SYNBIOCHEM

INTRODUCTIONS

Overview

- What is biological information?
- Types of 'omic data
- Basic analysis and tools
- Network analysis of 'omic data

WHAT IS BIOLOGICAL INFORMATION?

Genotype vs. Phenotype

- **Genotype**

- The genetic makeup of an organism
 - An organisms complete set of genes
 - Instructions for building and maintaining
 - Formation of proteins, regulation of metabolism
 - Genetic traits
 - Internally coded- not observed
 - Copied during cell division & reproduction

- **Phenotype**

- Observable physical properties of an organism
 - Appearance, development & behavior

*Phenotype is determined
by an organisms
genotype and ALSO
environmental factors*

Genes + Environment = Phenotype

Central Paradigm of Molecular Biology

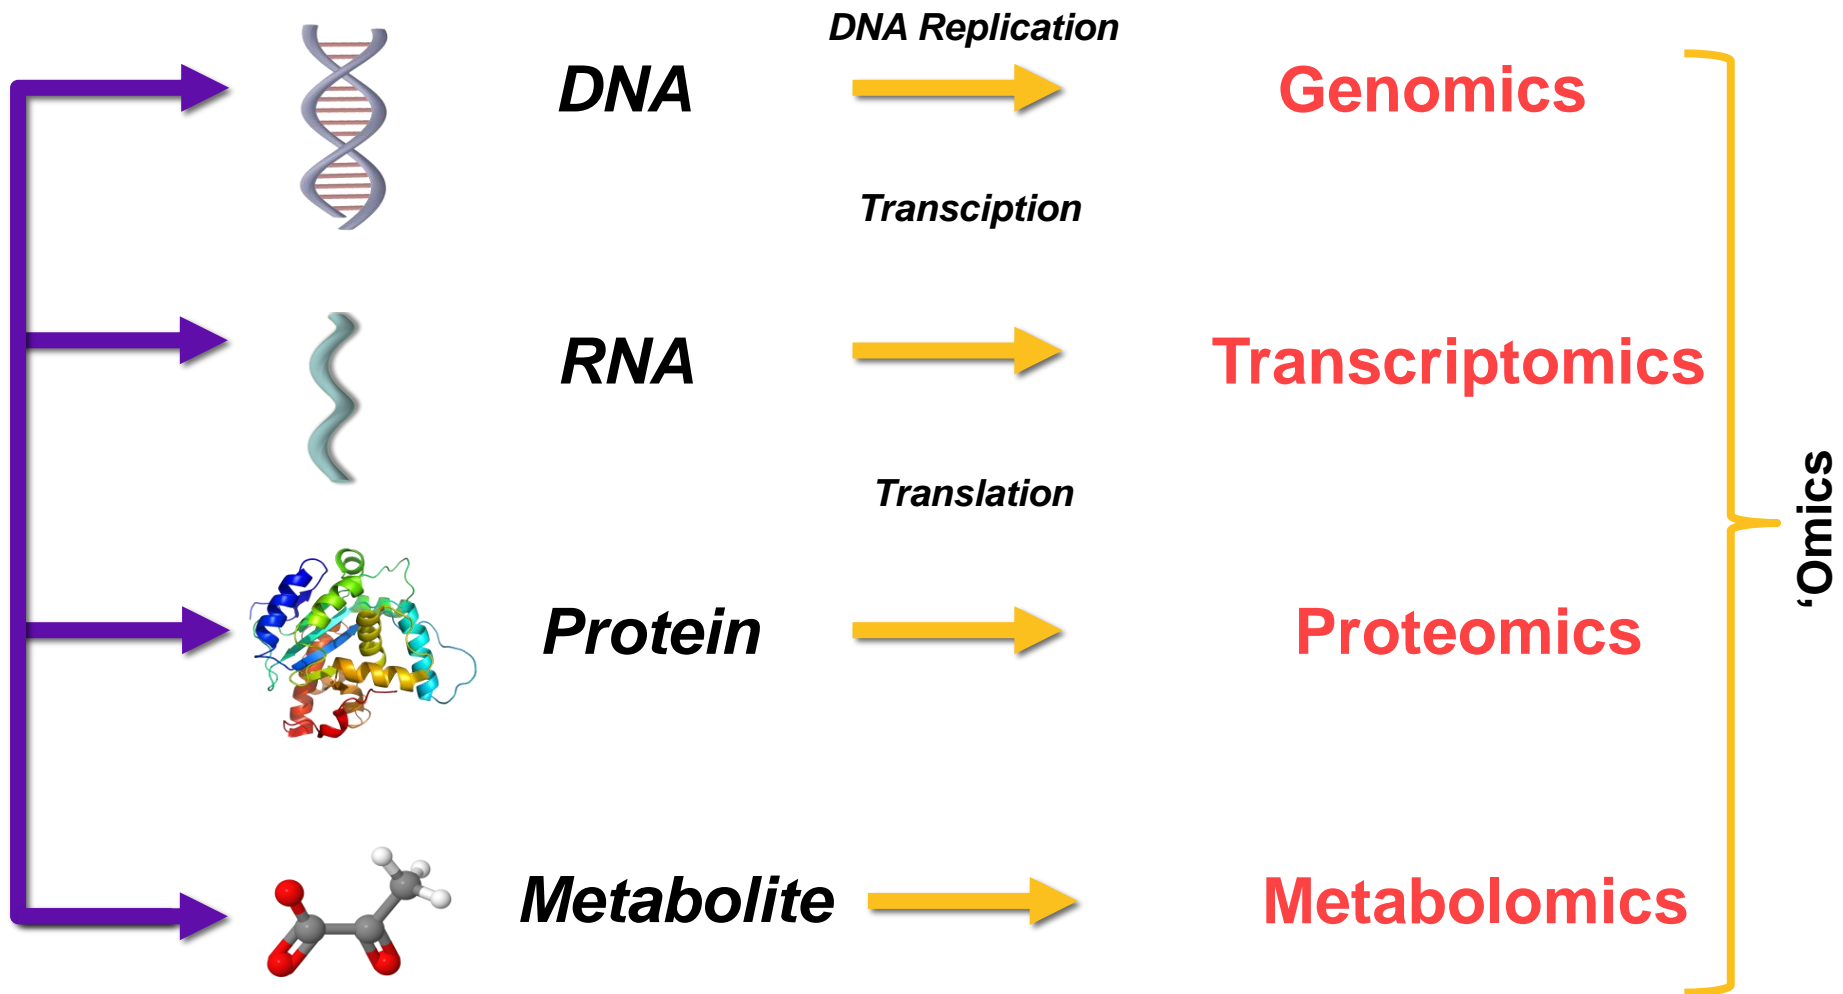

Genes to messenger to proteins

DNA \rightarrow mRNA \rightarrow Protein

Biological information flow

Central dogma of molecular biology

DNA & Genomics

- Deoxyribonucleic acid (DNA)
 - Polymer of nucleotides
 - Sequence of nucleotides is responsible for carrying and retaining hereditary information in a cell – Base Sequence
- Double helix of complementary base pairs
- Nitrogenous base
 - Adenine and Thymine
 - Cytosine and Guanine
- Phosphate group
- Deoxyribose

RNA & Transcriptomics

- Ribonucleic acid (mRNA)
 - Result of TRANSCRIPTION
 - Information encoded with the DNA sequence of one or more genes is TRANSCRIBED into a strand of RNA –RNA transcript
 - Single stranded
 - A,G,C,U (T)

Translation: DNA to mRNA to Protein

By: Suzanne Clancy, Ph.D. & William Brown, Ph.D. (Write Science Right) © 2008 Nature Education

Citation: Clancy, S. & Brown, W. (2008) Translation: DNA to mRNA to Protein. Nature Education 1(1):101

Proteins & Proteomics

A GUIDE TO THE TWENTY COMMON AMINO ACIDS

AMINO ACIDS ARE THE BUILDING BLOCKS OF PROTEINS IN LIVING ORGANISMS. THERE ARE OVER 500 AMINO ACIDS FOUND IN NATURE - HOWEVER, THE HUMAN GENETIC CODE ONLY DIRECTLY ENCODES 20. 'ESSENTIAL' AMINO ACIDS MUST BE OBTAINED FROM THE DIET, WHILST NON-ESSENTIAL AMINO ACIDS CAN BE SYNTHESISED IN THE BODY.

