

Introduction to Disease Modelling and some advanced techniques

Fabian Sailer (f.sailer@ucl.ac.uk)

Department of Primary Care & Population Health

7th April 2017

Acknowledgements

This presentation presents independent research funded by the National Institute for Health Research School for Primary Care Research (NIHR SPCR).

The views expressed are those of the author(s) and not necessarily those of the NIHR, the NHS or the Department of Health.

What am I going to talk about?

Animal models

Why?

- Inform public health interventions
 - Examine Cost-effectiveness
- Test “what if” scenarios

Doing a trial without actually conducting it

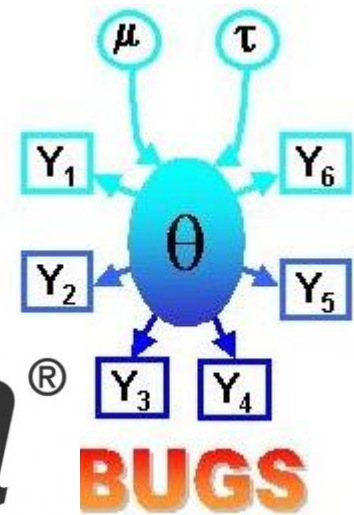

- Predicting the future

How to?

- Software
 - TreeAge
 - WinBUGS
 - Arena
 - ...

Arena
Simulation
Software

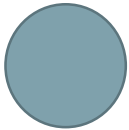

- DIY
 - MS Excel (or similar)
 - R
 - ...

