. Discussions based on a semi-structured schedule were conducted at five diverse hospitals from four provinces in Canada as part of the More-2-Eat implementation project. One researcher conducted 2-day site visits over a two-month period to complete all interviews and FGs. Interviews were transcribed verbatim while key points and quotes were taken from FGs. Transcripts were coded line-by-line with initial thematic analysis completed by the primary author. Other authors (n = 3) confirmed the themes by reviewing a subset of transcripts and the draft themes. Themes were then refined and further detailed. Member checking of site summaries was completed with site champions.

Results: Participants (n = 133) included nurses, physicians, food service workers, dietitians, and hospital management, among others. Discussion regarding ways to improve nutrition care in each specific site facilitated the thought process during FG and interviews. Five

main themes were identified: building a reason to change; involving relevant people in the change process; embedding change into current practice; accounting for climate; and building strong relationships within the hospital team. Conclusions: Hospital staff need a reason to change their nutrition care practices and a significant change driver is perceived and experienced benefit to the patient. Participants described key ingredients to support successful change and specifically engaging the interdisciplinary team to effect sustainable improvements in nutrition care.

Short Title: Barriers and facilitators to preventing pressure ulcers

in nursing home residents: A qualitative analysis informed by the Theoretical Domains Framework

ISSN: 0020-7489

DOI: 10.1016/j.ijnurstu.2017.12.015

Accession Number: WOS:000437069900010

Abstract: Background: Pressure ulcers are areas of localised damage to the skin and underlying tissue; and can cause pain, immobility, and delay recovery, impacting on health-related quality of life. The individuals who are most at risk of developing a pressure ulcer are those who are seriously ill, elderly, have impaired mobility and/or poor nutrition; thus, many nursing home residents are at risk.

Objectives: To understand the context of pressure ulcer prevention in nursing homes and to explore the potential barriers and facilitators to evidence-informed practices. **Methods:** Semi-structured interviews were conducted with nursing home nurses, healthcare assistants and managers, National Health Service community-based wound specialist nurses (known in the UK as tissue viability nurses) and a nurse manager in the North West of England. The interview guide was developed using the Theoretical Domains Framework to explore the barriers and facilitators to pressure ulcer prevention in nursing home residents. Data were analysed using a framework analysis and domains were identified as salient based on their frequency and the potential strength of their impact.

Findings: 25 participants (nursing home: 2 managers, 7 healthcare assistants, 11 qualified nurses; National Health Service community services: 4 tissue viability nurses, 1 manager) were interviewed. Depending upon the behaviours reported and the context, the same domain could be classified as both a barrier and a facilitator. We identified seven domains as relevant in the prevention of pressure ulcers in nursing home residents mapping to four "barrier" domains and six "facilitator" domains. The four "barrier" domains were knowledge, physical skills, social influences and environmental context and resources and the six "facilitator" domains were interpersonal skills, environmental context and resources, social influences, beliefs about capabilities, beliefs about consequences and social/professional role and identity). Knowledge and insight into these barriers and facilitators provide a theoretical understanding of the complexities in preventing pressure ulcers with reference to the staff capabilities, opportunities and motivation related to pressure ulcer prevention. **Conclusion:** Pressure ulcer prevention in nursing home residents is complex and is influenced by several factors. The findings will inform a theory and evidence-based intervention to aid the prevention of pressure ulcers in nursing home settings.

DOI: 10.1007/s40266-016-0377-y

Accession Number: WOS:000379709300002

Abstract: Chronic obstructive pulmonary disease (COPD) is common in older people. Inhaled medications are the mainstay of pharmacological treatment of COPD, and are typically administered by handheld inhalers, such as pressurised metered-dose inhalers and dry

powder inhalers, or by nebulisers. For each of the three major categories of aerosol delivery devices, several new inhalers have recently been launched, each with their own particularities, advantages and disadvantages. Consequently, broader availability of new drug-device combinations will increase prescription opportunities. Despite this, however, there is limited guidance available in published guidelines on the choice of inhalers, and still less consideration is given to elderly patients with COPD. The aim of this article is to provide a guide for healthcare professionals on device selection and factors to be considered for effective inhaled drug delivery in elderly COPD patients, including device factors (device type and complexity of use), patient factors (inspiratory capabilities, manual dexterity and hand strength, cognitive ability, co-morbidities) and considerations for healthcare professionals (proper education of patients in device use).

Title: User-centered and theory-based design of a professional training program on shared decision-making with older adults living with neurocognitive disorders: a mixed-methods study

Journal: BMC Medical Informatics and Decision Making

Volume: 21

Issue: 1

Date: Feb

Short Title: User-centered and theory-based design of a professional training program on shared decision-making with older adults living with neurocognitive disorders: a mixed-methods study

DOI: 10.1186/s12911-021-01396-y

Article Number: 59

Accession Number: WOS:000620941900001

Abstract: Background We know little about the best approaches to design training for healthcare professionals. We thus studied how user-centered and theory-based design contribute to the development of a distance learning program for professionals, to increase their shared decision-making (SDM) with older adults living with neurocognitive disorders and their caregivers. Methods In this mixed-methods study, healthcare professionals who worked in family medicine clinics and homecare services evaluated a training program in a user-centered approach with several iterative phases of quantitative and qualitative evaluation, each followed by modifications. The program comprised an e-learning activity and five

evidence summaries. A subsample assessed the e-learning activity during semi-structured think-aloud sessions. A second subsample assessed the evidence summaries they received by email. All participants completed a theory-based questionnaire to assess their intention to adopt SDM. Descriptive statistical analyses and qualitative thematic analyses were integrated at each round to prioritize training improvements with regard to the determinants most likely to influence participants' intention. Results of 106 participants, 98 completed their evaluations of either the e-learning activity or evidence summary (93%). The professions most represented were physicians (60%) and nurses (15%). Professionals valued the e-learning component to gain knowledge on the theory and practice of SDM, and the evidence summaries to apply the knowledge gained through the e-learning activity to diverse clinical contexts. The iterative design process allowed addressing most weaknesses reported. Participants' intentions to adopt SDM and to use the summaries were high at baseline and remained positive as the rounds progressed. Attitude and social influence significantly influenced participants' intention to use the evidence summaries ($P < 0.0001$). Despite strong intention and the tailoring of tools to users, certain factors external to the training program can still influence the effective use of these tools and the adoption of SDM in practice. Conclusions A theory-based and user-centered design approach for continuing professional development interventions on SDM with older adults living with neurocognitive disorders and their caregivers appeared useful to identify the most important determinants of learners' intentions to use SDM in their practice, and validate our initial interpretations of learners' assessments during the subsequent evaluation round.

Short Title: 'I'm glad I can walk, but sometimes it's so challenging that it's an inconvenience to myself and others': physical activity experiences among individuals with spinal cord injury who ambulate

ISSN: 2159-676X

DOI: 10.1080/2159676x.2022.2046630

Accession Number: WOS:000763145800001

Abstract: Leisure-time physical activity (LTPA) participation involves two dimensions: quantity and quality. Research has been undertaken to explore strategies for increasing the quantity of LTPA among ambulators with spinal cord injury (SCI). Yet, no studies have been conducted to examine the quality of LTPA participation among ambulators with SCI, which may be important for well-being, health, and maintaining participation. Thus, the purpose of this study was to explore conditions and elements involved in positive and negative quality LTPA experiences. Semi-structured interviews were conducted with 22 ambulators with SCI. Using pragmatism and integrated knowledge translation as guiding approaches, the data were thematically analysed. Following inductive coding, the Quality Participation Framework and the Quality Parasport Participation Framework were employed for deductively coding the elements and conditions associated with LTPA experiences, respectively. Three principal themes were identified which provide broad insights for LTPA among ambulators with SCI: ableism, feeling sidelined, and effects of SCI. These themes capture conditions that fostered a positive or negative quality PA experience, including: three intrapersonal, five social, four programme, and one physical condition(s). Elements identified in the Quality Participation Framework were also related to both positive and negative quality LTPA experiences. This study provides insight on how LTPA is uniquely experienced by ambulators with SCI, including conditions and elements that influence quality participation. Self-determination theory may be useful to inform the design of behavioural interventions due to its alignment with the Quality Participation Framework. Behavioural interventions should employ behaviour change techniques to target conditions and elements of LTPA participation.

Accession Number: WOS:000638175500001

Abstract: Purpose The purpose of this study was to employ the theoretical domains framework (TDF) to identify behaviour change factors related to leisure-time physical activity (LTPA) in spinal cord injury (SCI) ambulators. Methods A cross-sectional design was employed. Among 43 SCI ambulators, the TDF behaviour change factors were assessed, along with the duration, types, and intensities of LTPA performed over the previous week. Results The TDF behaviour change factors identified as barriers to LTPA included: knowledge, beliefs about capabilities, coping planning, and goal conflict. Approximately 71.81 mins/day (SD = 75.41) was spent doing LTPA. Participants reported aerobic and resistance training activities, along with several other types of LTPA (e.g., rock climbing). Coping planning, action planning, goal conflict, and skills explained significant variance in time spent on LTPA (R -adjusted(2) = 0.259, $p < 0.01$), but only action planning uniquely predicted LTPA. Conclusions Greater use of coping and action planning, lower levels of goal conflict and stronger skills were associated with greater participation in LTPA. These factors will be targeted for a future LTPA-enhancing intervention for SCI ambulators, informed by behaviour change theory. SCI ambulators participate in a surprisingly wide range of LTPA. Rehabilitation specialists can use this list to suggest activities for patients with SCI who ambulate. Notes: Lawrason, Sarah V. C. DOI: 10.1123/jsep.2022-0087

Accession Number: WOS:000944294200001

Abstract: The purpose of this study was to test a partnered, self-determination theory-informed mobile health intervention called SCI Step Together, using an 8-week randomized controlled trial design. The aim of SCI Step Together is to increase the quantity and quality of physical activity (PA) among adults with spinal cord injury (SCI) who walk. The SCI Step Together program provides PA modules and PA self-monitoring tools and facilitates peer and health coach support. Process, resource, management, and scientific feasibility were

assessed, and participants completed questionnaires at baseline, mid-, and postintervention to assess determinants and outcomes of PA. Interviews were conducted to evaluate acceptability. Results suggest that the program demonstrated good feasibility, acceptability, and engagement. The intervention group (n = 11) had greater fulfillment of basic psychological needs and knowledge (p = .05) than the control group (n = 9). There were no significant interaction effects for other outcomes. The SCI Step Together program is feasible and acceptable and efficacious for improving some psychosocial variables. Results may inform SCI mobile health programs.

Short Title: Effectiveness of an Integrated Engagement Support System to Facilitate Patient Use of Digital Diabetes Prevention Programs: Protocol for a Randomized Controlled Trial

ISSN: 1929-0748

DOI: 10.2196/26750

Article Number: e26750

Accession Number: WOS:000632479700007

Abstract: Background: Digital diabetes prevention programs (dDPPs) are effective behavior change tools to prevent disease progression in patients at risk for diabetes. At present, these programs are poorly integrated into existing health information technology infrastructure and clinical workflows, resulting in barriers to provider-level knowledge of, interaction with, and support of patients who use dDPPs. Tools that can facilitate patient-provider interaction around dDPPs may contribute to improved patient engagement and adherence to these programs and improved health outcomes. Objective: This study aims to use a rigorous, user-centered design (UCD) methodology to develop a theory-driven system that supports patient engagement with dDPPs and their primary care providers with their care. Methods: This study will be conducted in 3 phases. In phase 1, we will use systematic UCD, Agile software development, and qualitative research methods to identify key user (patients, providers, clinical staff, digital health technologists, and content experts) requirements, constraints, and prioritization

of high-impact features to design, develop, and refine a viable intervention prototype for the engagement system. In phase 2, we will conduct a single-arm feasibility pilot of the engagement system among patients with prediabetes and their primary care providers. In phase 3, we will conduct a 2-arm randomized controlled trial using the engagement system. Primary outcomes will be weight, BMI, and A1c at 6 and 12 months. Secondary outcomes will be patient engagement (use and activity) in the dDPP. The mediator variables (self-efficacy, digital health literacy, and patient-provider relationship) will be measured. Results: The project was initiated in 2018 and funded in September 2019. Enrollment and data collection for phase 1 began in September 2019 under an Institutional Review Board quality improvement waiver granted in July 2019. As of December 2020, 27 patients have been enrolled and first results are expected to be submitted for publication in early 2021. The study received Institutional Review Board approval for phases 2 and 3 in December 2020, and phase 2 enrollment is expected to begin in early 2021. Conclusions: Our findings will provide guidance for the design and development of technology to integrate dDPP platforms into existing clinical workflows. This will facilitate patient engagement in digital behavior change interventions and provider engagement in patients'; use of dDPPs. Integrated clinical tools that can facilitate patient-provider interaction around dDPPs may contribute to improved patient adherence to these programs and improved health outcomes by addressing barriers faced by both patients and providers. Further evaluation with pilot testing and a clinical trial will assess the effectiveness and implementation of these tools.

Title: Multimodal Secondary Prevention Behavioral Interventions for TIA and Stroke: A Systematic Review and Meta-Analysis

Journal: Plos One

Volume: 10

Issue: 3

Date: Mar

Short Title: Multimodal Secondary Prevention Behavioral

Interventions for TIA and Stroke: A Systematic Review and Meta-Analysis

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0120902

Article Number: e0120902

Accession Number: WOS:000352083900087

Abstract: Background Guidelines recommend implementation of multimodal interventions to help prevent recurrent TIA/stroke. We undertook a systematic review to assess the effectiveness of behavioral secondary prevention interventions. Strategy Searches were conducted in 14 databases, including MEDLINE (1980–January 2014). We included randomized controlled trials (RCTs) testing multimodal interventions against usual care/modified usual care. All review processes were conducted in accordance with Cochrane guidelines. Results Twenty-three papers reporting 20 RCTs (6,373 participants) of a range of multimodal behavioral interventions were included. Methodological quality was generally low. Meta-analyses were possible for physiological, lifestyle, psychosocial and mortality/recurrence outcomes. Note: all reported confidence intervals are 95%. Systolic blood pressure was reduced by 4.21 mmHg (mean) (-6.24 to -2.18, $P = 0.01$, I-2 = 58%, 1,407 participants); diastolic blood pressure by 2.03 mmHg (mean) (-3.19 to -0.87, $P = 0.004$, I-2 = 52%, 1,407 participants). No significant changes were found for HDL, LDL, total cholesterol, fasting blood glucose, high sensitivity-CR, BMI, weight or waist: hip ratio, although there was a significant reduction in waist circumference (-6.69 cm, -11.44 to -1.93, $P = 0.006$, I-2 = 0%, 96 participants). There was no significant difference in smoking continuance, or improved fruit and vegetable consumption. There was a significant difference in compliance with antithrombotic medication (OR 1.45, 1.21 to 1.75, $P < 0.0001$, I-2 = 0%, 2,792 participants) and with statins (OR 2.53, 2.15 to 2.97, $P < 0.00001$, I-2 = 0%, 2,636 participants); however, there was no significant difference in compliance with antihypertensives. There was a significant reduction in anxiety (-1.20, -1.77 to -0.63, $P < 0.0001$, I-2 = 85%, 143 participants). Although there was no significant difference in odds of death or recurrent TIA/stroke, there was a significant reduction in the odds of cardiac events (OR 0.38, 0.16 to 0.88, $P = 0.02$, I-2 = 0%, 4,053 participants). Conclusions There are benefits to be derived from multimodal secondary prevention interventions. However, the findings are complex and should be interpreted with caution. Further, high quality trials providing comprehensive detail of interventions and outcomes, are required.

Short Title: Perinatal support for breastfeeding using mHealth: A mixed methods feasibility study of the My Baby Now app

ISSN: 1740-8695

DOI: 10.1111/mcn.13482

Accession Number: WOS:000922898300001

Abstract: Despite the well-known benefits of breastfeeding, breastfeeding rates remain suboptimal, particularly for women with lower socioeconomic position. Although popular, breastfeeding apps are often poor quality; their impact on breastfeeding knowledge, attitudes, confidence and intentions is unknown. A mixed method pre-post feasibility study was conducted to: 1) explore the feasibility of the My Baby Now app in providing perinatal breastfeeding support; 2) examine the impact on breastfeeding knowledge, attitudes, confidence and intentions; 3) to examine any differences in acceptability and impact of the app according to maternal education. The My Baby Now app was offered to pregnant women 20-30 weeks gestation. Breastfeeding knowledge and intentions were collected at baseline (T1) and 36-38 weeks gestation (T2); attitudes and confidence were collected at baseline, T2 and T3 (8-12 weeks post-partum). App engagement was measured via app analytics. Qualitative interviews were conducted with a purposeful sample following T3. Of 266 participants recruited, 169 (64%) completed T2 and 157 (59%) completed T3. Mothers without university education rated the app to be higher quality, more useful and impactful than mothers with university education. From T1-T2, breastfeeding knowledge (59.6% vs. 66.5%, $p < 0.001$) and exclusive breastfeeding intentions (76.6% vs. 80.9%, $p < 0.001$) increased. Breastfeeding attitudes and confidence scores also increased significantly across T1-T2 and T1-T3. App engagement during pregnancy predicted changes in breastfeeding attitudes from T1-T2 among participants without university education. App engagement did not predict changes in breastfeeding knowledge, confidence or intentions. Future randomised controlled studies should examine the effectiveness of mHealth interventions on breastfeeding outcomes.

Short Title: Barriers and Facilitators to Participation in Health

Screening: an Umbrella Review Across Conditions

ISSN: 1389-4986

DOI: 10.1007/s11121-022-01388-y

Accession Number: WOS:000811412000001

Abstract: Screening is an essential prevention practice for a number of health conditions. However, screening coverage remains generally low. Studies that investigate determinants of screening participation are becoming more common, but oftentimes investigate screening for health conditions in an individualized rather than integrated fashion. In routine clinical practice, however, healthcare professionals are often confronted with situations in which several screening procedures are recommended for the same patient. The consideration of their common determinants may support a more integrated screening approach. The objectives of this umbrella review were therefore to examine: 1) the determinants (barriers and facilitators) that have been identified in relation to recommended health screening procedures; and 2) the modifiable determinants (in primary care) common across health conditions or specific to individual procedures. Results were presented through a narrative synthesis. PubMed, PsycInfo and Cochrane were searched up to January 2022. Systematic reviews reporting determinants of participation in health screening procedures with grade A or B recommendation according to the US Preventive Services Task Force were included. A total of 85 systematic reviews were included, most which contained both qualitative and quantitative studies on determinants that describe individual factors (961 occurrences), social factors (113 occurrences), healthcare professional factors (149 occurrences), health system factors (105 occurrences) and screening procedure factors (99 occurrences). The most studied screening procedures concerned cervical cancer/human papillomavirus (n = 33), breast cancer (n = 28), colorectal cancer (n = 25) and the human immunodeficiency virus (n = 12). Other conditions have been under-studied (e.g. cardiovascular problems, lung cancer, syphilis). The individual domain, including determinants such as knowledge, beliefs and emotions, was the most covered across health conditions. Healthcare professional's recommendations and the quality of patient-provider communication were identified to have a strong influence on screening participation in most conditions. The other three domains included determinants which were more specific to a condition or a population. Various determinants modifiable in primary care were found in the individual domain and in the health system, healthcare professional and screening procedure domains. Quality was assessed as low for most systematic reviews included.

The identification of various modifiable determinants common across conditions highlights the potential of an integrated screening participation approach. Interventions may address common determinants in a broader person-centred framework within which tailoring to specific procedures or populations can be considered. This approach needs to be explored in intervention studies. The systematic review registration is PROSPERO CRD42019126709.

DOI: 10.1016/j.ctcp.2023.101764

Article Number: 101764

Accession Number: WOS:000989260200001

Abstract: Background: Overcoming the various barriers to evidence implementation is critical to delivering evidence-based health care. Identifying and managing these obstacles is somewhat challenging however, due to interprofessional and interjurisdictional variations in reported barriers. An efficient, systematic, comprehensive and innovative approach to isolating the barriers to evidence implementation is therefore needed. Materials and methods: Using a mixed methods design, the study aimed to develop, refine and validate a tool to assess the evidence implementation environment for complementary medicine (CM) professions. The tool was developed using a five-stage process, and refined and validated using a two-round e-Delphi technique. Results: Informed by reviews examining the barriers and enablers to evidence implementation in CM, and shaped by the Behaviour Change Wheel Framework, a preliminary 33-item tool was created (i.e. the Global Assessment of the Evidence Implementation Environment [GENIE] tool). A two-round Delphi technique was used to refine the criteria, with a panel of 23 experts agreeing to the removal of two criteria, and the addition of two items. In the end, the Delphi panel reached consensus on 33 criteria, which were sorted into nine stakeholder groups. Conclusion: This study has for the first time, created an innovative tool to assess the capacity and capability of CM professions to engage in evidence-based practice at an optimal level. By assessing the

evidence implementation environment of CM professions, the GENIE tool is able to determine where resources, infrastructure and personnel should be directed in order to optimise the uptake of evidence-based practices within CM professions.

Abstract: New opportunities are opening for electric cooking (eCooking) as a cost-effective, practical and desirable solution to the twin global challenges of clean cooking and electrification. Globally, momentum is building behind the transformative potential of eCooking to achieve a range of environmental and social impacts. However, cooking is a complex, culturally embedded practice, that results in an array of behavioural change challenges that must be understood and overcome for these new opportunities to translate into impact at scale. The Modern Energy Cooking Services (MECS) programme was designed to explore this space and pilot innovative new eCooking services with the potential to rapidly scale. This paper reflects upon the programme's key learnings to date on the behavioural change dimension of eCooking. It consolidates what we now know on the subject and highlights the gaps that remain, where further investigation is needed. The evidence shows that the uptake of eCooking can be hindered by (often false) perceptions around cost, taste and safety, the high cost and steep learning curve for new appliances, the lack of awareness/availability/after-sales service for energy-efficient appliances and the reluctance of male decision-makers to authorise appliance purchases. However, it also shows that the convenience and potential cost savings offered by energy-efficient appliances can offer an aspirational cooking experience and that uptake could be driven forward rapidly by urbanisation and changing lifestyles.

Title: Modifying Older Adults' Daily Sedentary Behaviour Using an Asset-based Solution: Views from Older Adults

Journal: Aims Public Health

Volume: 3

Issue: 3

Pages: 542-554

Short Title: Modifying Older Adults' Daily Sedentary Behaviour Using an Asset-based Solution: Views from Older Adults

ISSN: 2327-8994

DOI: 10.3934/publichealth.2016.3.542

Accession Number: WOS:000382488300009

Abstract: Objective: There is a growing public health focus on the promotion of successful and active ageing. Interventions to reduce sedentary behaviour (SB) in older adults are feasible and are improved by tailoring to individuals' context and circumstances. SB is ubiquitous; therefore part of the tailoring process is to ensure individuals' daily sedentary routine can be modified. The aim of this study was to understand the views of older adults and identify important considerations when creating a solution to modify daily sedentary patterns. Method: This was a qualitative research study. Fifteen older adult volunteers (mean age = 78 years) participated in 1 of 4 focus groups to identify solutions to modify daily sedentary routine. Two researchers conducted the focus groups whilst a third took detailed fieldnotes on a flipchart to member check the findings. Data were recorded and analysed thematically. Results: Participants wanted a solution with a range of options which could be tailored to individual needs and circumstances. The strategy suggested was to use the activities of daily routine and reasons why individuals already naturally interrupting their SB, collectively framed as assets. These assets were categorised into 5 sub-themes: physical assets (eg. standing up to reduce stiffness); psychological assets (eg. standing up to reduce feelings of guilt); interpersonal assets (eg. standing up to answer the phone); knowledge assets (eg. standing up due to knowing the benefits of breaking SB) and activities of daily living assets (eg. standing up to get a drink). Conclusion: This study provides important considerations from older adults' perspectives to modify their daily sedentary patterns. The assets identified by participants could be used to co-create a tailored intervention with older adults to reduce SB, which may increase effectiveness and adherence.

ISSN: 1359-107X

DOI: 10.1111/bjhp.12598

Accession Number: WOS:000782000000001

Abstract: Objectives This study aimed to (1) examine barriers and enablers to General Practitioners' (GP) use of National Institute for Health and Care Excellence (NICE) guidelines for self-harm and (2) recommend potential intervention strategies to improve implementation of them in primary care. Design: Qualitative interview study. Methods Twenty-one telephone interviews, semi-structured around the capabilities, opportunities and motivations model of behaviour change (COM-B), were conducted with GPs in the United Kingdom. The Theoretical Domains Framework was employed as an analytical framework. Using the Behaviour Change Wheel, Behaviour Change Techniques (BCTs), intervention functions and exemplar interventions were identified. Results GPs valued additional knowledge about self-harm risk assessments (knowledge), and communication skills were considered to be fundamental to high-pressure consultations (cognitive and interpersonal skills). GPs did not engage with the guidelines due to concerns that they would be a distraction from patient cues about risk during consultations (memory, attention and decision processes), and perceptions that following the guidance is difficult due to time pressures and lack of access to mental health referrals (environmental context and resources). Clinical uncertainty surrounding longer term care for people that self-harm, particularly patients that are waiting for or cannot access a referral, drives GPs to rely on their professional judgement over the guidance (beliefs about capabilities).

Conclusions Three key drivers related to information and skill needs, guideline engagement and clinical uncertainty need to be addressed to support GPs to be able to assess and manage self-harm. Five intervention functions and ten BCT groups were identified as potential avenues for intervention design.

Short Title: What do Pregnant Women Know About the Healthy Eating
Guidelines for Pregnancy? A Web-Based Questionnaire

ISSN: 1092-7875

DOI: 10.1007/s10995-016-2071-4

Accession Number: WOS:000383582000020

Abstract: Objectives This study explored nutrition knowledge of pregnant women, and how it correlated with participant characteristics, their main sources of information and changes to their diet since becoming pregnant. Methods Pregnant women residing in Australia accessing pregnancy forums on the internet were invited to complete a web-based questionnaire on general nutrition and pregnancy-specific nutrition guidelines. Results Of the 165 eligible questionnaire responses, 114 were complete and included in the analysis. Pregnancy nutrition knowledge was associated with education ($r(s) = 0.21, p < 0.05$) and income ($r(s) = 0.21, p < 0.05$). Only 2 % of pregnant women achieved nutrition knowledge scores over 80 %. Few women received nutrition advice during their pregnancy, of which most were advised by their doctor. Dietary changes adopted since becoming pregnant included consuming more fruit, vegetables, dairy and high fibre foods. Conclusions for Practice Pregnant women in this study had limited knowledge of the dietary guidelines for healthy eating during pregnancy. Furthermore, nutrition counselling in maternity care appears to be infrequent. One approach to optimising maternal diets and subsequently preventing adverse health outcomes is to enhance their knowledge of the pregnancy nutrition guidelines through the provision of nutritional counselling. Furthermore, research exploring the access and use of nutrition resources, and nutrition advice provided to pregnant women is recommended to understand how knowledge impacts on dietary behaviour.

Abstract: As an initial effort in developing tools that support users' creation of their own behavior-change plans, we conducted a formative user study. We intended to explore people's creation of plans for their own behavioral goals, with minimal support to facilitate their goal-setting, implementation of behavior-change techniques, and self-monitoring. In this paper, we present lessons that we obtained from this initial study, and insights on shifts in our design tools for a follow-up formative study currently underway.

Abstract: The Lancet COVID-19 Commission Task Force for Public Health Measures to Suppress the Pandemic was launched to identify critical points for consideration by governments on public health interventions to control coronavirus disease 2019 (COVID-19). Drawing on our review of published studies of data analytics and modelling, evidence synthesis and contextualisation, and behavioural science evidence and theory on public health interventions from a range of sources, we outline evidence for a range of institutional measures and behaviour-change measures. We cite examples of measures adopted by a range of countries, but especially jurisdictions that have, thus far, achieved low numbers of COVID-19 deaths and limited community transmission of severe acute respiratory syndrome coronavirus 2. Finally, we highlight gaps in knowledge where research should be undertaken. As countries consider long-term measures, there is an opportunity to learn, improve the response and prepare for future pandemics.

Abstract: The shared challenges posed by the production and distribution of health-harming products have led to growing recognition of the need for policy learning and transfer across

problems, populations, and social contexts. The commercial determinants of health (CDoH) can serve as a unifying concept to describe the population health consequences arising from for-profit actors and activities, along with the social structures that sustain them. Strategies to mitigate harms from CDoH have focused on behavioral change, regulation, fiscal policies, consumer and citizen activism, and litigation. While there is evidence of effective measures for each strategy, approaches that combine strategies are generally more impactful. Filling gaps in evidence can inform ways of adapting these strategies to specific populations and social contexts. Overall, CDoH are addressed most effectively not through siloed efforts to reduce consumption of health-harming products, but instead as a set of integrated strategies to reduce exposures to health-harming commercial actors and activities.

Accession Number: WOS:000869499100001

Abstract: Aims To identify barriers and enablers to implementing coaching in acute pediatric settings from the perspective of occupational therapists and develop an implementation plan to address the identified barriers at a large metropolitan hospital. Methods Participatory Action Research was used, and two stages of focus groups were conducted with 17 occupational therapists working in an acute pediatric hospital. Reflexive thematic analysis was employed for data analysis. Results Stage one themes; (1) Lack of clarity around coaching definition, (2) Acute setting barriers to coaching, (3) Family acceptance and appropriateness, and (4) Enablers for coaching. Stage two themes; (1) Addressing skepticism about coaching, (2) Logistics and approvals, and (3) Implementation strategies for coaching. In Stage Two, participants and researchers developed an implementation plan. Conclusion Occupational therapists perceived coaching as hard to implement in acute pediatric settings due to acuity of caseloads and traditional medical models. The six-

step implementation plan aims to enhance therapist knowledge and motivation as well as reduce environmental barriers, with the aim of embedding coaching into acute pediatric settings.

Short Title: Improving opioid safety practices in primary care: protocol for the development and evaluation of a multifaceted, theory-informed pilot intervention for healthcare providers

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2016-013244

Article Number: e013244

Accession Number: WOS:000402527200030

Abstract: Introduction In North America, drug overdose deaths are reaching unprecedented levels, largely driven by increasing prescription opioid-related deaths. Despite the development of several opioid guidelines, prescribing behaviours still contribute to poor patient outcomes and societal harm. Factors at the provider and system level may hinder or facilitate the application of evidence-based guidelines; interventions designed to address such factors are needed. Methods and analysis Using implementation science and behaviour change theory, we have planned the development and evaluation of a comprehensive Opioid Self-Assessment Package, designed to increase adherence to the Canadian Opioid Guideline among family physicians. The intervention uses practical educational and self-assessment tools to provide prescribers with feedback on their current knowledge and practices, and resources to improve their practice. The evaluation approach uses a pretest and post-test design and includes both quantitative and qualitative methods at baseline and 6 months. We will recruit a purposive sample of approximately 10 family physicians in Ontario from diverse practice settings, who currently treat patients with long-term opioid therapy for chronic pain. Quantitative data will be analysed using basic descriptive statistics, and qualitative data will be analysed using the Framework Method. Ethics and dissemination The University Health Network Research Ethics Board approved this study. Dissemination

plan includes publications, conference presentations and brief stakeholder reports. This evidenceinformed, theory-driven intervention has implications for national application of opioid quality improvement tools in primary care settings. We are engaging experts and end users in advisory and stakeholder roles throughout our project to increase its national relevance, application and sustainability. The performance measures could be used as the basis for health system quality improvement indicators to monitor opioid prescribing. Additionally, the methods and approach used in this study could be adapted for other opioid guidelines, or applied to other areas of preventive healthcare and clinical guideline implementation processes.

DOI: 10.1186/1748-5908-8-144

Article Number: 144

Accession Number: WOS:000329792600001

Abstract: Background: DECISION + 2, a training program for physicians, is designed to implement shared decision making (SDM) in the context of antibiotics use for acute respiratory tract infections (ARTIs). We evaluated the impact of DECISION + 2 on SDM implementation as assessed by patients and physicians, and on physicians' intention to engage in SDM. Methods: From 2010 to 2011, a multi-center, two-arm, parallel randomized clustered trial appraised the effects of DECISION + 2 on the decision to use antibiotics for patients consulting for ARTIs. We randomized 12 family practice teaching units (FPTUs) to either DECISION + 2 or usual care. After the consultation, both physicians and patients independently completed questionnaires based on the D-Option scale regarding SDM behaviors during the consultation. Patients also answered items assessing the role they assumed during the consultation (active/collaborative/passive). Before and after the intervention, physicians completed a questionnaire based on the Theory of Planned Behavior to measure their intention to engage in SDM. To account for the cluster design, we used generalized estimating equations and generalized linear mixed models to assess the impact of DECISION + 2 on the outcomes of interest. Results: A total of 270 physicians (66% women) participated in the study. After DECISION + 2, patients' D-Option scores were 80.1 +/- 1.1 out of 100 in the intervention group and 74.9 +/- 1.1 in the control group ($p = 0.001$). Physicians' D-Option scores were 79.7 +/- 1.8 in the intervention group and 76.3 +/- 1.9 in the control group ($p = 0.2$). However, subgroup analyses showed that teacher physicians D-Option scores were 79.7 +/- 1.5 and 73.0 +/- 1.4 respectively ($p = 0.001$). More patients reported assuming an active or collaborative role in the intervention group (67.1%), than in the control group (49.2%) ($p = 0.04$). There was a significant relation between patients' and physicians' D-Option scores ($p < 0.01$) and also between patient-reported assumed roles and both D-Option scores (as assessed by patients, $p < 0.01$; and physicians, $p = 0.01$). DECISION + 2 had no impact on the intention of physicians to engage in SDM. Conclusion: DECISION + 2 positively influenced SDM behaviors as assessed by patients and teacher physicians. Physicians' intention to engage in SDM was not affected by DECISION + 2.

Accession Number: WOS:000307914700002

Abstract: Objective: To identify and analyze training programs in shared decision-making (SDM) for health professionals. Methods: We conducted an environmental scan looking for programs that train health professionals in SDM. Pairs of reviewers independently analyzed the programs identified using a standardized data extraction sheet. The developers of the programs validated the data extracted. Results: We identified 54 programs conducted between 1996 and 2011 in 14 countries and 10 languages. Thirty-four programs targeted licensed health professionals, 10 targeted pre-licensure health professionals, and 10 targeted both. Most targeted only the medical profession (n = 32): six targeted more than one health profession. The five most frequently mentioned teaching methods were case-based discussion, small group educational session, role play, printed educational material, and audit and feedback. Thirty-six programs reported having evaluated their impacts but evaluation data was available only for 17. Conclusions: Health professional training programs in SDM vary widely in how and what they deliver, and evidence of their effectiveness is sparse. Practice implications: This study suggests there is a need for international consensus on ways to address the variability in SDM training programs. We need agreed criteria for certifying the programs and for determining the most effective types of training. (C) 2012 Elsevier Ireland Ltd. All rights reserved.

Abstract: Lay Summary In an era where global health is an increasing concern for the population, it appeared necessary to study the extent to which health professionals were willing to change their behaviours in their professional lives. This study was based on the interview of 12 French general practitioners and investigated their perspective on sustainable development and how they implemented it in their practice. Four main themes were highlighted. Some physicians did not spontaneously see the link between their practice and sustainable development. Our study showed that they were willing to adapt their practice despite organisational constraints and the difficulty in changing their behaviour. Background As health care accounts for 4-5% of global carbon emissions, many health organisations have called for implementing sustainable development actions in health care. However, sustainable development measures in general practice are rarely implemented by physicians. The aim of this study was to explore the practices of general practitioners (GPs) in terms of sustainable development to identify which actions are appropriate and achievable. Methods A qualitative study was conducted in 12 French GPs using face-to-face or telephone interviews, transcribed verbatim and analysed through a global inductive analysis with constant comparison. Semi-structured interviews were focussed on waste management, relationships between health professionals, sustainable development, and GPs' activity. Results The mean age of the GPs was 42.8 years and they mainly worked in an urban environment. The interviews highlighted 4 themes. It appeared that a balance needs to be found between the

environmental impact and the constraints related to medical care. To be able to think about integrating sustainable development into health care, GPs should make a personal commitment to change their routine. In practice, consumption should be reassessed, prescriptions and prevention reconsidered. These actions could be applied to the GPs' environment as role models for their patients, business leaders, and members of the healthcare system. Conclusion GPs felt concerned by sustainable development and were already involved in its implementation in their practice. Tools are available to help GPs to continue to implement their actions described in this article, but their impact remains to be investigated.

Short Title: A self-management approach using self-initiated action plans for symptoms with ongoing nurse support in patients with Chronic Obstructive Pulmonary Disease (COPD) and comorbidities: The COPE-III study protocol

ISSN: 1551-7144

DOI: 10.1016/j.cct.2013.06.003

Accession Number: WOS:000324961300009

Abstract: Background: Chronic Obstructive Pulmonary Disease (COPD) frequently coexists with other diseases. Whereas COPD action plans are currently part of usual care, they are less suitable and potentially unsafe for use in the presence of comorbidities. This study evaluates whether an innovative treatment approach directed towards COPD and frequently existing comorbidities can reduce COPD exacerbation days. We hypothesise that this approach, which combines self-initiated action plans and nurse support, will accelerate proper treatment actions and lead to better control of deteriorating symptoms. Methods: In this multicenter randomised controlled trial we aim to include 300 patients with COPD (GOLD II-IV), and with at least one comorbidity (cardiovascular disease, diabetes, anxiety and/or depression). Patients will be recruited from hospitals in the

Netherlands (n = 150) and Australia (n = 150) and will be assigned to an intervention or control group. All patients will learn to complete daily symptom diaries for 12-months. Intervention group patients will participate in self-management training sessions to learn the use of individualised action plans for COPD and comorbidities, linked to the diary. The primary outcome is the number of COPD exacerbation days. Secondary outcomes include hospitalisations, quality of life, self-efficacy, adherence, patient's satisfaction and confidence, health care use and cost data. Analyses: Intention-to-treat analyses (random effect negative binomial regression and random effect mixed models) and cost-effectiveness analyses will be performed. Discussion: Prudence should be employed before extrapolating the use of COPD specific action plans in patients with comorbidities. This study evaluates the efficacy of tailored action plans for both COPD and common comorbidities. (C) 2013 Elsevier Inc. All rights reserved.

Article Number: 147

Accession Number: WOS:000610521100002

Abstract: Background Brief messaging interventions, including Short Message Service (SMS) text-messages, delivered via mobile device platforms, show promise to support and improve treatment adherence. To understand how these interventions work, and to facilitate transparency, we need clear descriptions of the intervention development process. Method We describe and reflect on the process of designing and pretesting an evidence- and theory-informed brief messaging intervention, to improve diabetes treatment adherence in

sub-Saharan Africa. We followed the stepwise approach recommended by the Medical Research Council, United Kingdom (MRC UK) Framework for Development and Evaluation of Complex Health Interventions and guidance for mobile health intervention development. Results We used a four-phase, iterative approach that first generated primary and secondary evidence on the lived experience of diabetes, diabetes treatment services and mobile-phone use. Second, we designed a type 2 diabetes-specific, brief text-message library, building on our previous hypertension text-message library, as well as drawing on the primary and secondary data from phase one, and on expert opinion. We then mapped the brief text-messages onto behaviour change (COM-B) theoretical constructs. Third, we refined and finalised the newly developed brief text-message library through stakeholder consultation and translated it into three local languages. Finally, we piloted the intervention by pre-testing the automated delivery of the brief text-messages in the trial sites in Malawi and South Africa. The final SMS text Adherence support for people with type 2 diabetes (StAR2D) intervention was tested in a randomised controlled trial in Malawi and South Africa (trial registration: ISRCTN70768808). Conclusion The complexity of public health interventions requires that we give more attention to intervention development work. Our documentation and reflection on the StAR2D intervention development process promotes transparency, replicability, assessment of intervention quality, and comparison with other studies.

Article Number: 1576

Accession Number: WOS:000687154300003

Abstract: Background: The SMS text Adherence support for people with type 2 diabetes (StAR2D) intervention is a pragmatic randomised controlled trial, testing the effectiveness of brief text messaging for improving clinical outcomes and medication adherence. The intervention did not impact glycaemic control. We conducted a pre-

and post-trial process evaluation alongside the StAR2D study in Malawi and South Africa, exploring the experiences and perceptions of patient participants, to better understand potential underlying reasons for the trial outcomes. Methods: We employed a qualitative research design, including conducting semi structured in-depth interviews and focus groups at both trial sites. Purposive sampling was used to ensure representation of a wide range of patients with type 2 diabetes with regards to age, gender, ethnicity, language, and duration of diabetes. We interviewed the same participants at baseline and at the end of the trial. We used within-case and across-case thematic analysis to identify key themes. Results: Brief messages delivered by text were acceptable and useful for addressing informational and support needs for participants. Some participants reported behaviour changes because of the text reminders and advice on a healthy lifestyle. Both participating in the trial and the messages were experienced as a source of support, caring, and motivation. Participants' ability to act on the messages was limited. A common theme was frustration over the lack of ability to effectively control one's blood glucose level. They reported a range of routinised, partial diabetes care adherence behaviours, shaped by complex and interacting individual, social, and health service factors. Participant responses and intervention impact were similar across sites, despite differences in health services. Conclusion: This process evaluation provided context and insight into the factors influencing participants' engagement with the text messaging intervention. The complex context in which patients take their diabetes medication, may explain in part, why brief text messaging may have been insufficient to bring about changes in health outcomes. The scale of need for self-management and health service support, suggests that health system strengthening, and other forms of self-management support should accompany digital communication interventions.

Accession Number: WOS:000755993900005

Abstract: The Active Smarter Kids (ASK) study evaluated the effect of a 7-month curriculum-prescribed physical activity intervention on academic performance in fifth-grade Norwegian students. However, there is also a need to examine teachers' perception and maintenance of the ASK intervention. We conducted a prospective, mixed methods descriptive study across 1 yr of the ASK intervention. Data were collected via a self-report questionnaire, administered online, at two time points, immediately after the ASK intervention and 1 yr postintervention. The first questionnaire comprised open-ended questions about the teacher's experience with the ASK intervention. The second questionnaire determined teachers' maintenance of the ASK intervention. All teachers (N = 59) from the 28 intervention schools were eligible to participate. To prevent workload burden, teachers from the same school were offered the option to respond as a group to a single questionnaire. Thirty-one teachers from 22 schools completed the first questionnaire, and 26 teachers from 25 schools completed the second questionnaire. An analysis of the openended responses in the first questionnaire identified themes centering on the teachers perception of the ASK intervention, including benefits on student's social engagement, professional competence, and interpersonal processes. Eighty-one percent reported that they maintained the use of physically active learning and physical activity breaks as part of their weekly pedagogical practice 1 yr postintervention. Only 18% reported maintained use of physical activity homework. A novel finding was a recognition that the interaction in physically active learning opportunities was especially beneficial for low academic achievement students. Furthermore, the findings indicate that it is important to collaborate with teachers to codesign interventions. This seems to be critical in order for teachers to achieve agency and empower teachers to integrate physical activity into their school day.

Short Title: Training And Supervision Did Not Meaningfully Improve Quality Of Care For Pregnant Women Or Sick Children In Sub-Saharan Africa

ISSN: 0278-2715

DOI: 10.1377/hlthaff.2016.0261

Accession Number: WOS:000387114300024

Abstract: In-service training courses and supportive supervision of health workers are among the most common interventions to improve the quality of health care in low-and middle-income countries. Despite extensive investment from donors, evaluations of the long-term effect of these two interventions are scarce. We used nationally representative surveys of health systems in seven countries in sub-Saharan Africa to examine the association of in-service training and supervision with provider quality in antenatal and sick child care. The results of our analysis showed that observed quality of care was poor, with fewer than half of evidence-based actions completed by health workers, on average. In-service training and supervision were associated with quality of sick child care; they were associated with quality of antenatal care only when provided jointly. All associations were modest-at most, improvements related to interventions were equivalent to 2 additional provider actions out of the 18-40 actions expected per visit. In-service training and supportive supervision as delivered were not sufficient to meaningfully improve the quality of care in these countries. Greater attention to the quality of health professional education and national health system performance will be required to provide the standard of health care that patients deserve.