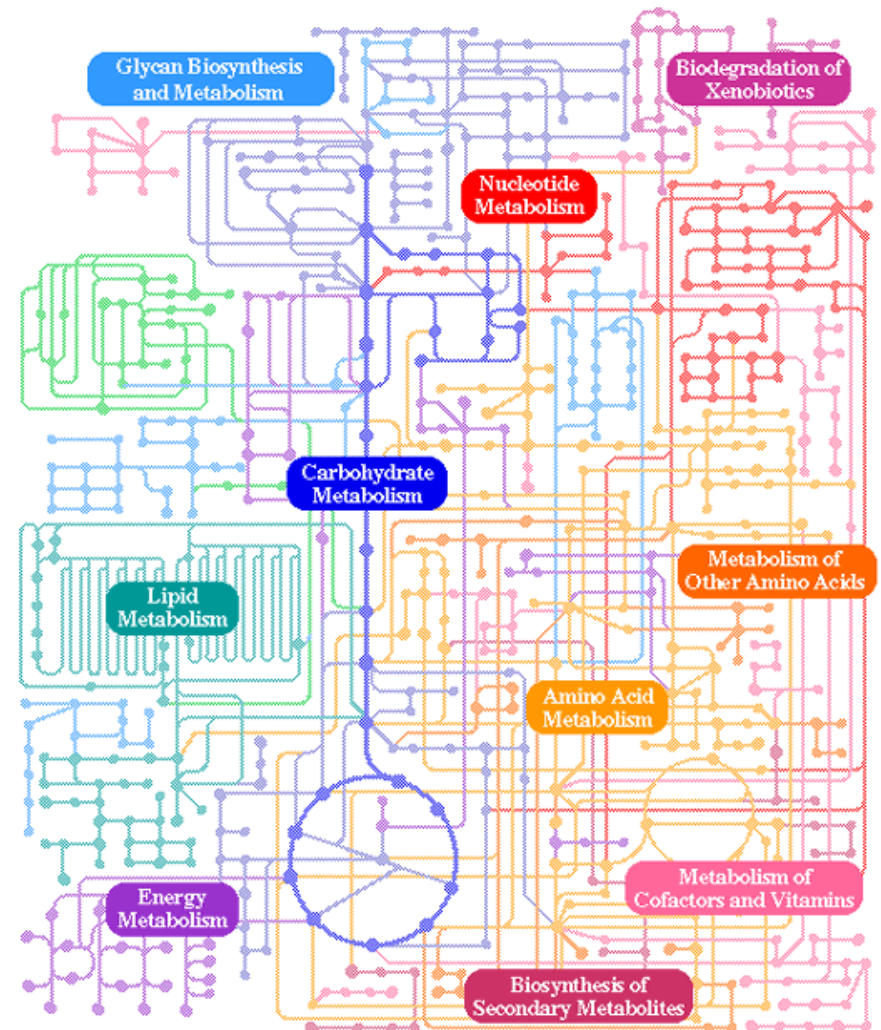

Chart Key: ● ALIPHATIC ● AROMATIC ● ACIDIC ● BASIC ● HYDROXYLIC ● SULFUR-CONTAINING ● AMIDIC ○ NON-ESSENTIAL ○ ESSENTIAL

Note: This chart only shows those amino acids for which the human genetic code directly codes for. Selenocysteine is often referred to as the 21st amino acid, but is encoded in a special manner. In some cases, distinguishing between asparagine/aspartic acid and glutamine/glutamic acid is difficult. In these cases, the codes asx (B) and glx (Z) are respectively used.

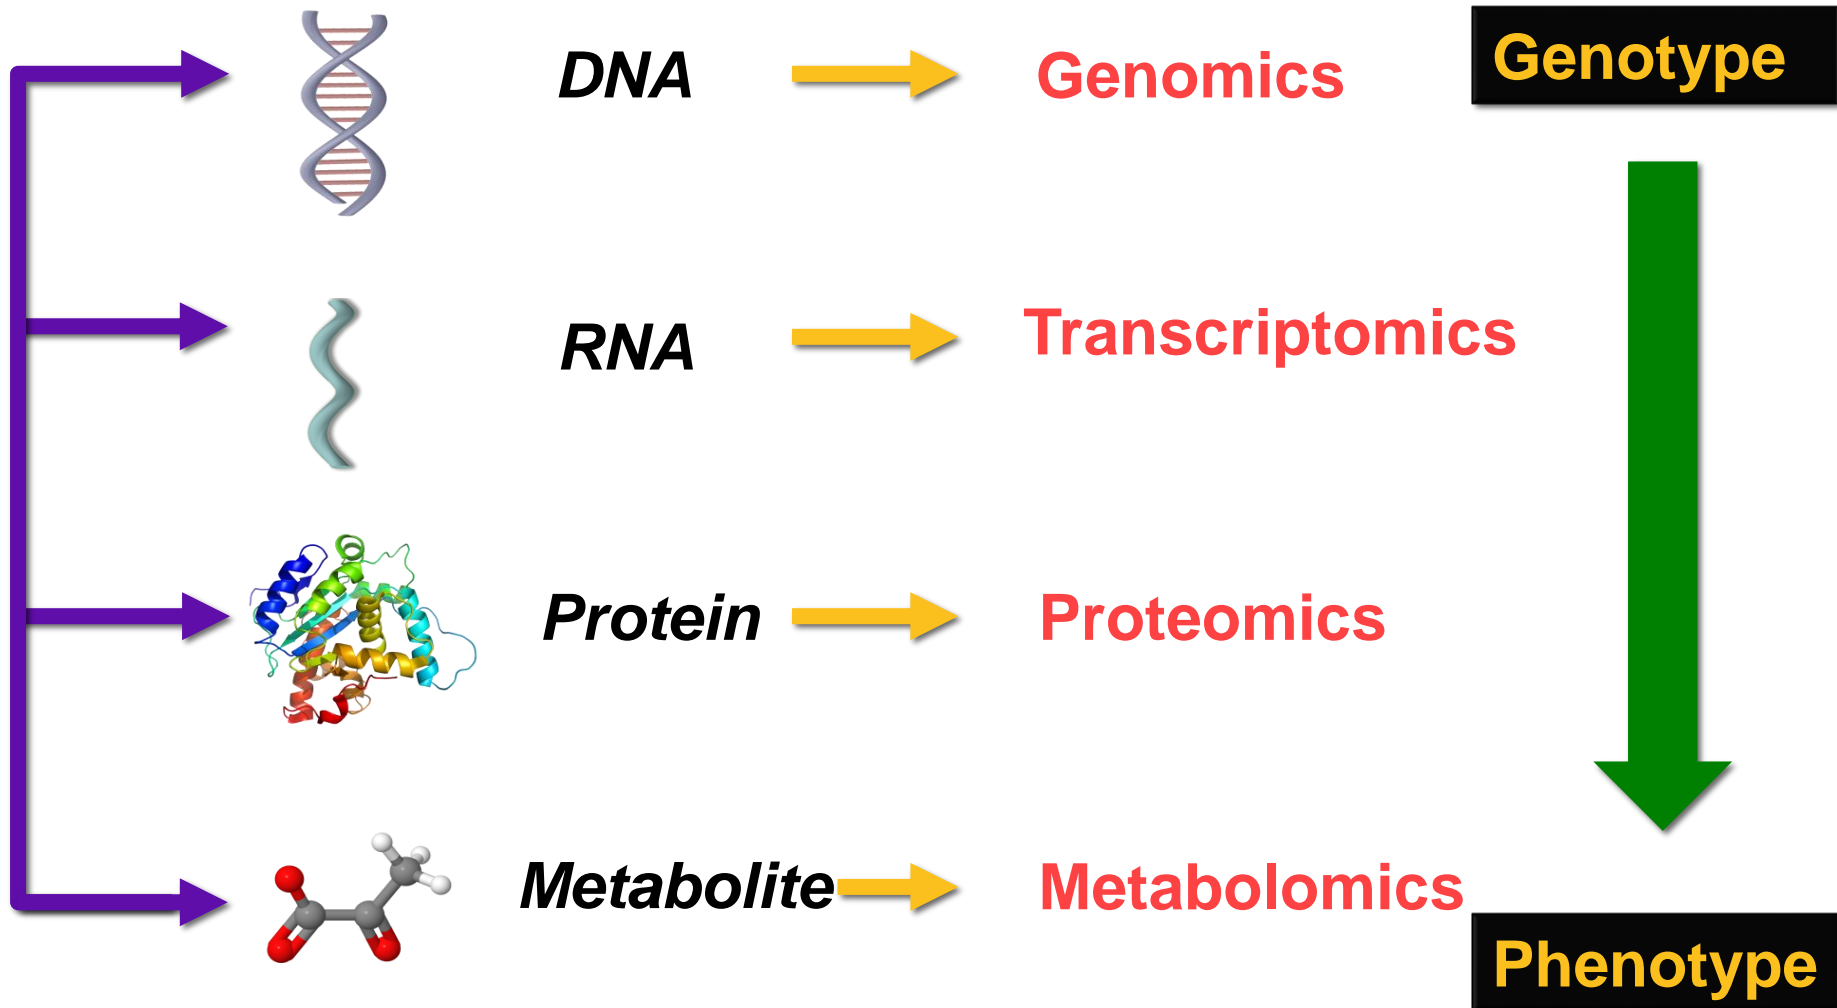

Metabolites & Metabolomics

- Low molecular weight products
- Metabolism is a complex interplay of reactions that occur within cells
- Diverse roles
 - Energy metabolism
 - Amino acid metabolism
 - Lipid metabolism
- Primary metabolism – direct development
- Secondary metabolism – environmental interactions
 - Antibiotics, steroids *etc*