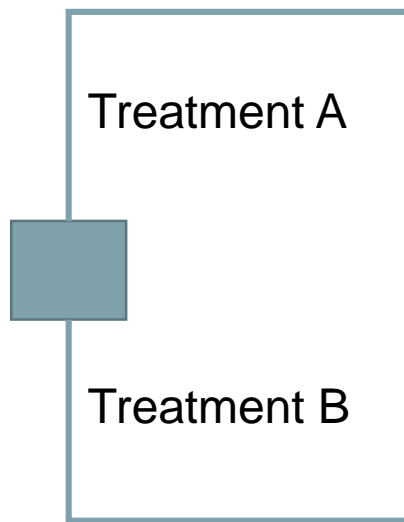

Decision Trees

Structure

- Decision node 
- Chance node 
- Outcome node 

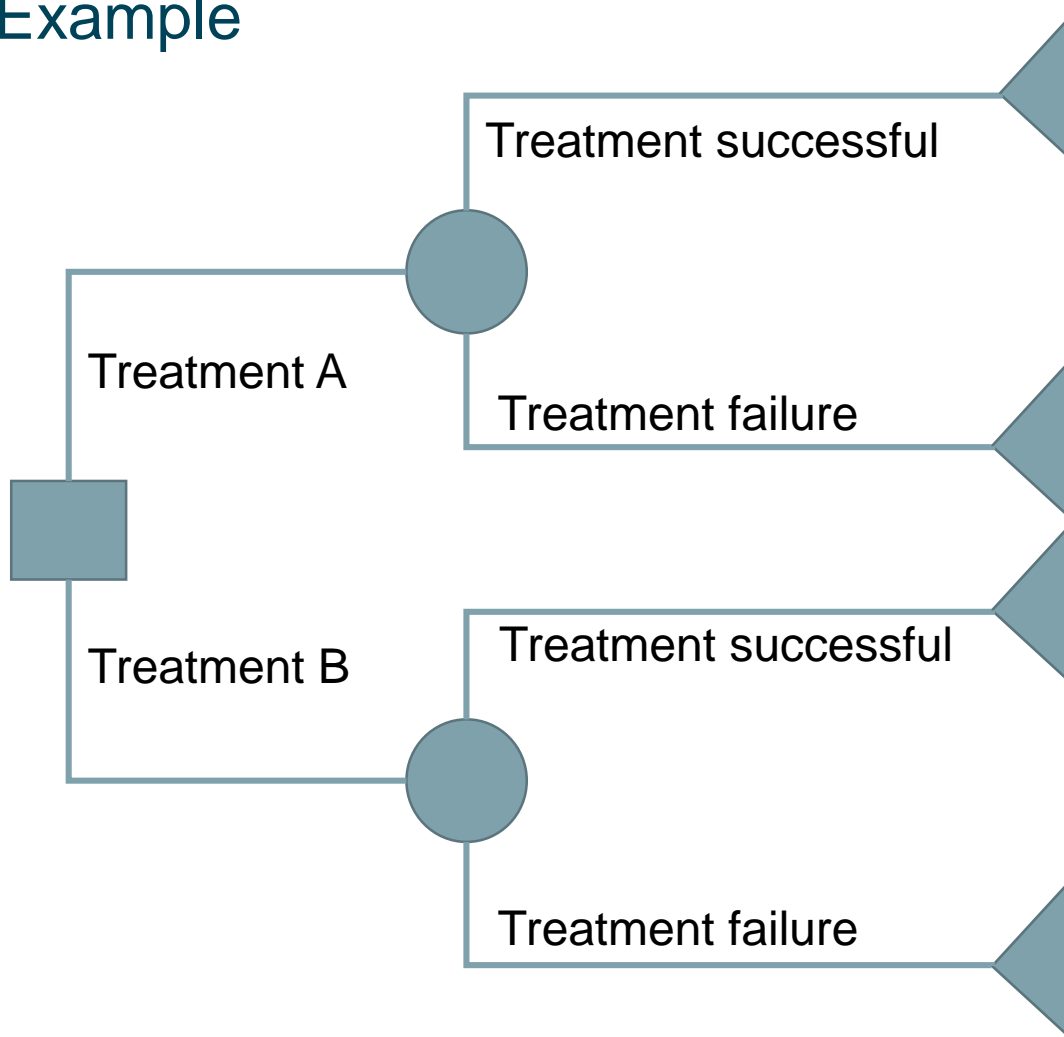

Decision Trees

Example

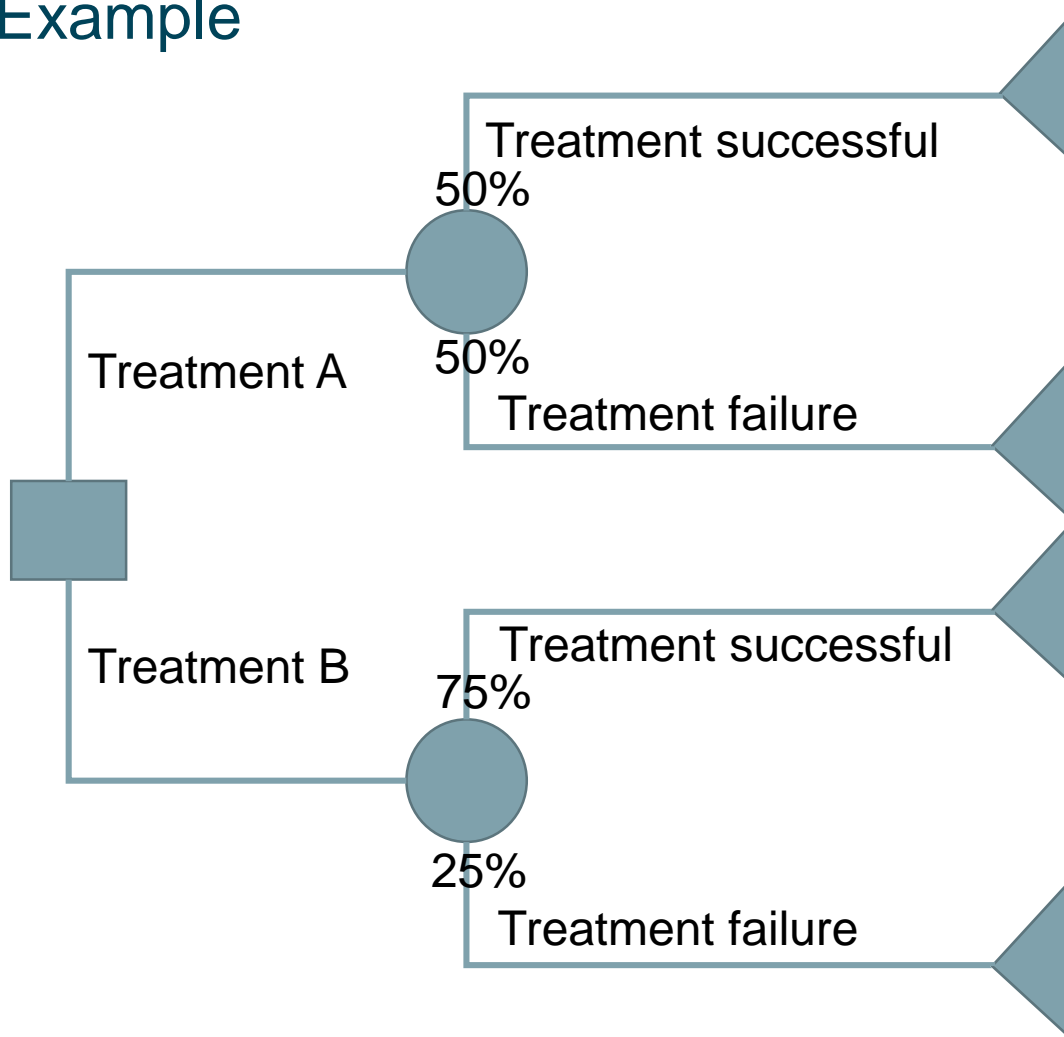