Title: Collaborative knowledge sharing in developing and evaluating a training programme for health professionals to implement a social intervention in dementia research

Journal: Journal of Mental Health Training Education and Practice

Volume: 16

Issue: 4

Pages: 269-284

Date: Jul

Short Title: Collaborative knowledge sharing in developing and evaluating a training programme for health professionals to implement a social intervention in dementia research

ISSN: 1755-6228

DOI: 10.1108/jmhtep-10-2020-0071

Accession Number: WOS:000657046800001

Abstract: Purpose This study aims to explore the utility of

collaborative knowledge sharing with stakeholders in developing and evaluating a training programme for health professionals to implement a social intervention in dementia research. Design/methodology/approach The programme consisted of two phases: 1) development phase guided by the Buckley and Caple's training model and 2) evaluation phase drew on the Kirkpatrick's evaluation model. Survey and interview data was collected from health professionals, people with dementia and their supporters who attended the training programme, delivered or participated in the intervention. Qualitative data was analysed using the framework analysis. Findings Seven health professionals participated in consultations in the development phase. In the evaluation phase, 20 intervention facilitators completed the post one-day training evaluations and three took part in the intervention interviews. Eight people with dementia and their supporters from the promoting independence in dementia feasibility study participated in focus groups interviews. The findings show that intervention facilitators were satisfied with the training programme. They learnt new knowledge and skills through an interactive learning environment and demonstrated competencies in motivating people with dementia to engage in the intervention. As a result, this training programme was feasible to train intervention facilitators. Practical implications The findings could be implemented in other research training contexts where those delivering research interventions have professional skills but do not have knowledge of the theories and protocols of a research intervention. Originality/value This study provided insights into the value of collaborative knowledge sharing between academic researchers and multiple non-academic stakeholders that generated knowledge and maximised power through building new capacities and alliances.

ISSN: 0031-9023

DOI: 10.2522/ptj.20130500

Accession Number: WOS:000352121400015

Abstract: The knowledge-to-practice gap in rehabilitation has spurred knowledge translation (KT) initiatives aimed at promoting clinician behavior change and improving patient care. Online KT resources for physical therapists and other rehabilitation clinicians are appealing because of their potential to reach large numbers of individuals through self-paced, self-directed learning. This article proposes best practice recommendations for developing online KT resources that are designed to translate evidence into practice. Four recommendations are proposed with specific steps in the development, implementation, and evaluation process: (1) develop evidence-based, user-centered content; (2) tailor content to online format; (3) evaluate impact; and (4) share results and disseminate knowledge. Based on KT evidence and instructional design principles, concrete examples are provided along with insights gained from experiences in creating and evaluating online KT resources for physical therapists. In proposing these recommendations, the next steps for research are suggested, and others are invited to contribute to the discussion.

Short Title: Assessing the complexity of interventions within systematic reviews: development, content and use of a new tool (iCAT_SR)

DOI: 10.1186/s12874-017-0349-x

Article Number: 76

Accession Number: WOS:000400239100004

Abstract: Background: Health interventions fall along a spectrum from simple to more complex. There is wide interest in methods for reviewing 'complex interventions', but few transparent approaches for assessing intervention complexity in systematic reviews. Such assessments may assist review authors in, for example, systematically describing interventions and developing logic models. This paper describes the development and application of the

intervention Complexity Assessment Tool for Systematic Reviews (iCAT_SR), a new tool to assess and categorise levels of intervention complexity in systematic reviews. Methods: We developed the iCAT_SR by adapting and extending an existing complexity assessment tool for randomized trials. We undertook this adaptation using a consensus approach in which possible complexity dimensions were circulated for feedback to a panel of methodologists with expertise in complex interventions and systematic reviews. Based on these inputs, we developed a draft version of the tool. We then invited a second round of feedback from the panel and a wider group of systematic reviewers. This informed further refinement of the tool. Results: The tool comprises ten dimensions: (1) the number of active components in the intervention; (2) the number of behaviours of recipients to which the intervention is directed; (3) the range and number of organizational levels targeted by the intervention; (4) the degree of tailoring intended or flexibility permitted across sites or individuals in applying or implementing the intervention; (5) the level of skill required by those delivering the intervention; (6) the level of skill required by those receiving the intervention; (7) the degree of interaction between intervention components; (8) the degree to which the effects of the intervention are context dependent; (9) the degree to which the effects of the interventions are changed by recipient or provider factors; (10) and the nature of the causal pathway between intervention and outcome. Dimensions 1-6 are considered 'core' dimensions. Dimensions 7-10 are optional and may not be useful for all interventions. Conclusions: The iCAT_SR tool facilitates more in-depth, systematic assessment of the complexity of interventions in systematic reviews and can assist in undertaking reviews and interpreting review findings. Further testing of the tool is now needed.

Short Title: Barriers and facilitators to pharmacists' engagement in response to domestic violence: a qualitative interview study informed by the capability–opportunity–motivation–behaviour model

ISSN: 1741–3842

DOI: 10.1093/pubmed/fdab375

Accession Number: WOS:000764765200001

Abstract: Background Domestic and sexual violence and abuse (DSVA) is a global public health problem resulting in health inequalities. Community pharmacies are uniquely placed to help people affected by DSVA. We examined factors that impact pharmacists' engagement in response to DSVA when providing public health services. Methods Semi-structured qualitative interviews with community pharmacists (n = 20) were analyzed thematically, with inductive themes mapped to the Capability–Opportunity–Motivation Behaviour (COM–B) model. Results Pharmacists were confident in providing public health services, but a lack of DSVA training meant there is a need to support their 'Capability' to respond to DSVA. Pharmacies were perceived as highly accessible healthcare providers on the high street, with sexual health consultations offering an ideal 'Opportunity' to enquire about DSVA in a private consultation room. Pharmacist's 'Motivation' to enquire about DSVA was driven by potential positive client outcomes and a desire to be more involved in public health interventions, but organisation– and system–level support and remuneration is needed. Conclusions Community pharmacy offers opportunities for integrating DSVA work in existing public health services. Pharmacists need training on DSVA, ongoing support, allocated funding for DSVA work, and awareness raising campaign for the public on their extended public health role.

Abstract: Dementia is prevalent worldwide, and increases the care burden and potential costs. Physical activity (PA) has been increasingly shown to be beneficial for them. This was a cross-sectional observational study aiming to investigate the status of PA among community-dwelling older adults with dementia in Beijing or Hangzhou, China, and verify the relationships between neuropsychiatric symptoms, activities of daily living (ADL), caregivers' fear of patients' falling and their PA using a path analysis approach. The level of PA among 216 included people with dementia was low. PA was related to the neuropsychiatric symptoms, with ADL and caregivers' fear of patients' falling have mediation roles. The findings indicated that person-centered strategies related to the management of these symptoms might be helpful to improve ADL, relieve caregivers' concerns about them falling and consequently foster positive participation in PA.

DOI: 10.1016/j.erss.2016.11.008

Accession Number: WOS:000396395200009

Abstract: To achieve significant energy reductions in buildings, decision-makers can engage occupants in different types of interventions such as information sharing, feedback and social marketing. To improve the effectiveness of these energy saving interventions, this study develops and tests a model which is capable of identifying occupants' energy use characteristics and the influential factors of their energy use behaviors (e.g., turning off lights when not in use). The consumer segmentation approach from social marketing is adopted to divide occupants into different categories using three metrics: motivation, opportunity and ability.

As a result, a set of hypotheses and corresponding measures are identified to study the effect of influential factors on occupants' energy use characteristics and intentional energy use behaviors. The occupants are then clustered into five main segments that take into account how the occupants will respond to interventions. In the case study, a survey is designed to test the hypotheses and their validity using descriptive statistical analysis and structural equation modeling. The proposed framework is expected to provide decision-makers with useful information to design effective energy saving interventions to reduce overall energy consumption in buildings. Accession Number: WOS:000886852700001

Abstract: This paper presents a study of middle-aged online consumers' specific shopping behaviour on live streaming platforms

and analyses the distinct marketing strategy provided by online experts. Influenced by unique social and cultural backgrounds, middle-aged online consumers lack related shopping experience and keep counterfeiting concerns to live streaming shopping, making them prefer to interact with online experts before making final decisions. Based on the COM-B Behaviour Changing theory and the Emotional attachment theory, the research model has been established in this study, and it divides influencing factors into the Emotion unit, Opportunity unit and Capability unit. To test the relationships between influencing factors and middle-aged online consumers' interactive motivation, the partial least-squares path modelling and variance-based structural equation modelling (PLS-SEM) have been applied on the SmartPLS. By analysing 450 samples, the study shows that the counterfeiting concern and ease of use factors positively impact online consumers' motivation to interact with online experts, and self-efficacy plays a negative role.

DOI: 10.1108/jeee-08-2021-0299

Accession Number: WOS:000727929700001

Abstract: Purpose This study aims to present the Chinese entrepreneurial environment and explore Chinese tertiary students' online-startup motivation on live streaming platforms. Based on the COM-B behaviour changing theory, this paper discovers various influencing factors from environmental opportunity and personal capability aspects. It analyses their effects under the cooperative system established among official departments, industries and universities. Meanwhile, considering social and cultural control, it also refers to the uncertainty-avoidance dimension from the Hofstede cultural theory and re-evaluates its influence on Chinese tertiary students' online-startup motivation. Design/methodology/approach The authors analyse 474 responses from online questionnaires through partial least squares path modelling and variance-based structural equation modelling. The paper claims that environmental opportunity

and personal capability factors positively affect students' online-startup motivation, but uncertainty-avoidance thinking plays a negative role. The study also measures the importance-performance map analysis to explore additional findings and discuss managerial implications. Findings Both platform support and official department support positively impact Chinese tertiary students' online-startup motivation and entrepreneurial skills learned from universities are beneficial for them to build online-startup confidence. Meanwhile, influenced by the cooperative system implemented among official departments, industries and universities, official department support positively affects platform support and entrepreneurial skills. Conversely, influenced by Chinese traditional Confucian culture, uncertainty-avoidance thinking negatively affects tertiary students' online-startup motivation. Originality/value This paper demonstrates the analysis of Chinese tertiary students' online-startup motivation drawing on the COM-B behaviour changing and Hofstede cultural theories. Specifically, this study divides influencing factors into three specific aspects as follows: environmental opportunity, personal capability and social and cultural control. Unlike existing research applying traditional research models, the combination of the COM-B behaviour changing theory and the Hofstede cultural theory could be conducive to making the research model reflect influencing factors and present their different relationships.

DOI: 10.1111/ggi.14520

Accession Number: WOS:000904073200001

Abstract: BackgroundThe benefits of physical activity are well-documented, and the prevalence of physical inactivity is high in older patients with chronic diseases. This study aimed to investigate the impact of an aerobic exercise intervention based on

the capacity, opportunity, motivation-behavior (COM-B) model on physical activity and health-related outcomes in this population. Methods Thirty-five participants were randomly assigned to the intervention group (IG) for an exercise intervention based on the COM-B model, and 33 were assigned to the control group (CG) for usual care. Physical activity levels, daily steps and bone mineral density T-value, body mass index, waist-hip ratio, subendocardial myocardial viability rate, central arterial pressure, growth index, brachial-ankle pulse wave velocity, ankle-arm index were measured at baseline, during the 12-week intervention, and after the 12-week follow-up. Results Compared with the CG and pre-intervention, total physical activity in the IG increased significantly ($P < 0.05$); however, after the 12-week follow-up, total physical activity decreased. At the same time, the average daily steps of the elderly in both groups increased. Compared with the CG, at the 12-week follow-up, the bone mineral density T-value in the IG was significantly improved ($P < 0.05$). Compared with the pre-intervention values, during the 12-week intervention, bone mineral density T-value, body mass index, waist-hip ratio, subendocardial myocardial viability rate and central arterial pressure were significantly improved ($P < 0.05$); after the 12-week follow-up, brachial-ankle pulse wave velocity and ankle-arm index were significantly improved ($P < 0.05$). No statistically significant changes in the growth index were detected, independent of the group and time. Conclusion Theory-based exercise interventions can change the physical inactivity behavior of older people with chronic diseases, effectively promoting physical activity and improves bone mineral density T-value, controls body weight, and reduces cardiovascular risk and physiological indicators related to atherosclerosis. Short Title: A new paradigm in adverse drug reaction reporting:
consolidating the evidence for an intervention to improve reporting

ISSN: 1474-0338

DOI: 10.1080/14740338.2022.2118712

Accession Number: WOS:000849592500001

Abstract: Introduction Adverse drug reaction (ADR) under-reporting is highly prevalent internationally and interventions created to address this problem have only been temporarily successful. This review aims to investigate how to leverage digital applications and automation across the healthcare industry to improve the quantity and quality of ADR reporting. Areas covered This review investigated the significance of ADR under-reporting, the barriers of reporting ADRs, and the magnitude of success of various interventions to improve ADR reporting by searching the EMBASE and MEDLINE databases to include studies published between January 2000 and February 2022. This data was integrated with a view to describe a future ADR reporting framework. Expert opinion Digital transformation has presented a significant opportunity with vast quantities of patient health data becoming available in electronic formats. The application of artificial intelligence to detect ADRs and then using automation to report these directly to regulatory agencies without human input would significantly enhance the quantity and quality of ADR reporting. Emphasis should be placed on ADRs identified for newly approved or black triangle medicines. Future studies are needed to measure the success of this ADR reporting framework in reducing the time taken to identify new safety issues and improving patient outcomes.

Short Title: Nursing assistants' knowledge, attitudes and training needs regarding urinary incontinence in nursing homes: a mixed-methods study

DOI: 10.1186/s12877-023-03762-z

Article Number: 39

Accession Number: WOS:000919074600001

Abstract: Background Urinary incontinence is an increasingly common problem, especially among older people in nursing homes. Nursing assistants are the leading workforce in nursing homes, and their knowledge and attitudes regarding urinary incontinence have garnered considerable attention in the context of aging in China. However,

most previous studies on this issue have focused on registered nurses. This study aimed to explore nursing assistants' knowledge, attitudes and training needs with regard to urinary incontinence. Methods We conducted a two-part mixed-methods study. After institutional manager approval, we surveyed the knowledge and attitudes of 509 nursing assistants regarding urinary incontinence. We carried out semi-structured interviews with 40 nursing assistants to elicit detailed information on training needs. Results In general, knowledge about urinary incontinence was poor (14.00 +/- 4.18), although attitudes were primarily positive (35.51 +/- 3.19). Most nursing assistants were very willing to learn more about urinary incontinence (93.9%, 478/509), but time constraints and low educational background may be barriers to learning motivation. The three preferred training styles among nursing assistants were face-to-face guidance from a mentor, training combining theory with practice, and online video training. Conclusions Chinese nursing assistants had poor knowledge but positive attitudes toward urinary incontinence. Facility managers should focus on developing training and learning mechanisms regarding urinary incontinence. It is important to adopt diverse training styles according to the actual situation of nursing homes.

Title: Experiences of older people, healthcare providers and caregivers on implementing person-centered care for community-dwelling older people: a systematic review and qualitative meta-synthesis

Journal: BMC Geriatrics

Volume: 23

Issue: 1

Date: Mar

Short Title: Experiences of older people, healthcare providers and caregivers on implementing person-centered care for community-dwelling older people: a systematic review and qualitative meta-synthesis

DOI: 10.1186/s12877-023-03915-0

Article Number: 207

Accession Number: WOS:000984100800005

Abstract: Background Person-centered care (PCC) is a critical approach to improving the quality of care for community-dwelling older people. Old-age care services could be provided according to older peoples' choices, needs, and preferences. The purpose of this study was to synthesize research evidence on the experiences of older people, healthcare providers, and caregivers with PCC and to identify the enablers and barriers to implementing PCC for

community-dwelling older people. Methods A meta-synthesis of qualitative research design was adopted. Data searches were performed using CINAHL (EBSCOhost), PubMed (OvidSP), Embase (Ovid), Cochrane Database, and PsycINFO (Ovid) in published articles and were reviewed from the earliest date to February 2023. The Qualitative Method Appraisal Tool was used to conduct a quality appraisal on selected articles. Data were extracted based on the capacity, opportunity, and motivation-behavior model (COM-B model), and the findings were synthesized using the meta-aggregative approach. Results Twelve included articles were analyzed to identify 122 findings that were organized into 11 categories and combined into three synthesized findings-capacities of older people, healthcare providers, and caregivers; opportunities in the implementation of PCC; motivation in implementing PCC. Capacities consisted of a lack of person-centered knowledge and skills, negative attitudes toward shared decision-making, and a lack of formal training to enhance capabilities among HCPs. Opportunities included a lack of coordination in resource allocation, strengthening multidisciplinary teamwork, establishing a desirable environment, and time constraints. Motivation in implementing PCC included encouraging self-reflection and regulation, respecting the autonomy of older people, lack of clear reward and empowerment mechanisms, and being resilient and optimistic. Conclusions The findings of this research provide a reference for implementing successful PCC in the community. The researchers identified barriers and facilitators of implementing PCC, facilitating through stakeholder's person-centered knowledge and skills being valued and respecting the autonomy of older people. Establishing a positive environment and strengthening multidisciplinary team members also promotes the implementation of PCC. However, additional studies are required to explore the influencing factors and address the barriers.

Title: Examining the Utility of Social Media in COVID-19

Vaccination: Unsupervised Learning of 672,133 Twitter Posts

Journal: Jmir Public Health and Surveillance

Volume: 7

Issue: 11

Date: Nov

Short Title: Examining the Utility of Social Media in COVID-19

Vaccination: Unsupervised Learning of 672,133 Twitter Posts

ISSN: 2369-2960

DOI: 10.2196/29789

Article Number: e29789

Accession Number: WOS:000738935100027

Abstract: Background: Although COVID-19 vaccines have recently become available, efforts in global mass vaccination can be hampered by the widespread issue of vaccine hesitancy. Objective: The aim of this study was to use social media data to capture close-to-real-time public perspectives and sentiments regarding COVID-19 vaccines, with the intention to understand the key issues that have captured public attention, as well as the barriers and facilitators to successful COVID-19 vaccination. Methods: Twitter was searched for tweets related to "COVID-19" and "vaccine" over an 11-week period after November 18, 2020, following a press release regarding the first effective vaccine. An unsupervised machine learning approach (ie, structural topic modeling) was used to identify topics from tweets, with each topic further grouped into themes using manually conducted thematic analysis as well as guided by the theoretical framework of the COM-B (capability, opportunity, and motivation components of behavior) model. Sentiment analysis of the tweets was also performed using the rule-based machine learning model VADER (Valence Aware Dictionary and Sentiment Reasoner). Results: Tweets related to COVID-19 vaccines were posted by individuals around the world (N=672,133). Six overarching themes were identified: (1) emotional reactions related to COVID-19 vaccines (19.3%), (2) public concerns related to COVID-19 vaccines (19.6%), (3) discussions about news items related to COVID-19 vaccines (13.3%), (4) public health communications about COVID-19 vaccines (10.3%), (5) discussions about approaches to COVID-19 vaccination drives (17.1%), and (6) discussions about the distribution of COVID-19 vaccines (20.3%). Tweets with negative sentiments largely fell within the themes of emotional reactions and public concerns related to COVID-19 vaccines. Tweets related to facilitators of vaccination showed temporal variations over time, while tweets related to barriers remained largely constant throughout the study period. Conclusions: The findings from this study may facilitate the formulation of comprehensive strategies to improve COVID-19 vaccine uptake; they highlight the key processes that require attention in the planning of COVID-19 vaccination and provide feedback on evolving barriers and facilitators in ongoing vaccination drives to allow for further policy tweaks. The findings also illustrate three key roles of social media in COVID-19 vaccination, as follows: surveillance and monitoring, a communication platform, and evaluation of government responses.

Title: The Codevelopment of "My Kidneys & Me": A Digital Self-management Program for People With Chronic Kidney Disease

Journal: Journal of Medical Internet Research

Volume: 24

Issue: 11

Date: Nov

Short Title: The Codevelopment of "My Kidneys & Me": A Digital Self-management Program for People With Chronic Kidney Disease

ISSN: 1438-8871

DOI: 10.2196/39657

Article Number: e39657

Accession Number: WOS:000965048200003

Abstract: Background: Health care self-management is important for people living with nondialysis chronic kidney disease (CKD).

However, the few available resources are of variable quality.

Objective: This work describes the systematic codevelopment of "My Kidneys & Me" (MK&M), a theory-driven and evidence-based digital self-management resource for people with nondialysis CKD, guided by an established process used for the successful development of the diabetes education program MyDESMOND (Diabetes Education and Self-Management for Ongoing and Newly Diagnosed, DESMOND). Methods: A

multidisciplinary steering group comprising kidney health care professionals and researchers and specialists in the development of complex interventions and digital health provided expertise in the clinical and psychosocial aspects of CKD, self-management, digital health, and behavior change. A patient and public involvement group helped identify the needs and priorities of MK&M and co-design the resource. MK&M was developed in 2 sequential phases. Phase 1 involved the codevelopment process of the MK&M resource (content and materials), using Intervention Mapping (IM) as a framework. The first 4 IM steps guided the development process: needs assessment was conducted to describe the context of the intervention;

intervention outcomes, performance objectives, and behavioral determinants were identified; theory- and evidence-based change methods and practical strategies to deliver change methods were selected; and program components were developed and refined. Phase 2 involved the adoption and adaptation of the existing MyDESMOND digital platform to suit the MK&M resource. Results: The needs assessment identified that individuals with CKD have multiple differing needs and that delivering a self-management program digitally would enable accessible, tailored, and interactive information and support. The intended outcomes of MK&M were to improve and maintain effective self-management behaviors, including physical activity and lifestyle, improve knowledge, promote self-care skills, increase self-efficacy, and enhance well-being. This was achieved through the provision of content and materials designed to increase CKD knowledge and patient activation, reduce health risks, manage symptoms, and improve physical function. Theories and behavior change techniques selected include Self-Management Framework, Capability, Opportunity, Motivation Behavior model components of Behaviour Change Wheel and taxonomy of behavior change techniques, Health Action Process Approach Model, Common Sense Model, and Social Cognitive Theory. The program components developed comprised educational and behavior change sessions, health trackers (eg, monitoring blood pressure, symptoms, and exercise), goal-setting features, and forums for social support. The MyDESMOND

digital platform represented an ideal existing platform to host MK & M; thus, the MyDESMOND interface and features were adopted and adapted for MK&M. Conclusions: Applying the IM framework enabled the systematic application of theory, empirical evidence, and practical perspectives in the codevelopment of MK&M content and materials. Adopting and adapting a preexisting platform provided a cost- and time-efficient approach for developing our digital intervention. In the next stage of work, the efficacy of MK&M in increasing patient activation will be tested in a randomized controlled trial.

Title: A qualitative exploration of dietitians' experiences of prescribing oral nutritional supplements to patients with malnutrition: A focus on shared tailoring and behaviour change support

Journal: Journal of Human Nutrition and Dietetics

Volume: 34

Issue: 5

Pages: 858-867

Date: Oct

Short Title: A qualitative exploration of dietitians' experiences of prescribing oral nutritional supplements to patients with malnutrition: A focus on shared tailoring and behaviour change support

ISSN: 0952-3871

DOI: 10.1111/jhn.12867

Accession Number: WOS:000618007600001

Abstract: Background Oral nutritional supplements (ONS) are commonly prescribed to patients with malnutrition. Dietitians have been suggested as preferred prescribers but generally lack ONS prescribing rights. How dietitians with prescribing rights experience their professional practice of prescribing ONS remains understudied. Thus, by exploring dietitians' experiences of prescribing ONS, the present study aimed to obtain a deeper understanding of specific aspects that are of importance for

dietitians when providing a nutrition therapy including ONS. Methods Qualitative individual interviews were conducted with 13 dietitians prescribing ONS to free-living adult outpatients with malnutrition or at nutritional risk in the hospital or primary care setting. Systematic text condensation was used for data analysis. Results Two main categories signifying important aspects were identified and labelled: 'Shared tailoring of the ONS prescription' and 'Supporting and facilitating ONS use'. First, the dietitians described tailoring the ONS prescription together with the patient, having their acceptance as a prerequisite, and being flexible regarding products and amounts prescribed. Second, they described performing different communication strategies and organising of practical issues (e.g., ONS delivery and support from others) to support and facilitate patients' ONS usage. Conclusions The present study identifies patient involvement and the role of dietitians as behaviour change facilitators as two important aspects when dietitians prescribe ONS. These findings allow for dietitians' ideals and strategies on how to prescribe ONS to be made more visible, which can inform both clinical practice and clinical trials for future improvements in nutrition therapy to address malnutrition.

ISSN: 1460-6925

DOI: 10.1080/14606925.2022.2144474

Accession Number: WOS:000884709500001

Abstract: This paper introduces a real-world, case study application of a Design for Sustainable Behaviour (DfSB) process model and associated evaluation criteria towards the collection of single use cups for recycling at x. It concludes that strategy selection criteria need to be contextualised to ensure meaning and relevance; that framing criteria as prompting questions encourages discussion and reflection, and that engagement with multiple stakeholders when selecting strategies is vital. It also underlines the importance of ethical considerations when implementing behaviour change interventions within the public domain, and mindfulness of potential

'rebound effects'.

Title: An Analysis on the Implementation of the Evidence-based PCOS
Lifestyle Guideline: Recommendations from Women with PCOS

Journal: Seminars in Reproductive Medicine

Volume: 39

Issue: 03/04

Pages: 153-160

Date: Jul

Short Title: An Analysis on the Implementation of the Evidence-based
PCOS Lifestyle Guideline: Recommendations from Women with PCOS

ISSN: 1526-8004

DOI: 10.1055/s-0041-1735575

Accession Number: WOS:000691022800001

Abstract: Polycystic ovary syndrome (PCOS) is the most common
endocrinological disorder affecting women of reproductive age,
affecting 8-13% in this group. Women with PCOS are more likely to
have excess BMI, which in turn exacerbates the symptoms of PCOS in
these women. The latest evidence-based guideline recommends
lifestyle management as the first-line treatment for PCOS. However,
the implementation of this recommendation through health services
faces a significant challenge. As part of the mapping of the
implementation plan for lifestyle management in PCOS, citizen panels
and semi-structured interviews were conducted to capture the voices
of consumers. Women with PCOS expressed the need for
multidisciplinary, integrated care as a recurrent theme. Other
important considerations included health professionals who listen
and are open to learning about PCOS, the empowerment of women to
self-manage PCOS and the provision of peer support. Women with PCOS
also expressed the key recommendation of focusing on practical
skills when providing lifestyle advice. Within that, both individual
and group lifestyle sessions were valued for privacy and peer
support respectively and delivery by a dietitian is preferred. These
recommendations by women with PCOS should be considered when
developing the implementation plan for the PCOS lifestyle guideline.

Abstract: The overall aim of this research is to develop an adaptive digital coaching system that gives seniors personalized support for increasing physical activity, and promoting participation in social activity and their own care. The main research question is how can different behavioral and motivational factors of an individual be formally integrated into the knowledge base of a coach agent for generating support tailored to the individual's needs and preferences in a specific situation? The results include a theory-based motivational model incorporating different person-centric factors, and an algorithm for generating the adaptive and persuasive behavior of the agent that aims to motivate the individual. These are integrated in a mobile coaching application together with a set of theory-based motivating messages targeting primarily physical and social activities. Future work includes the development of methods for handling conflicting motives, and user studies.

Short Title: A sequential, multiple assignment randomized trial comparing web-based education to mobile video interpreter access for improving provider interpreter use in primary care clinics: the mVOCAL hybrid type 3 study protocol

ISSN: 1748-5908

DOI: 10.1186/s13012-023-01263-6

Article Number: 8

Accession Number: WOS:000948427700001

Abstract: Background Individuals who use a language other than English for medical care are at risk for disparities related to healthcare safety, patient-centered care, and quality. Professional interpreter use decreases these disparities but remains underutilized, despite widespread access and legal mandates. In this study, we compare two discrete implementation strategies for improving interpreter use: (1) enhanced education targeting intrapersonal barriers to use delivered in a scalable format (interactive web-based educational modules) and (2) a strategy targeting system barriers to use in which mobile video interpreting is enabled on providers' own mobile devices. **Methods** We will conduct a type 3 hybrid implementation-effectiveness study in 3-5 primary care organizations, using a sequential multiple assignment randomized trial (SMART) design. Our primary implementation outcome is interpreter use, calculated by matching clinic visits to interpreter invoices. Our secondary effectiveness outcome is patient comprehension, determined by comparing patient-reported to provider-documented visit diagnosis. Enrolled providers (n = 55) will be randomized to mobile video interpreting or educational modules, plus standard interpreter access. After 9 months, providers with high interpreter use will continue as assigned; those with lower use will be randomized to continue as before or add the alternative strategy. After another 9 months, both strategies will be available to enrolled providers for 9 more months. Providers will complete 2 surveys (beginning and end) and 3 in-depth interviews (beginning, middle, and end) to understand barriers to interpreter use, based on the Theoretical Domains Framework. Patients who use a language other than English will be surveyed (n = 648) and interviewed (n = 75) following visits with enrolled providers to understand their experiences with communication. Visits will be video recorded (n = 100) to assess fidelity to assigned strategies. We will explore strategy mechanism activation to refine causal pathway models using a quantitative plus qualitative approach. We will also determine the incremental cost-effectiveness of each implementation strategy from a healthcare organization perspective, using administrative and provider survey data. **Discussion** Determining how these two scalable strategies, alone and in sequence, perform for improving interpreter use, the mechanisms by which they do so, and at what cost, will provide critical insights for addressing a persistent cause of healthcare disparities.

Short Title: From policy to patient: Using a socio-ecological framework to explore the factors influencing safe practice in UK primary care

ISSN: 0277-9536

DOI: 10.1016/j.socscimed.2021.113906

Article Number: 113906

Accession Number: WOS:000668752500035

Abstract: Background: The recent and rapid changes in the model of primary care delivery have led to an increased focus on patient safety in what is one of the most diverse and complex healthcare settings. However, previous initiatives have failed to deliver the expected improvements, leading to calls for a better understanding of how a range of personal and contextual factors influence the decisions and behaviours of individual care providers. Methods: The socio-ecological framework, successfully used in public health settings to interpret the complex influences on individual behaviours, enabled a post-hoc deductive analysis of a series of semi-structured interviews conducted with clinical staff and senior managers at a range of practices across five geographically diverse regions in England to explore their perspectives on the factors that influence safe practice. Results: The five levels of the socio-ecological framework successfully helped unpick the myriad influences on safe primary care practice, including, at the Individual level, assumptions of responsibility and previous experience; at the Interpersonal, equitable communication in support of a team ethos; at the Organisational, the physical infrastructure, size and complexity of the practice; at the Community, the health profile and literacy of patients; and at the Policy, meeting the demands of competing local and national governing bodies.

Conclusions: Coherent, realistic and achievable goals are needed for improving patient safety in primary care addressing personal, organisational and environmental factors. Such goals and the tools and interventions designed to meet them must therefore be sympathetic to the demands on resources and the characteristics of patients, staff, and their organisations. Using the framework to interpret our findings provided much needed insight into the impact of these varying influences, and highlights the importance of recognising and communicating the relationship between specific contextual factors and the ability of individual providers to

provide safe primary care.

Short Title: Adaption, implementation and evaluation of collaborative service improvements in the testing and result communication process in primary care from patient and staff perspectives: a qualitative study

DOI: 10.1186/s12913-017-2566-8

Article Number: 615

Accession Number: WOS:000408662800003

Abstract: Background: Increasing numbers of blood tests are being ordered in primary care settings and the swift and accurate communication of test results is central to providing high quality care. The process of testing and result communication is complex and reliant on the coordinated actions of care providers, external groups in laboratory and hospital settings, and patients. This fragmentation leaves it vulnerable to error and the need to improve an apparently fallible system is apparent. However, primary care is complex and does not necessarily adopt change in a linear and prescribed manner influenced by a range of factors relating to practice staff, patients and organisational factors. To account for these competing perspectives, we worked in conjunction with both staff and patients to develop and implement strategies intended to improve patient satisfaction and increase efficiency of existing processes. Methods: The study applied the principles of 'experience-based co-design' to identify key areas of weakness and source proposals for change from staff and patients. The study was undertaken within two primary practices situated in South Birmingham (UK) of contrasting size and socio-economic environment. Senior practice staff were involved in the refinement of the interventions for introduction. We conducted focus groups singly constituted of staff and patients at each practice to determine suitability, applicability and desirability alongside the practical implications of their introduction. Results: At each practice four of the six proposals for change were implemented these were increased access to

phlebotomy, improved receptionist training, proactive communication of results, and increased patient awareness of the tests ordered and the means of their communication. All were received favourably by both patients and staff. The remaining issues around the management of telephone calls and the introduction of electronic alerts for missing results were not addressed due to constraints of time and available resources. Conclusions: Approaches to tackling the same area of weakness differed at practices and was determined by individual staff attitudes and by organisational and patient characteristics. The long-term impact of the changes requires further quantitative evaluation.

Date: Feb

Short Title: Development and Validation of a Two-component Perceived Control Measure

ISSN: 0883-6612

DOI: 10.1093/abm/kaac033

Accession Number: WOS:000826629000001

Abstract: Background Research indicates that perceived behavioral control (PBC) is an important determinant of behavior and that it is composed of perceived capability and opportunity. However, typical measurement of these constructs may be confounded with motivation and outcome expectations. Vignettes presented before questionnaire items may clarify construct meaning leading to precise measurement. Purpose The purpose of this study was to develop and validate measures of perceived capability and opportunity that parse these constructs from the influence of motivation and outcome expectations using vignettes. Methods Study 1 collected feedback from experts (N = 9) about the initial measure. Study 2a explored internal consistency reliability and construct and discriminant validity of the revised measure using two independent samples (N = 683 and N = 727). Finally, using a prospective design, Study 2b (N = 1,410) investigated test-retest reliability, construct and discriminant validity at Time 2, and nomological validity. Results After Study 1, the revised measure was tested in Studies 2a and 2b. Overall, the

evidence suggests that the measure is optimal with four items for perceived capability and three for the perceived opportunity. The measure demonstrated strong internal consistency (> 0.90) and test-retest reliability (intraclass correlation coefficients [ICCs] $> .78$). The measure also showed construct and discriminant validity by differentiating itself from behavioral intentions (i.e., motivation) and affective attitude (based on expected outcomes) (SRMR = 0.03; RMSEA = 0.06). It also demonstrated evidence of nomological validity as behavior 2 weeks later was predicted. Conclusions We recommend researchers use this tool in future correlational and intervention studies to parse motivation and outcome expectations from perceived capability and opportunity measurement.

Short Title: ?That?s the routine?: A qualitative exploration of mealtime screen use in lower educated Australian families with young children

ISSN: 0195-6663

DOI: 10.1016/j.appet.2022.106377

Article Number: 106377

Accession Number: WOS:000917007300004

Abstract: Background: Family meals are an opportune context for initiating healthy eating habits in young children. However, using screens at family mealtimes may negate some of the associated nutritional and social benefits. In High Income countries, frequent mealtime screen use is common, particularly in families of low socioeconomic position (SEP). This study aimed to explore experiences and acceptability of mealtime screen use in families of low SEP with young children. Methods: Qualitative interviews with 25 mothers of low SEP were conducted via telephone or ZoomTM using Photo Interviewing and a semi-structured interview script. Transcripts were analysed thematically using a Constructivist paradigm. Results: Many parents reported an eagerness for reducing family mealtime screen use. Three major themes were identified in explaining the reasons behind levels of engagement in family mealtime screen use. These included parental self-efficacy, such as parental confidence in saying no to screens at mealtimes, physical

resources such as having enough space in the home for a functioning dining table without view of a television, and temporal priorities such as prioritising screen use for managing children's difficult behaviour at mealtimes over long-term health considerations.

Conclusions: This study highlights that although family mealtime screen use is likely linked with a range of child behaviours and parenting practices that may negatively influence children's dietary intake and social engagement, parents often considered screens acceptable at mealtimes. Nonetheless, parents' desire to reduce family mealtime screen use provides an important opportunity to determine how best to support parents to achieve this.

Title: Two Domains to Five: Advancing Veterinary Duty of Care to Fulfil Public Expectations of Animal Welfare Expertise

Journal: Animals

Volume: 11

Issue: 12

Date: Dec

Short Title: Two Domains to Five: Advancing Veterinary Duty of Care to Fulfil Public Expectations of Animal Welfare Expertise

ISSN: 2076-2615

DOI: 10.3390/ani11123504

Article Number: 3504

Accession Number: WOS:000735278800001

Abstract: Simple Summary Veterinarians are animal health experts. More recently, explicit references to veterinarians as animal welfare experts have proliferated. Veterinarians are ideally situated to act as animal welfare experts by virtue of their core work with animals, influence over owners, their roles in policy development, compliance, and monitoring, and as educators of future veterinary professionals. However, the discipline of animal welfare science has moved beyond a focus on nutrition and health towards an acceptance that the mental experiences of animals are the focus of welfare consideration. The Five Domains Model is a framework for assessing animal welfare and focuses on mental experiences arising from a broad range of impacts or opportunities. The Model can be used as a framework to integrate contemporary understanding of animal welfare science in veterinary curricula and improve welfare literacy within the veterinary profession. Veterinarians are animal health experts. More recently, they have been conferred a leading role as experts in animal welfare. This expectation of veterinarians as welfare experts appears to stem from their training in veterinary medicine as well as professional contributions to welfare-relevant

policy and law. Veterinarians are ideally situated to act as animal welfare experts by virtue of their core work with animals and potential influence over owners, their roles in policy development, compliance, and monitoring, and as educators of future veterinarians. However, since its inception as a discipline over 70 years ago, animal welfare science has moved beyond a two-dimensional focus on nutrition and health (biological functioning) towards an understanding that the mental experiences of animals are the focus of welfare consideration. The Five Domains Model is a structured and systematic framework for more holistically considering conditions that contribute to the animal's internal state and its perception of its external situation, and the resultant mental experiences. The Model can be used to better align veterinary animal welfare expertise with contemporary understanding of animal welfare science and improve welfare literacy within the veterinary profession. Improved understanding of animal welfare science is likely to lead to increased confidence, competence, and empowerment to act as experts in their daily lives.

Title: Optimising a targeted test reduction intervention for patients admitted to the intensive care unit: The Targeted Intensive Care Test Ordering Cluster Trial intervention

Journal: Australian Critical Care

Volume: 34

Issue: 5

Pages: 419-426

Date: Sep

Short Title: Optimising a targeted test reduction intervention for patients admitted to the intensive care unit: The Targeted Intensive Care Test Ordering Cluster Trial intervention

ISSN: 1036-7314

DOI: 10.1016/j.aucc.2020.11.003

Accession Number: WOS:000685540600004

Abstract: Background: Approaches to routine diagnostic testing in the intensive care unit include time-scheduled testing and targeted testing. Blood tests and chest radiographs requested on a routine, time-scheduled basis may reduce the risk of missing important findings. Targeted testing, considering individual patient needs, may reduce unnecessary testing, wasted clinician time, and costs. However, existing evidence of targeted testing interventions is generally of low quality, and the optimal testing approach is

uncertain. Objectives: The aim of the study was to describe the development of an intervention to reduce unnecessary diagnostic test ordering by clinicians working in intensive care, with the aim of informing the design of a pivotal clinical trial. Methods: The Capability, Opportunity, Motivation-Behaviour model was used as a theoretical framework for change. The intervention components were informed by systematically identifying, assessing, and classifying targeted testing interventions in behavioural terms. Feedback from intensive care clinicians and patients was sought using surveys and a consumer reference group. Results: The mean percentage of routine tests considered unnecessary by 201 intensive care clinicians was 33 (standard deviation = 16). When presented with a statement of the pros and cons for targeted versus liberal testing (n = 154), 93 (60%) consumer survey respondents preferred a more liberal approach, 33 (21%) preferred a more restrictive approach, and 28 (18%) were unsure. There were 24 behavioural interventions identified and incorporated into the final intervention. This had five major components: (i) a management committee to acquire, disseminate, and coordinate intervention-related information, (ii) a targeted testing guideline for sites, (iii) educational material for sites, (iv) site medical and nursing champions, and (v) site audit and feedback. Conclusions: Although surveyed intensive care clinicians report substantial unnecessary routine diagnostic testing, on the basis of currently available evidence, consumers prefer a more liberal approach. This feedback, and a framework to identify behavioural interventions, has been used to inform the design of a proposed targeted testing clinical trial. Short Title: Patients' and Providers' Perspectives of a Polypill Strategy to Improve Cardiovascular Prevention in Australian Primary Health Care A Qualitative Study Set Within a Pragmatic Randomized, Controlled Trial

ISSN: 1941–7705

DOI: 10.1161/circoutcomes.115.001483

Accession Number: WOS:000354743900012

Abstract: Background–This study explores health provider and patient attitudes toward the use of a cardiovascular polypill as a health service strategy to improve cardiovascular prevention. Methods and Results–In-depth, semistructured interviews (n= 94) were conducted with health providers and patients from Australian general practice, Aboriginal community–controlled and government–run Indigenous Health Services participating in a pragmatic randomized controlled trial evaluating a polypill–based strategy for high–risk primary and secondary cardiovascular disease prevention. Interview topics included polypill strategy acceptability, factors affecting adherence, and trial implementation. Transcribed interview data were analyzed thematically and interpretively. Polypill patients commented frequently on cost–savings, ease, and convenience of a daily–dosing pill. Most providers considered a polypill strategy to facilitate improved patient medication use. Indigenous Health Services providers and indigenous patients thought the strategy acceptable and beneficial for indigenous patients given the high disease burden. Providers noted the inflexibility of the fixed dose regimen, with dosages sometimes inappropriate for patients with complex management considerations. Future polypill formulations with varied strengths and classes of medications may overcome this barrier. Many providers suggested the polypill strategy, in its current formulations, might be more suited to high–risk primary prevention patients. Conclusions–The polypill strategy was generally acceptable to patients and providers in cardiovascular prevention. Limitations to provider acceptability of this particular polypill were revealed, as was a perception it might be more suitable for high–risk primary prevention patients, though future combinations could facilitate its use in secondary prevention. Participants suggested a polypill–based strategy as particularly appropriate for lowering the high cardiovascular burden in indigenous populations. Accession Number: WOS:000764322600001

Abstract: Preventive behavior, such as hand hygiene, facemask wearing, and social distancing, plays a vital role in containing the spread of viruses during pandemics. However, people in many parts of the world usually encounter difficulties adhering to this behavior due to various causes. Thus, this article aims to develop a research framework and propose design strategies to prompt individuals' behavior change during pandemics. Initially, we integrated a literature review and a structured interview (n = 22) to ascertain the core factors impacting behavior change during pandemics. These factors were categorized into four aspects: perceptual factors (attitudes, subjective norms and perceived behavior control, risk perceptions); social factors (knowledge and information dissemination, governmental regulations); physical factors (tools and facilities and surveillance); and sociocultural factor (cultural contexts). Then, a theoretical framework with antecedents was developed to reveal behavior intention and formation process. After that, an empirical study was carried out to test the research framework through a questionnaire survey (n = 549). The research findings indicated that all derived factors could directly or indirectly affect individuals' preventive behavior during pandemics. This article strives to provide valuable insights for different stakeholders when coping with pandemic situations.

Title: Determinants of recreational screen time behavior following

the COVID-19 pandemic among Canadian adults
Journal: Applied Physiology Nutrition and Metabolism
Date: 2023 May
Short Title: Determinants of recreational screen time behavior following the COVID-19 pandemic among Canadian adults
ISSN: 1715-5312
DOI: 10.1139/apnm-2022-0379
Accession Number: WOS:000985432500001

Abstract: The objectives of our study were to examine recreational screen time behavior before and 2 years following the COVID-19 pandemic lockdown, and explore whether components of the capability-opportunity-motivation-behavior (COM-B) model would predict changes in this recreational screen time behavior profile over the 2-year period. This cross-sectional, retrospective study was conducted in March 2022. Canadian adults (n = 977) completed an online survey that collected demographic information, current screen time behavior, screen time behavior prior to the pandemic, and beliefs about capability, opportunities, and motivation for limiting screen time based on the COM-B model. We found that post-pandemic recreational screen time (3.91 +/- 2.85 h/day) was significantly higher than pre-pandemic levels (3.47 +/- 2.50 h/day, p < 0.01). Three recreational screen time behavior profiles were identified based on the Canadian 24-Hour Movement Guidelines: (1) always met screen time guidelines (<= 3 h/day) (47.8%; n = 454); (2) increased screen time (10.1%; n = 96); and (3) never met screen time guidelines (42%; n = 399). The overall discriminant function was found to be significant among the groups (Wilks' lambda = 0.90; canonical r = 0.31, chi 2 = (14) = 95.81, p < 0.001). The group that always met screen time guidelines had the highest levels of automatic motivation, reflective motivation, social opportunity, and psychological capabilities to limit screen time compared to other screen time profile groups. In conclusion, recreational screen time remains elevated post-pandemic. Addressing motivation (automatic and reflective), psychological capabilities, and social opportunities may be critical for future interventions aiming to limit recreational screen time.