01100 5/31/04 Image source from KEGG

Central dogma of molecular biology

What is 'Omic Data

Omic data sets include:

- Genetics (SNPs, CNVs)
- Transcriptomics (Affymetrix, RNAseq)
- Epigenomics (DNA methylation, histone mods)
- ChIPseq
- Metabolomics
- Proteomics
- Phosphoproteomics

All have specific quality control (QC) issues and difficulties in analysis
All rely on the use of a false discovery rate correction (FDR) for analysis

TYPES OF 'OMICS DATA?

Why 'omics?

- Adopts an holistic view of all 'molecules' that make up a cell, tissue or organism
- Universal approach/Hypothesis-generating
- No analysis bias
- Many applications
 - '**BIOMARKER**' discovery
 - Early detection/population screening
 - Increasing understanding of disease aetiology
 - Drug discovery & toxicity and efficacy screens

Biomarkers of disease

In medicine, a **biomarker** is a measurable indicator of the severity or presence of some disease state. More generally a **biomarker** is anything that can be used as an indicator of a particular disease state or some other physiological state of an organism.

Experimental Design

- Case vs. Control (an appropriate one!)
- Samples numbers?
 - How many is sufficient?
 - Test cohort + validation cohort?
- Quality of samples
 - Collection/storage/processing
- Confounding factors?
 - Age, gender, environment

Is this good experimental design?

- Metabolomics investigation of liver failure from plasma samples

Table 1. Demographic Information of the Healthy Group and Liver Failure Patient Group Investigated^a

	healthy group (<i>n</i> = 23)	patient group (<i>n</i> = 24)
Gender (male/female)	15/8	21/3
HBsAg	Negative	Positive
Age (year)	27.39 ± 9.24	46.77 ± 13.35
ALT (U/L)	<40	172.63 ± 147.49
TB (μmol/L)	<12	457.33 ± 135.48
PT (s)	<14	26.06 ± 15.14
MELD score	/	24.68 ± 8.38

^a Abbreviations: ALT, alanine aminotransferase; TB, total bilirubin; PT, prothrombin time; MELD, model for end-stage liver disease. The value is represented as the form of mean ± SD.

Or what about this one?

Molecular Classification of Cancer: Class Discovery and Class Prediction by Gene Expression Monitoring

T. R. Golub^{1,2,*†}, D. K. Slonim^{1,†}, P. Tamayo¹, C. Huard¹, M. Gaasenbeek¹, J. P. Mesirov¹, H. Coller¹, M. L. Loh², J. R. Downing...

Novel biomarkers for pre-eclampsia detected using metabolomics and machine learning

Louise C. Kenny^{a,*}, Warwick B. Dunn^b, David I. Ellis^b, Jenny Myers^a, Philip N. Baker^a and the GOPEC Consortium, and Douglas B. Kell^{b,*}

- **Pre-eclampsia** - Pregnancy-induced hypertension which may affect mother and foetus

Table 1
Demographic data for patients from whom plasma samples were taken

	Normal outcome <i>n</i> = 87	Preeclampsia <i>n</i> = 87
Age	30 (19–43)	31 (19–41)
Parity	0 (0–2)	0 (0–2)
BMI (weight/height ²)	25 (19–46)	26 (18–46)
Max (S) BP (mm Hg)	122 (96–147)	162 (138–220)*
Max (D) BP (mm Hg)	80 (60–93)	110 (90–140)*
Delivery gestation (weeks + days)	40 + 4 (34 + 3 to 42 + 0)	37 + 0* (26 + 3 to 41 + 1)
Birth weight (g)	3420 (2380–4420)	2410 (590–4300)*
IBR (centile)	34 (10–99)	8 (0–99)*

Median (range).

Pre-eclampsia vs normal outcome.

**p* < 0.0001.

Genomics

- Genome = total DNA of a cell or an organism
- Human genome = 3.2 billion bases and estimated > 30,000 protein coding genes
- Seeking mutations or alterations that may contribute towards a certain disease!
 - *i.e.* the genes BRCA1 and BRCA2 cause 60% of all cases of hereditary breast and ovarian cancers
 - BUT not a single mutation- there are >800 different mutations in BRCA1 alone