Decision Trees

Decision Trees

Example

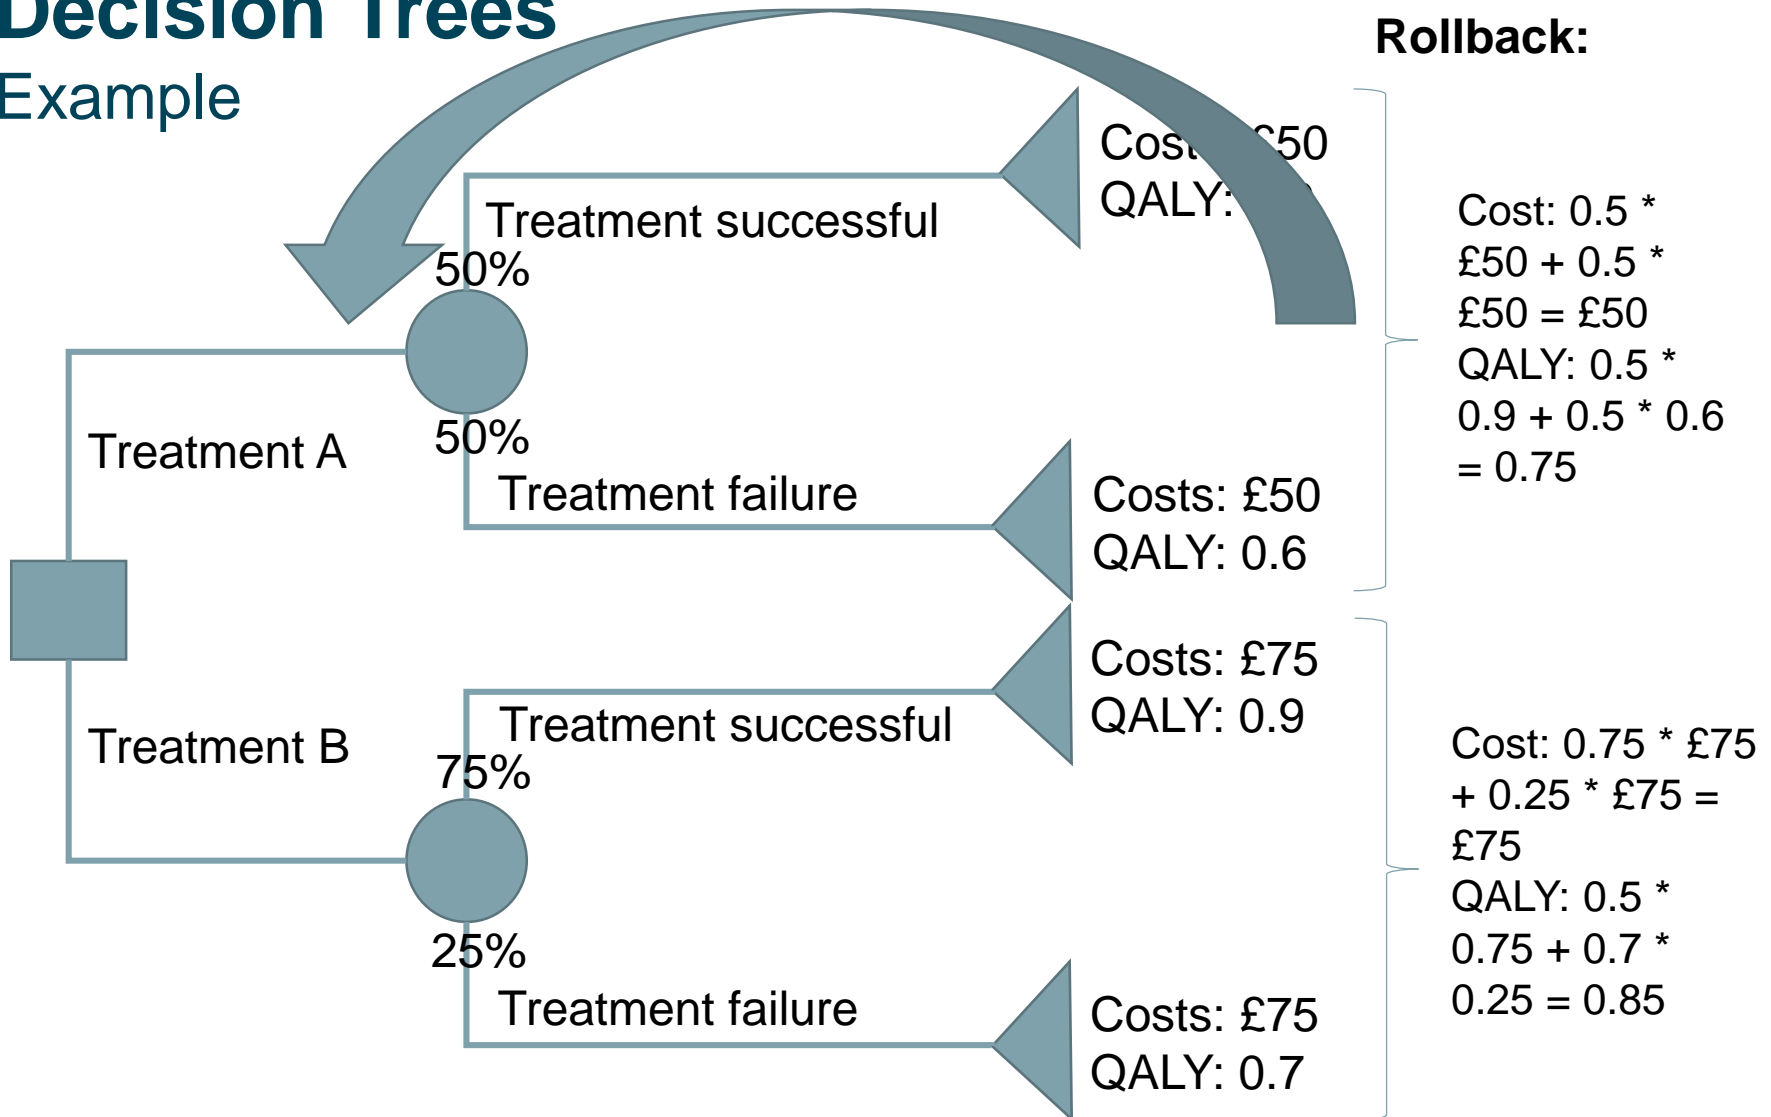

Decision Trees

Example

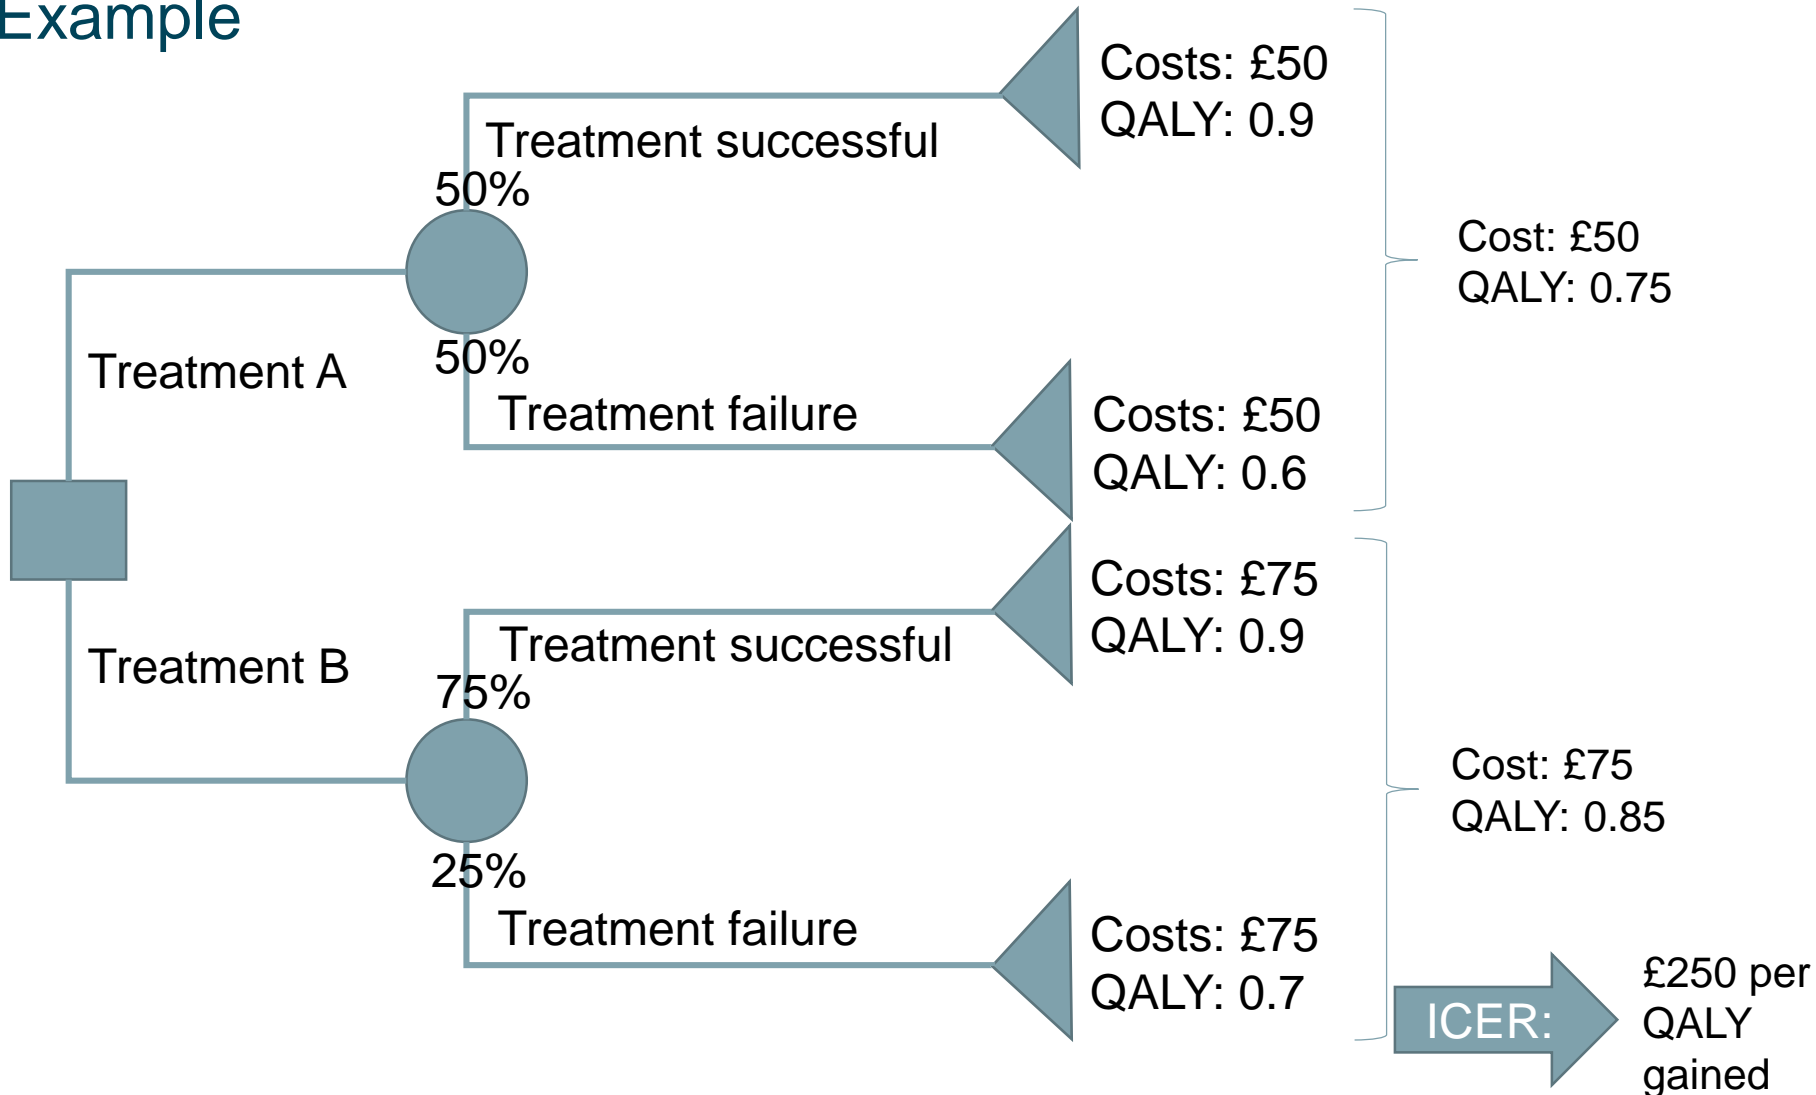

Decision Trees

Detailed Example

Kraut-Becher, J., et al. (2004). "Cost-effectiveness of universal screening for chlamydia and gonorrhea in US jails." *Journal of Urban Health-Bulletin of the New York Academy of Medicine* **81**(3): 453-471.