Short Title: Leveraging Transfer Learning to Analyze Opinions,

Attitudes, and Behavioral Intentions Toward COVID-19 Vaccines:
Social Media Content and Temporal Analysis

ISSN: 1438-8871

DOI: 10.2196/30251

Article Number: e30251

Accession Number: WOS:000683837700006

Abstract: Background: The COVID-19 vaccine is considered to be the most promising approach to alleviate the pandemic. However, in recent surveys, acceptance of the COVID-19 vaccine has been low. To design more effective outreach interventions, there is an urgent need to understand public perceptions of COVID-19 vaccines.

Objective: Our objective was to analyze the potential of leveraging transfer learning to detect tweets containing opinions, attitudes, and behavioral intentions toward COVID-19 vaccines, and to explore temporal trends as well as automatically extract topics across a large number of tweets. **Methods:** We developed machine learning and transfer learning models to classify tweets, followed by temporal analysis and topic modeling on a dataset of COVID-19 vaccine-related tweets posted from November 1, 2020 to January 31, 2021. We used the F1 values as the primary outcome to compare the performance of machine learning and transfer learning models. The statistical values and P values from the Augmented Dickey-Fuller test were used to assess whether users' perceptions changed over time. The main topics in tweets were extracted by latent Dirichlet allocation analysis. **Results:** We collected 2,678,372 tweets related to COVID-19 vaccines from 841,978 unique users and annotated 5000 tweets. The F1 values of transfer learning models were 0.792 (95% CI 0.789-0.795), 0.578 (95% CI 0.572-0.584), and 0.614 (95% CI 0.606-0.622) for these three tasks, which significantly outperformed the machine learning models (logistic regression, random forest, and support vector machine). The prevalence of tweets containing attitudes and behavioral intentions varied significantly over time. Specifically, tweets containing positive behavioral intentions increased significantly in December 2020. In addition, we selected tweets in the following categories: positive attitudes, negative attitudes, positive behavioral intentions, and negative behavioral intentions. We then identified 10 main topics and relevant terms for each category. **Conclusions:** Overall, we provided a method to automatically analyze the public understanding of COVID-19 vaccines from real-time data in social media, which can be used to tailor educational programs and other interventions to effectively promote the public acceptance of COVID-19 vaccines.

Article Number: e28118
Accession Number: WOS:000649822100005
Abstract: Background: Acceptance rates of COVID-19 vaccines have still not reached the required threshold to achieve herd immunity. Understanding why some people are willing to be vaccinated and others are not is a critical step to develop efficient implementation strategies to promote COVID-19 vaccines. Objective: We conducted a theory-based content analysis based on the capability, opportunity, motivation-behavior (COM-B) model to characterize the factors influencing behavioral intentions toward COVID-19 vaccines mentioned on the Twitter platform. Methods: We collected tweets posted in English from November 1-22, 2020, using a combination of relevant keywords and hashtags. After excluding retweets, we randomly selected 5000 tweets for manual coding and content analysis. We performed a content analysis informed by the adapted COM-B model. Results: Of the 5000 COVID-19 vaccine-related tweets that were coded, 4796 (95.9%) were posted by unique users. A total of 97 tweets carried positive behavioral intent, while 182 tweets contained negative behavioral intent. Of these, 28 tweets were mapped to capability factors, 155 tweets were related to motivation, 23 tweets were related to opportunities, and 74 tweets did not contain any useful information about the reasons for their behavioral intentions ($K=0.73$). Some tweets mentioned two or more constructs at the same time. Tweets that were mapped to capability ($P<.001$), motivation ($P<.001$), and opportunity ($P=.03$) factors were more likely to indicate negative behavioral intentions. Conclusions: Most behavioral intentions regarding COVID-19 vaccines were related to the motivation construct. The themes identified in this study could be used to inform theory-based and evidence-based interventions to improve acceptance of COVID-19 vaccines.

Short Title: A theory-based meta-regression of factors influencing clinical decision support adoption and implementation

ISSN: 1067-5027

DOI: 10.1093/jamia/ocab160

Accession Number: WOS:000711702400023

Abstract: Objective: The purpose of the study was to explore the theoretical underpinnings of effective clinical decision support (CDS) factors using the comparative effectiveness results. Materials and Methods: We leveraged search results from a previous systematic literature review and updated the search to screen articles published from January 2017 to January 2020. We included randomized controlled trials and cluster randomized controlled trials that compared a CDS intervention with and without specific factors. We used random effects meta-regression procedures to analyze clinician behavior for the aggregate effects. The theoretical model was the Unified Theory of Acceptance and Use of Technology (UTAUT) model with motivational control. Results: Thirty-four studies were included. The meta-regression models identified the importance of effort expectancy (estimated coefficient = -0.162 ; $P = .0003$); facilitating conditions (estimated coefficient = 0.094 ; $P = .013$); and performance expectancy with motivational control (estimated coefficient = 1.029 ; $P = .022$). Each of these factors created a significant impact on clinician behavior. The meta-regression model with the multivariate analysis explained a large amount of the heterogeneity across studies ($R^2 = 88.32\%$). Discussion: Three positive factors were identified: low effort to use, low controllability, and providing more infrastructure and implementation strategies to support the CDS. The multivariate analysis suggests that passive CDS could be effective if users believe the CDS is useful and/or social expectations to use the CDS intervention exist. Conclusions: Overall, a modified UTAUT model that includes motivational control is an appropriate model to understand psychological factors associated with CDS effectiveness and to guide CDS design, implementation, and optimization.

Abstract: IMPORTANCE Lowering sodium intake reduces blood pressure and may reduce the risk of cardiovascular diseases. The use of reduced-sodium salt (a salt substitute) may achieve sodium reduction, but its effectiveness may be associated with the context of its use. OBJECTIVE To identify factors associated with the use of salt substitutes in rural populations in China within the Salt Substitute and Stroke Study, a large-scale cluster randomized trial. DESIGN, SETTING, AND PARTICIPANTS This sequential mixed-methods qualitative evaluation, conducted from July 2 to August 28, 2018, in rural communities across 3 provinces in China, included a quantitative survey, collection of 24-hour urine samples, and face-to-face interviews. A random subsample of trial participants, selected from the 3 provinces, completed the quantitative survey (n = 1170) and provided urine samples (n = 1025). Interview respondents were purposively selected from the intervention group based on their different ranges of urinary sodium excretion levels. Statistical analysis was performed from September 18, 2018, to February 22, 2019. EXPOSURES The intervention group of the Salt Substitute and Stroke Study was provided with the free salt substitute while the control group continued to use regular salt. MAIN OUTCOMES AND MEASURES Knowledge, attitudes, and behaviors regarding the use of the salt substitute were measured using quantitative surveys, and urinary sodium levels were measured using 24-hour urine samples. Contextual factors were explored through semistructured interviews and integrated findings from surveys and interviews. RESULTS A total of 1170 individuals participated in the quantitative survey. Among the 1025 participants with successful urine samples, the mean (SD) age was 67.4 (7.5) years, and 502 (49.0%) were female. The estimated salt intake of participants who believed that high salt intake was good for health was higher; however, it was not significantly different (0.84 g/d [95% CI, -0.04 to 1.72 g/d]) from those who believed that high salt intake was bad for health. Thirty individuals participated in the qualitative interviews (18 women [60.0%]; mean [SD] age, 70.3 [6.0] years). Quantitative and qualitative data indicated high acceptability of and adherence to the salt substitute. Contextual factors negatively associated with the use of the salt substitute included a lack of knowledge about the benefits associated with salt reduction and consumption of high-sodium pickled foods. In addition, reduced antihypertensive medication was reported by a few participants using the salt substitute. CONCLUSIONS AND RELEVANCE This study suggests that lack of comprehensive understanding of sodium reduction and salt

substitutes and habitual consumption of high-sodium foods (such as pickled foods) were the main barriers to the use of salt substitutes to reduce sodium intake. These factors should be considered in future population-based, sodium-reduction interventions.

Abstract: The COVID-19 pandemic has brought about unprecedented global changes in individual and collective behaviour. To reduce the spread of the virus, public health bodies have promoted social distancing measures while attempting to mitigate their mental health consequences. The current study aimed to identify cognitive predictors of social distancing adherence and mental health symptoms, using computational models derived from delay discounting (the preference for smaller, immediate rewards over larger, delayed rewards) and patch foraging (the ability to trade-off between exploiting a known resource and exploring an unknown one). In a representative sample of the UK population (N = 442), we find that steeper delay discounting predicted poorer adherence to social distancing measures and greater sensitivity to reward magnitude during delay discounting predicted higher levels of anxiety symptoms. Furthermore, under-valuing recently sampled information during foraging independently predicted greater violation of lockdown guidance. Our results suggest that those who show greater

discounting of delayed rewards struggle to maintain social distancing. Further, those who adapt faster to new information are better equipped to change their behaviour in response to public health measures. These findings can inform interventions that seek to increase compliance with social distancing measures whilst minimising negative repercussions for mental health.

Title: The New South Wales Allied Health Workplace Learning Study: barriers and enablers to learning in the workplace

Journal: BMC Health Services Research

Volume: 14

Date: Mar

Short Title: The New South Wales Allied Health Workplace Learning Study: barriers and enablers to learning in the workplace

DOI: 10.1186/1472-6963-14-134

Article Number: 134

Accession Number: WOS:000333556700001

Abstract: Background: Workplace learning refers to continuing professional development that is stimulated by and occurs through participation in workplace activities. Workplace learning is essential for staff development and high quality clinical care. The purpose of this study was to explore the barriers to and enablers of workplace learning for allied health professionals within NSW Health. Methods: A qualitative study was conducted with a purposively selected maximum variation sample (n = 46) including 19 managers, 19 clinicians and eight educators from 10 allied health professions. Seven semi-structured interviews and nine focus groups were audio-recorded and transcribed. The 'framework approach' was used to guide the interviews and analysis. Textual data were coded and charted using an evolving thematic framework. Results: Key enablers of workplace learning included having access to peers, expertise and 'learning networks', protected learning time, supportive management and positive staff attitudes. The absence of these key enablers including heavy workload and insufficient staffing were important barriers to workplace learning. Conclusion: Attention to these barriers and enablers may help organisations to

more effectively optimise allied health workplace learning.
Ultimately better workplace learning may lead to improved patient,
staff and organisational outcomes.

Short Title: A mixed-methods evaluation of the impact of a
pharmacist-led feedback pilot intervention on insulin prescribing in
a hospital setting

ISSN: 1551-7411

DOI: 10.1016/j.sapharm.2021.03.007

Accession Number: WOS:000700969600015

Abstract: Aims: To explore the impact of a prescribing feedback
intervention on insulin prescribing. Methods: This was a mixed-
methods study in a hospital setting. An insulin prescribing feedback
intervention was delivered verbally and in writing to twelve
doctors. Insulin prescribing error frequency was compared to ten
doctors who had not received the feedback intervention. Insulin
prescribing was audited over four weeks at the start and end of the
intervention period. Semi-structured interviews were conducted with
participating doctors who had received feedback, and qualitative
data analysed thematically to explore the impact of the intervention
on their prescribing practice. Results: Prescribing data were
collected on 370 insulin prescriptions with 241 errors identified. A
significant reduction ($\chi^2 = 22.6, p < 0.05$) in insulin prescribing
error frequency was observed in the intervention group, with a non-
significant increase reported in the control group. Feedback was
received positively and considered valuable by doctors, supporting
development of their knowledge and skills and encouraging reflection
on their prescribing performance. Doctors described enhanced
confidence in insulin prescribing and a desire to improve as a
prescriber and avoid harm, with feedback raising awareness of their
development needs. Prescribers also described enhanced team work,
with greater information and feedback seeking behavior to inform
future prescribing decisions. Conclusions: Feedback has potential to
improve insulin prescribing and is a valued and acceptable process

intervention for doctors. The impact on insulin prescribing practice is varied and complex influencing the capability, opportunity and motivation of prescribers to adapt and evolve their behavior in response to ongoing feedback.

Title: Evaluation of a community awareness programme to reduce delays in referrals to early intervention services and enhance early detection of psychosis

Journal: BMC Psychiatry

Volume: 15

Date: May

Short Title: Evaluation of a community awareness programme to reduce delays in referrals to early intervention services and enhance early detection of psychosis

DOI: 10.1186/s12888-015-0485-y

Article Number: 98

Accession Number: WOS:000354176200001

Abstract: Background: Reducing treatment delay and coercive pathways to care are accepted aims for Early Intervention Services (EIS) for people experiencing first episode psychosis but how to achieve this is unclear. A one-year community awareness programme was implemented in a London EIS team, targeting staff in non-health service community organisations. The programme comprised psycho-educational workshops and EIS link workers, and offering direct referral routes to EIS. Its feasibility and its impact on duration of untreated psychosis and pathways to EIS were evaluated. Methods: Evaluation comprised: pre and post questionnaires with workshop participants assessing knowledge and attitudes to psychosis and mental health services; and a comparison of new service users' "service DUP" (time from first psychotic symptom to first contact with EIS) and pathways to care in the intervention year and preceding year. Focus groups sought stakeholders' views regarding the benefits and limitations of the programme and what else might promote help-seeking. Results: 41 workshops at 36 community organisations were attended by 367 staff. 19 follow up workshops were conducted and 16 services were allocated an EIS link worker. Participants' knowledge and attitudes to psychosis and attitudes to mental health services improved significantly following workshops. In the year of the intervention, only 6 of 110 new service users reached EIS directly via community organisations. For all new referrals accepted by EIS, in the intervention year compared to the previous year, there was no difference in mean or median service DUP. A clear impact on pathways to care could not be discerned. Stakeholders suggested that barriers

to referral remained. These included: uncertainty about the signs of early psychosis, disengagement by young people when becoming unwell, and worries about stigma or coercive treatment from mental health services. More general, youth focused, mental health services were proposed. Conclusions: The community awareness programme did not reduce treatment delays for people experiencing first episode psychosis. Further research is needed regarding effective means to reduce duration of untreated psychosis. Although EIS services are guided to promote access through community engagement, this may not be an effective use of their limited resources.

Abstract: The concept of 'Teachable Moment' (TM) is an increasingly used term within mainstream health psychology in relation to interventions and health behaviour change. It refers to a naturally occurring health event where individuals may be motivated to change their behaviours from unhealthy ones to healthier choices. Pregnancy is seen as a key time for behaviour change interventions, partly due to the idea that the mother has increased motivations to protect her unborn child. This paper proposes a Critical Health Psychological (CHP) re-examination of the concept and explores the 'teachable moment' within a wider framing of contemporary parenting ideologies in order to offer a more critical, nuanced and contextual consideration of pregnancy and the transition to motherhood. The paper locates these discussions using an example of alcohol usage in pregnancy. In doing so, this paper is the first of its kind to consider the 'teachable moment' from a critical health psychological

perspective.

Short Title: Exploring Problem-framing through Behavioural Heuristics

ISSN: 1991-3761

Accession Number: WOS:000323948400003

Abstract: Design for behaviour change aims to influence user behaviour, through design, for social or environmental benefit. Understanding and modelling human behaviour has thus come within the scope of designers' work, as in interaction design, service design and user experience design more generally. Diverse approaches to how to model users when seeking to influence behaviour can result in many possible strategies, but a major challenge for the field is matching appropriate design strategies to particular behaviours (Zachrisson & Boks, 2012). In this paper, we introduce and explore behavioural heuristics as a way of framing problem-solution pairs (Dorst & Cross, 2001) in terms of simple rules. These act as a 'common language' between insights from user research and design principles and techniques, and draw on ideas from human factors, behavioural economics, and decision research. We introduce the process via a case study on interaction with office heating systems, based on interviews with 16 people. This is followed by worked examples in the 'other direction', based on a workshop held at the Interaction '12 conference, extracting heuristics from existing systems designed to influence user behaviour, to illustrate both ends of a possible design process using heuristics.

Abstract: Reflective processing is a joint social action that develops in interaction. Using conversation analysis and discursive psychology, this article focuses on self-reflective turns of talk in group counselling for adults at risk of type 2 diabetes. We show how reflective processing unfolds in patterns of interaction, wherein group members take an observing, evaluating or interpreting position towards their own actions and experiences. Self-reflective talk is neither exclusively dependent on counsellors' actions nor limited to the niches the counselling programme structure offers. Self-reflective talk is one method of generating joint reflective processing. Such talk makes a topic available for discussion by connecting details of counselling with individuals' experiences and enabling sharing. Self-reflective talk thus serves as a way for group members to participate in constructing a lifestyle problem, to invite or provide sharing of experiences and to display their orientation to the institutional task at hand.

Abstract: Vaccine hesitancy and refusal have undermined COVID-19 vaccination efforts of nursing staff. This study aimed to identify behavioral factors associated with COVID-19 vaccine uptake among unvaccinated nursing staff in long-term care facilities (LTCF) in

Finland. Methodology: The study was based on the Theoretical Domains Framework. Data were collected through qualitative in-depth interviews among nursing staff and managers of LTCFs. The analysis was based on thematic analysis. We identified seven behavioral domains, with several themes, that reduced the staff's intention to get vaccinated: knowledge (information overload, inability to identify trustworthy information sources, lack of vaccine-specific and understandable scientific information), beliefs about consequences (incorrect perceptions about the vaccine effectiveness, and lack of trust in the safety of the vaccine), social influences (influence of family and friends), reinforcement (limited abilities of the management to encourage vaccination), beliefs about capabilities (pregnancy or desire to get pregnant), psychological factors (coping with changing opinion), and emotions (confusion, suspicion, disappointment, and fatigue). We also identified three behavioral domains that encouraged vaccine uptake: social influences (trust in health authorities), environmental context and resources (vaccination logistics), and work and professional role (professional pride). The study findings can help authorities to develop tailored vaccine promotion strategies for healthcare workers in LTCFs.

Abstract: Background: Compliance with infection prevention and control (IPC) measures is critical to preventing COVID-19 transmission in healthcare settings. Aim: To identify and explain factors influencing compliance with COVID-19-specific IPC measures among healthcare workers (HCWs) in long-term care facilities (LTCF) in Finland. Methods: The study included a web-based survey and

qualitative study based on the Theoretical Domains Framework (TDF). The link to the anonymous survey was distributed via email to LTCFs through regional IPC experts in December 2020. Outcome was modelled using ordinary logistic regression and penalised ridge logistic regression using regrouped explanatory variables and an original, more correlated set of explanatory variables, respectively. In-depth interviews were conducted among survey participants who volunteered during January– March 2021. Data were analysed thematically using qualitative data analysis software (NVIV012). Results: A total of 422 HCWs from 17/20 regions responded to the survey. Three TDF domains were identified that negatively influenced IPC compliance: environmental context and resources, reinforcement and beliefs about capabilities. Twenty HCWs participated in interviews, which resulted in identification of several themes: changes in professional duties and lack of staff planning for emergencies (domain: environmental context and resources); management culture and physical absence of management (domain: reinforcement), knowledge of applying IPC measures, nature of tasks and infrastructure that supports implementation (domain: beliefs about capabilities), that explained how the domains negatively Notes: Lohiniva, Anna–Leena Toura, Saija Arifulla, Dinah Ollgren, Jukka Lyytikainen, Outi

Abstract: Background: Many models and frameworks are currently used to classify or describe knowledge translation interventions to promote and integrate evidence into practice in healthcare. Methods: We performed a scoping review of intervention classifications in public health, clinical medicine, nursing, policy, behaviour science, improvement science and psychology research published to May 2013 by searching MEDLINE, PsycINFO, CINAHL and the grey literature. We used five stages to map the literature: identifying the research question; identifying relevant literature; study selection; charting the data; collating, summarizing, and reporting results. Results: We identified 51 diverse classification schemes, including 23 taxonomies, 15 frameworks, 8 intervention lists, 3

models and 2 other formats. Most documents were public health based, 55% included a literature or document review, and 33% were theory based. Conclusions: This scoping review provides an overview of schemes used to classify interventions which can be used for evaluation, comparison and validation of existing and emerging models. The collated taxonomies can guide authors in describing interventions; adequate descriptions of interventions will advance the science of knowledge translation in healthcare.

Accession Number: WOS:000425149400022

Abstract: Objective: this study aimed to explore the enablers and barriers to implementation of the Australian smoking cessation in pregnancy guidelines. These guidelines direct clinicians to follow the 5As of cessation: Ask, Advise, Assess, Assist and Arrange follow-up. Design: semi-structured interviews based on the Theoretical Domains Framework (TDF) elicited clinicians' views and experiences of implementing the guidelines. Setting: antenatal care in the NSW public health system. Participants: 27 maternity service managers, obstetricians and midwives. Findings: participants confirmed that implementation of the smoking cessation guidelines was sub-optimal. This was particularly the case with Assist and Arrange follow up at the initial visit, and with following any of the 5As at subsequent visits. Key barriers included systems which did not support implementation or monitoring, lack of knowledge, skills and training, perceived time restrictions, 'difficult conversations' and perceiving smoking as a social activity. Enablers included clinicians' knowledge of the harms of smoking in pregnancy, clinicians' skills in communicating with pregnant women, positive emotions, professional role and identity, the potential of training and of champions to influence practice, and systems that regulated behaviour. Key conclusions: these findings will contribute to the development of a multifaceted intervention to support clinicians in

implementing the guidelines.

and neck cancer (HNC) patients' and their family members' views on
acceptability and feasibility of patient-initiated follow-up (PIFU),
including concerns and anticipated benefits. Methods Patients were
recruited from UK HNC clinics, support groups and advocacy groups.
They completed a survey (n = 144) and/or qualitative interview (n =
30), three with a family member. Qualitative data were analysed
thematically, quantitative data using descriptive statistics.
Results Preference for follow-up care in HNC was complex and
individual. Many patients thought PIFU could beneficially reallocate
health care resources and encourage self-management. Patients' main
concerns with PIFU were losing the reassurance of regular clinic
appointments and addressing mental well-being needs within PIFU,
possibly using peer support. Patients were concerned about their
ability to detect recurrence due to lack of expertise and
information. They emphasised the importance of a reliable, direct
and easy urgent appointment service and of feeling supported and
heard by clinicians. Patients believed family and friends need
support. Conclusion PIFU may be feasible and acceptable for certain
HNC patients, providing it addresses support for mental well-being,
provides quick, reliable and direct clinician access and information
on "red flag" symptoms, and ensures patients and their caregivers
feel supported.

Short Title: Acceptability and Outcomes of Transdiagnostic Guided
Self-help Bibliotherapy for Internalizing Disorder Symptoms in
Adults: A Fully Remote Nationwide Open Trial

ISSN: 0147-5916

DOI: 10.1007/s10608-022-10338-5

Accession Number: WOS:000898460300001

Abstract: IntroductionDoing What Matters in Times of Stress (DWM) is
a five-module transdiagnostic guided self-help (GSH) intervention
developed by the World Health Organization, originally in a group-
based format. In a sample of individuals recruited from across the
United States, we conducted an open trial to study the feasibility
and acceptability of an adaptation of DWM in which guidance was
provided individually and remotely via phone and videoconferencing.
MethodsWe assessed internalizing symptoms, psychological well-being,
work and social functioning, usability of the intervention, and
emotion regulation over the course of 6 weeks. ResultsA total of 263
individuals completed our screening. Of those, 75.29% (n = 198)
qualified for the intervention. We reached most participants who
qualified (71.21%, n = 141) via phone to schedule a GSH session.
Most of those scheduled attended a study session (84.4%, n = 119),
and most of those who attended a session completed more than half
the treatment (84.03%, n = 100). Retention rates were comparable to
meta-analytic estimates of dropout rates in GSH. Participants showed
improvement on internalizing symptoms, psychological well-being,
work and social functioning, usability of the intervention, and
emotion regulation. ConclusionDWM is a freely available, seemingly
efficacious transdiagnostic intervention for internalizing disorder
symptoms.

Title: Attending a Blended In-Service Management Training in a Public Health System: Constraints and Opportunities for Pharmacists and Health Services

Journal: Pharmacy

Volume: 9

Issue: 1

Date: Mar

Short Title: Attending a Blended In-Service Management Training in a Public Health System: Constraints and Opportunities for Pharmacists and Health Services

DOI: 10.3390/pharmacy9010012

Article Number: 12

Accession Number: WOS:000633170900001

Abstract: Management and public health are important domains of competency for pharmacists. In about 90% of Brazilian health departments, pharmacists manage the selection and purchase of medicines. The Pharmaceutical Services and Access to Medicines Management Course (PSAMM) was offered to pharmacists working in the public health system. The aim of this study is to analyze the impacts of the course as perceived by the students (pharmacists). Two thousand five hundred pharmacists completed the course. It is a mixed-methods study, including subscribing forms (n = 2500), evaluation questionnaire (n = 1500), focus groups (n = 10), and semi-structured interviews (n = 31). Participants reported a high level of satisfaction with the course; they considered to have developed competencies related to leadership and management, competencies needed to enhance and sustain their practices in health services. Data analyses showed important barriers to complete the course: high course workload, poor quality of Internet access, lack of support from the health services. Participants highlighted crucial features of the course that helped them develop key competencies: practical in-service activities, useful and realistic contents, tutoring. These features helped participants overcome some important constraints described by them. The educational model described in this study was perceived as having a long-term impact on their behaviors and management practices in health services.

Title: A workers' health surveillance online training programme for occupational physicians

Journal: Occupational Medicine-Oxford

Volume: 73

Issue: 3

Pages: 148-154

Date: Apr

Short Title: A workers' health surveillance online training programme for occupational physicians

ISSN: 0962-7480

DOI: 10.1093/occmed/kqad024

Accession Number: WOS:000939702500001

Abstract: Background To support occupational physicians (OPs) in the implementation of workers' health surveillance (WHS), a training programme was developed. Aims (i) To evaluate the effects of a WHS training programme for OPs on knowledge, self-efficacy and skills to implement WHS. (ii) To evaluate to what extent a WHS training programme is acceptable and feasible for implementation in practice. Methods A single-blinded randomized controlled trial with waiting-list control group was used. The WHS training programme consisted of an e-learning and a 4.5-h online training session. OPs completed a knowledge test (0-8), self-efficacy questionnaires on knowledge and skills (6-60), and vignette assignments (0-16) to measure skills. OPs completed the questionnaires, either before and after the WHS training programme (intervention group), or before the training programme (control group) while receiving the training programme after the waiting period. All OPs completed questionnaires about the training's acceptability, and feasibility for implementation in practice. ANCOVA and Poisson regression analyses were conducted. Results The self-efficacy score ($M = 44.1$ versus $M = 37.2$) ($P < 0.001$) and skills score ($M = 9.6$ versus $M = 8.3$) ($P < 0.05$) of OPs in the training group ($N = 16$) were higher than the control group ($N = 23$). No effect was found on knowledge. Evaluation of acceptability and feasibility showed that 21 (58%) OPs were very satisfied with the training part on initiating WHS, and 29 (85%) would recommend the WHS training programme to colleagues. Conclusions This WHS training programme has a positive effect on self-efficacy and skills of OPs to implement WHS, and may be acceptable and feasible to implement in practice. Workers' health surveillance (WHS) is aimed at the prevention of work-related diseases. This study shows that a newly developed WHS training programme had a positive effect on self-efficacy and skills of occupational physicians (OPs) to implement WHS. Because the training showed to be acceptable and feasible, enhancing educational programmes with specific WHS training may support OPs to initiate and implement WHS.

Short Title: Novel technology to help understand the context of physical activity and sedentary behaviour

ISSN: 0967-3334

DOI: 10.1088/0967-3334/37/10/1834

Accession Number: WOS:000385497200014

Abstract: When used in large, national surveillance programmes, objective measurement tools provide prevalence estimates of low physical activity guideline compliance and high amounts of sedentary time. There are undoubtedly a plethora of reasons for this but one possible contributing factor is the current lack of behavioural context offered by accelerometers and posture sensors. Context includes information such as where the behaviour occurs, the type of activity being performed and is vital in allowing greater refinement of intervention strategies. Novel technologies are emerging with the potential to provide this information. Example data from three ongoing studies is used to illustrate the utility of these technologies. Study one assesses the concurrent validity of electrical energy monitoring and wearable cameras as measures of television viewing. This study found that on average the television is switched on for 202 min d(-1) but is visible in just 90 min of wearable camera images with a further 52 min where the participant is in their living room but the television is not visible in the image. Study two utilises indoor location monitoring to assess where older adult care home residents accumulate their sedentary time. This study found that residents were highly sedentary (sitting for an average of 720 min d(-1)) and spent the majority of their time in their own rooms with more time spent in communal areas in the morning than in the afternoon. Lastly, study three discusses the use of proximity sensors to quantify exposure to a height adjustable desk. These studies are example applications of this technology, with many other technologies available and applications possible. The adoption of these technologies will provide researchers with a more complete understanding of the behaviour than has previously been available.

Abstract: Purpose Multiple systematic reviews and meta-analyses have identified the effectiveness of patient education in improving cancer pain management. However, the mechanisms by which patient education improves pain outcomes are uncertain, as are the optimal delivery, content, timing, frequency, and duration. This review provides best-bet recommendations based on available evidence to guide service managers and clinicians in developing a patient education program. Methods We used patient-centered care, self-management, coaching, and a behavior change wheel as lenses through which to consider the evidence for elements of patient education most likely to be effective within the context of other strategies for overcoming barriers to cancer pain assessment and management. Results The evidence suggests that optimal strategies include those that are patient-centered and tailored to individual needs, are embedded within health professional-patient communication and therapeutic relationships, empower patients to self-manage and coordinate their care, and are routinely integrated into standard cancer care. An approach that integrates patient education with processes and systems to ensure implementation of key standards for pain assessment and management and education of health professionals has been shown to be most effective. Conclusion Patient education is effective in reducing cancer pain and should be standard practice in all settings. For optimal results, patient education should be integrated with other strategies for implementing evidence-based, person-centered care and overcoming barriers at the levels of patient, provider, and health system. DOI: 10.1001/jamanetworkopen.2022.0060

Article Number: e220060

Accession Number: WOS:000760984200002

Abstract: IMPORTANCE An evidence-practice gap exists for cancer pain management, and cancer pain remains prevalent and disabling.

OBJECTIVES To evaluate the capacity of 3 cancer pain guideline implementation strategies to improve pain-related outcomes for patients attending oncology and palliative care outpatient services.

DESIGN, SETTING, AND PARTICIPANTS A pragmatic, stepped wedge, cluster-randomized, nonblinded, clinical trial was conducted between 2014 and 2019. The clusters were cancer centers in Australia providing oncology and palliative care outpatient clinics.

Participants included a consecutive cohort of adult outpatients with advanced cancer and a worst pain severity score of 2 or more out of 10 on a numeric rating scale (NRS). Data were collected between August 2015 and May 2019. Data were analyzed July to October 2019 and reanalyzed November to December 2021.

INTERVENTIONS Guideline implementation strategies at the cluster, health professional, and patient levels introduced with the support of a clinical champion.

MAIN OUTCOMES AND MEASURES The primary measure of effect was the percentage of participants initially screened as having moderate to severe worst pain (NRS \geq 5) who experienced a clinically important improvement of 30% or more 1 week later. Secondary outcomes included mean average pain, patient empowerment, fidelity to the intervention, and quality of life and were measured in all participants with a pain score of 2 or more 10 at weeks 1, 2, and 4.

RESULTS Of 8099 patients screened at 6 clusters, 1564 were eligible, and 359 were recruited during the control phase (mean [SD] age, 64.2 [12.1] years; 196 men [55%]) and 329 during the intervention phase (mean [SD] age, 63.6 [12.7] years; 155 men [47%]), with no

significant differences between phases on baseline measures. The mean (SD) baselineworst pain scores were 5.0 (2.6) and 4.9 (2.6) for control and intervention phases, respectively. The mean (SD) baseline average pain scores were 3.5 (2.1) for both groups. For the primary outcome, the proportions of participants with a 30% or greater reduction in a pain score of 5 or more of 10 at baseline were similar in the control and intervention phases (31 of 280 participants [11.9%] vs 30 of 264 participants [11.8%]; OR, 1.12; 95% CI, 0.79–1.60; P=.51). No significant differences were found in secondary outcomes between phases. Fidelity to the intervention was low. CONCLUSIONS AND RELEVANCE A suite of implementation strategies was insufficient to improve pain-related outcomes for outpatients with cancer-related pain. Further evaluation is needed to determine the required clinical resources needed to enable wide-scale uptake of the fundamental elements of cancer pain care. Ongoing quality improvement activities should be supported to improve sustainability.

Short Title: Examining the implementation of NICE guidance: cross-sectional survey of the use of NICE interventional procedures guidance by NHS Trusts

ISSN: 1748-5908

DOI: 10.1186/s13012-015-0283-4

Accession Number: WOS:000357314200001

Abstract: Background: In the UK, NHS hospitals receive large amounts of evidence-based recommendations for care delivery from the

National Institute for Health and Care Excellence (NICE) and other organisations. Little is known about how NHS organisations implement such guidance and best practice for doing so. This study was therefore designed to examine the dissemination, decision-making, and monitoring processes for NICE interventional procedures (IP) guidance and to investigate the barriers and enablers to the implementation of such guidance. Methods: A cross-sectional survey questionnaire was developed and distributed to individuals responsible for managing the processes around NICE guidance in all 181 acute NHS hospitals in England, Scotland, Wales and Northern Ireland. A review of acute NHS hospital policies for implementing NICE guidance was also undertaken using information available in the public domain and from organisations' websites. Results: The response rate to the survey was 75 % with 135 completed surveys received. Additionally, policies from 25 % of acute NHS hospitals were identified and analysed. NHS acute hospitals typically had detailed processes in place to implement NICE guidance, although organisations recognised barriers to implementation including organisational process barriers, clinical engagement and poor targeting with a large number of guidance issued. Examples of enablers to, and good practice for, implementation of guidance were found, most notably the value of shared learning experiences between NHS hospitals. Implications for NICE were also identified. These included making improvements to the layout of guidance, signposting on the website and making better use of their shared learning platform. Conclusions: Most organisations have robust processes in place to deal with implementing guidance. However, resource limitations and the scope of guidance received by organisations create barriers relating to organisational processes, clinician engagement and financing of new procedures. Guidance implementation can be facilitated through encouragement of shared learning by organisations such as NICE and open knowledge transfer between organisations.

Short Title: Conditions required to ensure successful detection and management of mild cognitive impairment in primary care: A Delphi consultation study in China

DOI: 10.3389/fpubh.2022.943964

Article Number: 943964

Accession Number: WOS:000874015100001

Abstract: Objective Detection and management of mild cognitive impairment (MCI) in primary care has been recognized internationally as one of the strategies that can be employed to delay the development of dementia. However, little is known about what role primary care should play. This study aimed to develop a checklist of conditions necessary for successfully detecting and managing mild cognitive impairment in primary care in China. **Methods** This study employed the Delphi method to establish expert consensus on the conditions required for successfully detecting and managing MCI in primary care in China. Twenty-four experts who specialized in general practice, public health, neuropsychology, or community health service management rated the importance of pre-defined conditions (44 items measuring providers' preparedness, patient engagement, and system support in line with the Chronic Care Model). The degree of consensus among the experts was measured using four indicators: median ≥ 4 , mean ≥ 3.5 , Co-efficient of Variance < 0.25 , and retention in the checklist required $\geq 80\%$ agreement with a rating of important or essential. The checklist and descriptions of the conditions were revised according to the experts' feedback and then sent out for repeated consultations along with a summary of the results of the previous round of consultations. Consensus was achieved after the second round of consultations, which was completed by 22 of the experts. **Results** The experts endorsed a checklist of 47 conditions required for successful detection and management of MCI in primary care in China. These conditions were categorized into four domains: prepared general practitioners (17 items), engaged patients (15 items), organizational efforts (11 items), and environmental support (4 items). **Conclusions** Successful detection and management of MCI in primary care in China requires a dedicated and competent workforce of general practitioners, as well as the engagement of patients and family caregivers. Adequate support from healthcare organizations, health system arrangements, and the broader society is needed to enable effective interactions between general practitioners and patients and efficient delivery of the services required to detect and manage MCI.

ISSN: 1470-5931

DOI: 10.1177/1470593115607941

Accession Number: WOS:000376307400003

Abstract: Over the last decade, social marketing has moved away from traditional marketing management approaches towards service-oriented theory, integrating concepts from other disciplines, to account for the distinctive nature of social change and develop an ecological perspective. This article extends prior literature by interrogating the applicability of service-dominant logic (SDL) to social marketing, with a particular emphasis on how a systems perspective can offer new ways to address challenges of social change. In so doing, it examines how the social marketing benchmarks can be extended through applying (and adapting) the principles, concepts and theories of SDL. The article provides critical reflection on the challenges of transferring service-dominant theory to social change contexts highlighting implications for practice and a future research agenda.

Short Title: Development of an intervention to reduce antibiotic use
for childhood coughs in UK primary care using critical synthesis of
multi-method research

DOI: 10.1186/s12874-017-0455-9

Article Number: 175

Accession Number: WOS:000418777000001

Abstract: Background: Overuse of antibiotics contributes to the
global threat of antimicrobial resistance. Antibiotic stewardship
interventions address this threat by reducing the use of antibiotics
in occasions or doses unlikely to be effective. We aimed to develop
an evidence-based, theory-informed, intervention to reduce
antibiotic prescriptions in primary care for childhood respiratory
tract infections (RTI). This paper describes our methods for doing
so. Methods: Green and Krueger's Precede/Proceed logic model was
used as a framework to integrate findings from a programme of
research including 5 systematic reviews, 3 qualitative studies, and
1 cohort study. The model was populated using a strength of evidence
approach, and developed with input from stakeholders including

clinicians and parents. Results: The synthesis produced a series of evidence-based statements summarizing the quantitative and qualitative evidence for intervention elements most likely to result in changes in clinician behaviour. Current evidence suggests that interventions which reduce clinical uncertainty, reduce clinician/parent miscommunication, elicit parent concerns, make clear delayed or no-antibiotic recommendations, and provide clinicians with alternate treatment actions have the best chance of success. We designed a web-based within-consultation intervention to reduce clinician uncertainty and pressure to prescribe, designed to be used when children with RTI present to a prescribing clinician in primary care. Conclusions: We provide a worked example of methods for the development of future complex interventions in primary care, where multiple factors act on multiple actors within a complex system. Our synthesis provided intervention guidance, recommendations for practice, and highlighted evidence gaps, but questions remain about how best to implement these recommendations. The funding structure which enabled a single team of researchers to work on a multi-method programme of related studies (NIHR Programme Grant scheme) was key in our success.

Title: Barriers and facilitators to changing bowel care practices after spinal cord injury: a Theoretical Domains Framework approach

Journal: Spinal Cord

Volume: 60

Issue: 7

Pages: 664-673

Date: Jul

Short Title: Barriers and facilitators to changing bowel care practices after spinal cord injury: a Theoretical Domains Framework approach

ISSN: 1362-4393

DOI: 10.1038/s41393-021-00743-0

Accession Number: WOS:000740147000001

Abstract: Background Improvement to autonomic processes such as bladder, bowel and sexual function are prioritised by individuals with spinal cord injury (SCI). Bowel care is associated with high levels of dissatisfaction and decreased quality of life. Despite

dissatisfaction, 71% of individuals have not changed their bowel care routine for at least 5 years, highlighting a disconnect between dissatisfaction with bowel care and changing routines to optimise bowel care. Objective Using an integrated knowledge translation approach, we aimed to explore the barriers and facilitators to making changes to bowel care in individuals with SCI. Methods Our approach was guided by the Behaviour Change Wheel and used the Theoretical Domains Framework (TDF). Semi-structured interviews were conducted with individuals with SCI (n = 13, mean age 48.6 +/- 13.1 years) and transcribed verbatim (duration 31.9 +/- 7.1 min). Barriers and facilitators were extracted, deductively coded using TDF domains and inductively analysed for themes within domains. Results Changing bowel care after SCI was heavily influenced by four TDF domains: environmental context and resources (workplace flexibility, opportunity or circumstance, and access to resources); beliefs about consequences; social influences (perceived support and peer mentorship); and knowledge (knowledge of physiological processes and bowel care options). All intervention functions and policy categories were considered viable intervention options, with human (61%) and digital (33%) platforms preferred. Conclusions Modifying bowel care is a multi-factorial behaviour. These findings will support the systematic development and implementation of future interventions to both enable individuals with SCI to change their bowel care and to facilitate the optimisation of bowel care approaches.

Title: Theoretical underpinnings of consumers' financial capability research

Journal: International Journal of Consumer Studies

Volume: 47

Issue: 1

Pages: 373-399

Date: Jan

Short Title: Theoretical underpinnings of consumers' financial capability research

ISSN: 1470-6423

DOI: 10.1111/ijcs.12778

Accession Number: WOS:000754084500001

Abstract: This paper investigates the multidisciplinary theoretical context of financial capability and provides a critical examination of 14 relevant theoretical frameworks. To this end, the paper defines financial capability and develops a new theoretical

framework of financial capability termed the personal financial management system. Financial capability is defined as the capacity of consumers to undertake comprehensive financial activities and thereby achieve personal financial well-being. The exploration of financial capability includes the concepts of financial literacy and psychological financial capability, where the latter represents automatic and controlled mental processes. Recent advances in behavioural science have profoundly changed the realm of personal finances, and it is, therefore, essential to acknowledge the importance of the intuitive reasoning that shapes our financial decision making. As part of the financial management system's throughput, together with individual motivation and opportunity within the personal financial management system, financial capability forms financial behaviour. The framework identifies three groups of relevant antecedents of financial capability including sociodemographic factors, cognitive and affective factors and personality and values. By constructing a comprehensive theoretical model, this paper contributes to the literature by providing greater consistency in the definitions of capability and its related terms, encouraging academic discussion and affirming the much-needed directions for future research.

ISSN: 0047-0767

DOI: 10.7352/ijsp.2020.51.579

Accession Number: WOS:000835780000003

Abstract: While the use of Performance-Enhancing and Aesthetic Substances (PAES) has been observed for thousands of years, doping has been conceptualized and regulated only in the modern era. The aim of the present study was to review the doping prevention theme in a narrative manner. The theoretical and research considerations presented in this article overall are guided by the assumption that doping behavior partly depends on the dynamic interplay between a set of individual factors, its environment, and the goal that guide the intentional behavior. Relatedly, this article introduces the

general hypothesis that these forms interplay between socio-cognitive variables of particular importance in contributing to the scientific understanding of doping use, as they might help accounting for individual differences in doping intentions and doping use. In doing so, there are described theoretical and research frameworks that indirectly support this general view, and subsequently, is addressed the value of a focus on doping research. Finally, there are reported different research programs that have been tried to find empirical support to the hypothesized linkages between intervention, their efficacy and doping use in various sport contexts.