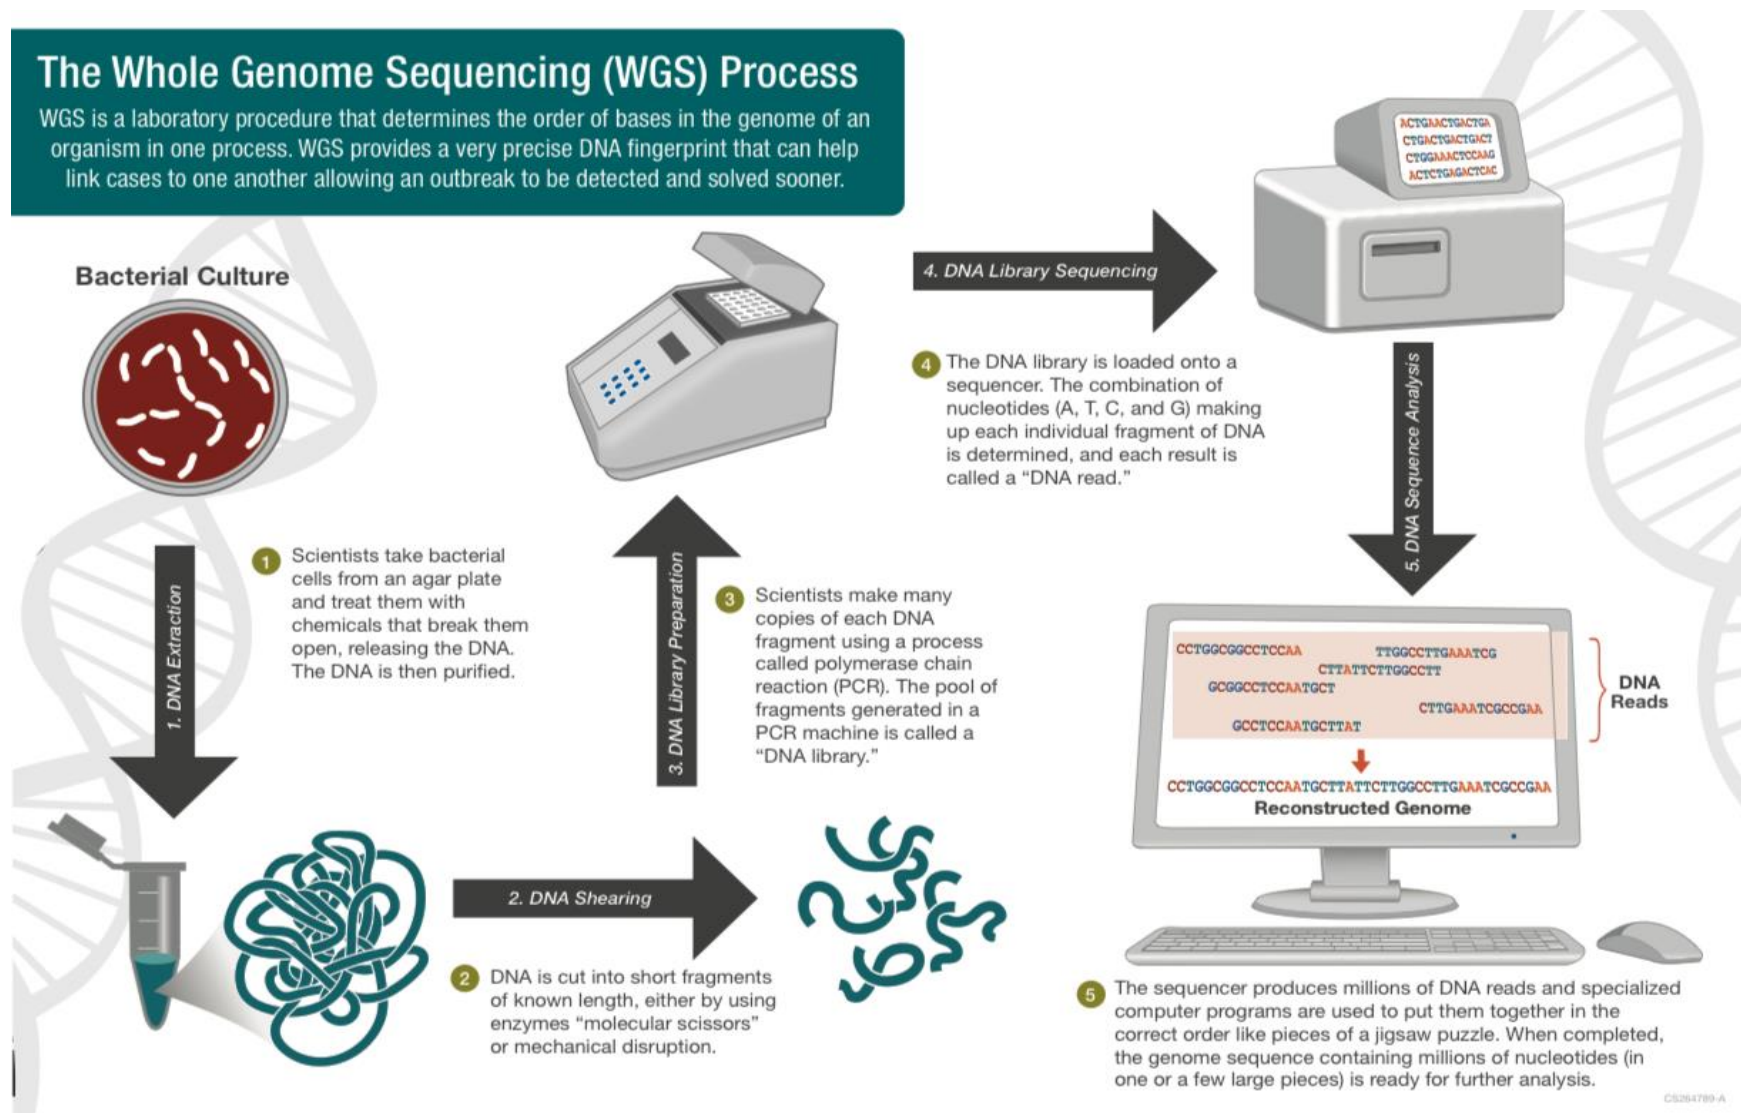

TOOLS: Whole Genome Sequencing

<https://theanalyticalscientist.com/fields-applications/the-tools-behind-genomics>

Sequencing

The Whole Genome Sequencing (WGS) Process

WGS is a laboratory procedure that determines the order of bases in the genome of an organism in one process. WGS provides a very precise DNA fingerprint that can help link cases to one another allowing an outbreak to be detected and solved sooner.

CS264789-A

Cost of Sequencing

PacBio Sequencer

Single-Molecule, Real-Time (SMRT) technology

www.pacb.com

Transcriptomics

- Measuring the transcriptome
 - All the mRNA that is transcribed at a given point in a given cell or organism
- Provides direct knowledge of gene regulation and protein content information
 - Which genes are actively expressed
- Began in 1990s and is now a widespread discipline
 - Many technological advances
 - Now a routine, 'simple' process
- **TOOLS: Microarrays & RNA-Seq**

DNA Microarrays

A microarray is an orderly arrangement of rows and columns on a surface like a glass slide. Each of the spots on an array contains single-stranded DNA molecules that correspond to a single gene. An array can contain a few, or thousands, of genes.

DNA Microarrays

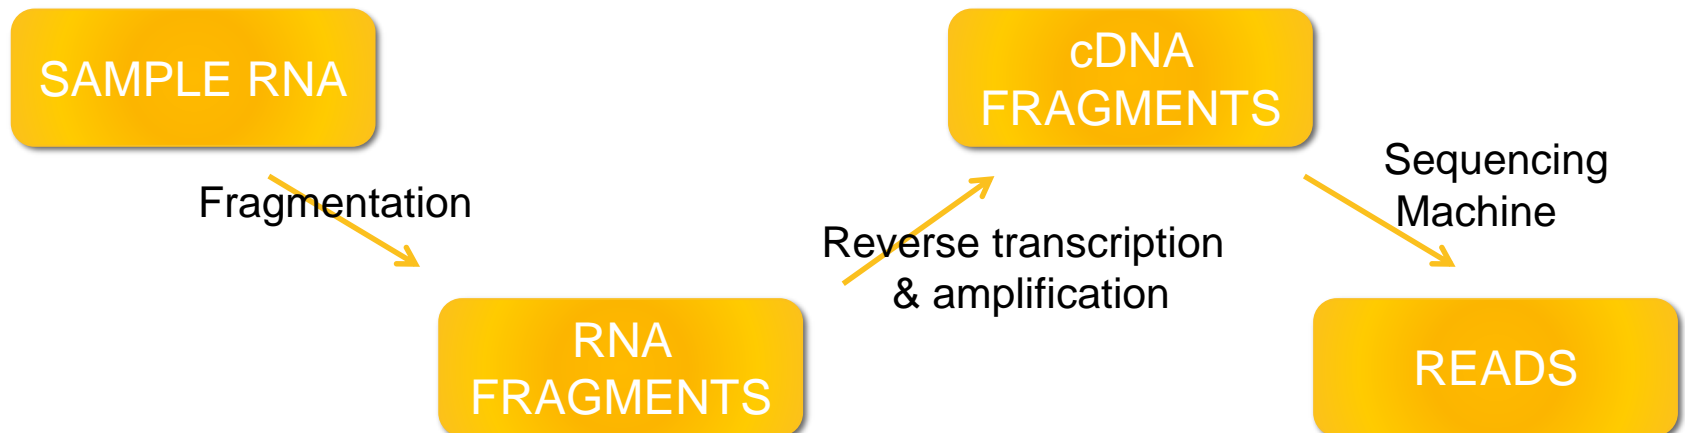

**Converted to
numerical
values for
interpretation**

Limitation: Results
limited to what
probes you have on
your chip

RNA Seq

- High throughput sequencing with computer
- No reference sequence
- Large dynamic range
- Sequences every RNA molecule and profiles the expression of a particular gene by counting the number of times its transcript has been sequenced
- Expression levels!