Decision Trees

Field of Application

- Comparison of distinctive (but similar) interventions
- “Either – or” decisions
- Once-only interventions
- No time component

Decision Trees

Advantages

- Fast calculations
- Easy to understand/ set-up

Decision Trees

Disadvantages/ Limitations

- We need estimates for the whole tree
- Complicated diseases
- Recurrences
- Time

SIR Models

- Individual-based vs **aggregated**
- Compartmental model
 - Susceptible – Infectious – Recovered
 - More sophisticated versions possible

SIR Models

Structure

- Health States

- Transitions

SIR Models

Example

$$S(t) = S(t-1) - a * S(t-1) * I(t-1)$$

$$I(t) = I(t-1) + a * S(t-1) * I(t-1) - b * I(t-1)$$

$$R(t) = R(t-1) + b * I(t-1)$$

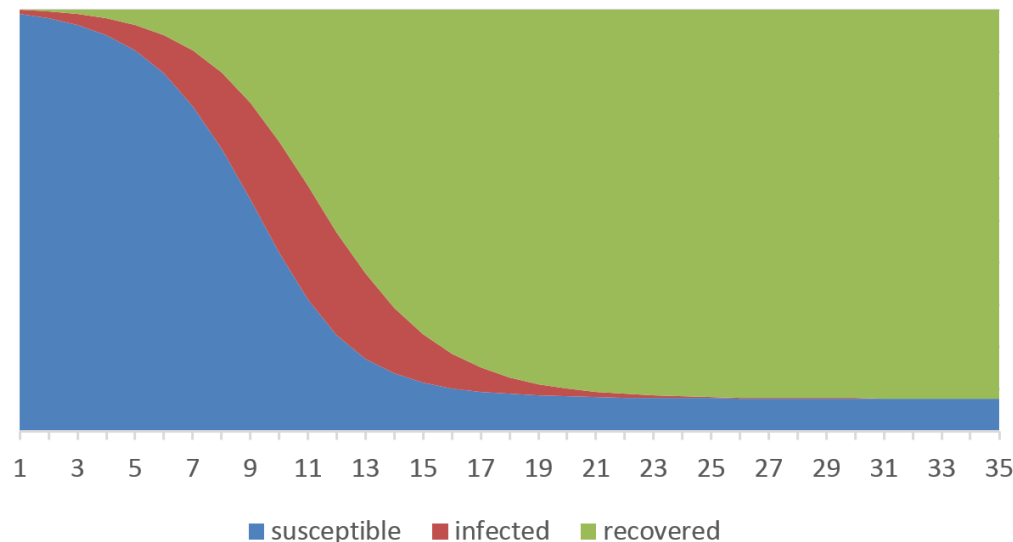

$$S(0) = 9900$$

$$I(0) = 100$$

$$R(0) = 0$$

$$a = 0.0001$$

$$b = 0.4$$

To compare interventions we would need to run the model twice with different input (e.g. different a for vaccination strategies)

SIR Models

Detailed example

HIV progression is divided into three stages of acute, chronic, and advanced, while HSV-2 infection is depicted by the three stages of primary infection, latent infection, and reactivation. Dual infection is characterized by nine stages according to each of HIV and HSV-2 stages.

SIR Models

Detailed example

Fully susceptible population

$$\frac{dS(i)}{dt} = \mu N_0(i) - \mu S(i) - \Lambda_{HIV}^{S(i)} S(i) - \Lambda_{HSV-2}^{S(i)} S(i)$$

HIV infected but HSV-2 susceptible populations $Y_\alpha(i)$

$$\frac{dY_1(i)}{dt} = \Lambda_{HIV}^{S(i)} S(i) - \mu Y_1(i) - \omega_{Y_1} Y_1(i) - g_{Y_1} \Lambda_{HSV-2}^{Y_1(i)} Y_1(i)$$

$$\frac{dY_2(i)}{dt} = \omega_{Y_1} Y_1(i) - \mu Y_2(i) - \omega_{Y_2} Y_2(i) - g_{Y_2} \Lambda_{HSV-2}^{Y_2(i)} Y_2(i)$$

$$\frac{dY_3(i)}{dt} = \omega_{Y_2} Y_2(i) - \mu Y_3(i) - \omega_{Y_3} Y_3(i) - g_{Y_3} \Lambda_{HSV-2}^{Y_3(i)} Y_3(i)$$

HSV-2 seropositive but HIV susceptible populations $I_\beta(i)$

$$\frac{dI_1(i)}{dt} = \Lambda_{HSV-2}^{S(i)} S(i) - \mu I_1(i) - \pi_{I_1} I_1(i) - h_{I_1} \Lambda_{HIV}^{I_1(i)} I_1(i)$$

$$\frac{dI_2(i)}{dt} = \pi_{I_1} I_1(i) - \mu I_2(i) - \pi_{I_2} I_2(i) - h_{I_2} \Lambda_{HIV}^{I_2(i)} I_2(i) + \pi_{I_3} I_3(i)$$

$$\frac{dI_3(i)}{dt} = \pi_{I_2} I_2(i) - \mu I_3(i) - \pi_{I_3} I_3(i) - h_{I_3} \Lambda_{HIV}^{I_3(i)} I_3(i)$$