Title: Fall prevention services for older Aboriginal people: investigating availability and acceptability

Journal: Public Health Research & Practice

Volume: 26

Issue: 5

Date: Dec

Short Title: Fall prevention services for older Aboriginal people: investigating availability and acceptability

ISSN: 2204-2091

DOI: 10.17061/phrp2651659

Article Number: e2651659

Accession Number: WOS:000391548300007

Abstract: Background: Falls and fall-related injury are emerging issues for older Aboriginal people. Despite this, it is unknown whether older Aboriginal people access available fall prevention programs, or whether these programs are effective or acceptable to this population. Objective: To investigate the use of available fall prevention services by older Aboriginal people and identify features that are likely to contribute to program acceptability for Aboriginal communities in New South Wales (NSW), Australia. Methods: A questionnaire was distributed to Aboriginal and mainstream health and community services across NSW to identify the fall prevention and healthy ageing programs currently used by older Aboriginal people. Services with experience in providing fall prevention interventions for Aboriginal communities, and key Aboriginal health services that delivered programs specifically for older Aboriginal people, were followed up and staff members were nominated from within each service to be interviewed. Service providers offered their suggestions as to how a fall prevention program could be designed and delivered to meet the health and social needs of their older Aboriginal clients. Results: Of the 131 services that completed the questionnaire, four services (3%) had past experience in providing a mainstream fall prevention program to Aboriginal people; however, there were no programs being offered at the time of

data collection. From these four services, and from a further five key Aboriginal health services, 10 staff members experienced in working with older Aboriginal people were interviewed. Barriers preventing services from offering appropriate fall prevention programs to their older Aboriginal clients were identified, including limited funding, a lack of available Aboriginal staff, and communication difficulties between health services and sectors. According to the service providers, an effective and acceptable fall prevention intervention would be evidence based, flexible, community-oriented and social, held in a familiar and culturally safe location and delivered free of cost. Conclusion: This study identified a gap in the availability of acceptable fall prevention programs designed for, and delivered to, older Aboriginal people in NSW. Further consultation with older Aboriginal people is necessary to determine how an appropriate and effective program can be designed and delivered. Terminology: The authors recognise the two distinctive Indigenous populations of Australia: Aboriginal and Torres Strait Islander people. Because the vast majority of the NSW Aboriginal and Torres Strait Islander population is Aboriginal (95.4%)(1), this population will be referred to as 'Aboriginal' in this manuscript.

DOI: 10.1007/s10639-021-10622-z

Accession Number: WOS:000664428100005

Abstract: Gamified learning tools refer to the websites, software or mobile applications that use game design elements for educational purposes. Though theoretically promising in engaging learners, gamified learning tools were not widely accepted in practice. This paper seeks to better understand what encourages and constrains teachers' use of gamified learning tools in secondary schools in China in order to better realise the potential of gamification in formal learning contexts. The research comprises a survey and an

interview that involves 347 and 14 secondary school teachers respectively, who were recruited with the use of convenience sampling method. Using the thematic analysis approach, the author obtained 16 themes that influence teachers' acceptance intention to gamification, followed by a list of sub-themes that furtherly explain the themes. Research limitations, implications and future research lines were addressed.

Article Number: 102293

Accession Number: WOS:000875644800019

Abstract: Objective: People with osteoarthritis are likely to be physically inactive and current socio-cognitive approaches to changing physical activity in this patient population are generally ineffective. We assessed prospective associations between physical activity and the automatic processes of habit automaticity, automatic evaluations, and automatic self-schema in people with knee osteoarthritis. Design: One-week prospective. Method: 253 adults (aged 46-82 years, 72% female, 28% male) with knee osteoarthritis self-reported their physical activity behaviour of the past week, habit automaticity for physical activity and completed two implicit association tests to assess automatic evaluations of physical activity (relative to sedentary behaviour) and automatic self-schema for physical activity. One week later, participants self-reported physical activity and pain while walking over the prior week. Linear regression models assessed associations of each automatic process with subsequent physical activity and the moderation effect of pain and each automatic process on subsequent physical activity, controlling for covariates. Results: We did not find evidence of a statistical relationship between physical activity with automatic evaluations, automatic self-schema, or habit automaticity. The inclusion of pain while walking did not moderate the relationship between any automatic process and physical activity. Conclusion: Although previous research on healthy, young adults suggests that

automatic processes affect physical activity behaviour, we did not find evidence to confirm whether a similar relationship exists for older adults with knee osteoarthritis. Replication and extension work testing these research questions is needed to ensure the findings are not a result of measurement and design features of the study.

Short Title: A German Model Project for Workplace Health Promotion-Flow of Communication, Information, and Reasons for Non-Participation in the Offered Measures

DOI: 10.3390/ijerph19138122

Article Number: 8122

Accession Number: WOS:000824412500001

Abstract: Background: Workplace health promotion (WHP) as a part of workplace health management (WHM) was strengthened in German legislature with the Prevention Act of 2015. However, smaller enterprises often do not offer WHM or WHP. Accordingly, a model-project for improving the uptake and implementation, particularly in micro-, small, and medium-sized enterprises (MSMEs) was carried out. The aim of the study was to determine reasons for non-participation in WHP offers and analyze communication issues, both from the employee's and employer's perspective. Methods: In total, 21 managers or persons responsible for WHP participated in the first online survey between March and April 2020, and 156 employees responded to the second online survey between June and October 2021. The importance of barriers and communication issues was investigated. Based on a principal component analysis on non-participation, differences regarding sociodemographic variables were analyzed. Results: Most employees knew about the offered measures and that the measures were cost free. There was no significant association between having communicated the offers to the employees and considering them suitable for their needs. Most of the managers or persons responsible for WHP rated the measures as sufficiently varied and allowed staff to take part during working-time. Reasons for non-participation from the managers' point of view were travel time to the location of the offers, lack of time, and a missing fit

between offers and employees' needs. From the employees' point of view, workload (including working time) was the main barrier to participation. Conclusions: For the practical implementation of model projects in MSMEs, special attention should be paid to ensuring opportunity to participate, which may be easier with in-house offers.

Title: "What is the actual goal of the pathway?": examining emergency department physician and nurse perspectives on the implementation of a pediatric concussion pathway using the theoretical domains framework

Journal: BMC Health Services Research

Volume: 21

Issue: 1

Date: Feb

Short Title: "What is the actual goal of the pathway?": examining emergency department physician and nurse perspectives on the implementation of a pediatric concussion pathway using the theoretical domains framework

DOI: 10.1186/s12913-021-06110-2

Article Number: 119

Accession Number: WOS:000617449200002

Abstract: Background Multiple evidence-based clinical practice guidelines (CPGs) exist to guide the management of concussion in children, but few have been translated into clinical pathways (CP), which operationalize guidelines into accessible and actionable algorithms that can be more readily implemented by health care providers. This study aimed to identify the clinical behaviours, attitudinal factors, and environmental contexts that potentially influence the implementation of a clinical pathway for pediatric concussion. Methods Semi-structured interviews were conducted from October 2017 to January 2018 with 42 emergency department clinicians (17 physicians, 25 nurses) at five urban emergency departments in Alberta, Canada. A Theoretical Domains Framework (TDF)-informed interview guide contained open-ended questions intended to gather feedback on the proposed pathway developed for the study, as well as factors that could potentially influence its implementation. Results The original 14 domains of the TDF were collapsed into 6 clusters based on significant overlap between domains in the issues discussed by clinicians: 1) knowledge, skills, and practice; 2) professional

roles and identity; 3) attitudes, beliefs, and motivations; 4) goals and priorities; 5) local context and resources; and 6) engagement and collaboration. The 6 clusters identified in the interviews each reflect 2-4 predominant topics that can be condensed into six overarching themes regarding clinicians' views on the implementation of a concussion CP: 1) standardization in the midst of evolving research; 2) clarifying and communicating goals; 3) knowledge dissemination and alignment of information; 4) a team-oriented approach; 5) site engagement; and 6) streamlining clinical processes. Conclusion Application of a comprehensive, evidence-based, and theory-driven framework in conjunction with an inductive thematic analysis approach enabled six themes to emerge as to how to successfully implement a concussion CP.

ISSN: 1369-6513

DOI: 10.1111/hex.13547

Accession Number: WOS:000807261500001

Abstract: Introduction Long-term benzodiazepine receptor agonist (BZRA) use persists in healthcare settings worldwide and poses risks of patient harm. Objective This study aimed to develop an intervention to support discontinuation of long-term BZRA use among willing individuals. Methods The intervention development process aligned with the UK Medical Research Council's complex intervention framework. This involved a previous systematic review of brief interventions targeting long-term BZRA use in primary care and qualitative interviews based on the Theoretical Domains Framework that explored barriers and facilitators to discontinuing long-term BZRA use. A codesign approach was used involving an active partnership between experts by experience, researchers and clinicians. Intervention content was specified in terms of behaviour change techniques (BCTs). Results The SAFEGUARDING-BZRAs (Supporting SAFE and GradUAL ReDUctIon of loNG-term BenZodiazepine Receptor Agonist uSe) toolkit comprises 24 BCTs and includes recommendations targeted at primary care-based clinicians for operationalizing each BCT to support individuals with BZRA discontinuation. Conclusion The SAFEGUARDING-BZRAs toolkit has been developed using a systematic and theory-based approach that addresses identified limitations of previous research. Further research is needed to assess its usability and acceptability by service users and clinicians, as well as its potential to effectively support safe and gradual reduction of long-term BZRA use. Patient or Public Contribution The qualitative interview phase included patients as participants. The codesign process included 'experts by experience' with either current or previous experience of long-term BZRA use as collaborators.

Short Title: Protocol for a hybrid type 2 cluster randomized trial of trauma-focused cognitive behavioral therapy and a pragmatic individual-level implementation strategy

ISSN: 1748-5908

DOI: 10.1186/s13012-020-01064-1

Article Number: 3

Accession Number: WOS:000608277600003

Abstract: Background More than two-thirds of youth experience trauma during childhood, and up to 1 in 5 of these youth develops posttraumatic stress symptoms that significantly impair their functioning. Although trauma-focused cognitive behavior therapy (TF-CBT) has a strong evidence base, it is rarely adopted, delivered with adequate fidelity, or evaluated in the most common setting where youth access mental health services—schools. Given that individual behavior change is ultimately required for successful implementation, even when organizational factors are firmly in place, focusing on individual-level processes represents a potentially parsimonious approach. Beliefs and Attitudes for Successful Implementation in Schools (BASIS) is a pragmatic, motivationally focused multifaceted strategy that augments training and consultation and is designed to target precise mechanisms of behavior change to produce enhanced implementation and youth clinical outcomes. This study protocol describes a hybrid type 2 effectiveness-implementation trial designed to concurrently evaluate the main effects, mediators, and moderators of both the BASIS implementation strategy on implementation outcomes and TF-CBT on youth mental health outcomes. Methods Using a cluster randomized controlled design, this trial will assign school-based mental health (SMH) clinicians and schools to one of three study arms: (a) enhanced treatment-as-usual (TAU), (b) attention control plus TF-CBT, or (c) BASIS+TF-CBT. With a proposed sample of 120 SMH clinicians who will each recruit 4–6 youth with a history of trauma (480 children), this project will gather data across 12 different time points to address two project aims. Aim 1 will evaluate, relative to an enhanced TAU condition, the effects of TF-CBT on identified mechanisms of change, youth mental health outcomes, and intervention costs and cost-effectiveness. Aim 2 will compare the effects of BASIS against an attention control plus TF-CBT condition on theoretical mechanisms of clinician behavior change and implementation outcomes, as well as examine costs and cost-

effectiveness. Discussion This study will generate critical knowledge about the effectiveness and cost-effectiveness of BASIS—a pragmatic, theory-driven, and generalizable implementation strategy designed to enhance motivation—to increase the yield of evidence-based practice training and consultation, as well as the effectiveness of TF-CBT in a novel service setting. Trial registration ClinicalTrials.gov registration number NCT04451161. Registered on June 30, 2020. Notes: Lyon, Aaron R. Pullmann, Michael D. Dorsey, Shannon Levin, Carol Gaias, Larissa M. Title: Reasons for indoor tanning use and the acceptability of alternatives: A qualitative study

Journal: Social Science & Medicine

Volume: 286

Date: Oct

Short Title: Reasons for indoor tanning use and the acceptability of alternatives: A qualitative study

ISSN: 0277-9536

DOI: 10.1016/j.socscimed.2021.114331

Article Number: 114331

Accession Number: WOS:000696314500009

Abstract: Rationale: Using indoor tanning devices is associated with substantial health consequences, such as an increased risk of melanoma and other skin cancers. Many people including minors and some at high risk of skin cancer continue to use these devices. In the absence of effective restrictions on use, it is important that behaviour change interventions are designed to reduce indoor tanning. Objective: To explore reasons for use of indoor tanning devices and the acceptability of alternatives in adult users residing in North-West England. Methods: Participants were required to be current indoor tanners aged 18 years and above and were recruited online. Twenty-one participants took part in either a focus group or semi-structured interview. An inductive thematic analysis was conducted. Results: Six themes were identified: psychological benefits; improving physical health; denial of health risks; alternatives do not meet psychological needs; alternatives do not meet physical needs; and perceived side-effects. Participants used indoor tanning devices to improve their self-esteem and to prevent sun damage to their skin (by gaining a 'base tan'). Participants appeared to justify their usage by responding defensively to avoid accepting they were at risk, exaggerating the benefits of indoor tanning, and discounting alternatives to indoor tanning. Alternatives to indoor tanning were perceived as risky for

health, inadequate to provide the desired aesthetic, and incapable of meeting their self-esteem needs. Conclusions: Interventions to reduce indoor tanning behaviour should increase sources of self-esteem other than appearance, increase media literacy and address defensive responses to information around indoor tanning and alternatives. Further research is needed to develop these interventions and assess their feasibility.

Short Title: Current Practices in and Barriers to Physiotherapists' Use of Resistance Exercise with Older Adults in Acute Care

ISSN: 0300-0508

DOI: 10.3138/ptc-2020-0123

Accession Number: WOS:000787332600001

Abstract: Purpose: The purpose of this cross-sectional study was to describe physiotherapists' current use of resistance exercise (REx) with older adults in acute care and to identify barriers to its use with this population. Methods: We developed an online questionnaire guided by the theoretical domains framework and distributed it to physiotherapists across British Columbia. We used thematic analysis to code open-text questionnaire responses. Results: One hundred five physiotherapists completed the questionnaire (78% female; mean age 39.9 [SD 10.3] years; mean years of experience 12.4 [SD 10.3]). Respondents reported frequently performing functional testing (95%) and assessing muscle strength (70%) in older adults, but few often prescribed REx (34%). The greatest barriers to use of REx that respondents identified were lack of prioritization of REx among other duties and perceived poor patient motivation. Open-text data analysis revealed that respondents felt that some patients were unable to perform REx and that physiotherapists lacked a clear definition of REx and sufficient support personnel. Conclusions: Addressing treatment priorities, patient motivation, and staffing resources can support physiotherapists in increasing REx use, an important strategy for reducing the incidence of hospital-associated deconditioning among older adults in acute care settings.

Date: Dec

Short Title: Tailored Interventions for Supporting Physical Activity Participation in People with Arthritis and Related Conditions: a Systematic Review

DOI: 10.1007/s40674-022-00194-5

Accession Number: WOS:000842759900001

Abstract: Purpose of Review To summarize both the research on and effects of physical activity tailoring in people with arthritis. Recent Findings Physical activity is an essential disease management strategy for people with arthritis. However, participation rates are low which may be due to generalized approaches to supporting physical activity behavior change. Tailored physical activity approaches involve the use of assessment to shape individualized intervention strategies to change physical activity. The effectiveness of tailored physical activity interventions in the general population is mixed, likely as a result of suboptimal tailoring methods, and the effectiveness in arthritis populations is unknown. We identified 24 unique assessment factors and 23 intervention strategies used in tailored physical activity interventions for people with osteoarthritis, inflammatory arthritis, or fibromyalgia. Health professionals should conduct comprehensive patient characteristics, physical, and psychosocial assessments to select the optimal physical activity prescription and strategies to deliver it. While more research is needed to refine methods for optimal tailoring of physical activity interventions for people with arthritis, health professionals should familiarize themselves with factors to consider for tailoring, collaborate with their patients on decisions about tailoring their physical activity, and adapt tailoring approaches as required over time to optimize physical activity participation.

Title: Unpacking the Black Box: A Formative Research Approach to the Development of Theory-Driven, Evidence-Based, and Culturally Safe Text Messages in Mobile Health Interventions

Journal: Jmir Mhealth and Uhealth

Volume: 4

Issue: 1

Pages: 266-278

Date: Jan-Mar

Short Title: Unpacking the Black Box: A Formative Research Approach to the Development of Theory-Driven, Evidence-Based, and Culturally Safe Text Messages in Mobile Health Interventions

ISSN: 2291-5222

DOI: 10.2196/mhealth.4994

Article Number: e10

Accession Number: WOS:000381182000021

Abstract: Background: Mobile-cellular subscriptions have increased steadily over the past decade. The accessibility of SMS messages over existing mobile networks is high and has almost universal availability even on older and unsophisticated mobile phones and in geographic settings where wireless coverage is weak. There is intensive exploration of this inexpensive mobile telecommunication technology to improve health services and promote behavior change among vulnerable populations. However, a neglected area of research is the documentation and critical analysis of the formative research process required in the development and refinement of effective SMS messages. Objective: The objective of this qualitative research study was to identify major factors that may impact on the effectiveness of evidence-based SMS messages designed to reduce health inequities in hypertension management in low resource settings, including Aboriginal populations in high-income countries and rural populations in low-income countries. Specifically, we were interested in uncovering the range of mediators that impact on appropriate message content transmission and, ultimately, on health behavior improvements in a range of these sociocultural settings. Methods: Collaborative qualitative research with Canadian Aboriginal and Tanzanian participants was conducted to deconstruct the content and transmission of evidence-based health information contained in SMS messages in the context of an international research project designed to address health inequalities in hypertension, and to develop a grounded theory of the major factors that mediate the effectiveness of this communication. We also examined the interrelationship of these mediators with the three essential conditions of the behavior system of the Behavioral Change Wheel model (capability, opportunity, and motivation) and cultural safety.

Results: Four focus groups with a total of 45 participants were conducted. Our grounded theory research revealed how discrepancies develop between the evidence-based text message created by researchers and the message received by the recipient in mobile health interventions. These discrepancies were primarily generated by six mediators of meaning in SMS messages: (1) negative or non-affirming framing of advocacies, (2) fear-or stress-inducing content, (3) oppressive or authoritarian content, (4) incongruity with cultural and traditional practices, (5) disconnect with the reality of the social determinants of health and the diversity of cultures within a population, and (6) lack of clarity and/or practicality of content. These 6 mediators of meaning provide the basis for sound strategies for message development because they impact directly on the target populations' capability, opportunity, and motivation for behavior change. Conclusions: The quality of text messages impacts significantly on the effectiveness of a mobile health intervention. Our research underscores the urgent need for interventions to incorporate and evaluate the quality of SMS messages and to examine the mediators of meaning within each targeted cultural and demographic group. Reporting on this aspect of mobile health intervention research will allow researchers to move away from the current black box of SMS text message development, thus improving the transparency of the process as well as the quality of the outcomes.

Title: A social marketing strategy to promote preconception care: development of the Woke Women strategy

Journal: Journal of Social Marketing

Volume: 12

Issue: 2

Pages: 154-173

Date: Mar

Short Title: A social marketing strategy to promote preconception care: development of the Woke Women strategy

ISSN: 2042-6763

DOI: 10.1108/jsocm-07-2021-0151

Accession Number: WOS:000753176200001

Abstract: Purpose - Exposure to unhealthy lifestyle behaviours before pregnancy affects the health of mothers and their (unborn) children. A social marketing strategy could empower prospective

parents to actively prepare for pregnancy through preconception care (PCC). This study aims to describe the development of a PCC social marketing strategy based on the eight-point benchmark criteria for effective social marketing and to clarify the concept of using social marketing for health promotion purposes. Design/methodology/approach – An extensive literature search was carried out regarding the needs of the target population and PCC behavioural goals, leading to the development of a bottom-up, ambassador-driven, communication concept. Findings – In-depth insights of all benchmarks were analysed and incorporated during the development process of a new PCC social marketing strategy, with a special focus on the application of the "Health Belief Model" (Benchmark 3) and "the Four-P framework" (Benchmark 8). Evidence-based preconceptional health information is our product, for a low price as the information is freely attainable, promoting a message of overall women's health and online or through a consult with a health-care provider as the appropriate place. This formative research resulted in the development of the Woke Women (R) strategy, empowering women to actively prepare for pregnancy. Originality/value – Developing a social marketing strategy to enhance actively preparing for pregnancy shows potential to encourage prospective parents to adopt healthier preconceptional lifestyle behaviours and can therefore improve the health of future generations.

Date: Jul

Short Title: Planning is not equivalent to preparing, how Dutch women perceive their pregnancy planning in relation to preconceptional lifestyle behaviour change—a cross-sectional study

DOI: 10.1186/s12884-022-04843-4

Article Number: 577

Accession Number: WOS:000827748600003

Abstract: Background Unhealthy prenatal lifestyle behaviours are associated with adverse pregnancy outcomes, but little is known about what motivates women to comply with preconceptional lifestyle recommendations or consciously plan their pregnancy. Therefore, the objective of this study is to explore the associations between preconceptional lifestyle behaviours, health beliefs and pregnancy

planning among Dutch pregnant women. Methods In this cross-sectional study based on the data of the APROPOS-II study, 1,077 low-risk pregnant women were eligible for inclusion. Preconception lifestyle behaviours and actively preparing for pregnancy were assessed in relation to planned pregnancies (based on the London Measure of Unplanned Pregnancies) and health beliefs (14 statements). The following preconceptional lifestyle behaviours were assessed through a self-administered questionnaire in the first trimester of pregnancy: fruit intake, vegetable intake, caffeine intake, (second-hand)smoking, alcohol intake, folic acid supplement use and exercise. Data were analysed using multivariate logistic regression analyses. Results A total of 921 (85.5%) women in our cohort had a planned pregnancy. However, of these women, 640 (69.5%) adequately used folic acid supplements and 465 (50.5%) women consumed alcohol at any point during pregnancy. Of the women considering themselves 'healthy enough and not needing preconception care', 48 (9.1%) women had an adequate vegetable intake, 294 (55.6%) women consumed alcohol at any point during pregnancy and 161 (30.4%) women were either over- or underweight. Conclusion Despite consciously planning their pregnancy, most women did not adhere to preconceptional lifestyle behaviour recommendations. Women's health beliefs and overestimation of their health status seem to interfere with actively planning and preparing for pregnancy. Findings from our study may encourage the development of prospective health-promoting interventions that focus on health beliefs and actively preparing for pregnancy, to improve preconceptional lifestyle behaviours, thereby optimizing the health of future generations.

DOI: 10.1093/jncics/pkaa110

Article Number: pkaa110

Accession Number: WOS:000648885600023

Abstract: Background: This study examined why women and doctors screen for ovarian cancer (OC) contrary to guidelines. Methods:

Surveys, based on the Theoretical Domains Framework, were sent to women in the Kathleen Cuninghams Foundation Consortium for Research into Familial Breast Cancer and family physicians and gynecologists who organized their screening. Results: Of 1264 Kathleen Cuninghams Foundation Consortium for Research into Familial Breast Cancer women, 832 (65.8%) responded. In the past 2 years, 126 (15.1%) had screened. Most of these (n = 101, 80.2%) would continue even if their doctor told them it is ineffective. For women, key OC screening motivators operated in the domains of social role and goals (staying healthy for family, 93.9%), emotion and reinforcement (peace of mind, 93.1%), and beliefs about capabilities (tests are easy to have, 91.9%). Of 531 clinicians 252 (47.5%) responded; a minority (family physicians 45.8%, gynecologists 16.7%) thought OC screening was useful. For gynecologists, the main motivators of OC screening operated in the domains of environmental context (lack of other screening options, 27.6%), and emotion (patient peace of mind, 17.2%; difficulty discontinuing screening, 13.8%). For family physicians, the strongest motivators were in the domains of social influence (women ask for these tests, 20.7%), goals (a chance these tests will detect cancer early, 16.4%), emotion (patient peace of mind, 13.8%), and environmental context (no other OC screening options, 11.2%). Conclusion: Reasons for OC screening are mostly patient driven. Clinician knowledge and practice are discordant. Motivators of OC screening encompass several domains, which could be targeted in interventions to reduce inappropriate OC screening. Article Number: 00178969221079587

Accession Number: WOS:000764094900001

Abstract: Objective: In the context of testicular torsion, research demonstrates a delay from the onset of testicular pain to attending hospital in adolescents, leading to high rates of testicular loss. This is due to a lack of knowledge about this condition. In this study, we aimed to investigate the methods adolescents and their parents felt would be effective in testicular torsion education. Design: Qualitative semi-structured interviews and focus group workshops were used to generate ideas and opinions regarding the 'ideal' education package for testicular torsion. Setting: One-to-one interviews with young men and a chosen chaperone recruited through purposive sampling from after-school clubs. Focus groups recruited from an active hospital youth forum. Method: Qualitative data analysis was undertaken to explore collective and normative views and to validate findings using a combination of thematic framework, and descriptive and content analysis. Results: In all, 16 young men aged 11-19 years with an attending chaperone were interviewed. Forty-four young people of both sexes participated in focus groups. Participants in all groups supported school-based teaching about testicular torsion, with focus group members mentioning Personal, Social, Health and Economic Education (PSHE) as the preferred setting. Members of all groups also advocated the use of video, but tone was a matter of debate. Reservations were expressed regarding the use of social and online media as primary means of dissemination but saw these as useful adjuncts to formal school lessons. Focus group members were supportive of teaching in a mixed sex environment and for repeat lessons at 11 and 13 years of age. Conclusion: Study findings support the development and use of PSHE teaching, using video methodology, to promote knowledge about testicular torsion in boys and young men. An evidence-based intervention to improve outcomes in testicular torsion for this cohort can now be developed.

trials

ISSN: 0165-0327

DOI: 10.1016/j.jad.2016.01.002

Accession Number: WOS:000370724200029

Abstract: Background: Medication non-adherence in bipolar disorder is a significant problem resulting in increased morbidity, hospitalisation and suicide. Interventions to enhance adherence exist but it is not clear how effective they are, or what works and why. Methods: We systematically searched bibliographic databases for RCTs of interventions to support adherence to medication in bipolar disorder. Study selection and data extraction was performed by two investigators. Data was extracted on intervention design and delivery, study characteristics, adherence outcomes and study quality. The meta-analysis used pooled odds ratios for adherence using random effects models. Results: Searches identified 795 studies, of which 24 met the inclusion criteria, 18 provided sufficient data for meta-analysis. The pooled OR was 2.27 (95% CI 1.45-3.56) equivalent to a two-fold increase in the odds of adherence in the intervention group relative to control. Smaller effects were seen where the control group consisted of an active comparison and with increasing intervention length. The effects were robust across other factors of intervention and study design and delivery. Limitations: Many studies did not report sufficient information to classify intervention design and delivery or judge quality and the interventions were highly variable. Therefore, the scope of moderation analysis was limited. Conclusions: Even brief interventions can improve medication adherence. Limitations in intervention and study design and reporting prevented assessment of which elements of adherence support are most effective. Applying published guidance and quality criteria for designing and reporting adherence interventions is a priority to inform the implementation of cost-effective adherence support. Lessons from systematic reviews from outside conservation science

DOI: 10.1111/csp2.627

Article Number: e627

Accession Number: WOS:000747806100001

Abstract: Conservationists have long sought to reduce consumer demand for products from overexploited wildlife species. Health practitioners have also begun calling for reductions in the wildlife trade to reduce pandemic risk. Most wildlife-focused demand reduction campaigns have lacked rigorous evaluations and thus their impacts remain unknown. There is thus an urgent need to review the evidence from beyond conservation science to inform future demand-reduction efforts. We searched for systematic reviews of interventions that aimed to reduce consumer demand for products that are harmful (e.g., cigarettes and illicit drugs). In total, 41 systematic reviews were assessed, and their data extracted. Mass-media campaigns and incentive programs were, on average, ineffective. While advertising bans, social marketing, and location bans were promising, there was insufficient robust evidence to draw firm conclusions. In contrast, the evidence for the effectiveness of norm appeals and risk warnings was stronger, with some caveats.

DOI: 10.1016/j.foodqual.2019.05.012

Accession Number: WOS:000472696600015

Abstract: Nutritional warnings have been recently introduced as a new front-of-pack nutrition labelling scheme. Its particular goal is to facilitate the identification of products with excessive content of nutrients, given these are associated with non-communicable diseases. The aim of the present study was to evaluate the influence

of nutritional warnings on consumers' choice of a snack in a choice experiment involving real products. A total of 199 participants were asked to evaluate a series of bread images on a computer screen using eye-tracking glasses. Once they finished the task, they were invited to help themselves a snack from a shelf as a compensation for their participation in the study. A total of 15 snack products with different nutritional composition were included on the shelf. Participants were randomly divided into groups: one that made their choice from a shelf containing products that did not include front-of-package nutritional information, whereas the other chose among products that featured nutritional warnings. Participants in both experiments invested an average of 14s to select their product. When products were presented with warnings, 50% of the participants fixated their gaze on the warnings during the choice task. Significant differences in the frequency of selection of the products ($p = 0.002$) were found between the groups. When the warnings were present, participants chose products with fewer warnings and lower average sodium, saturated fat, and sugar content ($p < 0.001$). These findings confirm the potential of nutritional warnings to encourage more healthful food choices.

DOI: 10.1111/1747-0080.12528

Accession Number: WOS:000468046600005

Abstract: AimTo establish an evidence-based dietetics service in an in-centre haemodialysis unit utilising implementation science.

MethodsThe service was developed through the Knowledge-to-Action Framework. The steps of the Action Cycle were addressed through a literature review, identification of evidence-based guidelines, benchmarking and local staff engagement. The theoretical domains framework (TDF) was used to identify barriers/enablers, and behaviour change wheel to determine appropriate interventions. To

monitor, evaluate outcomes and assess sustained knowledge use we employed multidisciplinary team engagement and database use. Audit data were collected at baseline, 6 and 12 months on nutrition assessment (Patient-Generated Subjective Global Assessment), intervention timeliness and alignment to dietetic workforce recommendations. Descriptive statistics, McNemar tests and a linear mixed model were applied. Results Barriers existed in the knowledge, skills, environmental context and resources TDF domains. Suitable interventions were identified with training on nutritional management of haemodialysis patients delivered to 148 nurses, and nutrition management recommendations summarised into local procedural resources. A database to prompt and monitor outcome measures was created and indicated that over 18 months post-service commencement, eligible patients received nutrition assessment at least 6-monthly, aligning with recommendations. Prevalence of malnutrition was 28% (n= 9/32) at baseline, 23% (n= 5/22) at 6 months and 20% (n= 4/20) at 12 months (P = 0.50). Conclusions We demonstrated benefits to service development and implementation with implementation science providing a structured and methodical approach to translating guidelines into practice. Development of training, resources and prompts for outcome measures has supported the establishment of an evidence-based dietetics service in a haemodialysis unit.

Title: The impact of interventions that promote family involvement in care on adult acute-care wards: An integrative review

Journal: Collegian

Volume: 25

Issue: 1

Pages: 131-140

Date: Feb

Short Title: The impact of interventions that promote family involvement in care on adult acute-care wards: An integrative review

ISSN: 1322-7696

DOI: 10.1016/j.colegn.2017.01.006

Accession Number: WOS:000425896500020

Abstract: Background: Healthcare that involves patients and their families in care has been recommended to improve patient safety and quality. With limited direction on care partnerships for adult acute care patients, their families and healthcare teams, there is a need for a review of interventions that have been used to promote family in patient care within adult acute care wards. Aim: The aim of this

integrative review was to describe interventions that have been used to promote family involvement in patient care within adult acute care wards. Method: Electronic databases of Cumulative Index of Nursing and Allied Health Literature (CINAHL), Cochrane, PubMed, and PsycINFO were searched between 1994 and 2016 using key search terms and word variations family involvement', family nursing', family centred care', family interventions', 'family therapies'. Additional literature was sourced from reference lists of relevant original publications. The Mixed Methods Appraisal Tool and Template for Intervention Description and Replication informed study and intervention assessment. Findings: Eleven single centered studies were included with interventions designed to improve functional capacity, cognitive function, and communication. Nurses were involved in intervention delivery for six of the 11 interventions. Outcomes of interest included patient outcomes (n = 8) and intervention acceptability and feasibility (n = 3). Improved patient outcomes were reported for seven studies. Intervention design and implementation were generally poorly described. Conclusion: Interventions designed to promote family in patient care on adult acute care wards improved patient outcomes in some instances, however, methodological limitations confound the evidence base for family involvement having a direct and positive impact on patient outcomes. Allowing patients and family members to partner in intervention design may enhance uptake and improve outcomes. Process and economic evaluations should also be included in future studies to allow assessment of clinical feasibility. (C) 2017 Australian College of Nursing Ltd. Published by Elsevier Ltd. Short Title: Identifying barriers and facilitators to implementing advance care planning in prisons: a rapid literature review

DOI: 10.1186/s40352-020-00123-5

Article Number: 22

Accession Number: WOS:000705317000001

Abstract: Background Limited information is available describing advance care planning (ACP) within correctional facilities, despite its increasing relevance due to the ageing population in prisons and the high rates of complex medical comorbidities. In Western countries, self-determination with respect to making future medical decisions is a human right that prisoners do not lose when they are remanded into custody. ACP enables individuals to plan for their health and personal care so their values, beliefs and preferences are made known to inform future decision-making, for a time when they can no longer communicate their decisions. This paper examines the limited academic literature relating to ACP within prisons to identify barriers and facilitators that influence the uptake of ACP and advance care directive (ACD) documentation. Common themes related to ACP in a correctional setting were extracted and synthesised to produce a high-level analysis of barriers and facilitators influencing ACP uptake for prisoners within a correctional setting. Results Six articles met the selection criteria and reported on the experience of ACP and ACDs in prisons; five from the United States of America and one from Switzerland. Three dominant themes were identified, with related subthemes: system-level factors, attitudes and perceptions, and ACP knowledge and comprehension. Barriers to ACP and ACD implementation were more prominent in articles than facilitators. Conclusions Limited academic literature regarding the implementation and experience of ACP in prisons is available. The dominance of barriers identified in studies highlights key challenges for improving ACP uptake in correctional settings. Further research is required to understand the barriers, enablers, and attitudes to ACP in prisons.

Title: Behavioural insights for improved uptake of agricultural sustainability assessment tools

Journal: People and Nature

Volume: 4

Issue: 2

Pages: 428–444

Date: Apr

Short Title: Behavioural insights for improved uptake of agricultural sustainability assessment tools

DOI: 10.1002/pan3.10294

Accession Number: WOS:000740669300001

Abstract: 1. Changing human behaviour to enhance agricultural sustainability outcomes is an ongoing challenge that urgently needs addressing. It requires identifying the mechanisms for the successful uptake and application of tools and behavioural interventions to mitigate the detrimental impacts of farm activities on the environment. 2. We combined a participatory action research and mixed-methods approach (via online surveys, workshops, seminars, meetings and emails) to work with diverse stakeholders to understand their perspectives on the following: (a) sharing farm biodiversity data; (b) behavioural factors likely to influence farmer uptake and use of a farm-level sustainability assessment tool developed for New Zealand farms; and (c) how to improve the tool. 3. Respondents (n = 133) to an online survey were most willing to share data to gain advice on improving farm practices, but least willing when farmers were paid for the data, or companies used it to market products to farmers. Respondents were most comfortable with sharing data when an independent board decided the data-use policies, or the contributor could change their sharing preferences and data were anonymised. 4. Feedback on the tool prototypes was elicited via 27 events and more than 133 individual interactions. Of the 529 alignments between 255 discussion points and 14 behavioural factors, almost half were centred on the material context (e.g. infrastructures, technologies, time and schedules) but were often coupled with individual and social factors. 5. Overall, a strong desire for a tool that empowers individual farmers to enhance their farm's biodiversity outcomes emerged, although, during the initial prototype tests, the tool's strengths were rarely acknowledged and concerns about weaknesses were more common. 6. Ten strategies were identified for enhancing the tool. These aligned closely with three human-thinking principles: four strategies focused on thinking automatically, three on thinking socially and seven on thinking using mental models. The system transformations required to implement such an integrated package of interventions to change behaviour at scale include a collective approach to developing a stronger evidence base for conservation actions, and behavioural interventions to enhance social and environmental capital in production landscapes.

Title: Self-Reported Digital Literacy of the Pharmacy Workforce in
North East Scotland
Journal: Pharmacy
Volume: 3
Issue: 4
Pages: 182-196
Date: Dec
Short Title: Self-Reported Digital Literacy of the Pharmacy
Workforce in North East Scotland
DOI: 10.3390/pharmacy3040182
Accession Number: WOS:000367727900003
Abstract: In their day-to-day practice, pharmacists, graduate (pre-
registration) pharmacists, pharmacy technicians, dispensing
assistants and medicines counter assistants use widely available
office, retail and management information systems alongside

dedicated pharmacy management and electronic health (ehealth) applications. The ability of pharmacy staff to use these applications at home and at work, also known as digital literacy or digital competence or e-skills, depends on personal experience and related education and training. The aim of this research was to gain insight into the self-reported digital literacy of the pharmacy workforce in the North East of Scotland. A purposive case sample survey was conducted across NHS Grampian in the NE of Scotland. Data collection was based on five items: sex, age band, role, pharmacy experience plus a final question about self-reported digital literacy. The study was conducted between August 2012 and March 2013 in 17 community and two hospital pharmacies. With few exceptions, pharmacy staff perceived their own digital literacy to be at a basic level. Secondary outcome measures of role, age, gender and work experience were not found to be clear determinants of digital literacy. Pharmacy staff need to be more digitally literate to harness technologies in pharmacy practice more effectively and efficiently.

Title: mHealth prompts within diabetes prevention programs: a scoping review

Journal: Mhealth

Volume: 8

Issue: 2

Date: Apr

Short Title: mHealth prompts within diabetes prevention programs: a scoping review

DOI: 10.21037/mhealth-21-22

Article Number: 20

Accession Number: WOS:000850208700007

Abstract: Background: Mobile health (mHealth) prompts (e.g., text messaging, push notifications) are a commonly used technique within behaviour change interventions to prompt or cue a specific behaviour. Such prompts are being increasingly integrated into diabetes prevention programs (DPPs). While mHealth prompts provide a convenient and cost-effective way to reinforce behaviour change, no reviews to date have examined mHealth prompt use within DPPs.

This scoping review aims to: (I) understand how mHealth prompts are being used within behaviour change interventions for individuals at risk for developing type 2 diabetes (T2D); and (II) provide recommendations for future mHealth prompt research, design, and application. Methods: The scoping review methodology outlined by

Arksey and O'Malley were followed. Medline, CINAHL, PsycInfo, Web of Science, and SportDiscus were searched. The search strategy combined keywords relating to T2D risk and mHealth prompts in conjunction with database-controlled vocabulary when available (e.g., MeSH for Medline). Results: Of the 4,325 publications screened, 44 publications (based on 33 studies) met the inclusion criteria and were included for data extraction. Text messaging was the most widely used mHealth prompt (73%) followed by push notifications (21%). Only 30% of studies discussed the theoretical basis for prompt content and time of day messages were sent, and only 27% provided justification for prompt timing and frequency. Fourteen studies assessed participant satisfaction with mHealth prompts of which only two reported dissatisfaction due to either prompting frequency (hourly) or message content (solely focused on weight). Nine studies assessed behavioural outcomes including weight loss, physical activity, and diabetes incidence, and found mixed effects overall. Conclusions: While mHealth prompts were well-received by participants, there are mixed effects on the influence of mHealth prompts on behavioural outcomes and diabetes incidence. More thorough reporting of prompt content development and delivery is needed, and more experimental research is needed to identify optimal content, delivery characteristics, and impact on behavioural and clinical outcomes.

Short Title: What evidence exists on the effects of public policy interventions for achieving environmentally sustainable food consumption? A systematic map protocol

DOI: 10.1186/s13750-022-00271-1

Article Number: 17

Accession Number: WOS:000796534900001

Abstract: Background: The global food system is causing considerable environmental harm. A transition towards more sustainable consumption is needed. Targeted public policy interventions are crucial for stimulating such transition. While there is extensive research about the promotion of more environmentally sustainable food consumption, this knowledge is scattered across different

sources. This systematic map aims to collate and describe the available evidence on public policy interventions such as laws, directives, taxes and information campaigns, for achieving sustainable food consumption patterns. Methods: We will search bibliographic databases, specialist websites, Google Scholar and bibliographies of relevant reviews. Searches for academic literature will be performed in English, while searches for grey literature will be performed in English, Swedish, Danish and Norwegian. Screening, including consistency checking exercises, will be done at two levels: title and abstract, and full text. We will use machine learning algorithms to support screening at the title and abstract level. Coding and meta-data extraction will include bibliographic information, policy details and context, and measured environmental outcome(s). The evidence base will be summarised narratively using tables and graphs and presented as an online interactive searchable database and a website that will allow for visualisation, filtering and exploring systematic map findings, knowledge gaps and clusters. Date: Dec

Short Title: Barriers and Facilitators to Implementing the HEADS-ED A Rapid Screening Tool for Pediatric Patients in Emergency Departments

ISSN: 0749-5161

DOI: 10.1097/pec.0000000000000651

Accession Number: WOS:000417604100014

Abstract: Objectives This study sought to identify barriers and facilitators to the implementation of the HEADS-ED, a screening tool appropriate for use in the emergency department (ED) that facilitates standardized assessments, discharge planning, charting, and linking pediatric mental health patients to appropriate community resources. Methods A qualitative theory-based design was used to identify barriers and facilitators to implementing the HEADS-ED tool. Focus groups were conducted with participants recruited from 6 different ED settings across 2 provinces (Ontario and Nova Scotia). The Theoretical Domains Framework was used as a

conceptual framework to guide data collection and to identify themes from focus group discussions. Results The following themes spanning 12 domains were identified as reflective of participants' beliefs about the barriers and facilitators to implementing the HEADS-ED tool: knowledge, skills, beliefs about capabilities, social professional role and identity, optimism, beliefs about consequences, reinforcement, environmental context and resources, social influences, emotion, behavioral regulation and memory, and attention and decision process. Conclusions The HEADS-ED has the potential to address the need for better discharge planning, complete charting, and standardized assessments for the increasing population of pediatric mental health patients who present to EDs. This study has identified potential barriers and facilitators, which should be considered when developing an implementation plan for adopting the HEADS-ED tool into practice within EDs.

Short Title: Workplace Healthy Lifestyle Determinants and Wellbeing Needs across the Preconception and Pregnancy Periods: A Qualitative Study Informed by the COM-B Model

DOI: 10.3390/ijerph18084154

Article Number: 4154

Accession Number: WOS:000644114300001

Abstract: Overweight and obesity present health risks for mothers and their children. Reaching women during the key life stages of preconception and pregnancy in community settings, such as workplaces, is an ideal opportunity to enable health behavior change. We conducted five focus groups with 25 women aged between 25 and 62 years in order to investigate the determinants of healthy lifestyle behaviors, weight management, and wellbeing needs during the preconception and pregnancy periods in an Australian university workplace. Discussions explored women's health and wellbeing needs with specific reference to workplace impact. An abductive analytical approach incorporated the capability, opportunity, and motivation of behavior (COM-B) model, and four themes were identified: hierarchy of needs and values, social interactions, a support scaffold, and

control. Findings highlight the requirement for greater organization-level support, including top-down coordination of wellbeing opportunities and facilitation of education and support for preconception healthy lifestyle behaviors in the workplace. Interventionists and organizational policy makers could incorporate these higher-level changes into workplace processes and intervention development, which may increase intervention capacity for success. Short Title: Using the COM-B model to characterize the barriers and facilitators of pre-exposure prophylaxis (PrEP) uptake in men who have sex with men
ISSN: 1359-107X
DOI: 10.1111/bjhp.12605
Accession Number: WOS:000810257600001
Abstract: Objectives Using the COM-B model, this study aimed to characterize barriers and facilitators to pre-exposure prophylaxis (PrEP) uptake amongst men who have sex with men (MSM). Design and Method Semistructured interviews with 13 MSM who were non-PrEP users were conducted with a specific focus on barriers and facilitators to PrEP uptake. A 15-item interview schedule was created informed by the COM-B model. Transcripts were transcribed verbatim and inductively analysed using thematic analysis. To illustrate pathways for intervention design, inductive themes were then deductively mapped onto COM-B constructs. Results Results demonstrated that barriers to PrEP uptake were closely aligned with five (of six) COM-B components: psychological capability, physical opportunity, social opportunity, reflective motivation and automatic motivation. These COM-B subcomponents reflected seven thematized barriers: (1) limited information about PrEP, (2) restricted access to PrEP, (3) gay identity and sexual stigmatization, (4) social and cultural stigmatization, (5) capabilities in treatment adherence, (6)

optimistic bias about sexual behaviours and (7) calculating risk. No facilitators or physical capability concerns were demonstrated. Conclusion This study adopted a novel behaviour change-informed approach to understanding barriers and facilitators to PrEP uptake amongst MSM. Unrealistic optimism about self-protective individual behaviours, the physical accessibility of PrEP and (mis)information together interacted closely with perceptions of personal and social stigmatization to dynamically impact PrEP uptake decisions. Barriers to PrEP uptake mapped clearly to the COM-B; therefore, these results provide the foundation for Behaviour Change Wheel intervention development to improve rates of PrEP uptake and its acceptability for MSM.