Proteomics

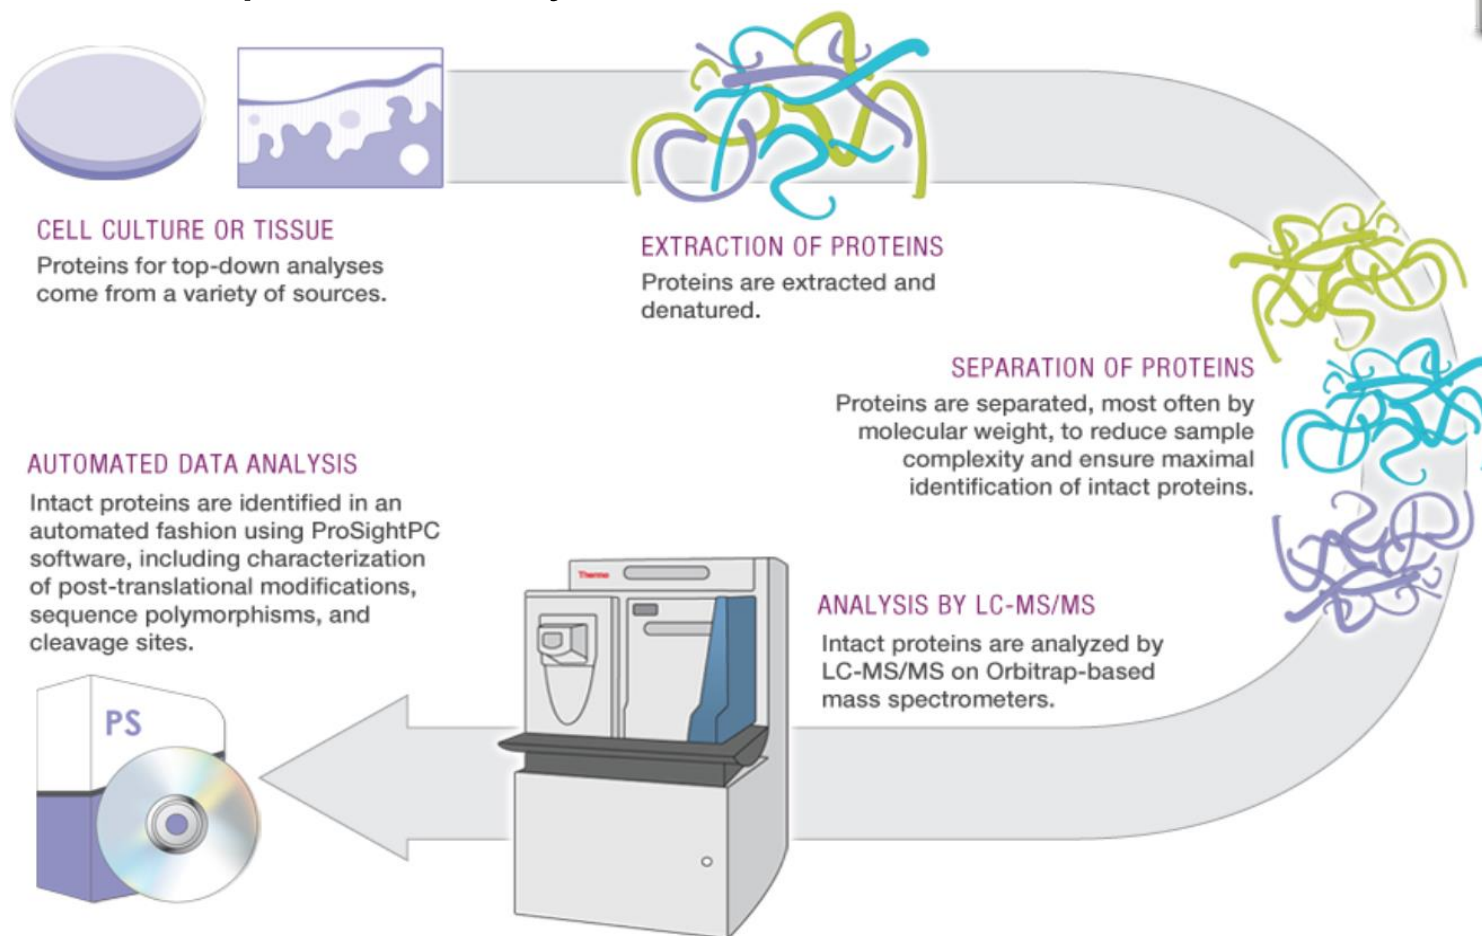

- Investigating the entire complement of proteins within a cell, tissue or organism.
- >100,000 proteins
- Large dynamic range

- Some questions
 - When & where proteins are expressed
 - The involvement of proteins with particular phenotypes
 - How proteins are modified or how they interact with each other

