The second Challenge of Chronic Pain conference will discuss recent discoveries and current challenges in pain research, with a focus on translating basic research insights into new therapies. We will explore the clinical landscape of chronic pain and pain syndromes, the innovative approaches in target validation in animal and human studies, and their translation into novel therapeutic interventions.

Topics will include:
- Chronic pain: the clinical landscape and translational horizons
- CNS processing in acute and chronic pain
- Pain genetics
- Cell biology of pain
- Drug discovery and development
- Neuro-immune interactions
- Imaging

A limited number of bursaries are available. Participants are also invited to attend a Big Data hands-on workshop, visit the website to learn more.