Title: Facilitators and barriers to COVID-19 vaccination uptake among ethnic minorities: A qualitative study in primary care

Journal: Plos One

Volume: 17

Issue: 7

Date: Jul

Short Title: Facilitators and barriers to COVID-19 vaccination uptake among ethnic minorities: A qualitative study in primary care

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0270504

Article Number: e0270504

Accession Number: WOS:000844536800058

Abstract: Introduction COVID-19 vaccination effectively reduces severe disease and death from COVID-19. However, both vaccine uptake and intention to vaccinate differ amongst population groups. Vaccine hesitancy is highest amongst specific ethnic minority groups. There is very limited understanding of the barriers and facilitators to COVID-19 vaccine uptake in Black and South Asian ethnicities.

Therefore, we aimed to explore COVID-19 vaccination hesitancy in primary care patients from South Asian (Bangladeshi/Pakistani) and Black or Black British/ African/Caribbean/Mixed ethnicities. Methods Patients from the above ethnicities were recruited using convenience sampling in four London general practices. Telephone interviews were conducted, using an interpreter if necessary, covering questions on the degree of vaccine hesitancy, barriers and potential facilitators, and decision-making. Interviews were transcribed verbatim and thematically analysed. Data collection and analysis occurred concurrently with the iterative development of the topic guide and coding framework. Key themes were conceptualised through discussion with the wider team. Results Of thirty-eight interviews,

55% (21) of these were in Black or Black British/African/Caribbean/Mixed ethnicities, 32% (12) in Asian / British Asian and 13% (5) in mixed Black and White ethnicities. Key themes included concerns about the speed of vaccine roll-out and potential impacts on health, mistrust of official information, and exposure to misinformation. In addition, exposure to negative messages linked to vaccination appears to outweigh positive messages received. Facilitators included the opportunity to discuss concerns with a healthcare professional, utilising social influences via communities and highlighting incentives. Conclusion COVID-19 has disproportionately impacted ethnic minority groups. Vaccination is an effective strategy for mitigating risk. We have demonstrated factors contributing to vaccine reluctance, hesitancy and refusal and highlighted levers for change.

Article Number: e0275907

Accession Number: WOS:000925067300024

Abstract: Introduction Research suggests that patients who are prisoners experience greater morbidity, increased health inequalities and frequent preventable harm, compared to the general population. Little is known about the process and influencing factors for safe prescribing in the unique prison environment, which may limit the development efforts to improve the quality of care in prisons. This study aimed to understand the process and challenges associated with prescribing in prisons, explore the causes and impact of these challenges, and explore approaches to improve prescribing safety in prisons. Methods Grounded theory informed data collection and analysis of a nominal group discussion by seven participants and semi-structured telephone interviews with twenty prison healthcare staff, including GPs, pharmacists, psychiatrists and nurses. Findings The underlying complexity of prescribing in prison settings increased the level of challenge and influenced the safety of this process. Multiple contributors to the challenges of safe prescribing were identified (comprising governance and policy; the prison structure; staff retention, training and skill mix; IT systems and interface; polypharmacy and co-morbidity; tradability and patient behaviour) with overarching constructs of variations in practice/policy and the influence of prison culture. Participants identified measures to address these challenges through multi-disciplinary collaborative working, increased consistency in processes, and the need for more innovation and education/training. Conclusions Our study highlighted that healthcare provision in prisons is unique and needs to tailor the care provided to patients without enforcing a model focused on primary, secondary or tertiary care. Participants emphasised a necessary shift in workplace culture and behaviour change to support improvements. The COM-B model of behaviour change may be effectively applied to develop interventions in organisations that have in-depth understanding of their own unique challenges.

Date: Oct-Dec

Short Title: Readability and Suitability Assessment of university students Educational Materials in Preventing Smoking

ISSN: 0976-5921

Accession Number: WOS:000742170400036

Abstract: Background: Educational materials are frequently used by health care providers to inform university students and young people about smoking and the health risks of smoking. However, little attention has been paid to the readability and suitability of these educational materials. Objectives: The study aimed to determine the readability and suitability of educational materials in preventing smoking for university students. Methods: Multiple instructional materials and books were used for the design and preparation of educational materials and were then tailored to the target group. Readability was measured by using the readability assessment of materials (RAM); and suitability was determined by the suitability assessment of materials (SAM) that considers characteristics such as content, graphics, layout/topography, and cultural appropriateness. Twenty reviewers, including 15 students and 5 health specialists scored the educational materials. Results: The mean readability score \pm standard deviation(SD) of the educational materials was 8 \pm 1.6, 9 \pm 1.5 and 10 \pm 1.7, for the booklet, the pamphlet of the skill of saying no, smoking pamphlet and quitting it, respectively, which were increased to 15 \pm 1.4, 16 \pm 1.7 and 17 \pm 0.8, after tailoring the content. The average SAM scores before and after tailoring the content were 45% for the booklet, which was increased to 88% and 75% for the pamphlet of the skill of saying no, which was increased to 93% and 79% for the smoking pamphlet and quitting it, which was increased to 95%. The increase in all scores was significant ($p < 0.01$). The final tailored educational material was rated "superior media" on the SAM ratings. Conclusions: Given that most of the printed materials are suitable for people with higher education levels, health providers are strongly advised to prepare simple and understandable education materials that may increase the likelihood of consumer perception and recall.

Title: Implementation Science and Employer Disability Practices: Embedding Implementation Factors in Research Designs

Journal: Journal of Occupational Rehabilitation

Volume: 26

Issue: 4

Pages: 448-464

Date: Dec

Short Title: Implementation Science and Employer Disability
Practices: Embedding Implementation Factors in Research Designs
ISSN: 1053-0487

DOI: 10.1007/s10926-016-9677-7

Accession Number: WOS:000392946000006

Abstract: Purpose For work disability research to have an impact on employer policies and practices it is important for such research to acknowledge and incorporate relevant aspects of the workplace. The goal of this article is to summarize recent theoretical and methodological advances in the field of Implementation Science, relate these to research of employer disability management practices, and recommend future research priorities. **Methods** The authors participated in a year-long collaboration culminating in an invited 3-day conference, "Improving Research of Employer Practices to Prevent Disability", held October 14-16, 2015, in Hopkinton, MA, USA. The collaboration included a topical review of the literature, group conference calls to identify key areas and challenges, drafting of initial documents, review of industry publications, and a conference presentation that included feedback from peer researchers and a question/answer session with a special panel of knowledge experts with direct employer experience. **Results** A 4-phase implementation model including both outer and inner contexts was adopted as the most appropriate conceptual framework, and aligned well with the set of process evaluation factors described in both the work disability prevention literature and the grey literature. Innovative interventions involving disability risk screening and psychologically-based interventions have been slow to gain traction among employers and insurers. Research recommendations to address this are : (1) to assess organizational culture and readiness for change in addition to individual factors; (2) to conduct process evaluations alongside controlled trials; (3) to analyze decision-making factors among stakeholders; and (4) to solicit input from employers and insurers during early phases of study design. **Conclusions** Future research interventions involving workplace support and involvement to prevent disability may be more feasible for implementation if organizational decision-making factors are imbedded in research designs and interventions are developed to take account of these influences.

Short Title: Systematically developing a family-based health promotion intervention for women with prior gestational diabetes based on evidence, theory and co-production: the Face-it study

DOI: 10.1186/s12889-021-11655-2

Article Number: 1616

Accession Number: WOS:000694243200003

Abstract: Background: Women with prior gestational diabetes mellitus (GDM) are at high risk of developing type 2 diabetes; however, this risk can be reduced by engaging in positive health behaviours e.g. healthy diet and regular physical activity. As such behaviours are difficult to obtain and maintain there is a need to develop sustainable behavioural interventions following GDM. We aimed to report the process of systematically developing a health promotion intervention to increase quality of life and reduce diabetes risk among women with prior GDM and their families. We distil general lessons about developing complex interventions through co-production and discuss our extensions to intervention development frameworks. Methods: The development process draws on the Medical Research Council UK Development of complex interventions in primary care framework and an adaptation of a three-stage framework proposed by Hawkins et al. From May 2017 to May 2019, we iteratively developed the Face-it intervention in four stages: 1) Evidence review, qualitative research and stakeholder consultations; 2) Co-production of the intervention content; 3) Prototyping, feasibility- and pilot-testing and 4) Core outcome development. In all stages, we involved stakeholders from three study sites. Results: During stage 1, we identified the target areas for health promotion in families where the mother had prior GDM, including applying a broad understanding of health and a multilevel and multi-determinant approach. We pinpointed municipal health visitors as deliverers and the potential of using digital technology. In stage 2, we tested intervention content and delivery methods. A health pedagogic dialogue tool and a digital health app were co-adapted as the main intervention components. In stage 3, the intervention content and delivery were further adapted in the local context of the three study sites. Suggestions for intervention manuals were refined to optimise flexibility, delivery, sequencing of activities and from this, specific training manuals were developed. Finally, at stage 4, all stakeholders were involved in developing realistic and relevant evaluation outcomes. Conclusions: This comprehensive description of the development of the Face-it intervention provides an example of how to co-produce and prototype a complex intervention balancing evidence and local conditions. The thorough, four-stage development is expected to create ownership and feasibility among intervention participants, deliverers and local stakeholders.

Abstract: Aims: As the COVID-19 pandemic has grown internationally, there has been an increased need for volunteers. This study aimed to identify the predictors of volunteering including demographic backgrounds, socio-economic characteristics, personality, and psychosocial factors. Methods: Data were analysed from 31,890 adults in the UK COVID-19 Social Study run by the University College London - a longitudinal study focusing on the psychological and social experiences of adults living in the UK during the COVID-19 pandemic. Tetrachoric factor analysis was applied to identify latent categories of voluntary work. Multivariate logistic regression was used to identify predictors for volunteering and change in volunteering behaviours since before the COVID-19 pandemic. Results: Three types of volunteering during the pandemic were identified as follows: formal volunteering, social action volunteering, and neighbourhood volunteering. Regression analysis showed that the pattern of voluntary work was structured by demographic backgrounds, socio-economic factors, personality, and psychosocial factors. Conclusion: The predictors of volunteering during the pandemic may

be slightly different from other non-emergency period.

DOI: 10.1111/obr.13167

Accession Number: WOS:000604875200001

Abstract: A healthy postpartum lifestyle is vital for the promotion of optimal maternal health, return to pre-pregnancy weight and prevention of postpartum weight retention, but barriers exist. We performed a systematic review that aimed to describe the barriers and facilitators to a healthy lifestyle in the first 2 years postpartum from the perspectives of women and healthcare providers. Databases were searched for eligible studies published up to 26 August 2019. Following thematic analysis, identified themes were mapped to the Theoretical Domains Framework and the Capability, Opportunity, Motivation and Behaviour model. We included 28 qualitative and quantitative studies after screening 15,643 citations and 246 full texts. We identified barriers and facilitators relating to capability (e.g., lack of knowledge regarding benefits of lifestyle behaviours; limitations in healthcare providers' skills in providing lifestyle support), opportunity (e.g., social support from partners, family, friends and healthcare providers; childcare needs) and motivation (e.g., identifying benefits of exercise and perception of personal health; enjoyment of the activity or food). We suggest intervention components to include in lifestyle interventions for postpartum women based on the identified themes. Our findings provide evidence to inform the development of interventions to support postpartum women in adopting and maintaining a healthy lifestyle.

Article Number: 4229

Accession Number: WOS:000873493700001

Abstract: Postpartum lifestyle interventions are known to be efficacious in reducing postpartum weight retention, but uptake and engagement are poor. This multi-method study explored the preferences of postpartum women for the delivery of lifestyle interventions based on the Template for Intervention Description and Replication (TIDieR) checklist. Semi-structured interviews were conducted with 21 women within 2 years of childbirth, recruited through convenience and snowball sampling throughout Australia (15 May 2020 to 20 July 2020). Transcripts were analysed thematically using an open coding approach. A cross-sectional online survey was conducted in November 2021 among postpartum women within 5 years of childbirth in Australia. Data were summarised using descriptive statistics. The survey was completed by 520 women. Both the survey and interviews revealed that women were interested in receiving lifestyle support postpartum and wanted a program delivered by health professionals. They preferred a flexible low-intensity program embedded within existing maternal and child health services that is delivered through both online and face-to-face sessions. Having a pragmatic approach that taught practical strategies and enlists the support of partners, family and peers was important to mothers. Consumer-informed postpartum lifestyle interventions promote optimal engagement and improve program reach and therefore, impact.

Abstract: Introduction An online interactive repository of available medication adherence technologies may facilitate their selection and adoption by different stakeholders. Developing a repository is among the main objectives of the European Network to Advance Best practices and technology on medication adherence (ENABLE) COST Action (CA19132). However, meeting the needs of diverse stakeholders requires careful consideration of the repository structure. Methods and analysis A real-time online Delphi study by stakeholders from 39 countries with research, practice, policy, patient representation and technology development backgrounds will be conducted. Eleven ENABLE members from 9 European countries formed an interdisciplinary steering committee to develop the repository structure, prepare study protocol and perform it. Definitions of medication adherence technologies and their attributes were developed iteratively through literature review, discussions within the steering committee and ENABLE Action members, following ontology development recommendations. Three domains (product and provider information (D1), medication adherence descriptors (D2) and evaluation and implementation (D3)) branching in 13 attribute groups are proposed: product and provider information, target use scenarios, target health conditions, medication regimen, medication adherence management components, monitoring/measurement methods and targets, intervention modes of delivery, target behaviour determinants, behaviour change techniques, intervention providers, intervention settings, quality indicators and implementation indicators. Stakeholders will evaluate the proposed definition and attributes' relevance, clarity and completeness and have multiple opportunities to reconsider their evaluations based on aggregated feedback in real-time. Data collection will stop when the predetermined response rate will be achieved. We will quantify agreement and perform analyses of process indicators on the whole sample and per stakeholder group. Ethics and dissemination Ethical approval for the

COST ENABLE activities was granted by the Malaga Regional Research Ethics Committee. The Delphi protocol was considered compliant regarding data protection and security by the Data Protection Officer from University of Basel. Findings from the Delphi study will form the basis for the ENABLE repository structure and related activities.

Abstract: Background: Telehealth services have helped enable continuity of care during the coronavirus pandemic. We aimed to investigate use and views towards telehealth among allied health clinicians treating people with musculoskeletal conditions during the pandemic. Methods: Cross-sectional international survey of allied health clinicians who used telehealth to manage musculoskeletal conditions during the coronavirus pandemic.

Questions covered demographics, clinician-related factors (e.g. profession, clinical experience and setting), telehealth use (e.g.

proportion of caseload, treatments used), attitudes towards telehealth (Likert scale), and perceived barriers and enablers (open questions). Data were presented descriptively, and an inductive thematic content analysis approach was used for qualitative data, based on the Capability-Opportunity-Motivation Behavioural Model. Results: 827 clinicians participated, mostly physiotherapists (82%) working in Australia (70%). Most (71%, 587/ 827) reported reduced revenue (mean (SD) 62% (24.7%)) since the pandemic commenced. Median proportion of people seen via telehealth increased from 0% pre (IQR 0 to 1) to 60% during the pandemic (IQR 10 to 100). Most clinicians reported managing common musculoskeletal conditions via telehealth. Less than half (42%) of clinicians surveyed believed telehealth was as effective as face-to-face care. A quarter or less believed patients value telehealth to the same extent (25%), or that they have sufficient telehealth training (21%). Lack of physical contact when working through telehealth was perceived to hamper accurate and effective diagnosis and management. Conclusion: Although telehealth was adopted by allied health clinicians during the coronavirus pandemic, we identified barriers that may limit continued telehealth use among allied health clinicians beyond the current pandemic. Title: A cluster randomized stepped-wedge trial to de-implement unnecessary post-operative antibiotics in children: the optimizing perioperative antibiotic in children (OPerAtiC) trial

Journal: Implementation Science

Volume: 16

Issue: 1

Date: Mar

Short Title: A cluster randomized stepped-wedge trial to de-implement unnecessary post-operative antibiotics in children: the optimizing perioperative antibiotic in children (OPerAtiC) trial

ISSN: 1748-5908

DOI: 10.1186/s13012-021-01096-1

Article Number: 29

Accession Number: WOS:000631128200002

Abstract: Background Antibiotic-resistant infections have become a public health crisis that is driven by the inappropriate use of antibiotics. In the USA, antibiotic stewardship programs (ASP) have been established and are required by regulatory agencies to help combat the problem of antibiotic resistance. Post-operative antibiotic use in surgical cases deemed low-risk for infection is an area with significant overuse of antibiotics in children. Consensus among leading public health organizations has led to guidelines

eliminating post-operative antibiotics in low-risk surgeries. However, the best strategies to de-implement these inappropriate antibiotics in this setting are unknown. Methods/design A 3-year stepped wedge cluster randomized trial will be conducted at nine US Children's Hospitals to assess the impact of two de-implementation strategies, order set change and facilitation training, on inappropriate post-operative antibiotic prescribing in low risk (i.e., clean and clean-contaminated) surgical cases. The facilitation training will amplify order set changes and will involve a 2-day workshop with antibiotic stewardship teams. This training will be led by an implementation scientist expert (VRM) and a pediatric infectious diseases physician with antibiotic stewardship expertise (JGN). The primary clinical outcome will be the percentage of surgical cases receiving unnecessary post-operative antibiotics. Secondary clinical outcomes will include the rate of surgical site infections and the rate of *Clostridioides difficile* infections, a common negative consequence of antibiotic use. Monthly semi-structured interviews at each hospital will assess the implementation process of the two strategies. The primary implementation outcome is penetration, which will be defined as the number of order sets changed or developed by each hospital during the study. Additional implementation outcomes will include the ASP team members' assessment of the acceptability, appropriateness, and feasibility of each strategy while they are being implemented. Discussion This study will provide important information on the impact of two potential strategies to de-implement unnecessary post-operative antibiotic use in children while assessing important clinical outcomes. As more unnecessary medical practices are identified, de-implementation strategies, including facilitation, need to be rigorously evaluated. Along with this study, other rigorously designed studies evaluating additional strategies are needed to further advance the burgeoning field of de-implementation. Abstract: Ageing population is a fact in the European countries. How to improve the quality of life and sustain healthy ageing is one of the big challenges that deserve to be addressed considering the several and different aspects of life. But a person is a complex system and the last decades' approach demonstrated that, even if general or cluster medicine reached good results, the new barriers to overcome are ad hoc solutions, tailored to the single to improve wellbeing and preserve decline. The Personalised Medicine call, SC1-PM-15-2017 Personalised coaching for well-being and care of people as they age, under the Horizon 2020 program, aims at developing and validating new ICT based approaches for empowering and motivating people. This section will introduce the reader to the European scenario, the challenge and the research and innovation action promoted under personalised medicine and the specific call.

Title: Development of key policy recommendations for active transport in New Zealand: A multi-sector and multidisciplinary endeavour

Journal: Journal of Transport & Health

Volume: 18

Date: Sep

Short Title: Development of key policy recommendations for active transport in New Zealand: A multi-sector and multidisciplinary endeavour

ISSN: 2214-1405

DOI: 10.1016/j.jth.2020.100859

Article Number: 100859

Accession Number: WOS:000571103400019

Abstract: Background: Despite national-level initiatives to encourage active transport (AT) in New Zealand since 2005, rates of AT have continued to decline in most parts of the country, with negative impacts on health and the environment. This article describes the development of key policy recommendations for increasing AT in New Zealand. The goal was to establish a cohesive set of priority recommendations to inform AT decision-making in central and local government, district health boards, public health units and regional sports trusts in New Zealand. Project description: The development of policy recommendations was a planned outcome of multi-sectoral discussions held at The Active Living and Environment Symposium (TALES; Dunedin, New Zealand; February 2019).

A ten-member working group consisting of TALEs symposium delegates working in academia, industry and non-governmental organisations led the development of the recommendations. Symposium delegates contributed their expertise to draft recommendations and reports prior to, during and after the symposium. Importance and feasibility of each recommended action were independently evaluated by working group members. The final set of 13 policy recommendations (and 39 associated actions) included: making a national-level commitment to change; establishing a nationally coordinated and funded programme of education and promotion of AT; making a commitment to design cities for people, not cars; and developing a regulatory system that encourages AT. The report aligns with the current New Zealand government's increased focus on wellbeing, walking, cycling, public transport and the Vision Zero approach. A final report was officially launched in April 2019 with presentations to stakeholders April-May 2019. Conclusions: This cross-sector effort resulted in a report with a set of recommendations designed to stimulate the development of a new AT strategy for New Zealand; prompt setting of targets and monitoring progress/outcomes; and inform New Zealand's response to the World Health Organization's Global Action Plan on Physical Activity 2018-2030.

Title: Capabilities, opportunities and motivations that drive food waste disposal practices: A case study of young adults in England

Journal: Journal of Cleaner Production

Volume: 370

Date: Oct

Short Title: Capabilities, opportunities and motivations that drive food waste disposal practices: A case study of young adults in England

ISSN: 0959-6526

DOI: 10.1016/j.jclepro.2022.133449

Article Number: 133449

Accession Number: WOS:000861357700001

Abstract: Data in England suggests that food waste is still being disposed into the black bin, also known as residual waste, despite continuous efforts to promote separate food waste collection and food waste reduction practices. Furthermore, it has been anecdotally reported that 18 to 30-year-olds have the highest propensity to

generate large amounts of food waste and thus need to be urgently engaged in communication that helps them change their behaviour. This study aims to explore young adults' capabilities (C), opportunities (O), and motivations (M) that may lead to a certain behaviour (B) towards food waste disposal practices (FWDP) grounded on the Behaviour Change Wheel, also called the COM-B model, and could reveal barriers to action. In doing so, a case study approach is used via Harrow Council residents in England within the age group of 18-30 years old. The study took place amid the national lockdown due to the Covid-19 pandemic and targeted young residents within the 18-30 age group using a structured interview approach with a diagnostic questionnaire promoted through Harrow Council's social media account, followed by in-depth interviews with eligible participants. Out of the 30 residents who completed the diagnostic questionnaire, 35% reported no FWDP, 42% partial FWDP (i.e., some incorrect items in the black bin waste), and 23% reported engaging in FWDP. The first two groups only were invited to the online interviews. The interview results are organised using the COM-B model and reveal that: 1) due to Covid-19 there was a shift to home cooking and increased food waste generation (B); 2) there is a lack of FWDP knowledge, information on benefits, and advice on alleviating pests/health concerns from councils, whereas FWDP differences between councils and reliance on 'common sense' often create confusion around FWDP (C); 3) the council may not always provide a caddy or a drop-off/collection service, whereas economic (caddy liners purchase) and logistic concerns (e.g., the lack of a regular collection schedule, unfavourable features of the caddy, and lack of prompts/reminders) resulted to limited uptake of FWDP as the norm (O); 4) the benefits of FWDP do not outweigh costs, while feelings of disgust and a sense of inconvenience lead to lack of or partial FWDP (M). To our knowledge, this is the first study using the COM-B model within the context of FWDP and with a specific focus on young adults in England. Novel theoretical and practical insights are discussed, along with limitations and future research directions.

Accession Number: WOS:000209895200010

Abstract: Background: Evidence-based solutions for changing health behaviors exist but problems with feasibility, sustainability, and dissemination limit their impact on population-based behavior change and maintenance. Objective: Our goal was to overcome the limitations of an established behavior change program by using the inherent capabilities of smartphones and wireless sensors to develop a next generation mobile health (mHealth) intervention that has the potential to be more feasible. Methods: In response to the clinical need and the growing capabilities of smartphones, our study team decided to develop a behavioral hypertension reduction mHealth system inspired by Dietary Approaches to Stop Hypertension (DASH), a lifestyle modification program. We outline the key design and development decisions that molded the project including decisions about behavior change best practices, coaching features, platform, multimedia content, wireless devices, data security, integration of systems, rapid prototyping, usability, funding mechanisms, and how all of these issues intersect with clinical research and behavioral trials. Results: Over the 12 months, our study team faced many challenges to developing our prototype intervention. We describe 10 lessons learned that will ultimately stimulate more effective and sustainable approaches. Conclusions: The experiences presented in this case study can be used as a reference for others developing mHealth behavioral intervention development projects by highlighting the benefits and challenges facing mHealth research.

Short Title: Modeling the Behavioral Response of Dentists to COVID-19 and Assessing the Perceived Impacts of Pandemic on Operative Dentistry Practices in Pakistan

DOI: 10.3389/fpubh.2022.904838

Article Number: 904838

Accession Number: WOS:000815994400001

Abstract: COVID-19 pandemic has affected dentistry in unprecedented

ways. This study investigates the perceived effects of the pandemic on operative dentistry procedures and dentistry profession in Pakistan and the factors that determine the behavioral changes among dentists to adapt to the "new normal." A Capability Opportunity Motivation-Behavioral model (COM-B) was utilized to investigate the factors that determine the behavior of dentists in Punjab, Pakistan to adhere to COVID-19 standard operating procedures (SOPs). Using social media, an online questionnaire was sent to operative dentistry professionals in Pakistan, and 312 responses were received. 81.4% of the respondents believed that the COVID-19 pandemic has severely affected the level of care provided to the patients, 66% were extremely worried about the risk of contagion during clinical practices, and more than 75% of the respondents opined that the pandemic has led to an increased emphasis on disinfection and oral hygiene instructions. The multiple regression model suggests that the behavior of Pakistani dentists to adhere to the COVID-19 SOPs is significantly affected by their Capabilities (beta = 0.358) and Opportunities (beta = 0.494). The study concluded that dentists in Punjab, Pakistan are concerned about the risk of contagion and report a serious concern about consequences such as financial loss and inappropriate care of patients. The current study results can feed the policymaking in Pakistan and other developing countries. Facilities and training to improve dentists' opportunities and capabilities can improve their ability to cope with the COVID-19 challenges.

Title: Optimal patient education for cancer pain: a systematic review and theory-based meta-analysis

Journal: Supportive Care in Cancer

Volume: 21

Issue: 12

Pages: 3529-3537

Date: Dec

Short Title: Optimal patient education for cancer pain: a systematic review and theory-based meta-analysis

ISSN: 0941-4355

DOI: 10.1007/s00520-013-1995-0

Accession Number: WOS:000326892100036

Abstract: Previous systematic reviews have found patient education to be moderately efficacious in decreasing the intensity of cancer pain, but variation in results warrants analysis aimed at identifying which strategies are optimal. A systematic review and meta-analysis was undertaken using a theory-based approach to classifying and comparing educational interventions for cancer pain. The reference lists of previous reviews and MEDLINE, PsycINFO, and

CENTRAL were searched in May 2012. Studies had to be published in a peer-reviewed English language journal and compare the effect on cancer pain intensity of education with usual care. Meta-analyses used standardized effect sizes (ES) and a random effects model. Subgroup analyses compared intervention components categorized using the Michie et al. (Implement Sci 6:42, 2011) capability, opportunity, and motivation behavior (COM-B) model. Fifteen randomized controlled trials met the criteria. As expected, meta-analysis identified a small-moderate ES favoring education versus usual care (ES, 0.27 [-0.47, -0.07]; P = 0.007) with substantial heterogeneity (IA(2) = 71 %). Subgroup analyses based on the taxonomy found that interventions using "enablement" were efficacious (ES, 0.35 [-0.63, -0.08]; P = 0.01), whereas those lacking this component were not (ES, 0.18 [-0.46, 0.10]; P = 0.20). However, the subgroup effect was nonsignificant (P = 0.39), and heterogeneity was not reduced. Factoring in the variable of individualized versus non-individualized influenced neither efficacy nor heterogeneity. The current meta-analysis follows a trend in using theory to understand the mechanisms of complex interventions. We suggest that future efforts focus on interventions that target patient self-efficacy. Authors are encouraged to report comprehensive details of interventions and methods to inform synthesis, replication, and refinement.

DOI: 10.3390/bs13020114

Article Number: 114

Accession Number: WOS:000938184400001

Abstract: Regular physical activity (PA) is protective and reduces disease burden but remains a challenge for pregnant women (PW). According to the World Health Organization (WHO) guidelines, PW without contraindications should practice 150 min of moderate PA per

week. Nonetheless, PA levels are concerningly low among PW. The aim of this study was to investigate PW's and midwives' perceptions regarding PA and recommended guidelines, and use this information to inform future health promotion strategies. We recruited 10 PW and 10 midwives to participate in online focus groups conducted between July 2020 and April 2021. Focus group probes and data analysis were guided by the COM-B (capability, opportunity, motivation-behaviour) framework. The majority of the sample had already practised PA, recognized the importance of PA during pregnancy, and considered the WHO guidelines reasonable. Notwithstanding, PW wanted more specific instruction on PA and desired opportunities to practice. Additional barriers reported by PW included low self-efficacy and lack of motivation. Midwives considered the lack of specific knowledge and confidence in managing PA as the main obstacles. The current findings suggest that PW and midwives need specific training in PA to overcome both psychological and physical barriers. Midwives play a vital role in educating and encouraging PA among PW.

DOI: 10.3390/su132112285

Article Number: 12285

Accession Number: WOS:000719196800001

Abstract: Background: Regular physical activity (PA) practice during pregnancy offers health and fitness benefits for both mother and baby. Therefore, healthy pregnant women with no contraindications to exercise should be encouraged to perform PA. Nevertheless, their levels of PA are generally low. The aim of the WELL-DONE! Study is to co-design an adapted physical activity intervention (APAI) for

pregnant women to include in childbirth preparation classes (CPCs) evaluating its feasibility and efficacy on quality of life (QoL), PA levels and other outcomes. Methods: A quasi-experimental study was divided in two progressive stages. First, APAI was developed in collaboration with pregnant women and midwives using focus groups; second, APAI's efficacy was evaluated comparing two groups: the experimental group engaged in the CPCs integrated with 1 h/week of the APAI administered by midwives and the control group participating in the standard CPCs. Pre-post evaluation was carried out in three stages through questionnaires and tests. Data analysis involved the combination of qualitative and quantitative methodologies. Discussion: Findings from the WELL-DONE! Study will help to assess the feasibility, sustainability, and efficacy of incorporating APAI inside CPCs as a new public health strategy oriented to QoL, well-being, and PA level improvements. Abstract: Since the first case of human SARS-CoV-2 infection late in 2019 workers across multiple disciplines have been strenuously engaged in attempting to prevent the spread of the virus and to provide care to patients. Never in history has so much human effort been concentrated on a single health trauma. Much of the new research is empirical in nature with relatively few strands of theory. This article focuses on two recent theories relevant to COVID-19 protective behaviours, the COM-B and the General Theory of Behaviour. New empirical findings on the means, motives and opportunities for COVID-19 protective behaviours improve our knowledge and capacity to cope with pandemics using psychological

homeostasis.

Title: A systematic review of the barriers and facilitators to adherence to mindfulness-based cognitive therapy for those with chronic conditions

Journal: British Journal of Health Psychology

Volume: 28

Issue: 2

Pages: 338-365

Date: May

Short Title: A systematic review of the barriers and facilitators to adherence to mindfulness-based cognitive therapy for those with chronic conditions

ISSN: 1359-107X

DOI: 10.1111/bjhp.12628

Accession Number: WOS:000876223500001

Abstract: Purpose Mindfulness-Based Cognitive Therapy (MBCT) can improve the lives of those with a chronic condition and psychological distress, however, high drop-out rates limit benefits. MBCT might be a candidate treatment for this population if nonadherence can be overcome. This review explores the existing literature on the barriers and facilitators to adherence to MBCT for those with chronic conditions. Method Databases MEDLINE, PsycINFO, CINAHL and Scopus were searched between 28(th) May and 11th June 2021. We included empirical papers that identified barriers and/or facilitators to MBCT adherence in patients with chronic conditions—excluding non-English and grey literature. Papers were screened and duplicates removed. Extracted data included: setting, design, aim, sample-size, population and identified barriers/facilitators to MBCT adherence. The Mixed Methods Appraisal Tool (MMAT) was adapted and used to appraise the quality of studies Results Twenty papers were eligible for review. Synthesis identified six themes (in prevalence order): (1) Practical Factors (e.g., time and other commitments), (2) Motivation (e.g., change-readiness), (3) Patient clinical and demographic characteristics (e.g., current physical health), (4) Connection with Others (facilitators and group members), (5) Credibility (perception of the intervention) and (6) Content difficulty (intervention accessibility). Findings highlight potential adaptations to implementation (e.g., clear treatment rationale, preference matching, and eliciting and responding to individual concerns or obstructive assumptions) that could address barriers and harness facilitators. Conclusion This review contributes a higher order understanding of factors that may support/obstruct client adherence to MBCT with implications for future implementation in research and practice. Future research

should prioritize open exploration of barriers/facilitators.

Title: Testing the content for a targeted age-relevant intervention to promote cervical screening uptake in women aged 50-64 years

Journal: British Journal of Health Psychology

Volume: 27

Issue: 2

Pages: 623-644

Date: May

Short Title: Testing the content for a targeted age-relevant intervention to promote cervical screening uptake in women aged 50-64 years

ISSN: 1359-107X

DOI: 10.1111/bjhp.12552

Accession Number: WOS:000680085000001

Abstract: Objectives Low uptake of cervical screening in women in their 50s and 60s leaves them at elevated risk of cancer in older age. An age-targeted intervention could be an effective way to motivate older women to attend cervical screening. Our primary objective was to test the impact of different candidate messages on cervical screening intention strength. Design A cross-sectional online survey with randomized exposure to different candidate messages. Methods Women aged 50-64 years who were not intending to be screened when next invited were recruited through an online panel. Those meeting the inclusion criteria (n = 825) were randomized to one of three groups: (1) control group, (2) intervention group 1, (3) intervention group 2. Each intervention group saw three candidate messages. These included a descriptive social norms message, a diagram illustrating the likelihood of each possible screening outcome, a response efficacy message, a risk reduction message and an acknowledgement of the potential for screening discomfort. We tested age-targeted versions (vs. generic) of some messages. The primary outcome was screening intention strength. Results After adjusting for baseline intention, social norms (p = .425), outcome expectancy (p = .367), risk reduction (p = .090), response efficacy (p = .136) and discomfort acknowledgement messages (p = .181) had no effect on intention strength. Age-targeted messages did not result in greater intention than generic ones. Conclusions There was no evidence that a single message used to convey social norms, outcome expectancy, risk reduction or response efficacy had an impact on intention strength for older women who did not plan to be screened in future.

Short Title: Promoting Sustainable Mobility: To What Extent Is "Health" Considered by Mobility App Studies? A Review and a Conceptual Framework

DOI: 10.3390/su14010047

Article Number: 47

Accession Number: WOS:000741346700001

Abstract: Promoting cycling and walking in cities improves individual health and wellbeing and, together with public transport, promotes societal sustainability patterns. Recently, smartphone apps informing and motivating sustainable mobility usage have increased. Current research has applied and investigated these apps; however, none have specifically considered mobility-related health components within mobility apps. The aim of this study is to examine the (potential) role of health-related information provided in mobility

apps to influence mobility behavior. Following a systematic literature review of empirical studies applying mobility apps, this paper (1) investigates the studies and mobility apps regarding communicated information, strategies, and effects on mobility behavior and (2) explores how, and to what extent, health and its components are addressed. The reviewed studies focus on environmental information, especially CO₂-emissions. Health is represented by physical activity or calories burned. The self-exposure to air pollution, noise, heat, traffic injuries or green spaces is rarely addressed. We propose a conceptual framework based on protection motivation theory to include health in mobility apps for sustainable mobility behavior change. Addressing people's self-protective motivation could empower mobility app users. It might be a possible trigger for behavior change, leading towards healthy and sustainable mobility and thus, have individual and societal benefits.

Short Title: Lessons from an experiment with values-based messaging to support watershed conservation

ISSN: 0888-8892

DOI: 10.1111/cobi.13910

Article Number: e13910

Accession Number: WOS:000801858800001

Abstract: Conservation professionals use language related to instrumental, intrinsic, and relational values when communicating about the importance of conservation, frequently in connection with ecosystem services. However, few researchers have examined whether messages that emphasize values associated with ecosystem services result in different policy-support or behavior-change outcomes among different audiences. We conducted a large-scale survey experiment with participants (n = 815) who resided in the United States and were recruited online via the survey platform Qualtrics. The experiment tested whether messages about watershed protection that emphasize instrumental, intrinsic, or relational values (as opposed to the information-only control message) resulted in differing support for policies or behavioral intentions related to watershed conservation. Respondents' personal characteristics had a stronger

effect on conservation beliefs than the way values were framed (i.e., than treatments in the experiment). For example, income positively predicted policy support ($\beta = 0.07$, 95% CI 0.02–0.12, $p = 0.01$, corrected $p = 0.03$). Instrumental messages decreased (SSG, tense) policy support among people who identified as politically liberal ($\beta = -0.75$, 95% CI -1.19 to -0.30, $p = 0.001$, corrected $\beta = 0.003$). Over 40% of respondents selected relational values over other value types as the main reason to protect watersheds. Our results demonstrated that political orientation interacts with how the importance of conservation is framed in complex ways and that conservation practitioners might improve the effectiveness of their communications by incorporating relational values and tailoring messages to different audiences.

Short Title: Addressing behavior in pollinator conservation policies to combat the implementation gap

ISSN: 0888-8892

DOI: 10.1111/cobi.13581

Accession Number: WOS:000579456400001

Abstract: Solutions for conserving biodiversity lie in changing people's behavior. Ambitious international and national conservation policies frequently fail to effectively mitigate biodiversity loss because they rarely apply behavior-change theories. We conducted a gap analysis of conservation behavior-change interventions advocated in national conservation strategies with the Behavior Change Wheel (BCW), a comprehensive framework for systematically characterizing and designing behavior-change interventions. Using pollinator conservation as a case study, we classified the conservation actions listed in national pollinator initiatives in relation to intervention functions and policy categories of the BCW. We included all national-level policy documents from the European Union available in March 2019 that focused on conservation of pollinators ($n = 8$). A total of 610 pollinator conservation actions were coded using in-depth directed content analysis, resulting in the

identification of 787 intervention function and 766 policy category codes. Overall, these initiatives did not employ the entire breadth of behavioral interventions. Intervention functions most frequently identified were education (23%) and environmental restructuring (19%). Least frequently identified intervention functions were incentivization (3%), and restriction (2%) and coercion were completely absent (0%). Importantly, 41% of all pollinator conservation actions failed to identify whose behavior was to be changed. Building on these analyses, we suggest that reasons for the serious implementation gap in national and international conservation policies is founded in insufficient understanding of which behavioral interventions to employ for most beneficial impacts on biodiversity and how to clearly specify the intervention targets. We recommend that policy advisors engage with behavior-change theory to design effective behavior-change interventions that underpin successful conservation policies.

Short Title: Understanding the barriers and drivers of sustainable construction adoption and implementation in South Africa: A quantitative study using the Theoretical Domains Framework and CO M-B model

ISSN: 1021-2019

DOI: 10.17159/2309-8775/2021/v63n4a2

Accession Number: WOS:000729960700002

Abstract: The construction industry is one of the largest consumers of natural resources. Improving the sustainability of construction industry activities is therefore key to mitigating the negative impact of the industry on the environment. Given the extent of the environmental challenges faced by many countries, the transition towards the adoption of sustainable alternatives in the construction industry must include dimensions of changing human behaviour. These

dimensions include influencing the capability, opportunity, and motivation to adopt the desired change in behaviour. In order to improve the adoption and implementation of sustainable practices within the construction industry, the behaviour change processes of stakeholders need to be considered. This study describes how the Capability, Opportunity, Motivation–Behaviour (COM–B) model and Theoretical Domains Framework (TDF) were used to identify the barriers to and drivers of sustainable construction practices by construction industry stakeholders. The study included a structured questionnaire survey completed by 108 construction industry stakeholders and indicated a need to improve the capability, opportunity, and motivation amongst construction industry stakeholders to facilitate the adoption of sustainable construction practices. The questionnaire identified that an increase in the awareness, knowledge, interest, and demand for sustainable construction will facilitate the adoption thereof. Additionally, providing training and access to education on best practices for sustainability can positively influence the behaviour of stakeholders and improve their confidence in implementing sustainable construction practices. Economic factors such as the cost of implementing sustainable solutions and the perception of the economic and social benefits of sustainable construction were identified as the critical barriers. These barriers and drivers are mapped to five TDF domains (knowledge, skills, social influences, beliefs about capabilities, and beliefs about consequences), which can be targeted for behaviour change amongst construction industry stakeholders in future interventions.

Title: The Evaluation of Determinants and Impacts of Co–Production in Healthcare: A Research Protocol for OPAT in Cystic Fibrosis

Journal: International Journal of Integrated Care

Volume: 21

Issue: 2

Date: Apr–Jun

Short Title: The Evaluation of Determinants and Impacts of Co–Production in Healthcare: A Research Protocol for OPAT in Cystic Fibrosis

ISSN: 1568–4156

DOI: 10.5334/ijic.5568

Article Number: 15

Accession Number: WOS:000663325600011

Abstract: Introduction: Co–production is more and more considered as a promising tool for dealing with the main challenges in the health sector (e.g., growing rates of chronic diseases, budget constraints,

higher patients' expectations of the quality and the value of services, equity to access of care, etc.). However, there is still little evidence on co-production determinants and impacts.

Description: This research protocol aims to present a framework to assess the determinants and impacts of the co-productive approach in healthcare delivery on patients, professionals, and providers from economic, organisational, and clinical perspectives. To this end, the paper examines the co-produced outpatient parenteral antimicrobial therapy (OPAT), applied to cystic fibrosis patients in an Italian hospital. A mixed methods approach will be adopted and data will be collected through semi-structured interviews and surveys of patients, caregivers, and professionals; biological samples of patients; archival sources. Then, the analyses to be performed are the following: (i) cost evaluation, (ii) content, (iii) descriptive and inferential statistical, (iv) microbiome analysis, and (v) desk analysis. Conclusion: The research protocol contributes to both theoretical and practical knowledge. It represents the first attempt to develop a systematic analytical framework for the evaluation of co-production in healthcare. Moreover, the findings gathered within the study will provide evidence to support policy makers and managers in decision-making and managerial processes within the health service.

Short Title: Engagement: Australia's weak link in biodiversity protection
ISSN: 0813-300X
Accession Number: WOS:000408993700001
Abstract: International and domestic conservation laws aim to address the biodiversity decline that is caused by intertwined environmental and human behaviour factors. In Australia, despite the country being a signatory to relevant conventions and having many biodiversity conservation laws, policy instruments and associated biodiversity strategies are not adequately protecting nature. For Australia to meet its Convention commitments to biodiversity protection a more effective approach to managing human behaviours is needed. Both tangible and intangible resources, including more scientifically sophisticated approaches to managing community engagement, are essential if legal instruments are to be made effective. This article forms part of a growing body of scholarship on the implementation of environmental instruments, and suggests that legal effectiveness will require new academic and policy approaches that take into account the diverse drivers and practical constraints on human behaviour.