- Blood, urine, tissues

Proteomic Tools

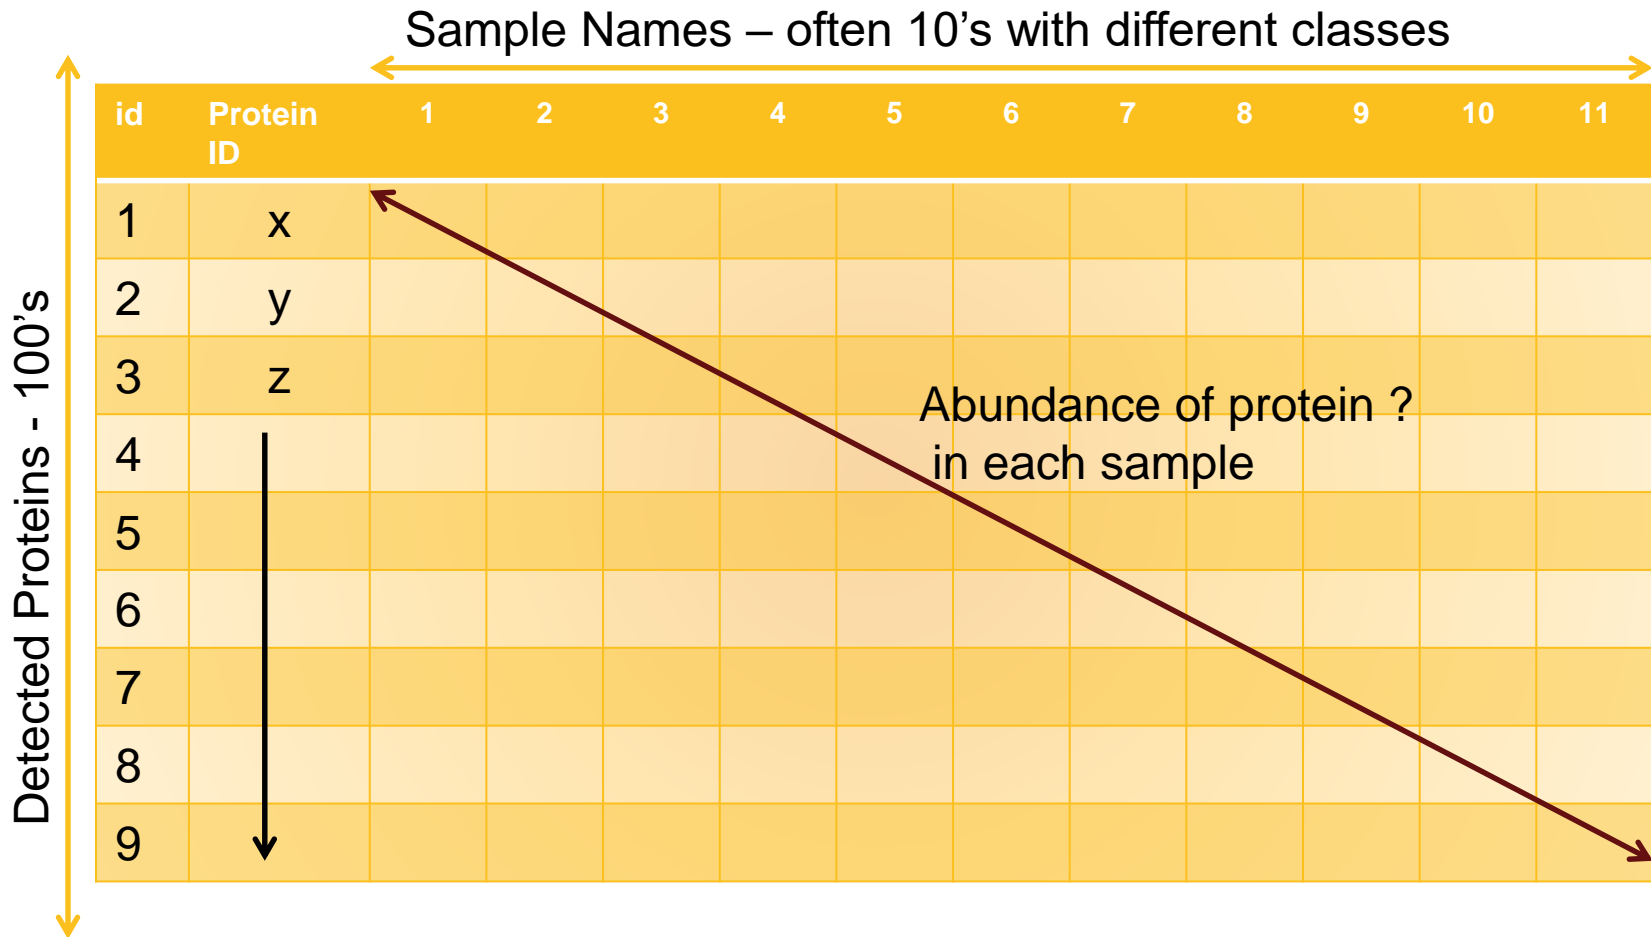

- Mass spectrometry

Proteomic Tools

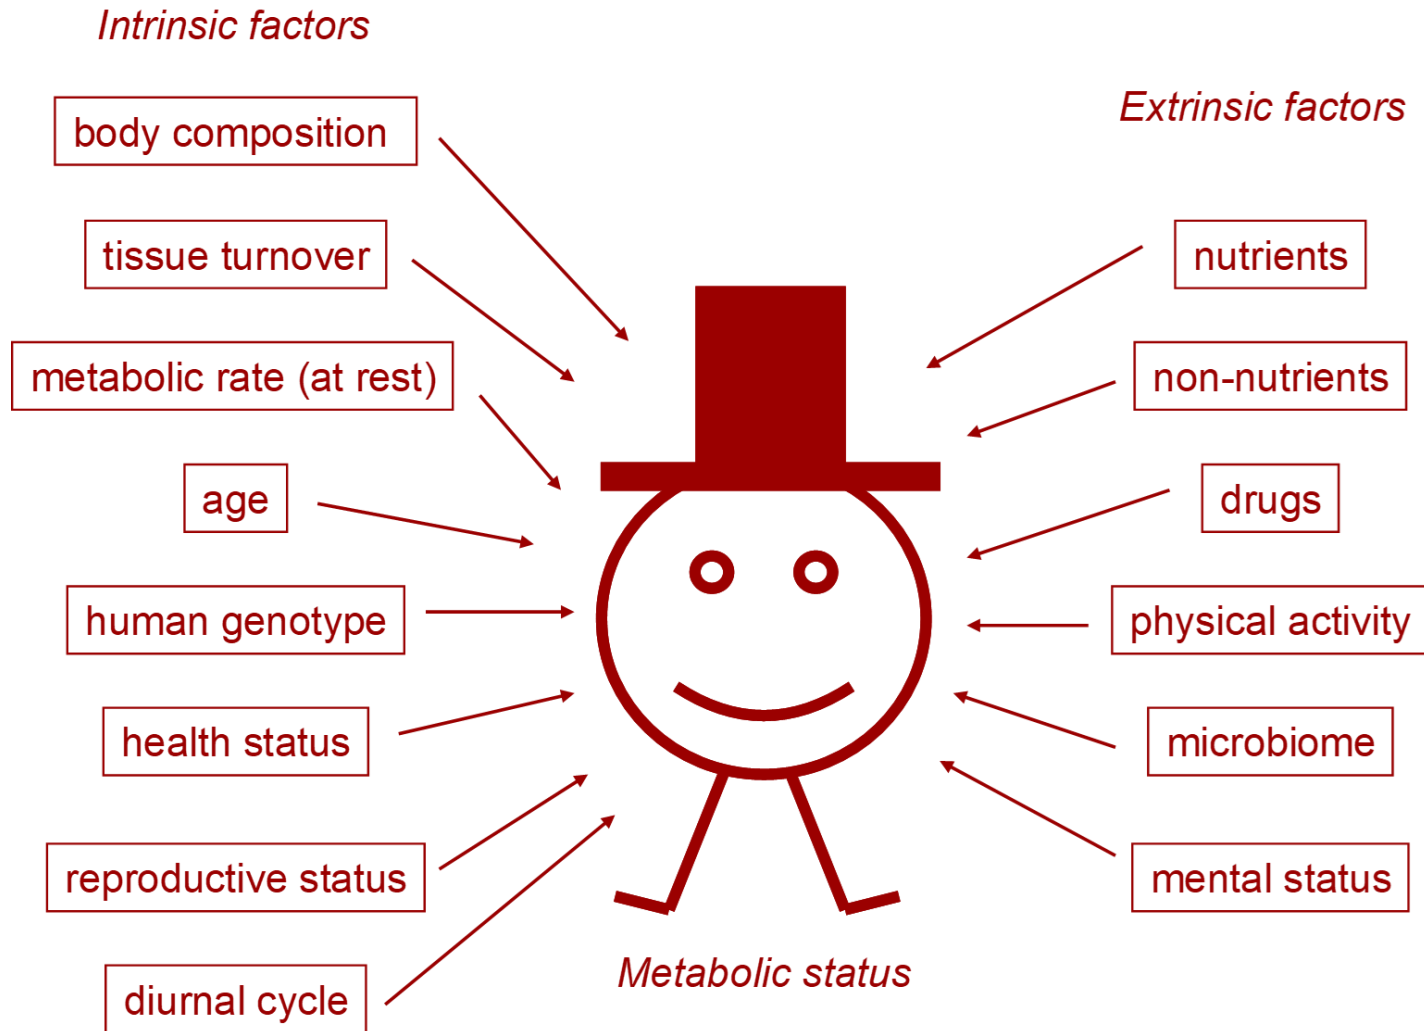

Proteomics Data

Do statistical analysis to decide which features change between classes

Metabolomics

- Investigating the entire complement of low molecular weight molecules in an sample of interest.
- ~ 5000 metabolites in a biological sample from a human
 - GREATLY impacted by environment!
 - GREATLY impacted by time!
- Experimental design & sample collection is VERY important!

	9														

Use RT & m/z to identify the metabolite – **MAJOR CHALLENGE!**

Do statistical analysis to decide which features change between classes

Common Theme

Data & lots of it!

“Data does not equal information;
information does not equal knowledge;
and, most importantly of all, knowledge
does not equal wisdom. We have oceans
of data, rivers of information, small puddles
of knowledge, and the odd drop of
wisdom.”

The challenge of biomarkers?