HIV and HSV-2 dually infected populations $Z_{\alpha,\beta}(i)$

$$\frac{dZ_{1,1}(i)}{dt} = g_{Y_1} \Lambda_{HSV-2}^{Y_1(i)} Y_1(i) + h_{I_1} \Lambda_{HIV}^{I_1(i)} I_1(i) - \mu Z_{1,1}(i) - \omega_{Z_{1,1}} Z_{1,1}(i) - \pi_{Z_{1,1}} Z_{1,1}(i)$$

$$\frac{dZ_{1,2}(i)}{dt} = h_{I_2} \Lambda_{HIV}^{I_2(i)} I_2(i) + \pi_{Z_{1,1}} Z_{1,1}(i) - \mu Z_{1,2}(i) - \omega_{Z_{1,2}} Z_{1,2}(i) - \pi_{Z_{1,2}} Z_{1,2}(i) + \pi_{Z_{1,3}} Z_{1,3}(i)$$

$$\frac{dZ_{1,3}(i)}{dt} = h_{I_3} \Lambda_{HIV}^{I_3(i)} I_3(i) + \pi_{Z_{1,2}} Z_{1,2}(i) - \mu Z_{1,3}(i) - \omega_{Z_{1,3}} Z_{1,3}(i) - \pi_{Z_{1,3}} Z_{1,3}(i)$$

$$\frac{dZ_{2,1}(i)}{dt} = g_{Y_2} \Lambda_{HSV-2}^{Y_2(i)} Y_2(i) + \omega_{Z_{1,1}} Z_{1,1}(i) - \mu Z_{2,1}(i) - \omega_{Z_{2,1}} Z_{2,1}(i) - \pi_{Z_{2,1}} Z_{2,1}(i)$$

$$\frac{dZ_{2,2}(i)}{dt} = \omega_{Z_{1,2}} Z_{1,2}(i) + \pi_{Z_{2,1}} Z_{2,1}(i) - \mu Z_{2,2}(i) - \omega_{Z_{2,2}} Z_{2,2}(i) - \pi_{Z_{2,2}} Z_{2,2}(i) + \pi_{Z_{2,3}} Z_{2,3}(i)$$

$$\frac{dZ_{2,3}(i)}{dt} = \omega_{Z_{1,3}} Z_{1,3}(i) + \pi_{Z_{2,2}} Z_{2,2}(i) - \mu Z_{2,3}(i) - \omega_{Z_{2,3}} Z_{2,3}(i) - \pi_{Z_{2,3}} Z_{2,3}(i)$$

$$\frac{dZ_{3,1}(i)}{dt} = g_{Y_3} \Lambda_{HSV-2}^{Y_3(i)} Y_3(i) + \omega_{Z_{2,1}} Z_{2,1}(i) - \mu Z_{3,1}(i) - \omega_{Z_{3,1}} Z_{3,1}(i) - \pi_{Z_{3,1}} Z_{3,1}(i)$$

$$\frac{dZ_{3,2}(i)}{dt} = \omega_{Z_{2,2}} Z_{2,2}(i) + \pi_{Z_{3,1}} Z_{3,1}(i) - \mu Z_{3,2}(i) - \omega_{Z_{3,2}} Z_{3,2}(i) - \pi_{Z_{3,2}} Z_{3,2}(i) + \pi_{Z_{3,3}} Z_{3,3}(i)$$

$$\frac{dZ_{3,3}(i)}{dt} = \omega_{Z_{2,3}} Z_{2,3}(i) + \pi_{Z_{3,2}} Z_{3,2}(i) - \mu Z_{3,3}(i) - \omega_{Z_{3,3}} Z_{3,3}(i) - \pi_{Z_{3,3}} Z_{3,3}(i)$$

Abu-Raddad LJ, Magaret AS, Celum C, Wald A, Longini IM Jr et al. (2008) Genital Herpes Has Played a More Important Role than Any Other Sexually Transmitted Infection in Driving HIV Prevalence in Africa. PLoS ONE 3(5): e2230. doi:10.1371/journal.pone.0002230

SIR Models

Field of Application

- Epidemic modelling
- Vaccination impact
- Overview vs. Detailed analyses

SIR Models

Advantages

- Broad fields of application
- Time component
- Existing frameworks

SIR Models

Disadvantages/ Limitations

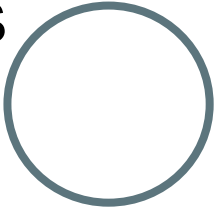

- Input
 - Backfitting might be necessary
- Not very intuitive
 - Mathematical

Markov Models

- Compartmental model
- Markov property/ memorylessness

Markov Models

Structure

- Health States 
- Transitions 
- Time sliced (= cycles)

Markov Models

Example

„to“ state

	healthy	ill	dead
healthy	0.8	0.15	0.05
ill	0.25	0.6	0.15
dead	0	0	1

„from“ state

Initial distribution:

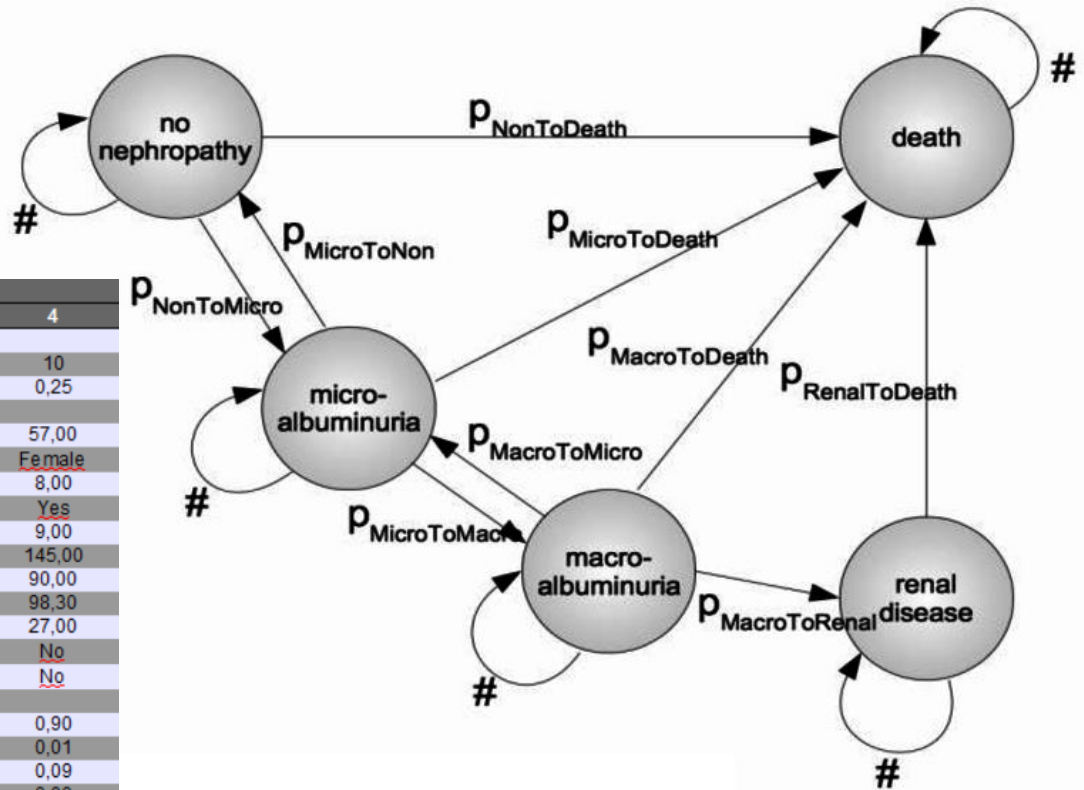

- Healthy: 100%
- Ill: 0%
- Dead: 0%

Markov Models

Detailed Example

parameter	1	2	3	4
<u>subgroup weight</u>				
absolute size	10	10	10	10
relative size	0,25	0,25	0,25	0,25
<u>health state</u>				
initial age [years]	50,00	55,00	60,00	57,00
gender	Male	Male	Female	Female
duration of diabetes [years]	5,00	7,00	7,00	8,00
smoker	Yes	No	No	Yes
HbA1c [%]	8,50	9,00	8,50	9,00
blood pressure (systolic) [mmHg]	140,00	135,00	130,00	145,00
blood pressure (diastolic) [mmHg]	80,00	90,00	85,00	90,00
blood pressure (MAP) [mmHg]	97,50	96,40	96,70	98,30
BMI [kg/m ²]	25,00	30,00	31,00	27,00
anti-hypertensive treatment	Yes	No	No	No
ACE inhibitors / ARB therapy	No	Yes	No	No
<u>initial population</u>				
no nephropathy [%]	0,64	0,93	0,75	0,90
microalbuminuria [%]	0,36	0,07	0,15	0,01
macroalbuminuria [%]	0,00	0,00	0,10	0,09
acute renal disease [%]	0,00	0,00	0,00	0,00
<u>therapy effects</u>				
HbA1c [%]	0,00	0,00	0,00	0,00
blood pressure (systolic) [mmHg]	0,00	0,00	0,00	0,00
blood pressure (diastolic) [mmHg]	0,00	0,00	0,00	0,00
blood pressure (MAP) [mmHg]	0,00	0,00	0,00	0,00