Title: A realist evaluation of patients' decisions to deprescribe in the EMPOWER trial
Journal: Bmj Open
Volume: 7
Issue: 4
Date: Apr
Short Title: A realist evaluation of patients' decisions to deprescribe in the EMPOWER trial
ISSN: 2044-6055
DOI: 10.1136/bmjopen-2017-015959
Article Number: e015959
Accession Number: WOS:000402527200130
Abstract: Background and objectives Successful mechanisms for engaging patients in the deprescribing process remain unknown but may include: (1) triggering motivation to deprescribe by increasing patients' knowledge and concern about medications; (2) building capacity to taper by augmenting self-efficacy and (3) creating

opportunities to discuss and receive support for deprescribing from a healthcare provider. We tested these mechanisms during the Eliminating Medications through Patient Ownership of End Results (EMPOWER) () trial and investigated the contexts that led to positive and negative deprescribing outcomes. Design A realist evaluation using a sequential mixed methods approach, conducted alongside the EMPOWER randomised clinical trial. Setting Community, Quebec, Canada. Participants 261 older chronic benzodiazepine consumers, who received the EMPOWER intervention and had complete 6-month follow-up data. Intervention Mailed deprescribing brochure on benzodiazepines. Measurements Motivation (intent to discuss deprescribing; change in knowledge test score; change in beliefs about the risk-benefits of benzodiazepines, measured with the Beliefs about Medicines Questionnaire), capacity (self-efficacy for tapering) and opportunity (support from a physician or pharmacist). Results The intervention triggered the motivation to deprescribe among 167 (n=64%) participants (mean age 74.6 years +/- 6.3, 72% women), demonstrated by improved knowledge (risk difference, 58.50% (95% CI 46.98% to 67.44%)) and increased concern about taking benzodiazepines (risk difference, 67.67% (95% CI 57.36% to 74.91%)). Those who attempted to taper exhibited increased self-efficacy (risk difference, 56.90% (95% CI 45.41% to 65.77%)). Contexts where the deprescribing mechanisms failed included lack of support from a healthcare provider, a focus on shortterm quality of life, intolerance to withdrawal symptoms and perceived poor health. Conclusion Deprescribing mechanisms that target patient motivation and capacity to deprescribe yield successful outcomes in contexts where healthcare providers are supportive, and patients do not have internal competing desires to remain on drug therapy. Accession Number: WOS:000364882000012

Abstract: This study evaluates the effects of a behaviour change intervention, which encourages the integration of physical activity into the teaching of academic lessons, on physical activity levels of students. The main outcome is mean minutes of moderate-to-

vigorous physical activity (MVPA) daily generated during the intervention lessons. Teacher's perceptions and students' enjoyment of the programme were also evaluated. Students accumulated a mean of 8 min MVPA during the intervention lessons daily. The teacher and students were very satisfied with the programme. Therefore, changing teacher behaviour towards using physically active teaching methods is a promising way of increasing children's physical activity levels. (C) 2015 Elsevier Ltd. ISSN: 1551-7144

DOI: 10.1016/j.cct.2015.01.019

Accession Number: WOS:000353000500022

Abstract: Background: Recent evidence demonstrates that children are not engaging in the recommended 60 min of moderate to vigorous physical activity per day. Physical activity (PA) interventions have been acknowledged by the WHO (2010) as a key strategy to increase the PA levels of children. School has been recognised as a primary location for reaching the majority of children and providing PA opportunities for them. However, the sedentary nature of lessons carried out in the classroom has been identified as a contributing factor to physical inactivity among this age group. Purpose: The aim of this study is to develop and evaluate a classroom-based intervention which integrates PA and academic content, and evaluate its effects on the PA levels of children aged 8-11 in Ireland.

Methods: Active Classrooms is an 8-week classroom based intervention guided by the behaviour change wheel (BCW) framework (Michie et al. 2011) that will be evaluated using a cluster randomised controlled trial (RCT). Study measures will be taken at baseline, during the final week of the intervention and at follow-up after 4 months. The primary outcome is minutes of moderate-to-vigorous intensity physical activity during school time objectively assessed using accelerometers (Actigraph). Teachers' perceptions on the

effectiveness and use of the intervention and students' enjoyment of the programme will be evaluated post intervention. Conclusions: Changing teacher behaviour towards using physically active teaching methods may increase the moderate to vigorous physical activity levels of their students. Therefore, the results of this study may have important implications for the health of children both now and into the future. (C) 2015 Elsevier Inc. All rights reserved.

Abstract: This paper evaluates perceptions of 5 teachers and 129 students, of participating in an 8-week primary school movement integration intervention. Following training and provision of resources, teachers were asked to teach 2 active lessons each day. Teachers completed questionnaires at post-intervention. Students participated in 'draw and write' activities and focus group interviews. Teachers reported great satisfaction, noting student enjoyment, enhanced teaching and learning, and provision of resources as contributing to the success of the programme. Students expressed high levels of enjoyment, with emphasis on peer-engagement, perceived health benefits, and improved academic motivation. (C) 2017 Elsevier Ltd. All rights reserved.

DOI: 10.3390/ijerph18031339

Article Number: 1339

Accession Number: WOS:000615188300001

Abstract: This study aimed to assess the feasibility of an educational intervention on hydration behavior in adolescent soccer players. A pilot study of a two-arm, non-randomized controlled cluster trial was conducted. A total of 316 players aged 13–16 agreed to participate. The response variables were the players' participation in the intervention, their perception of the knowledge acquired, the usefulness and the overall assessment of the intervention. Hydration patterns and acquisition of knowledge on hydration behavior were also assessed. The intervention involved two elements: posters and a web app. A total of 259 adolescents completed the study (intervention group (IG) = 131; control group (CG) = 128). 80.6% of the players responded to the survey assessing the feasibility of the intervention. The mean number of correct answers regarding behavior was significantly higher in the IG (3.54; SD = 1.162) than in the CG (2.64; SD = 1.174) ($p < 0.001$). The water consumption pattern at all the clubs was ad libitum. Of the players, 10% did not drink any water at all during the game. In conclusion, this intervention has been shown to be feasible for implementation with adolescent soccer players. It suggests that hydration guidelines should be informed by personal factors and that ad libitum water consumption should be avoided.

ISSN: 0957-5243

DOI: 10.1007/s10552-022-01647-x

Accession Number: WOS:000882547200001

Abstract: Purpose This study aimed to evaluate the preliminary effectiveness of an educational intervention using a web-app to improve knowledge of breast cancer risk factors and symptoms and adherence to healthy eating and physical activity among women without breast cancer diagnosis in Asturias (Spain). Methods A pragmatic randomized pilot trial was conducted to evaluate the impact of a web-app-based intervention for women without breast cancer diagnosis. Women in the intervention group participated in a 6-month intervention web-app based on the Behaviour Change Wheel Model. The web-app includes information about breast cancer risk factors, early detection, physical activity and diet. Results Two hundred and eighty-fifth women aged 25-50 were invited to join the study. Two hundred and twenty-four were randomly assigned to either the intervention group (IG = 134) or control group (CG = 90) according to their place of residence. Adherence among women in the IG increased significantly from pre- to post-intervention for eight of the 12 healthy behaviors and for the identification of six risk factors and six symptoms compared to women in the CG and, among whom adherence only increased for two behaviors, the identification of one risk factor and 0 symptoms. The intervention significantly improved the mean number of risk factors + 1.06 ($p < 0.001$) and symptoms + 1.18 ($p < 0.001$) identified by women in the IG.

Conclusions The preliminary results of this study suggest that an educational intervention using a web-app and based on the Behaviour Change Wheel model could be useful to improve knowledge of breast cancer risk factors and symptoms and to improve adherence to a healthy diet and physical activity in women without a previous breast cancer diagnosis.

Title: Development and validation of the MARA scale in Spanish to assess knowledge and perceived risks and barriers relating to breast cancer prevention

Journal: Cancer Causes & Control

Volume: 32

Issue: 11

Pages: 1237-1245

Date: Nov

Short Title: Development and validation of the MARA scale in Spanish to assess knowledge and perceived risks and barriers relating to breast cancer prevention

ISSN: 0957-5243

DOI: 10.1007/s10552-021-01473-7

Accession Number: WOS:000672415800002

Abstract: Objective The aim of this study was to develop a measurement instrument for assessing knowledge of breast cancer and perceived risk of developing the disease (MARA). Methods 641 women with a mean age of 36.19 years (SD = 7.49) participated in the study. Data collection took place during 2019 and included sociodemographic data, data on history of cancer and breast cancer, perceived risk, and feelings of concern about developing breast cancer. Internal consistency, test-retest reliability, convergent validity, and structural validity were tested. Results The questionnaire items comprise 4 subscales: risk factors (9 items), signs and symptoms (9 items), perceived risk (6 items), barriers (7 items). A factor analysis revealed that the first two subscales had two dimensions each, whereas the other two subscales had one dimension each. Each subscale was shown to have adequate reliability ($\alpha = 0.74-0.92$) and temporal stability ($r = 0.201-0.906$), as well as strong evidence of validity in relation to a questionnaire on breast cancer knowledge ($r = 0.131-0.434$). In addition, the subscales were shown to have high discriminatory power in terms of the presence or absence of a history of cancer or breast cancer, perceived risk, and feelings of concern. Conclusion The MARA questionnaire represents a valid, reliable tool for assessing Spanish women's knowledge, risks, perceptions, and barriers regarding breast cancer.

Title: Nursing interventions to reduce medication errors in paediatrics and neonates: Systematic review and meta-analysis

Journal: Journal of Pediatric Nursing-Nursing Care of Children & Families

Volume: 62

Pages: E139-E147

Date: Jan-Feb

Short Title: Nursing interventions to reduce medication errors in paediatrics and neonates: Systematic review and meta-analysis

ISSN: 0882-5963

DOI: 10.1016/j.pedn.2021.08.024

Accession Number: WOS:000793561700035

Abstract: Background: Medication errors are a great concern to health care organisations as they are costly and pose a significant risk to patients. Children are three times more likely to be affected by medication errors than adults with medication administration error rates reported to be over 70%. Objective: To identify nursing interventions to reduce medication administration errors and perform a meta-analysis. Methods: Online databases; British Nursing Index (BNI), Cochrane Database of Systematic Reviews, Cumulative Index to Nursing and Allied Health Literature (CINAHL), EMBASE and MEDLINE were searched for relevant studies published between January 2000 to 2020. Studies with clear primary or secondary aims focusing on interventions to reduce medication administration errors in paediatrics, children and or neonates were included in the review. Results: 442 studies were screened and 18 studies met the inclusion criteria. Seven interventions were identified from included studies; education programmes, medication information services, clinical pharmacist involvement, double checking, barriers to reduce interruptions during drug calculation and preparation, implementation of smart pumps and improvement strategies. Educational interventional aspects were the most common identified in 13 out of 18 included studies. Meta-analysis demonstrated an associated 64% reduction in medicine administration errors post intervention (pooled OR 0.36 (95% Confidence Interval (CI) 0.21-0.63) P = 0.0003). Conclusion: Medication safety education is an important element of interventions to reduce administration errors. Medication errors are multifaceted that require a bundle interventional approach to address the complexities and dynamics relevant to the local context. It is imperative that causes of errors need to be identified prior to implementation of appropriate interventions. (c) 2021 Elsevier Inc. All rights reserved.

Short Title: "I am getting something out of this, so I am going to stick with it": supporting participants' home practice in Mindfulness-Based Programmes

DOI: 10.1186/s40359-020-00453-x

Article Number: 91

Accession Number: WOS:000700919300001

Abstract: Background: The practice of mindfulness at home is a core component of standard eight-week mindfulness-based programmes (MBP). Teachers of mindfulness courses require an understanding of the factors that need to be addressed to support participants in establishing and maintaining a mindfulness practice. Method: Here, we present a review of seven factors that we argue are important for participants' practice of mindfulness. We use the well-established model of Behaviour Change, the COM-B model (Capability, Opportunity, Motivation and Behaviour) to organise and consider these factors. For each factor, we first present a definition and then a discussion in relation to psychological, health and Buddhist literature. We illustrate the importance of each factor with quotes from MBP participant interviews. Results: We discuss participants' Capability (planning/commitment, physical space), Opportunity (social support, the relationship with the teacher) and Motivation (readiness for self-care, beliefs about practice, self-efficacy, experiencing the rewards of practice), and how these lead to the target Behaviour (mindfulness practice). Conclusions: Our understanding, as teachers and researchers, of how best to support and guide participants during MBPs is at an early stage. We draw out practical lessons around each of the seven factors for mindfulness teachers in supporting participants' home practice.

Title: Health education for musicians in the UK: a qualitative

evaluation

Journal: Health Promotion International

Volume: 37

Issue: 2

Date: Apr

Short Title: Health education for musicians in the UK: a qualitative evaluation

ISSN: 0957-4824

DOI: 10.1093/heapro/daab146

Accession Number: WOS:000756580700001

Abstract: Lay Summary Professional classical musicians struggle with a range of occupational health issues. It has therefore been recommended that health education be integrated as part of their higher education training. Although some programmes of this nature have been implemented in recent years, very few were evaluated, so it is often unclear if they work and if so, how. This paper reports the evaluation of one such programme that lasted 5 months and was delivered to first-year undergraduate music students in the UK. Although the evaluation of the programme was complex and involved many measurements, this article reports only the analysis of themes arising from interviews with 20 participants that were audio-recorded and transcribed verbatim. The results of the analysis show that participants viewed the course positively. Specifically, they viewed the programme as relevant and informative, and appreciated the intimate nature of the seminars. The programme seemed to widen their perspective on musicianship and they reported changes in their behaviours related to preventative health and music practice, although they also expressed a preference for an even more practical and thus less theoretical approach. Musical training in higher education music institutions (e.g. conservatoires) has been associated with health-related issues among musicians. The Health Promotion in Schools of Music project in the USA and the Healthy Conservatoires project in the UK have therefore recommended health promotion at conservatoires. Few health education courses have been evaluated to date, however. A 5-month health education programme for first-year undergraduate students at a British conservatoire was introduced as part of the core curriculum in September 2016. The programme, which involved both lectures and seminars, was evaluated using quantitative and qualitative approaches. This article reports only the qualitative evaluation. Twenty semi-structured individual interviews were conducted either face-to-face or via Skype in April 2017. The data were transcribed verbatim and analysed thematically. Five themes were identified: (i) the programme as a catalyst for engagement with health; (ii) behavioural changes; (iii) barriers to engaging with the programme material and initiating changes; (iv) suggestions for improvement; and (v) misinformation. Generally, participants viewed the programme as relevant and informative, particularly appreciating the intimate nature of the seminars. They reported that the programme helped them take a broader perspective on musicianship and that they would welcome sessions that are more practical than theoretical. They also reported instances of change in their behaviours relating to both lifestyle and management of music practice. In conclusion, undergraduate music students viewed this health education programme positively. Their feedback

illustrates the complex nature of health promotion in the conservatoire setting.

Short Title: A systematic literature review of voluntary behaviour change approaches in single use plastic reduction

ISSN: 0301-4797

DOI: 10.1016/j.jenvman.2023.117582

Article Number: 117582

Accession Number: WOS:000951647000001

Abstract: Plastic waste is a leading contributor to climate change due to its build up in landfill and oceans, releasing harmful greenhouse gases and causing harm to ecosystems. The past decade has seen a rise in the number of policies and legislative regulations surrounding the use of single-use plastics (SUP). Such measures are needed and have shown effectiveness in the reduction of SUP's. However, it is becoming apparent that voluntary behaviour change efforts, which preserve autonomous decision making are also needed to further reduce demand for SUP. This mixed-methods systematic review had three aims, 1) synthesise existing voluntary behavioural change interventions and approaches aimed at reducing SUP consumption, 2) assess the level of autonomy preserved in interventions, and 3) assess the extent of theory use in voluntary SUP reduction interventions. A systematic search was executed across six electronic databases. Eligible studies were peer-reviewed literature published in English between 2000 and 2022 reporting on voluntary behaviour change programs aimed at reducing the consumption of SUPs. Quality was assessed using the Mixed Methods Appraisal Tool (MMAT). Overall, 30 articles were included. Due to the heterogenic nature of outcome data in included studies, meta-analytic analysis was not possible. However, data were extracted and narratively synthesised. Communication and informational campaigns were the most common intervention approach with most interventions taking place in community or commercial settings. There was limited theory use among included studies (27% used theory). A framework was created using the criteria outlined by Geiger et al. (2021) to evaluate level of autonomy pre-served in included interventions. Overall, level of autonomy preserved in included interventions was low. This review highlights the urgent need for more research into voluntary SUP reduction strategies,

increased inte-gration of theory in intervention development, and higher levels of autonomy preservation in SUP reduction interventions.

Short Title: Characteristics promoting behaviour change: physician experience with a coalition-led quality improvement initiative to reduce excessive laboratory test ordering

DOI: 10.1136/bmjopen-2022-001965

Article Number: e001965

Accession Number: WOS:000949185300001

Abstract: Background Attempts have been made to reduce excessive laboratory test ordering; however, the problem persists and barriers to physician involvement in quality improvement (QI) remain. We sought to understand physician participation experience following a laboratory test overuse initiative supported by a QI coalition. Methods As part of a larger mixed-methods study, structured virtual interviews were conducted with 12 physicians. The Theoretical Domains Framework (TDF) and the Behavioural Change Wheel (BCW) were used to identify characteristics that influence physician behaviour change for QI leadership and participation and appropriate blood urea nitrogen (BUN) test ordering. A content analysis of physicians' statements to the TDF was performed, resulting in overarching themes; relevant TDF domains were mapped to the intervention functions of the BCW. Results Nine overarching themes emerged from the data. Eight of 14 TDF domains influence QI leadership and participation, and 10 influence appropriate BUN-test ordering behaviours. The characteristics participants described that promoted a change in their QI participation, leadership and appropriate BUN-test ordering were: QI education with hands-on training; physician peer mentorship/support; personnel assistance (QI and analytics) and communication from a trusted/credible physician leader who shares data and insights about the physician role in the initiative, clinical best practice and past project success. Other elements included: a simply designed initiative

requiring minimal effort and no clinical workflow disruptions; revised order forms/panels and limiting test-order frequency when laboratory tests are normal. Additionally, various future intervention strategies were identified. For their initial initiative participation, physicians acknowledged coalition leader or member credibility was more important than awareness of the coalition. Conclusions Based on physicians' described perceptions and experiences, coalition characteristics that influenced their QI leadership and participation, and appropriate BUN-test ordering behaviours were revealed; these characteristics aligned to several TDF domains. The findings suggest that these behaviours are multidimensional, requiring a multistrategy approach to change behaviour.

Short Title: Promoting physical activity for people with haemophilia in the age of new treatments

ISSN: 1351-8216

DOI: 10.1111/hae.14641

Accession Number: WOS:000830700800001

Abstract: Haemophilia treatment has seen great advances in recent years with an accompanied reduced risk of physical activity (PA) related bleeds. Based on its known health benefits, people with haemophilia (PWH) are currently encouraged to regularly engage in PA. However, this may not always translate to increased levels of PA. In this narrative review we aim to provide a brief overview of what is currently understood regarding PA levels and influences for the three broad age groups of children and adolescents, adults and older adults. We also provide recommendations for members of the haemophilia team on important aspects related to promotion of PA in their clinical practice. We highlight that PA behaviour is multifactorial and that many PWH still have limited access to adequate care. Whilst some still face unique challenges to being more physically active, overall, the barriers and facilitators to activity are very similar to that of the general population.

Title: Avoidance of Supermarket Food Waste—Employees' Perspective on
Causes and Measures to Reduce Fruit and Vegetables Waste
Journal: Sustainability
Volume: 14
Issue: 16
Date: Aug
Short Title: Avoidance of Supermarket Food Waste—Employees'
Perspective on Causes and Measures to Reduce Fruit and Vegetables
Waste
DOI: 10.3390/su141610031
Article Number: 10031
Accession Number: WOS:000845182600001
Abstract: Identifying causes of food waste at grocery retail level
is crucial for the development of effective measures to reduce
waste. Frontline employees manage food waste in their day-to-day
operations; however, there is a paucity of research that draws
attention to their knowledge of and approach to causes and measures
to reduce food waste. In this empirical study, a mixed methods
approach is adopted, using multiple interviews and participatory
observations with employees, and primary quantitative data on fruit
and vegetable waste for one year from the supermarkets. The results
illuminate the fact that the role of employees is central for
reducing food waste, and from their perspective, the causes and
measures can be divided into four different main themes covering
policy, practice, people and product. The analysis involves 73
different fruit and vegetables categories, and the fruit and
vegetables waste at the three supermarkets is 60 tonnes. The results
also reveal different causes for different fruit and vegetables
categories, implying that generic descriptions of causes are not
enough to use as bases for planning reduction measures. The paper
provides a base for planning and implementing reduction measures for
the grocery retail sector, which contribute to a sustainable food
supply chain.

Short Title: A PRACTICAL TOOLKIT OF STRATEGIES FOR BUILDING RESEARCH CAPACITY IN ALLIED HEALTH
DOI: 10.24083/apjhm.v14i2.261
Accession Number: WOS:000493370600002
Abstract: OBJECTIVES The objectives of this project were firstly to develop a practical toolkit of evidence-informed strategies for building research capacity in allied health, and secondly to disseminate and apply this toolkit to inform tailored research capacity building plans for allied health teams. DESIGN: This project used a plan, do, study, act (PDSA) quality improvement methodology to develop, disseminate and apply a toolkit which was based on the results of a recent systematic review of allied health research capacity building frameworks and a narrative review of other interventions and theoretical recommendations. SETTING Eight allied health professional teams in a publicly funded tertiary health service were supported to develop tailored research capacity building plans based on their specific needs, goals and context. MAIN outcome measures: The outcomes of this project were evaluated using process measures including whether a research capacity building plan was developed and to what extent short-term goals were achieved within three months. RESULTS A practical toolkit was developed which consolidates existing evidence-informed strategies and organises these around three components including 'supporting clinicians in research', 'working together' and 'valuing research for excellence' and 17 sub-components. Several barriers and facilitators to applying the toolkit to teams were identified and this paper suggests some recommendations and future directions for addressing these. CONCLUSIONS This toolkit may be a useful resource to inform the development of team-based research capacity building plans for allied health. The application of the toolkit may be enhanced by a need's assessment and facilitation from a researcher.

Short Title: Parental work hours and household income as determinants of unhealthy food and beverage intake in young Australian children

ISSN: 1368-9800

DOI: 10.1017/s1368980022000349

Article Number: Pii s1368980022000349

Accession Number: WOS:000772533300001

Abstract: Objective: This study examined parental work hours and household income as determinants of discretionary (energy-dense, nutrient-poor) food and beverage intake in young children, including differences by eating occasion. Design: Secondary analysis of cross-sectional data. Three hierarchical regression models were conducted with percentage of energy from discretionary food and beverages across the day, at main meals and at snack times being the outcomes. Dietary intake was assessed by 1 x 24-h recall and 1-2 x 24-h food record(s). Both maternal and paternal work hours were included, along with total household income. Covariates included household, parent and child factors. Setting: Data from the NOURISH/South Australian Infants Dietary Intake studies were collected between 2008 and 2013. Participants: Participants included 526 mother-child dyads (median (interquartile range) child age 1 center dot 99 (1 center dot 96, 2 center dot 03) years). Forty-one percentage of mothers did not work while 57 % of fathers worked 35-40 h/week. Most (85 %) households had an income of >=\$50 k AUD/year. Results: Household income was consistently inversely associated with discretionary energy intake (beta = -0 center dot 12 to -0 center dot 15). Maternal part-time employment (21-35 h/week) predicted child consumption of discretionary energy at main meals (beta = 0 center dot 10, P = 0 center dot 04). Paternal unemployment predicted a lower proportion of discretionary energy at snacks (beta = -0 center dot 09, P = 0 center dot 047). Conclusions: This work suggests that household income should be addressed as a key opportunity-related barrier to healthy food provision in families of young children. Strategies to reduce the time burden of healthy main meal provision may be required in families where mothers juggle longer part-time working hours with caregiving and domestic duties. The need to consider the role of fathers and other parents/caregivers in shaping children's intake was also highlighted.

Title: Strategies Associated With Reducing Benzodiazepine Prescribing to Older Adults: A Mixed Methods Study

Journal: Annals of Family Medicine

Volume: 20

Issue: 4

Pages: 328-335

Date: Jul-Aug

Short Title: Strategies Associated With Reducing Benzodiazepine Prescribing to Older Adults: A Mixed Methods Study

ISSN: 1544-1709

DOI: 10.1370/afm.2825

Accession Number: WOS:000840719100005

Abstract: **PURPOSE** Unlike in many community-based settings, benzodiazepine (BZD) prescribing to older veterans has decreased. We sought to identify health care system strategies associated with greater facility-level reductions in BZD prescribing to older adults. **METHODS** We completed an explanatory sequential mixed methods study of health care facilities in the Veterans Health Administration (N = 140). Among veterans aged ≥ 75 years receiving long-term BZD treatment, we stratified facilities into relatively high and low performance on the basis of the reduction in average daily dose of prescribed BZD from October 1, 2015 to June 30, 2017. We then interviewed key facility informants (n = 21) who led local BZD reduction efforts (champions), representing 11 high-performing and 6 low-performing facilities. **RESULTS** Across all facilities, the age-adjusted facility-level average daily dose in October 2015 began at 1.34 lorazepam-equivalent mg/d (SD 0.17); the average rate of decrease was -0.27 mg/d (SD 0.09) per year. All facilities interviewed, regardless of performance, used passive strategies primarily consisting of education regarding appropriate prescribing, alternatives, and identifying potential patients for discontinuation. In contrast, champions at high-performing facilities described leveraging ≥ 1 active strategies that included individualized recommendations, administrative barriers to prescribing, and performance measures to incentivize clinicians. **CONCLUSIONS** Initiatives to reduce BZD prescribing to older adults that are primarily limited to passive strategies, such as education and patient identification, might have limited success. Clinicians might benefit from additional recommendations, support, and incentives to modify prescribing practices.

Abstract: Objective Prompted by an acute increase in necrotizing enterocolitis (NEC) rates, we aimed to decrease the rate of stage 2 or greater NEC in infants born at <1500 grams or <30 weeks gestational age from 19.5% to less than 9.7% (a 50% reduction) within 18 months, without adversely affecting central line-associated bloodstream infection (CLABSI) rates. Study design We utilized Define, Measure, Analyze, Improve, and Control (DMAIC) as our improvement model. Informed by our key driver diagram and root cause analyses, six Plan-Do-Study-Act cycles were completed. Results 147 infants in the QI initiative had a median gestational age of 28.1 weeks and a median birthweight of 1070 grams. NEC rates decreased from the QI baseline of 19.5% to 6% (p = 0.03). Oral care administration increased, and maximal gavage tube dwell time decreased. Conclusion NEC rates decreased during this QI initiative through a combination of multidisciplinary interventions aimed at reducing dysbiosis.

Accession Number: WOS:000771911900001

Abstract: Young people's engagement with online counselling remains an endemic obstacle faced by mental health services. This study utilises the Behaviour Change Wheel (BCW) framework to systematically explore the barriers and facilitators of young people's behavioural engagement with online webchat counselling. The current study defines behavioural engagement as any observable or active contribution by the young person in the webchat sessions, such as written verbalisation and self-expression. Semi-structured interviews with counsellors (n = 8) and open-ended questionnaire data from 43 young people (aged 18-25 years) were gathered and then coded. Nine core themes were identified including communication difficulties, the safety of the webchat environment, absence of face-to-face communication, ambiguity in messages or pauses, reaching goals, optimism about outcomes, pre-existing anxieties, mood or well-being and wanting/not wanting to attend. Using the BCW framework, these themes were mapped to broad intervention functions and behaviour change techniques (BCTs) to provide suggestions to optimise young people's engagement with online counselling. These include the application of persuasive design features, the use of social strategies, increased counsellor training and greater personalisation of the online therapeutic approach. Future research can determine the effectiveness of these proposed strategies and BCTs to enrich the emerging engagement strategy field and the wider digital and mental health behaviour change literature.

Short Title: Developing a systems-based approach to research use in education

ISSN: 2049-6613

DOI: 10.1002/rev3.3368

Article Number: e3368

Accession Number: WOS:000884038000001

Abstract: Models of research use in education tend to focus on specific elements of education systems or underplay the complexity of system change. Within other public policy areas, notably health,

more work has been undertaken to integrate systems thinking when considering knowledge mobilisation and research use. In this paper, we survey public policy system change literature to develop a set of system dimensions. We use these to examine models relating to research use that are widely referenced in education. We then apply these dimensions to the work of the Education Endowment Foundation (EEF), the UK's What Works Centre for Education, which aims to support evidence-informed practice at all levels of the education system. We focus on its work to embed research-informed practices in regional school systems, through a case analysis of two 'scale-up campaigns' to mobilise evidence relating to the effective deployment of teaching assistants (educational support paraprofessionals). The findings highlight the value of using the system dimensions framework as a diagnostic tool to understand how to effect system change, highlighting the key role of brokerage and system leadership at different system levels; school-level capacity to implement change; and system relationships. Rationale for this studyContext and implications Implications for educational researchers and policymakersWhy the new findings matter Current approaches to supporting research use in education underplay the complexity of system change. Failure to acknowledge the complexity of research-use systems is likely to result in less-than-optimal approaches and interventions to improve research use. By applying a systems perspective, we explore how research use can be more effectively supported. Research use emerges as a myriad of interconnected 'moving parts' that need to function optimally and be aligned. Weakness in any area of the system, or interactions between system actors and activities across system levels, can potentially impede research use. A systems perspective, using the dimensions table presented in the paper, can be used to examine the functioning of existing systems and make informed decisions on where best to intervene to support practitioners' use of research. There is value in exploring multi-stranded mobilisation strategies that work together at different levels of the system e.g. school, regional policy, national.

Accession Number: WOS:000747771900013

Abstract: Clinical guidelines that support practice and improve care are essential in this era of evidence-based medicine. However, implementing this guidance often falls short in practice. Sharing knowledge and auditing practice are important, but not sufficient to implement change. This article brings together evidence from the study of behaviour, education and clinical practice and offers practical tips on how practising neurologists might bring about change in the healthcare environment. Common themes include the importance of team working, multidisciplinary engagement, taking time to identify who and what needs changing, and selecting the most appropriate tool(s) for the job. Engaging with the challenge is generally more rewarding than resisting and is important for the effective provision of care.

Title: Feminizing care pathways: Mixed-methods study of reproductive options, decision making, pregnancy, post-natal care and parenting amongst women with kidney disease

Journal: Journal of Advanced Nursing

Date: 2023 Mar

Short Title: Feminizing care pathways: Mixed-methods study of reproductive options, decision making, pregnancy, post-natal care and parenting amongst women with kidney disease

ISSN: 0309-2402

DOI: 10.1111/jan.15659

Accession Number: WOS:000962144800001

Abstract: Aims: To identify the needs, experiences and preferences of women with kidney disease in relation to their reproductive health to inform development of shared decision-making interventions. Design: UK-wide mixed-methods convergent design (Sep 20-Aug 21). Methods: Online questionnaire (n = 431) with validated components. Purposively sampled semi-structured interviews (n = 30). Patient and public input throughout. Findings: Kidney disease was associated with defeminization, negatively affecting current (sexual) relationships and perceptions of future life goals. There was little evidence that shared decision making was taking place. Unplanned pregnancies were common, sometimes influenced by poor care and support and complicated systems. Reasons for (not) wanting children varied. Complicated pregnancies and miscarriages were common. Women often felt that it was more important to be a "good mother" than to address their health needs, which were often unmet and unrecognized. Impacts of pregnancy on disease and options for

alternates to pregnancy were not well understood. Conclusion: The needs and reproductive priorities of women are frequently overshadowed by their kidney disease. High-quality shared decision-making interventions need to be embedded as routine in a feminized care pathway that includes reproductive health. Research is needed in parallel to examine the effectiveness of interventions and address inequalities. Impact: We do not fully understand the expectations, needs, experiences and preferences of women with kidney disease for planning and starting a family or deciding not to have children. Women lack the knowledge, resources and opportunities to have high-quality conversations with their healthcare professionals. Decisions are highly personal and related to a number of health, social and cultural factors; individualized approaches to care are essential. Healthcare services need to be redesigned to ensure that women are able to make informed choices about pregnancy and alternative routes to becoming a parent. Patient or Public Contribution: The original proposal for this research came from listening to the experiences of women in clinic who reported unmet needs and detailed experiences of their pregnancies (positive and negative). A patient group was involved in developing the funding application and helped to refine the objectives by sharing their experiences. Two women who are mothers living with kidney disease were co-opted as core members of the research team. We hosted an interim findings event and invited patients and wider support services (adoption, fertility, surrogacy, education and maternal chronic kidney disease clinics) from across the UK to attend. We followed the UK national standards for patient and public involvement throughout.

Article Number: 134

Accession Number: WOS:000385316000001

Abstract: Background: Decreased sexual activity and sexual problems

are common among people with cardiovascular disease, negatively impacting relationship satisfaction and quality of life. International guidelines recommend routine delivery of sexual counselling to cardiac patients. The Cardiac Health and Relationship Management and Sexuality (CHARMS) baseline study in Ireland found, similar to international findings, limited implementation of sexual counselling guidelines in practice. The aim of the current study was to develop the CHARMS multi-level intervention to increase delivery of sexual counselling by healthcare professionals. We describe the methods used to develop the CHARMS intervention following the three phases of the Behaviour Change Wheel approach: understand the behaviour, identify intervention options, and identify content and implementation options. Survey (n = 60) and focus group (n = 14) data from two previous studies exploring why sexual counselling is not currently being delivered were coded by two members of the research team to understand staff's capability, opportunity, and motivation to engage in the behaviour. All potentially relevant intervention functions to change behaviour were identified and the APEASE (affordability, practicability, effectiveness, acceptability, side effects and equity) criteria were used to select the most appropriate. The APEASE criteria were then used to choose between all behaviour change techniques (BCTs) potentially relevant to the identified functions, and these BCTs were translated into intervention content. The Template for Intervention Description and Replication (TIDieR) checklist was used to specify details of the intervention including the who, what, how and where of proposed intervention delivery. Results: Providing sexual counselling group sessions by cardiac rehabilitation staff to patients during phase III cardiac rehabilitation was identified as the target behaviour. Education, enablement, modelling, persuasion and training were selected as appropriate intervention functions. Twelve BCTs, linked to intervention functions, were identified for inclusion and translated into CHARMS intervention content. Conclusions: This paper details the use of Behaviour Change Wheel approach to develop an implementation intervention in an under-researched area of healthcare provision. The systematic and transparent development of the CHARMS intervention will facilitate the evaluation of intervention effectiveness and future replication and contribute to the advancement of a cumulative science of implementation intervention design.

Accession Number: WOS:000608280800001
Abstract: Nurse-patient therapeutic engagement on acute mental health wards is beneficial to service users' outcomes and nurses' job satisfaction. However, engagement is not always fulfilled in practice and interventions to improve engagement are sparse and ineffective. We explored the experiences of service users, carers, and clinicians drawing from 80 hours of non-participant observations in an acute mental health ward and semi-structured interviews with 14 service users, two carers, and 12 clinicians. Analysis of these data resulted in 28 touchpoints (emotionally significant moments) and eight overarching themes. Service users, carers, and clinicians identified a lack of high-quality, person-centred, collaborative engagement and recognized and supported efforts to improve engagement in practice. Potential solutions to inform future intervention development were identified. Our findings align with previous research highlighting negative experiences and support the need to develop multicomponent interventions through participatory methods.

Abstract: Background The long-term care setting poses unique challenges and opportunities for effective knowledge translation. The objectives of this review are to (1) synthesize barriers and facilitators to implementing evidence-based guidelines in long-term care, as defined as a home where residents require 24-h nursing care, and 50% of the population is over the age of 65 years; and (2) map barriers and facilitators to the Behaviour Change Wheel framework to inform theory-guided knowledge translation strategies. Methods Following the guidance of the Cochrane Qualitative and Implementation Methods Group Guidance Series and the ENTREQ reporting guidelines, we systematically reviewed the reported experiences of long-term care staff on implementing evidence-based guidelines into practice. MEDLINE Pubmed, EMBASE Ovid, and CINAHL were searched from the earliest date available until May 2021. Two independent reviewers selected primary studies for inclusion if they were conducted in long-term care and reported the perspective or experiences of long-term care staff with implementing an evidence-based practice guideline about health conditions. Appraisal of the included studies was conducted using the Critical Appraisal Skills Programme Checklist and confidence in the findings with the GRADE-CERQual approach. Findings After screening 2680 abstracts, we retrieved 115 full-text articles; 33 of these articles met the inclusion criteria. Barriers included time constraints and inadequate staffing, cost and lack of resources, and lack of teamwork and organizational support. Facilitators included leadership and champions, well-designed strategies, protocols, and resources, and adequate services, resources, and time. The most frequent Behaviour Change Wheel components were physical and social opportunity and psychological capability. We concluded moderate or high confidence in all but one of our review findings. Conclusions Future knowledge translation strategies to implement guidelines in long-term care should target physical and social opportunity and psychological capability, and include interventions such as environmental restructuring, training, and education. Title: Are farmers ready to use phone-based digital tools for agronomic advice? Ex-ante user readiness assessment using the case of Rwandan banana farmers

Journal: Journal of Agricultural Education & Extension

Date: 2021 Oct

Short Title: Are farmers ready to use phone-based digital tools for agronomic advice? Ex-ante user readiness assessment using the case of Rwandan banana farmers

ISSN: 1389-224X

DOI: 10.1080/1389224x.2021.1984955

Accession Number: WOS:000705002900001

Abstract: Purpose Digital extension is widely embraced in African agricultural development, promising unprecedented outcomes and impact. Especially phone-based services attract attention as tools for effective and efficient agricultural extension. To date, assessments of digital extension services are generally ex-post in nature, thus consideration of users and broader systems occurs once an intervention is broadly identified. However, early understanding of user needs, readiness, and relevant context is a prerequisite for successful adoption and sustainable use of digital extension services. We conducted an ex-ante assessment of user readiness (UR) for phone-based services. Design/Methodology/Approach We developed an ex-ante framework to assess UR, considering capabilities, opportunities, and motivations of targeted users. The case study of Rwandan banana farmers served to verify the UR framework, using survey data from 690 smallholder farmers. Findings Findings demonstrate limited capacity to access and use phone-based extension services, especially those requiring a smartphone, and a mismatch between expected UR and actual UR, current capabilities and opportunities. Findings provide entry points for designing suitable digital extension projects and interventions, suggesting a need for capacity building. Practical implications The UR-framework provided understanding about current limitations in farmer readiness for digital extension. This ex-ante approach to explore UR before designing digital interventions for African farmers is recommended. It points at the importance of embedding digital technologies into existing practices and creating blends of 'digital' and 'analogue' or 'high-tech' and 'low-tech'. Theoretical implications The UR-framework provides a structured approach to developing pre-intervention insights about users and use-context, supporting

informed strategizing and decision-making about digital extension. It is a relevant addition to existing readiness frameworks, participatory design methods, and ex-post intervention performance assessments, as part of a balanced readiness level assessment. Originality/Value This is the first ex-ante assessment of UR for digital extension services in an African context, and the first attempt to analyse Rwandan farmers' readiness for digital extension services.

ISSN: 0887-0446

DOI: 10.1080/08870446.2022.2130921

Accession Number: WOS:000865656000001

Abstract: Objective Worry and rumination (Perseverative Cognition, PC) have been associated with health behaviours, but the underlying mechanisms are unknown. Given the role of physiological experiences on perceived behavioural control (PBC) and emotion regulation on intention-health behaviour relationships, we tested whether: PC prospectively predicts poorer health behaviours; PC moderates the relationship(s) between intentions/PBC and health behaviour, as well as whether the relationship between PC and health behaviour is mediated by intentions and PBC. Methods and Measures In a prospective design, 650 participants (mean age = 38.21 years; 49% female) completed baseline measures of intentions, PBC and PC (worry and rumination) and 590 (mean age = 38.68 years; 50% female) completed follow-up (Time 2) measures of health behaviours (physical activity, sleep, sedentary activity, unhealthy snacking) 1-week later. Results Worry and rumination (at T1) predicted poorer sleep quality. Worry, but not rumination, moderated PBC-physical activity frequency relations. Consistent with mediation, the indirect paths from both worry and rumination, through PBC, to sleep quality and total sleep time were significant. Conclusion PC is associated with poorer sleep quality and PBC can play a mediating role in such relationships. Future research should further consider the role that PBC plays in PC-health behaviour relations.

Short Title: Public engagement with air quality data: using health behaviour change theory to support exposure-minimising behaviours

ISSN: 1559-0631

DOI: 10.1038/s41370-022-00449-2

Accession Number: WOS:000818323200001

Abstract: Exposure to air pollution prematurely kills 7 million people globally every year. Policy measures designed to reduce emissions of pollutants, improve ambient air and consequently reduce health impacts, can be effective, but are generally slow to generate change. Individual actions can therefore supplement policy measures and more immediately reduce people's exposure to air pollution. Air quality indices (AQI) are used globally (though not universally) to translate complex air quality data into a single unitless metric, which can be paired with advice to encourage behaviour change. Here we explore, with reference to health behaviour theories, why these are frequently insufficient to instigate individual change. We examine the health behaviour theoretical steps linking air quality data with reduced air pollution exposure and (consequently) improved public health, arguing that a combination of more 'personalised' air quality data and greater public engagement with these data will together better support individual action. Based on this, we present a novel framework, which, when used to shape air quality interventions, has the potential to yield more effective and sustainable interventions to reduce individual exposures and thus reduce the global public health burden of air pollution.

Article Number: e013045

Accession Number: WOS:000391303600098

Abstract: Objective: To test the procedures proposed for a main trial of a safer sex intervention for young people delivered by mobile phone text message ('safetxt'). Design and setting: Pilot randomised controlled trial. Participants were recruited through sexual health services in the UK. An independent online randomisation system allocated participants to receive the safetxt intervention or to receive the control text messages (monthly messages about participation in the study). Texting software delivered the messages in accordance with a predetermined schedule. Participants: Residents of England aged 16-24 who had received either a positive chlamydia test result or reported unsafe sex in the last year (defined as more than 1 partner and at least 1 occasion of sex without a condom). Intervention: The safetxt intervention is designed to reduce sexually transmitted infection in young people by supporting them in using condoms, telling a partner about an infection and testing before unprotected sex with a new partner. Safetxt was developed drawing on: behavioural science; face-to-face interventions; the factors known to influence safer sex behaviours and the views of young people. Outcomes: The coprimary outcomes of the pilot trial were the recruitment rate and completeness of follow-up. Results: We recruited 200 participants within our target of 3 months and we achieved 81% (162/200) follow-up response for the proposed primary outcome of the main trial, cumulative incidence of chlamydia at 12 months. Conclusions: Recruitment, randomisation, intervention delivery and follow-up were successful and a randomised controlled trial of the safetxt intervention is feasible.

Short Title: Scoping review of adherence promotion theories in pelvic floor muscle training-2011 ics state-of-the-science seminar research paper i of iv

ISSN: 0733-2467

DOI: 10.1002/nau.22769

Accession Number: WOS:000359710200003

Abstract: AimsThis paper, the first of four emanating from the International Continence Society's 2011 State-of-the-Science Seminar on pelvic-floor-muscle training (PFMT) adherence, aimed to summarize the literature on theoretical models to promote PFMT adherence, as identified in the research, or suggested by the seminar's expert panel, and recommends future directions for clinical practice and research. MethodsExisting literature on theories of health behavior were identified through a conventional subject search of electronic databases, reference-list checking, and input from the expert panel. A core eligibility criterion was that the study included a theoretical model to underpin adherence strategies used in an intervention to promote PFM training/exercise. ResultsA brief critique of 12 theoretical models/theories is provided and, where appropriate, their use in PFMT adherence strategies identified or examples of possible uses in future studies outlined. ConclusionA better theoretical-based understanding of interventions to promote PFMT adherence through changes in health behaviors is required. The results of this scoping review and expert opinions identified several promising models. Future research should explicitly map the theories behind interventions that are thought to improve adherence in various populations (e.g., perinatal women to prevent or lessen urinary incontinence). In addition, identified behavioral theories applied to PFMT require a process whereby their impact can be evaluated. Neurourol. Urodynam. 34:??-??, 2015. (c) 2015 Wiley Periodicals, Inc.