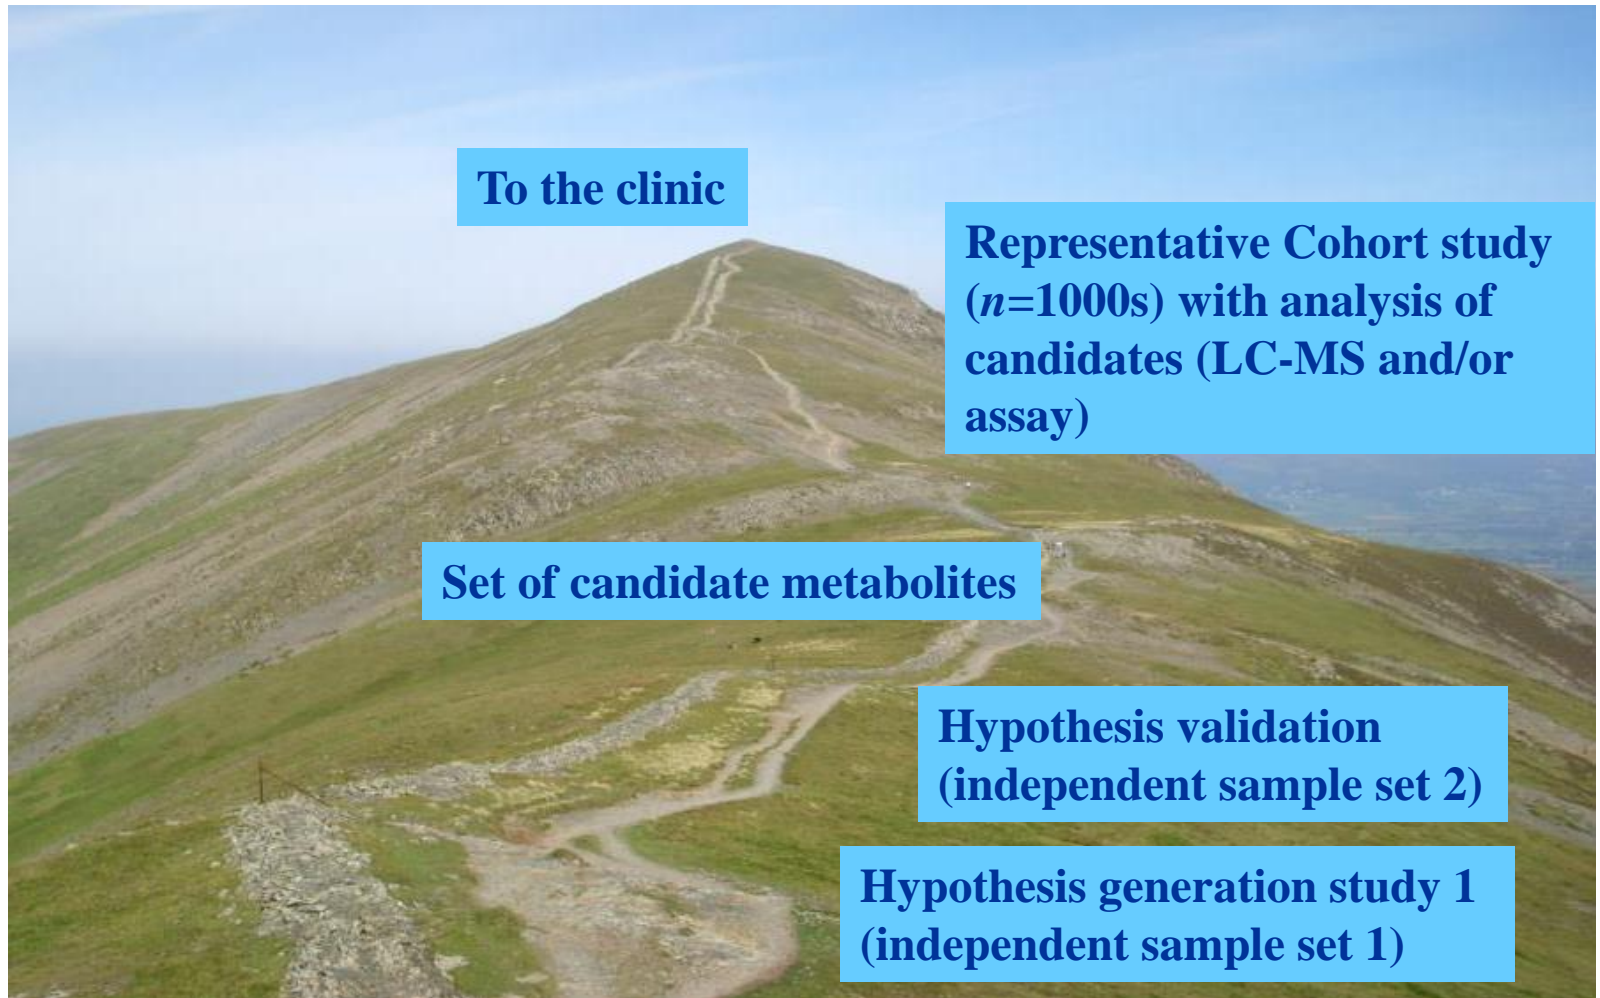

- Poste, G., *Bring on the biomarkers*. Nature, 2011. **469**(7329): p. 156-157.
- Multi-Centre, large cohort studies

A DROP IN THE OCEAN

Few of the numerous biomarkers so far discovered have made it to the clinic.

Biomarker Discover: From lab to bedside

Conception (objectives, collaborations, design of experiment)

SOME EXAMPLES.....

Personalised/Precision Medicine

- Is this the future of healthcare?
 - 2015 State of the Union address President Obama announced that he was launching the Precision Medicine Initiative
- Assess the genotype (SNPs) and phenotype (metabolome) of a patient before they undergo any treatment
 - Population monitoring & data collation
 - Seeking cures & preventative screening
- Offering a well-designed screening program at a reasonable cost may not always be possible due to the numerous associated challenges
 - monetary limitations (labour and consumable costs) as well as ethical, legal and social considerations for an opt-in test

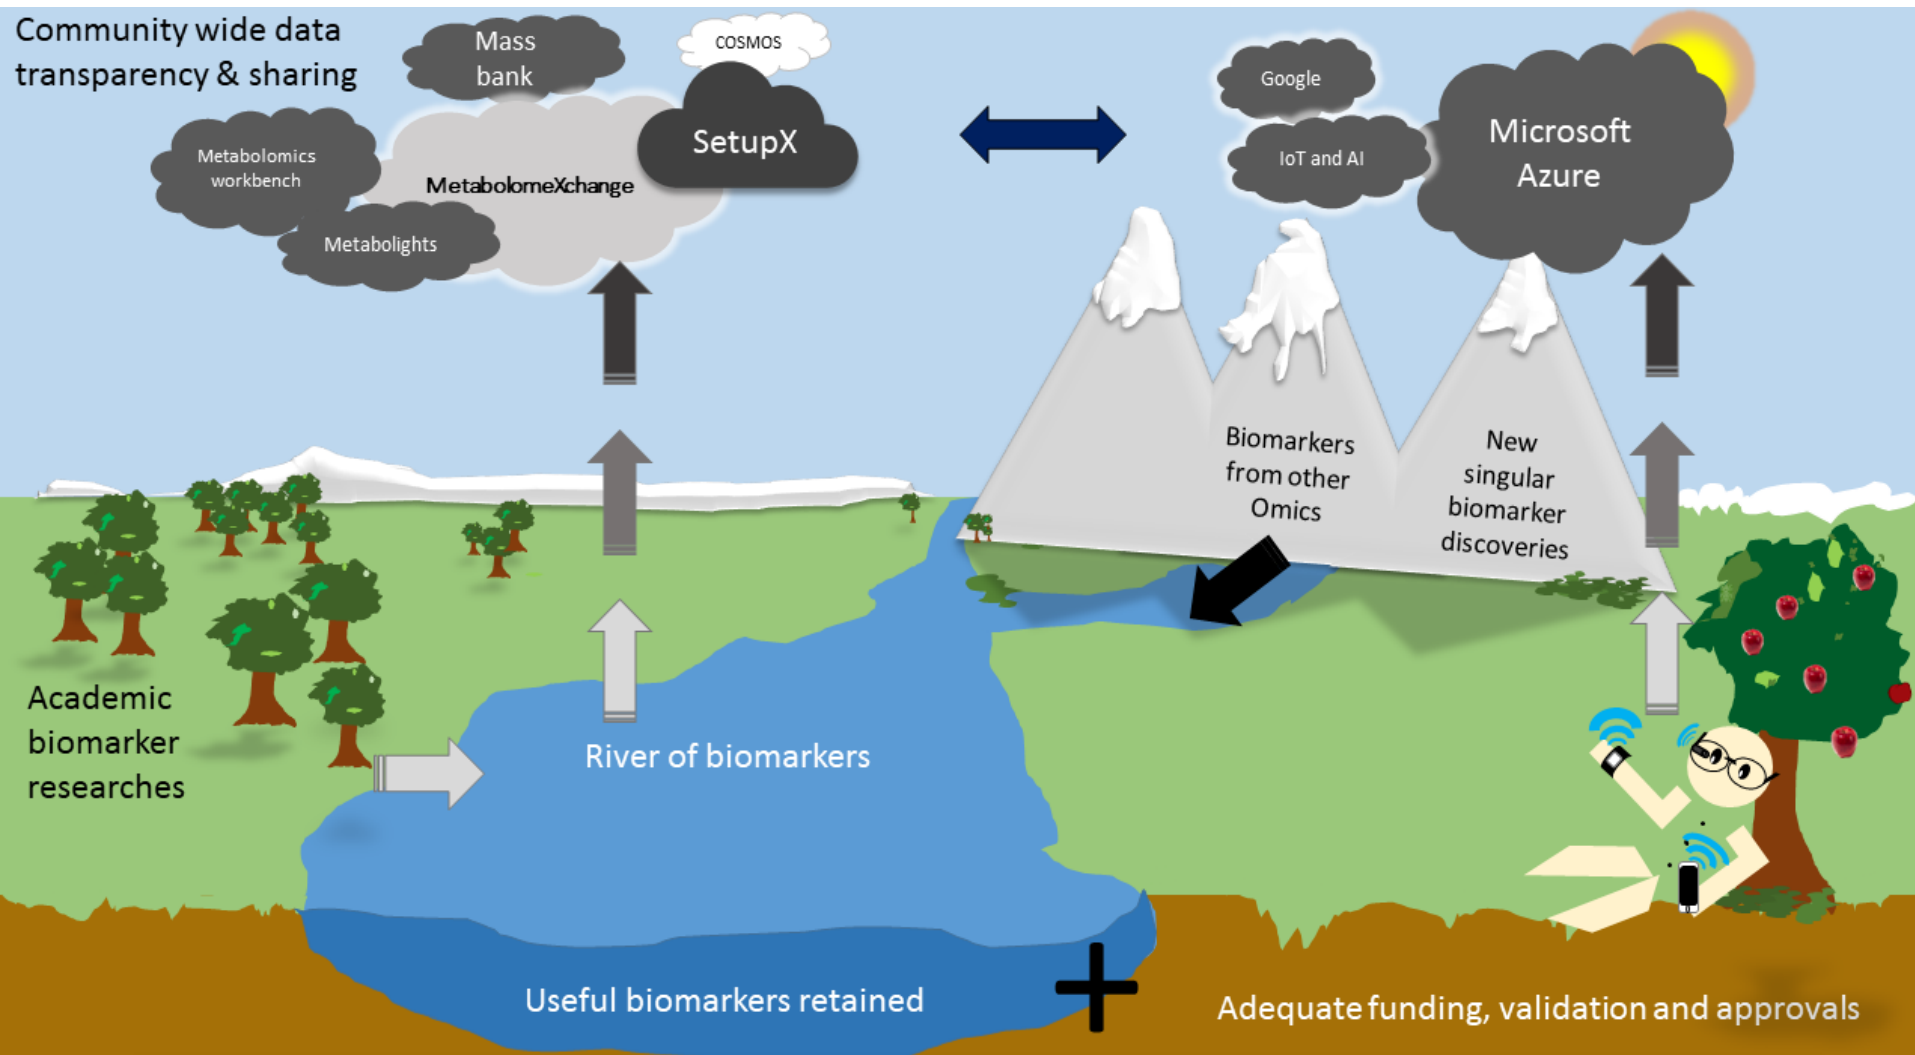

(Metabol)'omics for the masses?