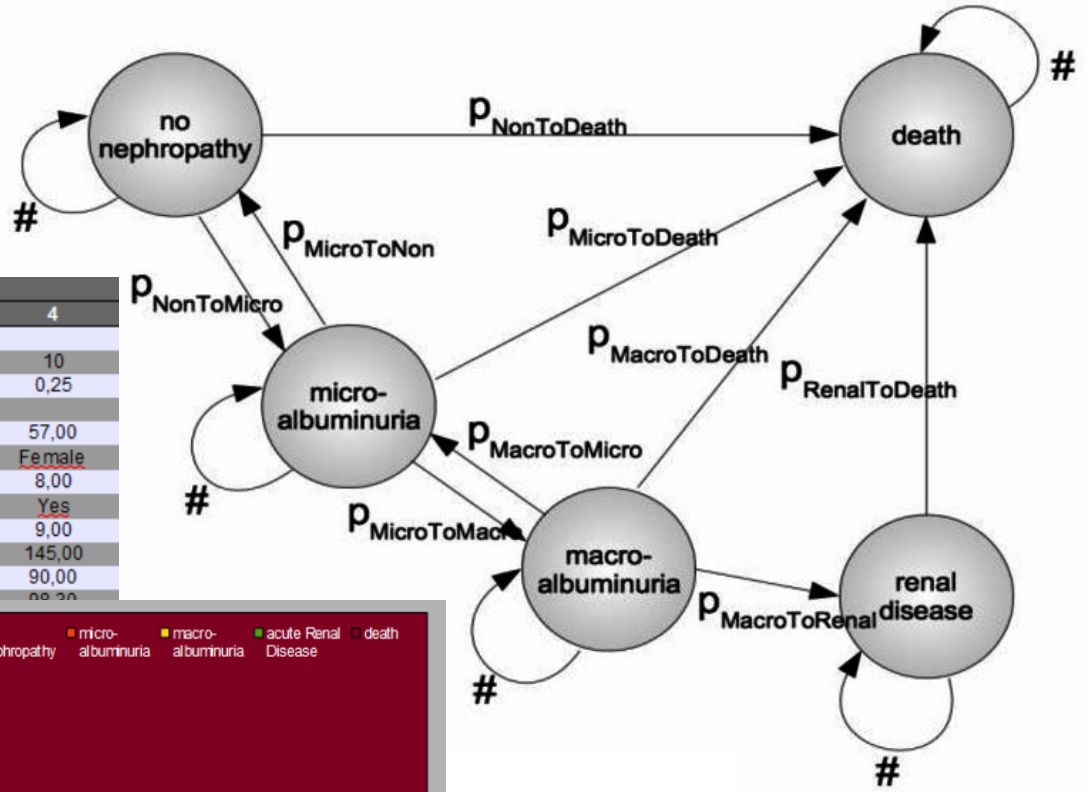

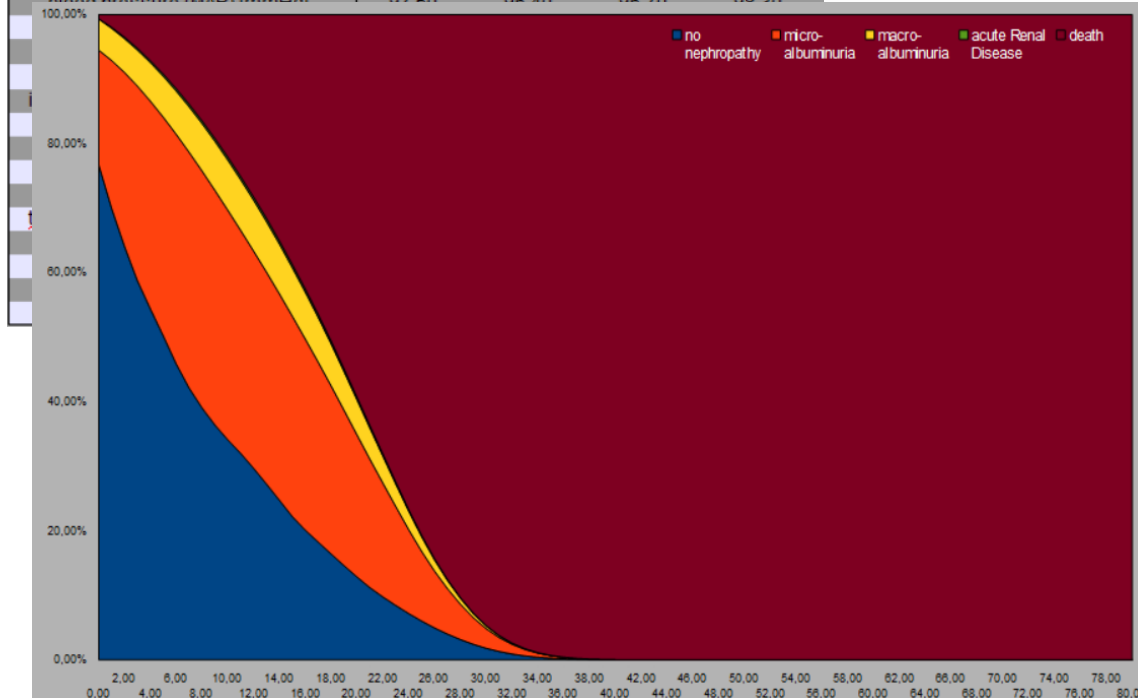

Unifying the Applications and Foundations of Biomedical and Health Informatics J. Mantas et al. (Eds.) IOS Press, 2016 © 2016 The authors and IOS Press. All rights reserved. doi:10.3233/978-1-61499-664-4-115 Academic paper (PDF): PROSIT Open Source Disease Models for Diabetes Mellitus.

Markov Models

Fields of Application

- Non-infectious diseases
 - Diabetes
 - Cancer
- Time-dependencies

Markov Models

Advantages

- Easy to set up
 - Excel
- Existing frameworks
- Many models to learn from

Markov Models

Disadvantages/ Limitations

- Markov property
- Timesteps of fixed length
- Individual differences not regarded

Markov Models

Monte Carlo

- Deterministic vs **stochastic**
 - Individuals instead of parts of cohort

	healthy	ill	dead
healthy	0.8	0.15	0.05
ill	0.25	0.6	0.15
dead	0	0	1

- Transition probabilities instead of proportion of population making transition

Disease modelling

glossary

- Fixed cohort vs open cohort
 - Fixed cohort: observe 10k individuals over a certain time
 - Open cohort: new individuals can enter the model
- Warm-up period
 - Necessary to get a valid initial state before starting to model

Discrete Event simulation

- Calendar-based vs **event-based**
 - Time not in slices of fixed length
- Used for pathway analyses
 - Optimize resource allocation
- Agent based modelling

Discrete Event Simulation

Agents

- Described by attributes
 - Age
 - Male/ Female
- Attributes can be fix, or change over time
 - Sex vs. Age
- Agents can interact

Discrete Event Simulation

Events

- Affect single or multiple agents
 - Death
 - Disease Transmission
- Changes attribute(s) of agents

Discrete Event Simulation

Example – Flu

- Person (25yo) is healthy
 - Only one event in event queue

Event Queue

Year 80 - Death

Discrete Event Simulation

Example – Flu

- Person (25yo) is healthy
 - Only one event in event queue
- Person gets infected
 - „Death“ event gets updated
 - „Curation“ event is added

Event Queue

Year 26 – Death
Year 25 - Cure

Discrete Event Simulation

Example – Flu

- Person (25yo) is healthy
 - Only one event in event queue
- Person gets infected
 - „Death“ event gets updated
 - „Curation“ event is added
- Person cures
 - „Death“ updated again

Event Queue

Year 80 - Death

Discrete Event Simulation

My PhD thesis

- Problem:
 - Many possible updates
 - Time consuming and often unnecessary
- Solution:
 - Multiple queues

What is missing?

- Clinical pathway analyses
- Sexual/ Infectious network analyses
- combined approaches

Evaluation

- Replicate the past
- Sensitivity analyses

Conclusion

*“Everything should be made as simple as possible,
but no simpler.”*