Title: Exploring pregnant women's experiences of stopping smoking with an incentive scheme with 'enhanced' support: a qualitative study

Journal: Perspectives in Public Health

Date: 2022 Jul

Short Title: Exploring pregnant women's experiences of stopping smoking with an incentive scheme with 'enhanced' support: a qualitative study

ISSN: 1757-9139

DOI: 10.1177/17579139221106842

Accession Number: WOS:000821250200001

Abstract: Aim: This study aims to understand pregnant women's experiences of smoking cessation with an incentive scheme in a deprived UK city. This is important because smoking cessation with pregnant women is one of the most crucial public health initiatives to promote, and is particularly challenging in deprived areas. While financial incentive schemes are controversial, there is a need to better understand pregnant women's experiences. The scheme combined quasi-financial incentives (shopping vouchers) for validated quits (carbon monoxide (CO) validated at < 10 ppm), enhanced support from smoking cessation advisors, the opportunity to identify a 'Significant Other Supporter' and nicotine replacement therapy.

Methods: With the focus on understanding pregnant women's experiences, a qualitative design was adopted. Semi-structured interviews were completed with 12 pregnant women from the scheme, and the three advisors. All interviews were transcribed, and thematic analysis conducted. Results: Pregnant women reported various challenges to quitting, including long-established routines, and stress. Participants were aware of stigma around incentives but were all very positive about the scheme. The relationship with advisors was described as fundamental. The women valued their advice and support, while uptake of the 'Significant Other Supporter' appeared low. Participants viewed the CO monitoring as 'an incentive', while the vouchers were framed as a 'bonus'. Advisors perceived the vouchers as helping engage pregnant women and maintain quit status, and women appreciated the vouchers both as financial assistance and recognition of their accomplishments. Conclusion:

This study highlights the great value women placed on the support, advice and monitoring from specialist advisors. The distinction between vouchers as a welcomed bonus, rather than 'the incentive' to engage, is important. How smoking cessation and schemes to promote this are communicated to pregnant women and health professionals is important, particularly given the stigma and controversy involved.

Title: The association between the built environment and intervention-facilitated physical activity: a narrative systematic review

Journal: International Journal of Behavioral Nutrition and Physical Activity

Volume: 19

Issue: 1

Date: Jul

Short Title: The association between the built environment and intervention-facilitated physical activity: a narrative systematic review

DOI: 10.1186/s12966-022-01326-9

Article Number: 86

Accession Number: WOS:000825410300001

Abstract: Background A diverse range of interventions increase physical activity (PA) but few studies have explored the contextual factors that may be associated with intervention effectiveness. The built environment (BE) may enhance or reduce the effectiveness of PA interventions, especially interventions that encourage PA in neighbourhood settings. Several studies have investigated the effects of the neighbourhood BE on intervention-facilitated PA, however, a comprehensive review of evidence has yet to be conducted. In our systematic review, we synthesize evidence from quantitative studies that have examined the relationships between objectively-measured neighbourhood BE and intervention-facilitated PA in adults. Method In October 2021, we searched 7 databases (Medline, CINAHL, Embase, Web of Science, SPORTDiscus, Environment Complete, and Cochrane Central Register of Controlled Trials) for English-language studies reporting on randomized and non-randomized experiments of physical activity interventions involving adults (≥ 18 years) and that estimated the association between objectively-measured BE and intervention-facilitated physical activity. Results Twenty articles, published between 2009 and 2021, were eligible for inclusion in the review. Among the 20 articles in this review, 13 included multi-arm experiments and 7 included single-arm experiments. Three studies examined PA interventions delivered at the population level and 17 examined interventions delivered at the individual level. PA intervention characteristics were heterogeneous and one-half of the interventions were implemented for at least 12-months ($n = 10$). Most studies were undertaken in North America ($n = 11$) and most studies ($n = 14$) included samples from populations identified as at risk of poor health (i.e., metabolic disorders, coronary heart disease, overweight, cancer, high blood pressure, and inactivity). Fourteen studies found evidence of a neighbourhood BE variable being negatively or positively associated with intervention-facilitated PA. Conclusion Approximately 70% of all studies reviewed found evidence for an association between a BE variable and intervention-facilitated PA. The BE's potential to enhance or constrain the effectiveness of PA interventions should be considered in their design and implementation.

Article Number: e016801

Accession Number: WOS:000406391200244

Abstract: Introduction Parkinson's disease (PD) with mild cognitive impairment (MCI-PD) or dementia (PDD) and dementia with Lewy bodies (DLB) are characterised by motor and 'non-motor' symptoms which impact on quality of life. Treatment options are generally limited to pharmacological approaches. We developed a psychosocial intervention to improve cognition, quality of life and companion burden for people with MCI-PD, PDD or DLB. Here, we describe the protocol for a single-blind randomised controlled trial to assess feasibility, acceptability and tolerability of the intervention and to evaluate treatment implementation. The interaction among the intervention and selected outcome measures and the efficacy of this intervention in improving cognition for people with MCI-PD, PDD or DLB will also be explored. Methods and analysis Dyads will be randomised into two treatment arms to receive either 'treatment as usual' (TAU) or cognitive stimulation therapy specifically adapted for Parkinson's-related dementias (CST-PD), involving 30 min sessions delivered at home by the study companion three times per week over 10 weeks. A mixed-methods approach will be used to collect data on the operational aspects of the trial and treatment implementation. This will involve diary keeping, telephone follow-ups, dyad checklists and researcher ratings. Analysis will include descriptive statistics summarising recruitment, acceptability and tolerance of the intervention, and treatment implementation. To pilot an outcome measure of efficacy, we will undertake an inferential analysis to test our hypothesis that compared with TAU, CST-PD improves cognition. Qualitative approaches using thematic analysis will also be applied. Our findings will inform a larger definitive trial. Ethics and dissemination Ethical opinion was granted (REC reference: 15/YH/0531). Findings will be published in peer-reviewed journals and at conferences. We will prepare reports for dissemination by organisations involved with PD and dementia.

Short Title: Utilising the 'COM-B' bio-psychosocial approach to aid diabetes management

ISSN: 2047-2897

DOI: 10.1002/pdi.2396

Accession Number: WOS:000806278200007

Abstract: With many individuals living with diabetes failing to make the necessary behaviour change to optimise glycaemic control(1) it is imperative that staff involved in their care have the skills required to guide them in this respect. The COM-B assists in this regard as it provides a behaviour-change model based on scientific evidence and theory in a practical and accessible format, which enables non-specialists to design and implement behaviour-change interventions. This paper reports a case of psychological assessment, formulation and intervention in a patient with type 1 diabetes mellitus associated anxiety and sub-optimal diabetes management. It highlights: (1) the importance of a bio-psychological approach to assessment and formulation; (2) the value of involving the patient in their care from the outset; and (3) the ease at which the COM-B can be routinely applied in clinical settings. ISSN: 1369-6513

DOI: 10.1111/hex.12217

Accession Number: WOS:000368250300054

Abstract: Background Adherence to treatment is low in bronchiectasis and is associated with poorer health outcomes. Factors affecting adherence decisions have not been explored in patients with bronchiectasis. Objective We aimed to explore patients' perspectives on adherence, factors affecting adherence decision making and to develop a conceptual model explaining this decision-making process in adults with bronchiectasis. Methods Adults with bronchiectasis participated in one-to-one semi-structured interviews. Interviews were audio-recorded, transcribed verbatim and analysed independently by two researchers using thematic analysis. Data from core themes were extracted, categorized into factors affecting adherence decision making and used to develop the conceptual model. Results Participants' beliefs about treatment, the practical aspects of managing treatment, their trust in health-care professionals and acceptance of disease and treatment were important aspects of treatment adherence. The conceptual model demonstrated that adherence decisions were influenced by participants' individual balance of barriers and motivating factors (treatment-related, disease-related, health-care-related, personal and social factors). Conclusion Adherence decision-making in bronchiectasis is complex, but there is the potential to enhance adherence by understanding patients' specific barriers and motivators to adherence and using this to tailor adherence strategies to individual patients and treatments.

ISSN: 1360-2322

DOI: 10.1111/jar.12985

Accession Number: WOS:000762091700001

Abstract: Background Adolescents with intellectual disabilities are insufficiently physically active. Where interventions have been developed and delivered, these have had limited effectiveness, and often lack a theoretical underpinning. Aim Through application of the COM-B model, our aim is to explore the factors influencing adolescent physical activity within schools. Methods A qualitative methodology, using focus groups with students who have mild/moderate intellectual disabilities, their parents'/carers' and teachers'. The COM-B model provided the lens through which the data were collected and analysed. Results We identified a range of individual, interpersonal, and environmental factors influencing physical activity, across all six COM-B constructs, within the context of the 'school-system'. Conclusion This is the first study to use the COM-B model to explore school-based physical activity behaviour, for adolescents with intellectual disabilities. Identification of such physical activity behavioural determinants can support the development of effective and sustainable interventions.

Short Title: The theory of planned behaviour and discrete food choices: a systematic review and meta-analysis

DOI: 10.1186/s12966-015-0324-z

Article Number: 162

Accession Number: WOS:000367428200001

Abstract: The combination of economic and social costs associated with non-communicable diseases provide a compelling argument for developing strategies that can influence modifiable risk factors, such as discrete food choices. Models of behaviour, such as the Theory of Planned Behaviour (TPB) provide conceptual order that allows program designers and policy makers to identify the substantive elements that drive behaviour and design effective interventions. The primary aim of the current review was to examine the association between TPB variables and discrete food choice behaviours. A systematic literature search was conducted to identify relevant studies. Calculation of the pooled mean effect size ($r(+)$) was conducted using inverse-variance weighted, random effects meta-analysis. Heterogeneity across studies was assessed using the Q - and I^2 -statistics. Meta-regression was used to test the impact of moderator variables: type of food choice behaviour; participants' age and gender. A total of 42 journal articles and four unpublished dissertations met the inclusion criteria. TPB variables were found to have medium to large associations with both intention and behaviour. Attitudes had the strongest association with intention ($r(+)$ = 0.54) followed by perceived behavioural control (PBC, $r(+)$ = 0.42) and subjective norm (SN, $r(+)$ = 0.37). The association between intention and behaviour was $r(+)$ = 0.45 and between PBC and behaviour was $r(+)$ = 0.27. Moderator analyses revealed the complex nature of dietary behaviour and the factors that underpin individual food choices. Significantly higher PBC-behaviour associations were found for choosing health compromising compared to health promoting foods. Significantly higher intention-behaviour and PBC-behaviour associations were found for choosing health promoting foods compared to avoiding health compromising foods. Participant characteristics were also found to moderate associations within the model. Higher intention-behaviour associations were found for older, compared to younger age groups. The variability in the association of the TPB with different food choice behaviours uncovered by the moderator analyses strongly suggest that researchers should carefully consider the nature of the behaviour being exhibited prior to selecting a theory.

Short Title: Facilitators and barriers to chlamydia testing in general practice for young people using a theoretical model (COM-B): a systematic review protocol

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2016-013588

Article Number: e013588

Accession Number: WOS:000398959400087

Abstract: Introduction: Chlamydia is a key health concern with high economic and social costs. There were over 200 000 chlamydia diagnoses made in England in 2015. The burden of chlamydia is greatest among young people where the highest prevalence rates are found. Annual testing for sexually active young people is recommended; however, many of those at risk do not receive testing. General practice has been identified as an ideal setting for testing, yet efforts to increase testing in this setting have not been effective. One theoretical model which may provide insight into the underpinnings of chlamydia testing is the Capability, Opportunity and Motivation Model of Behaviour (COM-B model). The aim of this systematic review is to: (1) identify barriers and facilitators to chlamydia testing for young people in general practice and (2) use a theoretical model to conduct a behavioural analysis of chlamydia testing behaviour. Methods and analysis: Qualitative, quantitative and mixed methods studies published after 2000 will be included. Seven databases (MEDLINE, PubMed, EMBASE, Informit, PsycInfo, Scopus, Web of Science) will be searched to identify peer-reviewed publications which examined barriers and facilitators to chlamydia testing in general practice. Risk of bias will be assessed using the Critical Appraisal Skills Programme. Data regarding study design and key findings will be extracted. The data will be analysed using thematic analysis and the resultant factors will be mapped onto the COM-B model components. All findings will be reported in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines. Ethics and dissemination: Ethical approval is not required. The results will be disseminated via submission for publication to a peer-review journal when complete and for presentation at national and international conferences. The review findings will be used to inform the development of interventions to facilitate effective and efficient chlamydia testing in general practice.

Short Title: Evaluation of a brief video intervention aimed at UK-based veterinary surgeons to encourage neutering cats at four months old: A randomised controlled trial

ISSN: 1932-6203

DOI: 10.1371/journal.pone.0263353

Article Number: e0263353

Accession Number: WOS:000821499100026

Abstract: In the UK, it is currently recommended that owned cats be neutered from four months of age. However, its uptake is inconsistent across the veterinary profession. Here we assess the effect of a brief video intervention that aimed to encourage four month neutering, whilst preserving clinical autonomy. We compare this theory-driven approach with traditional information giving and a control group. Veterinary surgeons who regularly undertook feline neutering work in the UK but did not routinely neuter cats at four months and/or recommend four month neutering for client owned cats were randomised into three groups (n = 234). Participants received either no information, a written summary of evidence or the video. The primary behaviour outcomes were the recommending and carrying out of neutering cats at four months. Evaluative, belief and stages of change measures were also collected. Self-reported outcomes were assessed pre-intervention, immediately post-intervention, two months post-intervention and six months post-intervention. At two months, participants that had received the video intervention were significantly more likely to have started recommending neutering cats at four months. At six months, participants that had received the video intervention were significantly more likely to have started carrying out neutering cats at four months. There were no significant behaviour changes for the other groups. At two months, the video intervention was associated with a significant increase in thinking about, and speaking to colleagues about, four-month neutering, relative to the control group. The written summary of evidence had no similar effect on stages of change, despite it being perceived as a significantly more helpful resource relative to the video. To conclude, a brief one-off video intervention resulted in an increase in positive behaviours towards neutering cats at 4 months, likely mediated by the social influences of the intervention prompting the opportunity to reflect and discuss four-month neutering with colleagues.

Article Number: 14072

Accession Number: WOS:000345390100002

Abstract: Significant attention has been given to the global burden of noncommunicable diseases including respiratory diseases and the potential of primary care to address this challenge. The International Primary Care Respiratory Group (IPCRG) has a potentially significant role to build capacity through research and education in a complex global network with varying degrees of capability. In this paper we outline a comprehensive strategy, which revisits the IPCRG's educational role, our aims, audiences and approach in this context. The paper was developed through a collaborative process involving experts in global health, primary care and respiratory education, leading to a consensus educational strategy statement. This is further informed by a review of recent trends in continuing medical education. Professional education and training of health-care workers is a core component of the global response to the challenge of managing respiratory conditions in primary care. This paper offers a revised strategy for building capacity and improving clinical practice in IPCRG member countries by revisiting and broadening our aims, exploring the key audiences, focus and approaches.

Article Number: 122

Accession Number: WOS:000893868900001

Abstract: Background: Air quality is a major public health threat linked to poor birth outcomes, respiratory and cardiovascular disease, and premature mortality. Deprived groups and children are disproportionately affected. Bradford will implement a Clean Air Zone (CAZ) as part of the Bradford Clean Air Plan (B-CAP) in 2022 to reduce pollution, providing a natural experiment. The aim of the current study is to evaluate the impact of the B-CAP on health outcomes and air quality, inequalities and explore value for money. An embedded process and implementation evaluation will also explore barriers and facilitators to implementation, impact on attitudes and behaviours, and any adverse consequences. Methods: The study is split into 4 work packages (WP). WP1A: 20 interviews with decision makers, 20 interviews with key stakeholders; 10 public focus groups and documentary analysis of key reports will assess implementation barriers, acceptability and adverse or unanticipated consequences at 1 year post-implementation (defined as point at which charging CAZ goes 'live'). WP1B: A population survey (n = 2000) will assess travel behaviour and attitudes at baseline and change at 1 year post-implementation). WP2: Routine air quality measurements will be supplemented with data from mobile pollution sensors in 12 schools collected by N = 240 pupil citizen scientists (4 within, 4 bordering and 4 distal to CAZ boundary). Pupils will carry sensors over four monitoring periods over a 12 month period (two pre, and two post-implementation). We will explore whether reductions in pollution vary by CAZ proximity. WP3A: We will conduct a quasi-experimental interrupted time series analysis using a longitudinal routine health dataset of > 530,000 Bradford residents comparing trends (3 years prior vs 3 years post) in respiratory health (assessed via emergency/GP attendances. WP3B: We will use the richly-characterised Born in Bradford cohort (13,500 children) to explore health inequalities in respiratory health using detailed socio-economic data. WP4: will entail a multi-sectoral health economic evaluation to determine value for money of the B-CAP. Discussion: This will be first comprehensive quasi-experimental evaluation of a city-wide policy intervention to improve air quality. The findings will be of value for other areas implementing this type of approach.

Short Title: Delivering Low Carbon Concrete for Network Rail on the Routemap to Net Zero

ISSN: 2214-5095

DOI: 10.1016/j.cscm.2022.e01343

Article Number: e01343

Accession Number: WOS:000843536500001

Abstract: Network Rail is tackling the problem of the GHG (primarily CO₂) emissions it produces and is committed to the Government's pledge to achieve Net Zero carbon emissions by 2050. It recently published its Environmental Sustainability Strategy 2020-2050 (Network Rail, 2020 [1]), which includes setting Science Based Targets for its Scope 1, 2 and 3 emissions. In this context, Expedition Engineering has been supporting Network Rail's Technical Authority and Decarbonisation Programme in efforts to reduce the CO₂e associated with its construction projects, primarily on those using concrete. This has included developing a Routemap to Net Zero Carbon Concrete, partnering with existing supply chains to decarbonise precast platform components used in high volume, and a feasibility piece focused on enabling significant carbon reductions in the ready-mix supply chain. The work has revealed the current difficulties and potential solutions within the UK concrete industry, as well as the value of supply chain partnering and putting research into practice. This paper summarises a combination of works completed and ongoing, and preliminary proposals under review. The route to Net Zero by 2050 must involve reduction in material quantities through design and construction efficiencies and a shift to using and developing materials with reduced CO₂e intensity. In the immediate term this will mean maximising Portland cement replacement and accelerating adoption of current state-of-the-art low carbon technology. In the medium- to longterm it is anticipated that use of calcined clay and limestone as cement replacement will form a key part in the progress to reduce CO₂e as the availability of PFA and GGBS reduces. The development of a standalone CO₂e Reduction Protocol document is proposed as being a useful mechanism to organise new guidance and requirements and tie in with existing standards and contracts.

Title: Improving Ad Hoc Medical Team Performance with an Innovative "I START-END" Communication Tool

Journal: Advances in Medical Education and Practice

Volume: 13

Pages: 809-820

Short Title: Improving Ad Hoc Medical Team Performance with an Innovative "I START-END" Communication Tool

ISSN: 1179-7258

DOI: 10.2147/amep.S367973

Accession Number: WOS:000838039800001

Abstract: Purpose: To study the effect of a communication tool entitled: "I START-END" (I-Identify; S-Story; T-Task; A-Accomplish/Adjust; R-Resources; T-Timely Updates; E-Exit; N-Next; D-Document and Debrief) in simulated urgent scenarios in non-operating room settings (referred to as "Ad Hoc") with anesthesia residents. The "I START-END" tool was created by incorporating Crisis Resource Management (CRM) principles into a practical and user-friendly format. Methods: This was a mixed methods pre/post observational study with 47 anesthesia resident volunteers participating from July 2014 to June 2016. Each resident served as their own control, and participated in three simulated Ad Hoc scenarios. The first simulation served as a baseline. The second simulation occurred 1-2 weeks after I START-END training. The third simulation occurred 3-6 months later. Simulation performance was videotaped and reviewed by trained experts using technical skill checklists and Anesthesia Non-Technical Skills (ANTS) score. Residents filled out questionnaires, pre-simulation, 1-2 weeks after I START-END training and 3-6 months later. Concurrently, resident performance at actual Code Blue events was scored by trained observers using the Mayo High Performance Teamwork Scale. Results: 80-90% of residents stated the tool provided an organized approach to Ad Hoc scenarios - specifically, information helpful to care of the patient was obtained more readily and better resource planning occurred as communication with the team improved. Residents stated they would continue to use the tool and apply it to other clinical settings. Resident video performance scores of technical skills showed significant improvement at the "late" session (3-6 months post exposure to the I START-END), ANTS scores were satisfactory and remained unchanged throughout. There was no difference between residents with and without I START-END training as measured by the Mayo High Performance Teamwork Scale, however, debriefing at Code Blues occurred twice as often when residents had I START-END training. Conclusion: Non-operating room settings are fraught with unfamiliarity that create many challenges. The I START-END tool operationalizes key CRM elements. The tool was well received by residents; it enabled them to speak up more readily, obtain vital information and continually update each other by anticipating, planning, and debriefing in an organized and collaborative way.

Short Title: Consumers attitudes and beliefs towards the receipt of antenatal corticosteroids and use of clinical practice guidelines
DOI: 10.1186/s12884-016-1043-4
Article Number: 259
Accession Number: WOS:000382459800001
Abstract: Background: Active participation of consumers in health care decision making, policy and clinical research is increasingly encouraged by governments, influential bodies and funders. Identifying the best way to achieve this is difficult due to the paucity of evidence. Consumers have mixed feelings towards clinical practice guidelines (CPG) demonstrating scepticism towards their purpose and applicability to their needs. There is no information pertaining to consumers' views and attitudes on the receipt of antenatal corticosteroids (ACS). The aim of this study was to examine the barriers and enablers to receiving ACS and use of CPG amongst consumers. Methods: Consumers were recruited from neonatal units across three district health boards (DHBs) in Auckland, New Zealand. Participants completed a semi-structured interview or

questionnaire. The questions posed and analyses were informed by the Theoretical Domains Framework (TDF). Barriers and enablers were identified by the presence of conflicting beliefs within a domain; the frequency of beliefs; and the likely strength of the impact of a belief on use of CPG and receipt of ACS. Results: Twenty four consumers participated in the study. Six domains were identified as barriers to receipt of ACS and use of CPG. Key barriers to receipt of ACS included: difficulty retaining information conveyed, requiring further information in a variety of formats, and time constraints faced by consumers and health professionals in the provision and understanding of information to facilitate decision making. Barriers to use of CPG included: uncertainty about applicability of guideline use among consumers and scepticism about health professionals adhering too rigidly to guidelines. Enablers to receipt of ACS included: optimism toward ACS use, a strong knowledge of why ACS were administered, improved resilience in their pregnancy and confidence in their decision making following receipt of information about ACS. Enablers to use of CPG included: validation and standardisation of decision making among health professionals providing care and facilitating the best care for women and their babies. Conclusions: Key barriers and enablers exist among consumers regarding receipt of ACS and use of CPG. These need to be addressed or modified in any intervention strategy to facilitate implementation of the ACS CPG.

Title: Exploring resilience in nursing and midwifery students: a literature review

Journal: Journal of Advanced Nursing

Volume: 72

Issue: 10

Pages: 2272-2283

Date: Oct

Short Title: Exploring resilience in nursing and midwifery students: a literature review

ISSN: 0309-2402

DOI: 10.1111/jan.12960

Accession Number: WOS:000383626900003

Abstract: Aim. The aim of this study was to explore the concepts of ;'resilience' and 'hardiness' in nursing and midwifery students in educational settings and to identify educational interventions to promote resilience. Background. Resilience in healthcare professionals has gained increasing attention globally, yet to date resilience and resilience education in nursing and midwifery students remain largely under-researched. Design. An integrative

literature review was planned, however, only quantitative evidence was identified therefore, a review of quantitative studies was undertaken using a systematic approach. Data sources. A comprehensive search was undertaken using Medline, CINAHL, Embase, PsycINFO and Maternity and Infant Care databases January 1980–February 2015. Review methods. Data were extracted using a specifically designed form and quality assessed using an appropriate checklist. A narrative summary of findings and statistical outcomes was undertaken. Results. Eight quantitative studies were included. Research relating to resilience and resilience education in nursing and midwifery students is sparse. There is a weak evidence that resilience and hardiness is associated with slightly improved academic performance and decreased burnout. However, studies were heterogeneous in design and limited by poor methodological quality. No study specifically considered student midwives. Conclusion. A greater understanding of the theoretical underpinnings of resilience in nursing and midwifery students is essential for the development of educational resources. It is imperative that future research considers both nursing and midwifery training cohorts and should be of strong methodological quality.

Title: Protocol for a randomised controlled feasibility trial of exercise rehabilitation for people with postural tachycardia syndrome: the PULSE study

Journal: Pilot and Feasibility Studies

Volume: 6

Issue: 1

Short Title: Protocol for a randomised controlled feasibility trial of exercise rehabilitation for people with postural tachycardia syndrome: the PULSE study

DOI: 10.1186/s40814-020-00702-1

Article Number: 157

Accession Number: WOS:000729238200163

Abstract: Background Postural orthostatic tachycardia syndrome (POTS) is an autonomic nervous system disorder causing an abnormal cardiovascular response to upright posture. It affects around 0.2% of the population, most commonly women aged 13 to 50 years. POTS can be debilitating; prolonged episodes of pre-syncope and fatigue can severely affect activities of daily living and health-related quality of life (HRQoL). Medical treatment is limited and not supported by randomised controlled trial (RCT) evidence. Lifestyle interventions are first-line treatment, including increased fluid and salt intake, compression tights and isometric counter-pressure manoeuvres to prevent fainting. Observational studies and small RCTs

suggest exercise training may improve symptoms and HRQoL in POTS, but evidence quality is low. Methods Sixty-two people (aged 18–40 years) with a confirmed diagnosis of POTS will be invited to enrol on a feasibility RCT with embedded qualitative study. The primary outcome will be feasibility; process-related measures will include the number of people eligible, recruited, randomised and withdrawn, along with indicators of exercise programme adherence and acceptability. Secondary physiological, clinical and health-related outcomes including sub-maximal recumbent bike exercise test, active stand test and HRQoL will be measured at 4 and 7 months post-randomisation by researchers blinded to treatment allocation. The Postural Tachycardia Syndrome Exercise (PULSE) intervention consists of (1) individual assessment; (2) 12-week, once to twice-weekly, supervised out-patient exercise training; (3) behavioural and motivational support; and (4) guided lifestyle physical activity. The control intervention will be best-practice usual care with a single 30-min, one-to-one practitioner appointment, and general advice on safe and effective physical activity. For the embedded qualitative study, participants (n = 10 intervention, n = 10 control) will be interviewed at baseline and 4 months post-randomisation to assess acceptability and the feasibility of progressing to a definitive trial. Discussion There is very little high-quality research investigating exercise rehabilitation for people with POTS. The PULSE study will be the first randomised trial to assess the feasibility of conducting a definitive multicentre RCT testing supervised exercise rehabilitation with behavioural and motivational support, compared to best-practice usual care, for people with POTS. Trial registration ISRCTN45323485 registered on 7 April 2020.

Title: Does education improve adherence to a training monitoring program in recreational athletes?

Journal: International Journal of Sports Science & Coaching

Volume: 18

Issue: 1

Pages: 101-113

Date: Feb

Short Title: Does education improve adherence to a training

monitoring program in recreational athletes?

ISSN: 1747-9541

DOI: 10.1177/174795412111070789

Article Number: 174795412111070789

Accession Number: WOS:000751389200001

Abstract: Monitoring athletes' training may help prevent negative consequences such as overtraining and burnout. However, acceptance or willingness of athletes to participate is a barrier to an effective training monitoring program. Educational strategies may potentially increase adherence. Therefore, our aims are to i) assess the impact of training monitoring education on adherence to a monitoring program; ii) determine the effect of the education intervention on burnout, stress, and recovery, and; iii) qualitatively investigate athlete perspectives of the education and training monitoring experience. Recreational athletes (18 male/17 female; age = 42.6 +/- 12.0) were randomised to either a control (n = 19) or education (n = 16) group and completed daily training monitoring through a smartphone application over 10 weeks. Pre-post assessments using the Athlete Burnout Questionnaire, the Acute Recovery Stress Scale, and a perceived knowledge of training monitoring questionnaire, and semi-structured interviews were performed. Adherence was low, with no differences between the control group ([mean +/- SD]; 43.0 +/- 38.8%) and the education group (45.8 +/- 36.7%). There were also no differences (p >0.05) between the groups on the standardised inventories. There was a significant effect of time (p <0.001) on participant's perceived understanding of training monitoring tools (scored out of 42) at the end of the washout period (Control: 24.4 +/- 6.6; Education: 28.5 +/- 5.6) and post-study (Control: 32.1 +/- 7.5; Education: 35.1 +/- 6.0) compared to the pre-study (Control: 21.5 +/- 7.3; Education: 21.9 +/- 7.7). Interviews revealed participants wanted more education on modifying their training, and feedback on their data. Our findings suggest this specific educational approach was not enough to increase adherence; other aspects of education and individual feedback needs to be further explored.

Short Title: Responsive Feeding Environments in Childcare Settings: A Scoping Review of the Factors Influencing Implementation and Sustainability

DOI: 10.3390/ijerph191911870

Article Number: 11870

Accession Number: WOS:000867896800001

Abstract: Children benefit from responsive feeding environments, where their internal signals of hunger and satiety are recognized and met with prompt, emotionally supportive and developmentally appropriate responses. Although there is existing research on responsive feeding environments in childcare, there is little synthesized literature on the implementation practices using a behavior change framework. This scoping review sought to explore the factors influencing the implementation and sustainability of responsive feeding interventions in the childcare environment, using the behavior change wheel (BCW). A total of 3197 articles were independently reviewed and 39 met the inclusion criteria. A thematic analysis identified the factors influencing the implementation and sustainability of responsive feeding, including the following: (1) pre-existing nutrition policies, (2) education and training, (3) provider beliefs and confidence, (4) partnership development and stakeholder engagement and (5) resource availability. The most common BCW intervention functions were education (n = 39), training (n = 38), environmental restructuring (n = 38) and enablement (n = 36). The most common policy categories included guidelines (n = 39), service provision (n = 38) and environmental/social planning (n = 38). The current literature suggests that broader policies are important for responsive feeding, along with local partnerships, training and resources, to increase confidence and efficacy among educators. Future research should consider how the use of a BCW framework may help to address the barriers to implementation and sustainability.

Short Title: Barriers and facilitators of physical activity participation for young people and adults with childhood-onset physical disability: a mixed methods systematic review

ISSN: 0012-1622

DOI: 10.1111/dmcn.14830

Accession Number: WOS:000616179900001

Abstract: Aim To understand the attitudes, barriers, and facilitators to physical activity participation for young people and adults with childhood-onset physical disability. Method Seven electronic databases (Embase, MEDLINE, PsychINFO, AMED, CINAHL, SPORTDiscus, and ERIC) were searched to November 2019. English language studies were included if they investigated attitudes, barriers, or facilitators to physical activity for young people (\geq 15y) or adults with childhood-onset physical disabilities. Two reviewers applied eligibility criteria and assessed methodological quality. Data were synthesized in three stages: (1) thematic analysis into descriptive themes, (2) thematic synthesis via conceptual framework, and (3) an interpretive synthesis of the thematic results. Results Nineteen studies were included.

Methodological quality varied, with only four qualitative studies and one quantitative study meeting all quality items. An overarching theme of 'finding the right balance' emerged. Six subthemes relating to capability, opportunity, and motivation contributed to physical activity participation being seen as 'the right fit' or 'all too hard'. The interpretive synthesis found social connections, social environment support, and an appropriate physical environment were essential to 'finding the right balance' to be physically active. Interpretation Physical activity participation for young people and adults with childhood-onset physical disabilities is primarily influenced by the social and physical environment.

Abstract: Background: Dementia is a common and complex condition. Evidence-based guidelines for the management of people with dementia in general practice exist; however, detection, diagnosis and disclosure of dementia have been identified as potential evidence-practice gaps. Interventions to implement guidelines into practice have had varying success. The use of theory in designing implementation interventions has been limited, but is advocated because of its potential to yield more effective interventions and aid understanding of factors modifying the magnitude of intervention effects across trials. This protocol describes methods of a randomised trial that tests a theory-informed implementation intervention that, if effective, may provide benefits for patients with dementia and their carers. **Aims:** This trial aims to estimate the effectiveness of a theory-informed intervention to increase GPs' (in Victoria, Australia) adherence to a clinical guideline for the detection, diagnosis, and management of dementia in general practice, compared with providing GPs with a printed copy of the guideline. **Primary objectives** include testing if the intervention is effective in increasing the percentage of patients with suspected cognitive impairment who receive care consistent with two key guideline recommendations: receipt of a i) formal cognitive assessment, and ii) depression assessment using a validated scale (primary outcomes for the trial). **Methods:** The design is a parallel cluster randomised trial, with clusters being general practices. We aim to recruit 60 practices per group. Practices will be randomised to the intervention and control groups using restricted randomisation. Patients meeting the inclusion criteria, and GPs' detection and diagnosis behaviours directed toward these patients, will be identified and measured via an electronic search of the medical records nine months after the start of the intervention. Practitioners in the control group will receive a printed copy of the guideline. In addition to receipt of the printed guideline, practitioners in the intervention group will be invited to participate in an interactive, opinion leader-led, educational face-to-face workshop. The theory-informed intervention aims to address identified barriers to and enablers of implementation of recommendations. Researchers responsible for identifying the cohort of patients with suspected cognitive impairment, and their detection and diagnosis outcomes, will be blind to group allocation.

Abstract: Background: The process of initiating and maintaining healthy lifestyle behaviours is complex, includes a number of distinct phases and is not static. Theoretical models of behaviour change consider psychological constructs such as intention and self efficacy but do not clearly consider the role of stress or psychological distress. General practice based interventions addressing lifestyle behaviours have been demonstrated to be feasible and effective however it is not clear whether general practitioners (GPs) take psychological health into consideration when discussing lifestyle behaviours. This qualitative study explores GPs' and patients' perspectives about the relationship between external stressors, psychological distress and maintaining healthy lifestyle behaviours. Methods: Semi-structured telephone interviews were conducted with 16 patients and 5 GPs. Transcripts from the interviews were thematically analysed and a conceptual model developed to explain the relationship between external stressors, psychological distress and healthy lifestyle behaviours. Results: Participants were motivated to maintain a healthy lifestyle however they described a range of external factors that impacted on behaviour in both positive and negative ways, either directly or via their impact on psychological distress. The impact of external factors was moderated by coping strategies, beliefs, habits and social support. In some cases the process of changing or maintaining healthy behaviour also caused distress. The concept of a threshold level of distress was evident in the data with patients and GPs describing a certain level of distress required before it negatively influenced behaviour. Conclusion: Maintaining healthy lifestyle behaviours is complex and constantly under challenge from external stressors. Practitioners can assist patients with maintaining

healthy behaviour by providing targeted support to moderate the impact of external stressors.

Title: Barriers and Facilitators to Participating in an Exercise Referral Scheme among Women Living in a Low Socioeconomic Area in Australia: A Qualitative Investigation Using the COM-B and Theoretical Domains Framework

Journal: International Journal of Environmental Research and Public Health

Volume: 19

Issue: 19

Date: Oct

Short Title: Barriers and Facilitators to Participating in an Exercise Referral Scheme among Women Living in a Low Socioeconomic Area in Australia: A Qualitative Investigation Using the COM-B and Theoretical Domains Framework

DOI: 10.3390/ijerph191912312

Article Number: 12312

Accession Number: WOS:000867020500001

Abstract: Introduction: Despite the health benefits of regular physical activity, women experiencing socioeconomic disadvantage are at high risk of inactivity. Reasons are multifactorial but likely include broad structural and contextual factors, e.g., lack of access to physical activity programs, as well as individual and interpersonal factors, e.g., lack of motivation and childcaring responsibilities. Few studies among women of low socioeconomic position (SEP) have explored these factors in-depth, yet an understanding of these factors can help inform the development and improve the uptake of exercise referral schemes. The Theoretical Domains Framework (TDF) and COM-B model (capability, opportunity, motivation and behaviour) were employed to understand behaviours for intervention development. Therefore, using these behaviour change models, this study aimed to explore the barriers and facilitators influencing the use of an exercise referral scheme among women living in a socioeconomically disadvantaged area. Methods: Semi-structured interviews were conducted with women who had registered with a free exercise referral scheme (Live Life Get Active) and living in a low socioeconomic neighbourhood in Sydney, Australia. Reflexive thematic analysis and framework analysis were used to allow naturally identified themes to be determined and then allocated to theoretically driven domains. Results: Nine women were interviewed (aged 30-69 years). Eighteen themes were identified and mapped directly on to the six COM-B constructs. The most reported

barriers to using the physical activity referral scheme related to the opportunity construct of the COM-B model, specifically childcare responsibilities, work commitments and environmental barriers. Key facilitators were enjoyment (motivation), no cost (opportunity), instructor led (opportunity) and social support (opportunity).

Conclusion: Future exercise referral schemes targeting women living in low-SEP neighbourhoods should ensure programs are designed and delivered to overcome barriers aligned with the constructs of the COM-B model, particularly opportunity-related constructs.

Title: Pregnant and Postpartum Women's Perceptions of Barriers to and Enablers of Physical Activity During Pregnancy: A Qualitative Systematic Review

Journal: Journal of Midwifery & Womens Health

Volume: 67

Issue: 4

Pages: 448-462

Date: Jul

Short Title: Pregnant and Postpartum Women's Perceptions of Barriers to and Enablers of Physical Activity During Pregnancy: A Qualitative Systematic Review

ISSN: 1526-9523

DOI: 10.1111/jmwh.13375

Accession Number: WOS:000800581800001

Abstract: Introduction Physical activity throughout pregnancy has been shown to have health benefits for the pregnant person, including reductions in the risk of preeclampsia and gestational weight gain and improvements in blood pressure regulation. Despite the benefits, many pregnant women do not meet the guidelines for physical activity throughout pregnancy. Therefore, it is important to determine what influences women's activity levels during pregnancy. This systematic review of the qualitative literature aimed to determine pregnant and postpartum women's perceptions of barriers to and enablers of physical activity, specifically during pregnancy. Methods MEDLINE, PsycINFO, CINAHL, and Embase were searched systematically to identify qualitative studies investigating pregnant or postpartum women's perceptions of barriers to and enablers of physical activity during pregnancy. Included studies were limited to populations of pregnant or postpartum women, the majority of whom were aged 18 to 40 years, and studies published from 1985 onward. Data quality was assessed using the Critical Appraisal Skills Programme Qualitative Studies Checklist. Data were

extracted using NVivo software and subsequently mapped on the COM-B framework. Results Twenty-five qualitative studies were included in this systematic review. Sixteen themes were identified that mapped onto 6 components of the COM-B framework. Commonly reported barriers to physical activity during pregnancy included pregnancy symptoms, lack of knowledge of what constitutes safe activity, and the opinions of women's social circles. Commonly reported enablers of physical activity during pregnancy were social support and the experienced benefits, including physiologic, psychological, and social benefits. Discussion The results of this systematic review have clinical implications for perinatal care providers, as the overall benefits of physical activity during pregnancy have been well documented in previous studies. The authors recommend clinicians aim to explore pregnant women's perspectives on physical activity during pregnancy in order to be able to address their perceived barriers to and enablers of physical activity during pregnancy.

Title: Refining Online Communication Strategies for Domestic Cat Management

Journal: Anthrozoos

Volume: 30

Issue: 4

Pages: 635-649

Short Title: Refining Online Communication Strategies for Domestic Cat Management

ISSN: 0892-7936

DOI: 10.1080/08927936.2017.1370237

Accession Number: WOS:000416653000008

Abstract: Management of the domestic cat (*Felis catus*) relies on community members adopting appropriate management practices toward both companion and unowned (stray, free-living) animals. Getting people to change their behavior and sustain these changes over time can be a challenging process. To date, very few studies have evaluated the effectiveness of interventions aimed at changing people's behavior toward these cats. This study provides a quantitative and qualitative content analysis of a sample of online cat management communications from 40 different organizations sourced using a general English language web search in 2014/2015. The potential effectiveness of these interventions was assessed using identified best-practice principles of behavior change and persuasive communication. Education through the provision of factbased information to persuade individuals to change their current behaviors was the most popular behavior-change strategy

(88%). Three-quarters of the interventions only scored average or below on the scales that described the ease of use and ability to promote action. Persuasive communication techniques such as commitment, prompts, goal setting, story-telling, descriptive norms, and likable and identifiable messengers were under-used. Other techniques such as the debunking of misinformation and framing of messages were not used effectively. We make suggestions on how to improve the behavioral effectiveness of cat management intervention designs.

DOI: 10.1080/14486563.2023.2173319

Accession Number: WOS:000942309800001

Abstract: Wild dogs pose a major threat to agriculture, biodiversity and community health across many areas of Australia. Coordinated actions are considered one of the most effective methods to minimise this threat, yet many landholders fail to engage. We used a mixed methodology, interviewing 14 wild dog experts and surveying 198 landholders to identify and organise potential drivers and barriers to participation in coordinated actions using the Capability, Opportunity, Motivation (COM) Behavioural model. Landholders' willingness to participate in coordinated control was found to be influenced primarily by their awareness of wild dog problems and motivational factors to join a group. However, segmentation using latent profile analysis highlighted that landholders were not a homogenous group, with each of the identified segments exhibiting their own unique COM profile. The use of the COM model and associated Behaviour Change Wheel framework allowed us to recommend the most appropriate type of interventions to enable practitioners to connect and engage with targeted audiences within their own communities.

Journal: Preventive Veterinary Medicine

Volume: 122

Issue: 3

Pages: 339-344

Date: Dec

Short Title: Born to roam? Surveying cat owners in Tasmania, Australia, to identify the drivers and barriers to cat containment

ISSN: 0167-5877

DOI: 10.1016/j.prevetmed.2015.11.007

Accession Number: WOS:000366780200012

Abstract: Free-roaming domestic cats, *Felis catus*, are a major public nuisance in neighbourhoods across the world, and have been linked to biodiversity loss and a host of community health problems. Owners who let their cats roam, also place their cats at risk of serious injury. One management strategy that is gaining considerable support involves encouraging cat owners to contain their pets within their property. Contemporary behaviour change models highlight the importance of identifying drivers and barriers that encourage and discourage target behaviours such as cat containment. Results from a random dial phone survey of 356 cat owners in northern Tasmania identified four distinct cat containment profiles: owners who contained their cat all the time, owners who only contained their cat at night, owners who sporadically contained their cat with no set routine, and owners who made no attempt to contain their pet. Our results indicated that cat-owners' decisions to contain or not contain their cats were guided by a range of factors including owners' beliefs about their ability to implement an effective containment strategy and their views about the physical and psychological needs of their cats. The results are discussed in terms of improving the behavioural effectiveness of cat containment interventions by selecting appropriate behavioural change tools for the identified drivers and barriers, and developing targeted engagement strategies and messaging. DOI: 10.1016/j.prevetmed.2017.08.005

Accession Number: WOS:000413886400017

Abstract: Owners of free-ranging domestic cats (*Felis catus*) are under increasing pressure to keep their pet contained within their house or yard, in an effort to reduce adverse impacts on cat welfare, ecosystem biodiversity and neighbourhoods. We conducted a randomised online experiment to assess the effectiveness of two persuasive messages to encourage cat owners to contain their pets. A total of 512 Australian cat owners, who currently do not contain their cats, were randomly assigned to view one of three short video messages: one framed to highlight the negative impact of cats' on wildlife and biodiversity ('wildlife protection' frame), one framed to highlight the health and safety benefits of keeping cats contained ('cat benefit' frame), and a control message focused on general information about cats ('neutral' frame). We assessed the impact of these video messages on two post-treatment outcome variables: (1) the intention of owners to contain their cat; and (2) the adoption of containment practices, based on a 4-week follow-up survey. Mediation analysis revealed both the 'wildlife protection' and 'cat benefit' messages increased owners' motivation to contain their cat and their beliefs that they could effectively contain their cat to achieve the desired outcomes (response efficacy). In turn, higher levels of motivation and response efficacy predicted increased cat containment intentions and increased adoption of cat containment. In addition, the response efficacy effects of the 'cat benefit' message were strengthened by the cat owner's bond to their pet, suggesting audience segmentation may improve the effectiveness of interventions. Implications for future intervention development are discussed.

Accession Number: WOS:000361264100008
Abstract: Invasive species wreak an estimated \$1.4 trillion in
damages globally, each year. To have any hope of reducing this
damage, best-practice control strategies must incorporate behavior
change interventions. Traditional interventions, based on the
knowledge-transfer model, assume that if land managers are properly
educated about risks and strategies, they will develop supportive
attitudes and implement appropriate control strategies. However, the
social sciences have produced a large number of behavioral models
and frameworks that demonstrate that knowledge transfer, by itself,
fails to change behavior. The challenge then lies in knowing which
behavioral model to choose, and when, from a potentially
overwhelming 'universe'. In this paper, we review nine behavior
theories relevant to invasive species management. We then introduce
the Behavior Change Wheel as a tool for integrating these theories
into a single practical framework. This framework links drivers of
and barriers to behavior change with intervention strategies and
policies, in what we consider, from an applied perspective, to be an
important advance. Crown Copyright (C) 2015 Published by Elsevier

Short Title: Co-Design of an eHealth Intervention to Reduce Cardiovascular Disease Risk in Male Taxi Drivers: ManGuard

DOI: 10.3390/ijerph192215278

Article Number: 15278

Accession Number: WOS:000887285900001

Abstract: Taxi driving, a male-dominated occupation, is associated with an increased risk of cardiovascular disease (CVD). The increased risk is linked to a high prevalence of modifiable CVD risk factors including overweight/obesity, poor nutrition, smoking, excessive alcohol consumption and physical inactivity. Behaviour change interventions may prove advantageous, yet little research has been conducted to reduce CVD risk in this population. The purpose of this study was to co-design an eHealth intervention, 'ManGuard', to reduce CVD risk in male taxi drivers. The IDEAS framework was utilised to guide the development of the eHealth intervention, with the Behaviour Change Wheel (BCW) incorporated throughout to ensure the intervention was underpinned by behaviour change theory. Development and refinement of ManGuard was guided by current literature, input from a multidisciplinary team, an online survey, a systematic review and meta-analysis, and focus groups (n = 3) with male taxi drivers. Physical inactivity was identified as the prime behavior to change in order to reduce CVD risk in male taxi drivers. Male taxi drivers indicated a preference for an eHealth intervention to be delivered using smartphone technology, with a simple design, providing concise, straightforward, and relatable content, and with the ability to track and monitor progress.

Short Title: An eHealth intervention (ManGuard) to reduce cardiovascular disease risk in male taxi drivers: protocol for a feasibility randomised controlled trial

DOI: 10.1186/s40814-022-01163-4

Article Number: 209

Accession Number: WOS:000855521800002

Abstract: Background: Men are at higher risk than women of developing cardiovascular disease (CVD), and male taxi drivers are a particularly high-risk group because of their typically unhealthy behaviours, such as poor eating habits, smoking and sedentary lifestyle. However, only two studies of behavioural interventions targeting taxi drivers have been identified, one of which reported a high attrition rate. Therefore, an eHealth intervention co-designed by taxi drivers may prove more acceptable and effective. The aim of this study is to assess the feasibility of an eHealth intervention (ManGuard) to reduce CVD risk in male taxi drivers. Methods: A randomised wait-list controlled trial will be conducted with a sample of 30 male taxi drivers to establish feasibility, including recruitment, engagement, and retention rates. Program usability and participant satisfaction will be assessed by a survey completed by all participants at 3 months after allocation. Additionally, an in-depth qualitative process evaluation to explore acceptability of the intervention will be conducted with a subset of participants by semi-structured telephone interviews. Preliminary efficacy of ManGuard for improving key CVD-related outcomes will be assessed, including biomarkers (total cholesterol, HDL cholesterol, LDL cholesterol, triglycerides, and total/HDL cholesterol ratio), blood pressure, anthropometry (body mass index, body fat percentage, and waist circumference), physical activity (accelerometry, and self-report) and psychosocial status (health-related quality of life, self-efficacy, and social support). Outcomes will be assessed at baseline, 7 weeks, and 3 months after group allocation. The wait-list control group will be offered access to the intervention at the completion of data collection. Discussion: eHealth interventions show potential for promoting behaviour change and reducing CVD risk in men, yet there remains a paucity of robust evidence pertaining to male taxi drivers, classified as a high-risk group. This study uses a randomised controlled trial to assess the feasibility of ManGuard for reducing CVD risk in male taxi drivers. It is envisaged that this study will inform a fully powered trial that will determine the effectiveness of eHealth interventions for this high risk and underserved population.

Title: Mechanisms of change of a novel weight loss programme provided by a third sector organisation: a qualitative interview study

Journal: BMC Public Health

Volume: 16

Date: May

Short Title: Mechanisms of change of a novel weight loss programme provided by a third sector organisation: a qualitative interview study

DOI: 10.1186/s12889-016-3063-4

Article Number: 378

Accession Number: WOS:000375524500001

Abstract: **Background:** There is a need for theory-driven studies that explore the underlying mechanisms of change of complex weight loss programmes. Such studies will contribute to the existing evidence-base on how these programmes work and thus inform the future development and evaluation of tailored, effective interventions to tackle overweight and obesity. This study explored the mechanisms by which a novel weight loss programme triggered change amongst participants. The programme, delivered by a third sector organisation, addressed both diet and physical activity. Over a 26 week period participants engaged in three weekly sessions (education and exercise in a large group, exercise in a small group and a one-to-one education and exercise session). Novel aspects included the intensity and duration of the programme, a competitive selection process, milestone physical challenges (e.g. working up to a 5 K and 10 K walk/run during the programme), alumni support (face-to-face and online) and family attendance at exercise sessions. **Methods:** Data were collected through interviews with programme providers (n = 2) and focus groups with participants (n = 12). Discussions were audio-recorded, transcribed and analysed using NVivo10. Published behaviour change frameworks and behaviour change technique taxonomies were used to guide the coding process. **Results:** Clients' interactions with components of the weight loss programme brought about a change in their commitment, knowledge, beliefs about capabilities and social and environmental contexts. Intervention components that generated these changes included the competitive selection process, group and online support, family involvement and overcoming milestone challenges over the 26 week programme. The mechanisms by which these components triggered change differed between participants. **Conclusions:** There is an urgent need to establish robust interventions that can support people who are overweight and obese to achieve a healthy weight and maintain this change. Third sector organisations may be a feasible alternative to private and public sector weight loss programmes. We have presented findings from one example of a novel community-based weight loss programme and identified how the programme components resulted in change amongst the participants. Further research is needed to robustly test the effectiveness, and cost-effectiveness, of this programme.

Short Title: A training programme for community pharmacists to support people living with severe and persistent mental illness:

Intervention mapping in the context of a pandemic

ISSN: 0017-8969

DOI: 10.1177/00178969221130461

Accession Number: WOS:000869942500001

Abstract: Objective: The Bridging the Gap Between Physical and Mental Illness in Community Pharmacy (PharMIbridge) randomised controlled trial (RCT) aims to test the effectiveness of a pharmacist-led support service in improving medication adherence, and the physical and mental health of people living with severe and persistent mental illness compared to a standard medication review service. Method: Using the six-step intervention mapping (IM) framework, this paper describes the development and content of the PharMIbridge pharmacist training programme, an integral part of the RCT implementation, and continuous adaptations made to the process to keep pace with the evolving severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) pandemic in Australia. A Training Working Group comprising health educators, practitioners, mental health consumers and researchers, refined the programme objectives and assisted with developing content and troubleshooting issues related to training delivery for pharmacists randomised to the RCT intervention arm. Results: A 2-day training programme was developed, which included Mental Health First Aid, simulated patient role-plays, and four pre-recorded modules using lectures, demonstration case vignettes, role-play activities and discussion. The programme, co-facilitated by project team members and mentors (pharmacist and consumer educators), aims to enhance pharmacists' mental health literacy, skills and confidence and empower them to engage with this vulnerable population using a strengths-based approach. Pre- and post-training questionnaires and interviews will be used to evaluate the impact of the PharMIbridge training programme. Conclusion: The systematic stepwise method provided by the IM framework highlights the solution-focused approach adopted by the project team and characteristics including adaptability and resilience which enabled training development and implementation across four Australian regions during the SARS-CoV-2 pandemic.

Abstract: Objectives Behavioural and cognitive-behavioural theories, models and frameworks have been incorporated for decades in behavioural and social oral health sciences, oral health care, and education of dentists, hygienists, and other oral healthcare professionals. Methods While a myriad of these conceptualizations have been incorporated in this work, there are six of them that have

had the greatest impact in the oral health arena: (a) Health Belief Model; (b) Theory of Reasoned Action, Theory of Planned Behavior and Integrated Behavioral Model, which are considered in unison; (c) Social Learning Theory and Social Cognitive Theory which are considered together; (d) Transtheoretical Model/Stages of Change Model; (e) Salutogenesis Model/Theory and Sense of Coherence Framework; and the (f) Behavior Change Wheel, Capability–Opportunity–Motivation–Behavior Model and Theoretical Domains Framework, which are categorized together. ResultsAn analysis of nomenclature (i.e. theories, models, frameworks and conceptualizations) is provided in the context of a description of each of these theories and models, with discussion about their aspects that particularly relate to oral health. Additionally, a quantitative, longitudinal view is provided of the frequency of use of these theories and models in the oral health arena. Given the benefits of theory-based intervention development, dissemination and implementation, it is important to consider these theories and models in a collective context. ConclusionsAt a basic level, these theories and models help in identifying and acting on mechanisms, both of behaviour itself and behaviour change. Future directions are discussed in terms of need for theory evolution and development.

ISSN: 2044-6055

DOI: 10.1136/bmjopen-2022-061027

Article Number: e061027

Accession Number: WOS:000841801100007

Abstract: Objectives To explore public reactions to the COVID-19 pandemic across diverse ethnic groups. Design Remote qualitative interviews and focus groups in English or Punjabi. Data were transcribed and analysed through inductive thematic analysis. Setting England and Wales, June to October 2020. Participants 100 participants from 19 diverse 'self-identified' ethnic groups. Results Dismay, frustration and altruism were reported across all ethnic groups during the first 6–9 months of the COVID-19 pandemic.

Dismay was caused by participants' reported individual, family and community risks, and loss of support networks. Frustration was caused by reported lack of recognition of the efforts of ethnic minority groups (EMGs), inaction by government to address COVID-19 and inequalities, rule breaking by government advisors, changing government rules around: border controls, personal protective equipment, social distancing, eating out, and perceived poor communication around COVID-19 and the Public Health England COVID-19 disparities report (leading to reported increased racism and social isolation). Altruism was felt by all, in the resilience of National Health Service (NHS) staff and their communities and families pulling together. Data, participants' suggested actions and the behaviour change wheel informed suggested interventions and policies to help control COVID-19. Conclusion To improve trust and compliance future reports or guidance should clearly explain any stated differences in health outcomes by ethnicity or other risk group, including specific messages for these groups and concrete actions to minimise any risks. Messaging should reflect the uncertainty in data or advice and how guidance may change going forward as new evidence becomes available. A contingency plan is needed to mitigate the impact of COVID-19 across all communities including EMGs, the vulnerable and socially disadvantaged individuals, in preparation for any rise in cases and for future pandemics. Equality across ethnicities for healthcare is essential, and the NHS and local communities will need to be supported to attain this.

Title: A scoping review to ascertain the parameters for an evidence synthesis of psychological interventions to improve work and wellbeing outcomes among employees with chronic pain

Journal: Health Psychology and Behavioral Medicine

Volume: 9

Issue: 1

Pages: 25-47

Date: Jan

Short Title: A scoping review to ascertain the parameters for an evidence synthesis of psychological interventions to improve work and wellbeing outcomes among employees with chronic pain

ISSN: 2164-2850

DOI: 10.1080/21642850.2020.1863809

Accession Number: WOS:000614408200001

Abstract: Background: Psychological interventions have mixed effects on improving employee outcomes, partly due to significant variability across studies and a lack of focus on mechanisms of action. This scoping review reports on the parameters of these interventions and examines intervention content to bring clarity to this heterogeneous topic area and direct future systematic review work. Method: Six databases were searched (Cinahl, Cochrane, Embase, Medline, PsychINFO and Web of Science) from April 2010 to August 2020, and a grey literature search was undertaken. Screening was undertaken independently by two authors. The results summarised country, participant and employment characteristics, psychological interventions and work, health and wellbeing outcomes. 10% of the papers were analysed to determine the feasibility of coding intervention descriptions for theory and behaviour change technique (BCT) components. Results: Database searches yielded 9341 titles, of which 91 studies were included. Most studies were conducted in Europe (78%) and included males and females (95%) ranging in age from 31–56.6 years although other demographic, and employment information was lacking. Musculoskeletal pain was common (87%). Psychological interventions commonly included cognitive behavioural therapy (30%) and education (28%). Most studies employed a randomised control trial design (64%). Over half contained a control group (54%). Interventions were delivered in mostly healthcare settings (72%) by health professionals. Multiple outcomes were often reported, many of which involved measuring sickness absence and return-to-work (62%) and pain and general health (53%). Within the feasibility analysis, most papers met the minimum criteria of containing one paragraph of intervention description, but none explicitly mentioned theory or BCTs. Conclusion: Psychological interventions for employees with chronic pain vary in their nature and implementation. We have shown scoping reviews can be used to assess the feasibility of applying tools from health psychology to identify the content of these interventions in future systematic review work to improve intervention development.

Short Title: What helps or hinders midwives to implement physical

activity guidelines for obese pregnant women? A questionnaire survey using the Theoretical Domains Framework

ISSN: 0266-6138

DOI: 10.1016/j.midw.2016.09.015

Accession Number: WOS:000405375900016

Abstract: Objective: to investigate barriers and facilitators to physical activity (PA) guideline implementation for midwives when advising obese pregnant women. Design: a cross-sectional, self-completion, anonymous questionnaire was designed using the Theoretical Domains Framework. this framework was developed to evaluate the implementation of guidelines by health care professionals. A total of 40 questions were included. These were informed by previous research on pregnant women's and midwives views, knowledge and attitudes to PA, and supported by national evidence based guidelines. Demographic information and free text comments were also collected. Setting: three diverse NHS Trusts in the North East of England. Participants: all midwives employed by two hospital Trusts and the community midwives from the third Trust (n= 375) were invited to participate. Measurements: mean domain scores were calculated. Factor and regression analysis were performed to describe which theoretical domains may be influencing practice. Free text comments were analysed thematically. Findings: 192 (53%) questionnaires were returned. Mean domain scores were highest for social professional role and knowledge, and lowest for skills, beliefs about capabilities and behaviour regulation. Regression analysis indicated that skills and memory/attention/decision domains had a statistically significant influence on midwives discussing PA with obese pregnant women and advising them accordingly. Midwives comments indicated that they felt it was part of their role to discuss PA with all pregnant women but felt they lacked the skills and resources to do so effectively. Key conclusions: midwives seem to have the necessary knowledge about the need/importance of PA advice for obese women and believe it is part of their role, but perceive they lack necessary skills and resources, and do not plan or prioritise the discussion regarding PA with obese pregnant woman.

Title: An Ethnographic Account of the British Equestrian Virtue of Bravery, and Its Implications for Equine Welfare

Journal: Animals

Volume: 11

Issue: 1

Date: Jan

Short Title: An Ethnographic Account of the British Equestrian
Virtue of Bravery, and Its Implications for Equine Welfare

ISSN: 2076-2615

DOI: 10.3390/ani11010188

Article Number: 188

Accession Number: WOS:000609683700001

Abstract: Simple Summary Bravery is an important virtue for British horse riders. This article is based on 14 months of ethnographic research, in which I spent time with horse riders (n = 35), observing their day-to-day lives and recording their riding lessons, competitions and 'yard chatter' in field notes and by Dictaphone. I found that when riders were fearful, they were often ridiculed, excluded and belittled. Riders' capacity to be brave became an issue particularly when horses were thought to be defiant. Riders tried to overcome their 'confidence issues' by 'getting tough'-on both themselves and on their horses-often at the demand of their instructors. When fearful riders sought alternative explanations for problematic equine behaviour (such as a veterinary diagnoses), other riders judged them as avoiding getting to grips with the 'real issues' (their horses' defiance, and their own fear). Programs that aim to help riders to develop confidence without instilling a sense of 'battle' with the horse, and without ridiculing the rider, are likely to have positive implications on equine welfare and human safety. This article describes the virtue of bravery in British equestrian culture and suggests that riders' tactics for bolstering bravery may have negative implications on equine welfare. These observations are based on 14 months of ethnographic research among amateur riders and the professionals who support them (n = 35), utilising participant observation and Dictaphone recordings. Riders suffering from 'confidence issues' could be belittled and excluded. Instructors' approaches towards bolstering bravery involved encouraging riders to 'get tough'-on both themselves and on their horses. Narrative theory is employed in this article to show that riders could demonstrate their own bravery through describing the horse as defiant. Alternate narrative possibilities existed, including describing the horse as needy patient and the rider as care provider. Riders were critically aware that veterinary diagnoses could be sought or avoided in line with riders' own dispositions. 'Diagnoses-seeking' behaviours could be judged negatively by others and seen as evidence of unresolved fearfulness. In conclusion, the British equestrian cultural orientation towards bravery can be associated with stressful or painful training techniques, delayed or missed diagnoses of physiological pathologies, and poor training outcomes. Programs that aim to help riders to develop confidence without instilling a sense of 'battle' with the horse, and without ridiculing the rider, are likely to have positive implications on equine welfare and human safety.

Short Title: Efficacy and cost-effectiveness of a community-based smoke-free-home intervention with or without indoor-air-quality feedback in Bangladesh (MCLASS II): a three-arm, cluster-randomised, controlled trial

ISSN: 2214-109X

Accession Number: WOS:000642463300029

Abstract: Background Exposure to second-hand smoke from tobacco is a major contributor to global morbidity and mortality. We aimed to evaluate the efficacy and cost-effectiveness of a community-based smoke-free-home intervention, with or without indoor-air-quality feedback, in reducing second-hand-smoke exposure in homes in Bangladesh. Methods We did a three-arm, cluster-randomised, controlled trial in Dhaka, Bangladesh, and randomly assigned (1:1:1) mosques and consenting households from their congregations to a smoke-free-home intervention plus indoor-airquality feedback, smoke-free-home intervention only, or usual services. Households were eligible if they had at least one resident attending one of the participating mosques, at least one adult resident (age 18 years or older) who smoked cigarettes or other forms of smoked tobacco (eg, bidi, waterpipe) regularly (on at least 25 days per month), and at least one non-smoking resident of any age. The smoke-free-home intervention consisted of weekly health messages delivered within an Islamic discourse by religious leaders at mosques over 12 weeks. Indoor-air-quality feedback comprised providing households with feedback on their indoor air quality measured over 24 h. Households in the usual services group received no intervention. Masking of participants and mosque leaders was not possible. The primary outcome was the 24-h mean household airborne fine particulate matter (<2.5 microns in diameter [PM 2.5]) concentration (a marker of second-hand smoke) at 12 months after randomisation. Cost-effectiveness was estimated using incremental cost-effectiveness ratios (ICERs). This trial is registered with ISRCTN, 49975452. Findings Between April 11 and Aug 2, 2018, we enrolled 1801 households from 45 mosques. 640 households (35.5%) were assigned to the smoke-free-home intervention plus indoor-air-quality feedback group, 560 (31.1%) to the smoke-free-home intervention only group, and 601 (33.4%) to the usual services group. At 12 months, the adjusted mean difference in household mean 24-h PM 2.5 concentration was $-1.0 \mu\text{g}/\text{m}^3$ (95% CI -12.8 to 10.9 , $p=0.88$) for the smoke-

free-home intervention plus indoor-air-quality feedback group versus the usual services group, 5.0 $\mu\text{g}/\text{m}^3$ (-7.9 to 18.0, $p=0.45$) for the smoke-free-home intervention only group versus the usual services group, and -6.0 $\mu\text{g}/\text{m}^3$ (-18.3 to 6.3, $p=0.34$) for the smoke-free-home intervention plus indoor-air-quality feedback group versus the smoke-free-home intervention only group. The ICER for the smoke-free-home intervention plus indoor-air-quality feedback versus usual services was US\$653 per quality-adjusted life-year (QALY) gained, which was more than the upper limit of the Bangladesh willingness-to-pay threshold of \$427 per QALY. Interpretation The smoke-free-home intervention, with or without indoor-air-quality feedback, was neither effective nor cost-effective in reducing household second-hand-smoke exposure compared with usual services. These interventions are therefore not recommended for Bangladesh. Copyright (C) 2021 The Author(s). Published by Elsevier Ltd. This is an Open Access article under the CC BY 4.0 license.

Issue: 1

Pages: E19-E30

Date: Jul

Short Title: Multiple Risk Behavior Interventions: Meta-analyses of RCTs

ISSN: 0749-3797

DOI: 10.1016/j.amepre.2017.01.032

Accession Number: WOS:000405285900003

Abstract: Context: Multiple risk behaviors are common and associated with developing chronic conditions such as heart disease, cancer, or Type 2 diabetes. A systematic review, meta-analysis, and metaregression of the effectiveness of multiple risk behavior interventions was conducted. Evidence acquisition: Six electronic databases including MEDLINE, EMBASE, and PsycINFO were searched to August 2016. RCTs of non-pharmacologic interventions in general adult populations were selected. Studies targeting specific at-risk groups (such as people screened for cardiovascular risk factors or

obesity) were excluded. Studies were screened independently. Study characteristics and outcomes were extracted and risk of bias assessed by one researcher and checked by another. The Behaviour Change Wheel and Oxford Implementation Index were used to code intervention content and context. Evidence synthesis: Random-effects meta-analyses were conducted. Sixty-nine trials involving 73,873 individuals were included. Interventions mainly comprised education and skills training and were associated with modest improvements in most risk behaviors: increased fruit and vegetable intake (0.31 portions, 95% CI = 0.17, 0.45) and physical activity (standardized mean difference, 0.25; 95% CI = 0.13, 0.38), and reduced fat intake (standardized mean difference, -0.24; 95% CI = -0.36, -0.12). Although reductions in smoking were found (OR = 0.78, 95% CI = 0.68, 0.90), they appeared to be negatively associated with improvement in other behaviors (such as diet and physical activity). Preliminary evidence suggests that sequentially changing smoking alongside other risk behaviors was more effective than simultaneous change. But most studies assessed simultaneous rather than sequential change in risk behaviors; therefore, comparisons are sparse. Follow-up period and intervention characteristics impacted effectiveness for some outcomes. Conclusions: Interventions comprising education (e.g., providing information about behaviors associated with health risks) and skills training (e.g., teaching skills that equip participants to engage in less risky behavior) and targeting multiple risk behaviors concurrently are associated with small changes in diet and physical activity. Although on average smoking was reduced, it appeared changes in smoking were negatively associated with changes in other behaviors, suggesting it may not be optimal to target smoking simultaneously with other risk behaviors. Abstract: Behavioral science units across the world advise policy makers on the use of 'nudge' techniques with the goal to improve health, wealth, and happiness. Nudges use psychology to steer people toward or away from making particular choices by designing choice architectures that frame or highlight options in particular ways. What has been missing from debates on nudging is a systematic consideration of the environments in which they are embedded. We argue that a detailed examination of the wider environment in which the policy issue is situated is essential for designing, implementing, and evaluating policy-making tools, nudge-like or otherwise. Successful policy making requires a good fit between intervention and the environment, otherwise we risk miscasting policy issues and designing futile interventions. Using real-world cases, we characterize the role of the environment in different policy problems and present a basic taxonomy for policy makers to identify critical factors in the environment beyond the confines of the choice architecture.

Abstract: This paper describes the use of program-monitoring data to track program performance and inform activities. Monitoring data were collected as part of an effectiveness trial of multiple micronutrient powders (MNPs) for children 6-18 months in Bihar, India. Communities (n = 70; reaching over 10,000 children) were randomized to receive either counselling on infant and young child feeding or both counselling and MNPs. Government frontline health workers (FLWs) implemented and monitored program activities with support from CARE India and university partners. Monitoring data

were collected over the duration of the entire program to assess program impact pathways using various checklists, which captured information about (a) attendance and training of FLWs at health subcentre meetings, (b) distribution of MNPs, (c) receipt and use of MNPs at the household level, and (d) midline mixed methods survey. At the beginning of the program, 72% of households reported receiving and 53% reported currently consuming MNPs. These numbers fell to 40% and 43% at midline, respectively. The main barrier to use by household was a lack of MNPs, due in part to infrequent FLW distribution. However, FLWs rarely reported MNP shortages at Anganwadi centres. Side effects also emerged as a barrier and were addressed through revised recommendations for MNP use. Qualitative data indicated high community acceptance of MNPs and a good understanding of the program by FLWs. The use of real-time program data allowed for recognition of key program issues and decision-making to enhance program implementation.

DOI: 10.1245/s10434-022-12628-4

Accession Number: WOS:000866314100001

Abstract: Background Compliance with evidence-based treatment guidelines for gastric cancer across the United States is poor. This pilot study aimed to create and evaluate a change package for disseminating information on the staging and treatment of gastric cancer during multidisciplinary tumor boards and for identifying barriers to implementation. Methods The change package included a 10-min video, a brief knowledge assessment, and a discussion guide. Commission on Cancer-accredited sites that perform gastrectomy were invited to participate. Participants completed the Organizational Readiness for Implementing Change (ORIC) scale (range, 12-60) and scales to measure the feasibility, acceptability, and

appropriateness (score range, 4–20). Semi-structured interviews were conducted to further define inner and outer setting barriers. Results Seven centers participated in the study. A total of 74 participants completed the pre-video knowledge assessment, and 55 participants completed the post-video assessment. The recommendations found to be most controversial were separate staging laparoscopy and modified D2 lymphadenectomy. Sum scores were calculated for acceptability (mean, 17.43 +/- 2.51) appropriateness (mean, 16.86 +/- 3.24), and feasibility (mean, 16.14 +/- 3.07) of the change package. The ORIC scores (mean, 46.57 +/- 8.22) correlated with responses to the open-ended questions. The key barriers identified were patient volume, skills in the procedures, and attitudes and beliefs. Conclusions The change package was moderately to highly feasible, appropriate, and acceptable. The activity identified specific recommendations for gastric cancer care that are considered controversial and local barriers to implementation. Future efforts could focus on building skills and knowledge as well as the more difficult issue of attitudes and beliefs.

Title: Patients Retransitioning from Biosimilar TNF alpha Inhibitor to the Corresponding Originator After Initial Transitioning to the Biosimilar: A Systematic Review

Journal: Biodrugs

Volume: 36

Issue: 1

Pages: 27-39

Date: Jan

Short Title: Patients Retransitioning from Biosimilar TNF alpha Inhibitor to the Corresponding Originator After Initial Transitioning to the Biosimilar: A Systematic Review

ISSN: 1173-8804

DOI: 10.1007/s40259-021-00508-4

Accession Number: WOS:000727151000001

Abstract: Background Transitioning patients from an originator to a corresponding biosimilar has been extensively studied in both randomized controlled trials and observational studies. Although transitioning is considered well-tolerated, with no negative impacts on efficacy and/or safety, 2.6–25.8% of patients restart treatment with the originator (retransitioning). Retransitioning to the originator can be considered an indication of biosimilar treatment failure or dissatisfaction with biosimilar treatment. Increasing our knowledge of patients who retransition might help to reduce the

number of patients retransitioning. Objective Our objective was to estimate the cumulative incidence of patients who retransitioned from a tumor necrosis factor (TNF)-alpha inhibitor biosimilar to originator and to explore potential patient, disease, and treatment and implementation strategy factors associated with retransitioning. Method We conducted a systematic literature search in the PubMed, EMBASE, and Cochrane Central Register of controlled trials databases until March 2021. Studies on TNF alpha inhibitors, biosimilar transitioning, and retransitioning were included. Transitioning was defined as switching from an originator to a biosimilar, and retransitioning was defined as switching from an originator to a biosimilar and back to the originator. Characteristics of the studies were descriptively analyzed. Studies were weighted by the number of patients transitioning, and the primary outcome was the median cumulative incidence of retransitioning. For each of the factors related to patient, disease, and treatment and implementation strategy, studies were stratified according to the categories of that factor. The weighted medians and interquartile ranges (IQRs) of the cumulative incidence of retransitioning in these studies were calculated and compared to explore whether a potential association existed between these factors and the cumulative incidence of retransitioning. Results Of 994 screened publications, 37 were included. The weighted median cumulative incidence of retransitioning was 7.6% (IQR 6.8-17.2). Studies that included only patients with inflammatory bowel disease (6.6 vs. 15.1-17.7% for other indications), included only patients with stable disease (7.0 vs. 13.7% for including all patients), and did not offer retransitioning at the introduction of the biosimilar (7.0 vs. 11.1% for studies that offered retransitioning) reported less retransitioning. In addition, the incidence of retransitioning was lower when extra laboratory monitoring was part of the implementation strategy (1.6 vs. 6.1%) and when gainsharing (patients' healthcare directly benefits from financial savings from transitioning) (1.4 vs. 7.2% for studies without gainsharing) was applied. Conclusions In studies on transitioning patients from TNF alpha originator to biosimilar, 8% of patients retransitioned. Retransitioning appeared to be lower in studies that included only patients with stable disease and in studies that did not offer patients the option of retransitioning at the introduction of the biosimilar. In addition, retransitioning appeared to be lower in studies that implemented extra laboratory monitoring as part of the biosimilar implementation strategy. Clinicians should consider implementing these suggestions as they might reduce retransitioning rates and improve the introduction of biosimilars in clinical practice. Accession Number: WOS:000727135100001

Abstract: The COVID-19 pandemic and climate change are two global crises that require collective action. Yet, the inertia typically associated with behavior change to limit climate change stands in contrast to the speed associated with behavior change to stop the spread of COVID-19. Identifying the roots of these differences can help us stimulate climate-friendly behaviors. We assessed the extent to which a number of theory-based drivers underlie behaviors aiming to counter COVID-19 and climate change with an online survey (N = 534). We focused on the role of a number of drivers derived from prominent behavior change theories and meta-analyses in the field, namely, personal threat, threat to close others, threat to vulnerable others, fear, participative efficacy, injunctive and descriptive social norms, and governmental policy perceptions. We investigated (1) what drivers people perceived as most important to engage in behaviors that limit the spread of the COVID-19 pandemic and climate change and (2) the strength of the associations between these drivers and engaging in behaviors that limit the spread of the pandemic and climate change. Results highlight three key drivers for climate change action: changing perceptions of governmental policy and perceptions of threat to close others and priming participative efficacy beliefs.

Abstract: Efficacy beliefs are pivotal for pro-environmental actions but conceptualized and labeled differently across research lines. Based on research from multiple fields in the social sciences, this paper presents a complete synthesis of how seven efficacy beliefs relate to pro-environmental action in the Personal-Collective-Governmental typology (PCG). The goal of this typology is to bridge social science disciplines, spark future research, and help explain environmentally significant behavior. A cross-sectional study (N = 556) confirms, using CFA, that seven efficacy subtypes can be discerned. Further, we used the typology to investigate how the seven efficacy subtypes are associated with a range of pro-environmental actions. OLS regressions showed that different efficacy subtypes are associated with different classes of pro-environmental action (e.g., private sphere behavioral intentions, public sphere behavioral intentions, private sphere policy support, and public sphere policy support). Supplemental Relative Importance Analyses gave an indication of which efficacy subtypes are most important for the different classes of pro-environmental action. This new PCG classification generates novel predictions and enables researchers to select fitting efficacy interventions for specific behaviors.

Article Number: 127134

Accession Number: WOS:000660247500019

Abstract: Transitioning to a circular economy depends on transforming the behaviour of both producers and consumers. Product labelling schemes are regularly offered as a solution to support those shifts. While numerous labelling schemes and related research on the effectiveness of individual schemes exist, it remains unclear how impactful labelling is in supporting circular economy outcomes. The emergence of behavioural public policy presents new opportunities for knowledge translation in this field. This study provides a systematic, succinct overview of evidence using a rapid review methodology, identifying and summarising existing systematic reviews or reports. A comprehensive search was undertaken in three databases of publications between 2000 and 2019, yielding 4,875 citations. Following screening by two independent reviewers, 10 reviews were included. Several key drivers and barriers for adopting product labelling schemes among consumers and businesses were identified. The existing evidence provides limited support for the impact of labelling schemes on behaviour, the environment, and business. Overall, results indicate that eco-labels on their own are an information-based communication tool that is unlikely to create significant shifts in consumer choices or production. Conditions required for schemes to have optimal impact and recommendations to amplify impact drawing on behavioural science are discussed. & nbsp; (c) 2021 Elsevier Ltd. All rights reserved.

DOI: 10.1111/hex.13186

Accession Number: WOS:000605012600001

Abstract: Background Cultural values are crucial to the practice and

impact of patient and public involvement (PPI) in research. Objective To understand different PPI cultures among research teams and the impacts of PPI associated with each culture type. Design A participatory action research design. Setting and participants The setting was 10 palliative care research projects. Seventeen patients and members of the public and 31 researchers participated. Intervention A programme consisting of four components: (1) training and coaching of patients and the public to prepare them for participation in research, (2) tailored coaching of the 10 research teams over 12–18 months, (3) a community of practice, and (4) a qualitative evaluation. Results We identified three cultures types: relationship cultures, task cultures, and control cultures. We identified four areas of impact: the project aim became more relevant to the target audience, methodological reliability increased, the research products were better able to reach the public, and the awareness increased, associated with behavioural changes, among researchers regarding PPI. Discussion A relationship culture appears to be long-lasting due to impacting the behaviours of the researchers during future projects. Different cultural types require different types of patients and researcher participants, assigned to different tasks. Conclusions Further research remains necessary to investigate the support required by researchers to enable relationship- and task-oriented PPI cultures. Patient or public contribution Patient advocates and representatives contributed to our research team throughout the entire research process, as well as within the 10 implementation projects. Abstract: Improving medication adherence is a critically important, but often enigmatic objective of patients, providers, and the overall health care system. Increasing medication adherence has the potential to reduce health care costs while improving care quality, patient satisfaction and health outcomes. While there are a number of papers that describe the benefits of medication adherence in terms of cost, safety, outcomes, or quality of life, there are limited reviews that consider how best to seamlessly integrate tools and processes directed at improving medication adherence. We will

address processes for implementing medication adherence interventions with the goal of better informing providers and health care systems regarding the safe and effective use of medications.

Short Title: A mixed-method study examining solutions to common barriers to teachers' adoption of evidence-based classroom practices

ISSN: 0033-3085

DOI: 10.1002/pits.22732

Accession Number: WOS:000793951000001

Abstract: We conducted a mixed-method focus group study to (a) assess the appropriateness and likely effectiveness of strategies that target individual behavior change mechanisms associated with perceived barriers of lack of time and unsupportive leadership and (b) identify recommendations regarding strategies for overcoming the barriers. Sample included 39 school-based staff (80% female, 77% White) across two districts in the Midwest. Mixed methods included a simultaneous approach. Lack of time and unsupportive leadership continue to pervade school-based implementation efforts.

Recommendations centered around the need for school leaders to give teachers the power to re-prioritize how they spend their time as well as providing protected, facilitated time for teachers to collaborate and learn practical skills targeting self-advocacy. Our findings provide compelling evidence for the use of implementation methodology to strategically target mechanisms of individual behavior change during the process of incorporating new and innovative practices in schools.

Short Title: Implementation interventions to improve the management of non-specific low back pain: a systematic review
DOI: 10.1186/s12891-016-1110-z
Article Number: 258
Accession Number: WOS:000378202700001
Abstract: Background: Recommendations in clinical practice guidelines for non-specific low back pain (NSLBP) are not necessarily translated into practice. Multiple studies have investigated different interventions to implement best evidence into clinical practice yet no synthesis of these studies has been carried out to date. The aim of this study was to systematically review available studies to determine whether implementation interventions in this field have been effective and to identify which strategies have been most successful in changing healthcare practitioner behaviours and improving patient outcomes. Methods: A systematic review was undertaken, searching electronic databases until end of December 2012 plus hand searching, writing to key authors and using prior knowledge of the field to identify papers. Included studies evaluated an implementation intervention to improve the management of NSLBP in clinical practice, measured key outcomes regarding change in practitioner behaviour and/or patient outcomes and subjected their data to statistical analysis. The Cochrane Effective Practice and Organisation of Care (EPoC) recommendations about systematic review conduct were followed. Study inclusion, data extraction and study risk of bias assessments were conducted independently by two review authors. Results: Of 7654 potentially eligible citations, 17 papers reporting on 14 studies were included. Risk of bias of included studies was highly variable with 7 of 17 papers rated at high risk. Single intervention or one-off implementation efforts were consistently ineffective in changing clinical practice. Increasing the frequency and duration of implementation interventions led to greater success with those continuously ongoing over time the most successful in improving clinical practice in line with best evidence recommendations. Conclusions: Single intervention or one-off implementation interventions may seem attractive but are largely unsuccessful in effecting meaningful change in clinical practice for NSLBP. Increasing frequency and duration of implementation interventions seems to lead to greater success and the most successful implementation interventions used consistently sustained strategies. Accession Number: WOS:000419897700004

Abstract: This paper describes the development of a Dutch online programme called Long Live Love+ focusing on positive, coercion-free relationships, contraception use, and the prevention of STIs, using the Intervention Mapping (IM) approach. All six steps of the approach were followed. Step 1 confirmed the need for a sexual health programme targeting young people aged 15 and over enrolled in higher level secondary education. Step 2 resulted in the production of a series of matrices-of-changes, including detailed programme objectives at the behavioural and the psycho-social level. Step 3 involved the selection of relevant methods and applications. Step 4 consisted of programme development, resulting in a sexual health programme with online and offline components, and including interactive exercises. Step 5 focused on adoption and implementation and included the production of a detailed teacher manual. Step 6 involved detailed planning for the process and effect evaluation and included interviews with teachers and focus group discussions with students to evaluate their experiences of the programme. The inclusion of a linkage group – and especially the inclusion of teachers in the development of the programme – turned out to be essential in terms of developing a programme in line with their context and needs.

ISSN: 1356–1294

DOI: 10.1111/jep.13660

Accession Number: WOS:000751689800001

Abstract: Rationale, Aims and Objectives The field of implementation science is critical for embedding research evidence into healthcare practice, benefiting individuals, organizations, governments, and the broader community. Implementation science is messy and complex, underpinned by many theories and frameworks. Efficacious interventions for older people with multiple comorbidities exist, yet many lack effectiveness evaluation relevant to pragmatic implementation within aged care practice. This article outlines the conceptualization and development of an Implementation Framework for Aged Care (IFAC), fit-for-purpose for an aged care organization, Bolton Clarke, intent on embedding evidence into practice. **Method** A four-stage process was adopted to (1) explore context and relevant literature to conceptualize the IFAC; (2) identify key elements for a draft IFAC; (3) expand elements and refine the draft in consultation with experts and (4) apply the IFAC to three existing projects, identifying key learnings. A checklist to operationalize the IFAC was then developed. **Results** The IFAC is grounded in codesign principles and encapsulated by the implementation context, from a social, cultural and political perspective. The IFAC addresses the questions of (1) why do we need to change?; (2) what do we know?; (3) who will benefit?; (4) who will make the change?; (5) what strategies will be used?; and (6) what difference are we making? **Three pilot projects:** early adoption of a Wellness and Reablement approach; a care worker and virtual physiotherapist-led program to prevent falls; and a therapeutic horticulture program for residential communities, highlight learnings of applying the IFAC in practice. **Conclusion** This fit-for-purpose IFAC was developed for a proactive and responsive aged care provider. The simplicity of the six-question IFAC is underpinned by substantial theoretical perspectives for its elements and their connections. This complexity is then consolidated into an 18-question checklist to operationalize the IFAC, necessary to advance the translation of evidence into clinical practice.

Short Title: Development of the (sic)Vamos por Mas! parenting program to prevent substance use among Chilean adolescents

ISSN: 0957-4824

DOI: 10.1093/heapro/daad004

Article Number: daad004

Accession Number: WOS:000942370600002

Abstract: In Chile, the prevalence of tobacco, alcohol and drug use among adolescents is very high. Decades of research indicate that parenting interventions reduce these risky behaviors. However, there are no parenting interventions validated in Chile to prevent adolescent substance use. This article reports the development of the (sic)Vamos por Mas! ((sic)VxM!) program following the recommendations of the Medical Research Council's framework for designing and evaluating complex interventions. After identifying key intervention components, a preliminary version of a substance-use prevention program was designed. The preliminary intervention targeted families with adolescents in fifth and sixth grade and had four components: personalized feedback, in-person workshops, virtual engagement, and family support, to deliver positive-youth development and family-strengthening content. Then, students, guardians, school staff and community experts from different school systems (N = 111) evaluated the preliminary version of the program through a convergent parallel mixed methods study, including focus groups (N = 14) and surveys (N = 101). In general, all participants had positive perceptions of the program and valued its purpose, strategies, objectives and contents. Suggestions included expanding the purpose to promote healthy relationships, focusing on schools with low and intermediate socioeconomic vulnerability, including self-control content, removing the personalized feedback component and adding two additional components: school partnership and external supervision, among other improvements. With this information, the final version of the (sic)VxM! program was developed. After a rigorous intervention development process, the (sic)VxM! program is ready to be piloted and evaluated in a randomized trial.

Short Title: A two-component intervention to improve hand hygiene practices and promote alcohol-based hand rub use among people who inject drugs: a mixed-methods evaluation

DOI: 10.1186/s12879-021-05895-1

Article Number: 211

Accession Number: WOS:000624570900004

Abstract: Background Inconsistent hand hygiene puts people who inject drugs (PWID) at high risk of infectious diseases, in particular skin and soft tissue infections. In healthcare settings, handwashing with alcohol-based hand rubs (ABRH) is recommended before aseptic procedures including intravenous injections. We aimed to evaluate the acceptability, safety and preliminary efficacy of an intervention combining ABHR provision and educational training for PWID. **Methods** A mixed-methods design was used including a pre-post quantitative study and a qualitative study. Participants were active PWID recruited in 4 harm reduction programmes of France and followed up for 6 weeks. After baseline assessment, participants received a face-to-face educational intervention. ABHR was then provided throughout the study period. Quantitative data were collected through questionnaires at baseline, and weeks 2 (W2) and 6 (W6) post-intervention. Qualitative data were collected through focus groups with participants who completed the 6-week study. **Results** Among the 59 participants included, 48 (81%) and 43 (73%) attended W2 and W6 visits, respectively. ABHR acceptability was high and adoption rates were 50% (W2) and 61% (W6). Only a minority of participants reported adverse skin reactions (ranging from 2 to 6%). Preliminary efficacy of the intervention was shown through increased hand hygiene frequency (multivariable linear mixed model: coef. W2=0.58, $p=0.002$; coef. W6=0.61, $p=0.002$) and fewer self-reported injecting-related infections (multivariable logistic mixed model: AOR W6=0.23, $p=0.021$). Two focus groups were conducted with 10 participants and showed that young PWID and those living in unstable housing benefited most from the intervention. **Conclusions** ABHR for hand hygiene prior to injection are acceptable to and safe for PWID, particularly those living in unstable housing. The intervention's educational component was crucial to ensure adoption of safe practices. We also provide preliminary evidence of the intervention's efficacy through increased hand hygiene frequency and a reduced risk of infection.

Abstract: Objectives We sought to characterise the role of hospital infection pharmacists in the UK and to understand the core challenges being faced, future role development desires and the required support to address these. Methods We developed a questionnaire underpinned by the theoretical domains framework exploring the barriers and enablers to pharmacists fulfilling their perceived roles and responsibilities. Any pharmacist whose role included 'specialist antimicrobial' or 'infectious diseases' was invited to complete a questionnaire sent via national infection and pharmacy groups/networks. Descriptive statistics were used to report responses to each item, and a content analysis was undertaken to summarize the key messages from an extended response option. Results Of the 102 respondents, 91 (89.2%) were from English hospitals. Fifty-three (52%) were from district general hospitals and 45 (45.1%) from teaching hospitals. Most (97, 95%) respondents were of a senior grade. The need for a comprehensive educational programme, recognition of research as core to the role and integration with infection/microbiology departments were key requirements along with protected time to engage with the activities. Highlights of the role were opportunities to teach, making a significant contribution to patient care and scope to contribute to strategy and vision. The COVID-19 pandemic negatively impacted on respondents' capacity to undertake their perceived roles and responsibilities. Conclusions Our study delineates the need for UK infection and pharmacy policy makers to review hospital infection pharmacist developmental pathways and roles. Joint learning, and closer working, with infection/microbiology departments may be an efficient strategy to address the issues raised.