- Wearable technologies – smartphones, smart-watches, health bands, necklaces, glucose monitoring contact lenses
 - Innovations for collecting personal information
- mPower - mobile Parkinson's Disease study that attempts to research the occurrence, presentation and management of PD symptoms *via* survey telemetry data using a smartphone app
 - Bot, B.M., et al., *The mPower study, Parkinson disease mobile data collected using ResearchKit*. Scientific Data, 2016. **3**: p. 160011.
- Smart-phone app to monitor the association between pain and the weather for people suffering from rheumatoid arthritis
 - Reade, S., et al., *Cloudy with a Chance of Pain: Engagement and Subsequent Attrition of Daily Data Entry in a Smartphone Pilot Study Tracking Weather, Disease Severity, and Physical Activity in Patients With Rheumatoid Arthritis*. JMIR Mhealth Uhealth, 2017. **5**(3): p. e37.
 - Dixon, W.G., et al. How the weather affects the pain of citizen scientists using a smartphone app. Npj Digital Medicine (2019) 2:105

Patients with chronic pain commonly believe their pain is related to the weather. Scientific evidence to support their beliefs is inconclusive, in part due to difficulties in getting a large dataset of patients frequently recording their pain symptoms during a variety of weather conditions. Smartphones allow the opportunity to collect data to overcome these difficulties. Our study *Cloudy with a Chance of Pain* analysed daily data from 2658 patients collected over a 15-month period. The analysis demonstrated significant yet modest relationships between pain and relative humidity, pressure and wind speed, with correlations remaining even when accounting for mood and physical activity. This research highlights how citizen-science experiments can collect large datasets on real-world populations to address long-standing health questions. These results will act as a starting point for a future system for patients to better manage their health through pain forecasts.

The future cycle of metabolomics precision medicine-based research and healthcare where academia, industrial partners, corporate data analytics work with patients' wearable data collection devices to provide health monitoring solutions.

MetaboLights

MetaboLights is a database for Metabolomics experiments and derived information. The database is cross-species, cross-technique and covers metabolite structures and their reference spectra as well as their biological roles, locations and concentrations, and experimental data from metabolic experiments. MetaboLights is the recommended Metabolomics repository for a number of leading journals.

MTBLS1: A metabolomic study of urinary changes in type 2 diabetes in human compared to the control group

Abstract

Type 2 diabetes mellitus is the result of a combination of impaired insulin secretion with reduced insulin sensitivity of target tissues. There are an estimated 150 million affected individuals worldwide, of whom a large proportion remains undiagnosed because of a lack of specific symptoms early in this disorder and inadequate diagnostics. In this study, NMR-based metabolomic analysis in conjunction with uni- and multivariate statistics was applied to examine the urinary metabolic changes in Human type 2 diabetes mellitus patients compared to the control group. The human population were un medicated diabetic patients who have good daily dietary control over their blood glucose concentrations by following the guidelines on diet issued by the American Diabetes Association. Note: This is part of a larger study, please refer to the original paper below.

PRIDE Archive - proteomics data repository

The PRIDE PRoteomics IDentifications (PRIDE) database is a centralized, standards compliant, public data repository for proteomics data, including protein and peptide identifications, post-translational modifications and supporting spectral evidence. PRIDE is a core member in the ProteomeXchange (PX) consortium, which provides a single point for submitting mass spectrometry based proteomics data to public-domain repositories. Datasets are submitted to PRIDE via ProteomeXchange and are handled by expert biocurators.

What is Network Biology

Biological networks are:

- “Scale free”
- Resistant to random error
- Exhibit “small world” properties

Nature **393**, 440-442 (4 June 1998) | doi:10.1038/30918; 1998

Collective dynamics of 'small-world' networks

Duncan J. Watts² & Steven H. Strogatz¹

$$L \propto \log N$$

typical distance L between two randomly chosen nodes (the number of steps required) grows proportionally to the logarithm of the number of nodes N in the network

small-world network - most nodes are not neighbours of one another, but most nodes can be reached from every other by a small number of steps.

Network Clusters are associated with hierarchy of biological function

“overlapping modules”

“Overlapping Community Clustering”

Hierarchy of functions and pathways ranked by centrality of cluster

Cluster	Hierarchy of Functions and Pathways	Core nodes of cluster
SUMO2	Cellular responses to stress, Apoptosis, Circadian clock, DNArepair, Metabolism of Proteins ($q < 1 \times 10^{-3}$). G1/S DNA damage checkpoint ($q < 6.2 \times 10^{-8}$)	SUMO2 , UBC, MDM2, TP53, EEF1A1, PRKDC, RPS4X, SRRM2, RPS13, RPS20
SKP1	Cell Cycle, Circadian Clock ($q < 1 \times 10^{-5}$). Wnt & Prolactin signalling ($q < 1.0 \times 10^{-5}$)	SKP1 , BTRC, CUL1, GSK3B, CTNNB1, SKP2, NFKBIA, CLSPN, FBXW11, FBXO6
GSK3B	Apoptosis, Signal transduction ($q < 0.01$). Wnt, PI3/AKT signalling ($q < 0.01$)	GSK3B , AXIN1, APP, AKT1, MAPT, CTNNB1, ELAVL1, KIF5B, AXIN2, HIPK2
NCOA1	Transcriptional regulation of white adipocyte differentiation, Regulation of lipid metabolism by PPARalpha, Circadian Clock, Mitochondrial biogenesis ($q < 0.01$)	NCOA1 , NCOA6, ESR1, PPARG, MLL3, RXRA, ESR2, MLL4, NCOR2, VDR
EZH2	Cellular Senescence, Epigenetic regulation of gene expression ($q < 1.0 \times 10^{-4}$)	EZH2 , EED, SUZ12, EZH1, JARID2, SON, SRSF7, NRF1, FBL, HDAC1
TCEB2	Cellular response to hypoxia ($q < 1 \times 10^{-5}$). TGF-beta Signalling ($q < 0.05$)	TCEB2 , VHL, CUL5, TCEB1, CUL2, TCEB3, ASB9, STK16, NEDD8, COPS6
NCOR2	Transcriptional regulation of white adipocyte differentiation, Regulation of lipid metabolism by PPARalpha, Circadian Clock, Mitochondrial biogenesis ($q < 0.01$)	NCOR2 , NCOA6, HDAC3, BCL6, RARA, AR, ANKRD11, THRB, HDAC1, KDM5B
DIABLO	Immune system, Apoptosis ($q < 0.05$) Toll-Like Receptors Cascades ($q < 1.0 \times 10^{-4}$)	DIABLO , XIAP, BIRC2, BIRC6, UBE2D4, BIRC3, BIRC7, TRAF2, BIRC5, ELAVL1
NBN	DNA Repair, Cell Cycle ($q < 1.0 \times 10^{-4}$) G2/M DNA damage checkpoint ($q < 6.7 \times 10^{-4}$)	NBN , MRE11A, MDC1, RAD50, BRCA1, H2AFX, FANCD2, ATM, TP53BP1, ATR
TSC1	Cellular response to stress ($q < 0.01$). Insulin, IGF1, mTOR, PI3K signalling ($q < 1.0 \times 10^{-5}$)	TSC1 , RHEB, TSC2, YWHAE, MTOR, YWHAB, RAF1, RPTOR, BECN1, MAST3

Boosting Signal-to-Noise in Complex Biology: Prior Knowledge Is Power

Trey Ideker,^{1,2,*} Janusz Dutkowski,¹ and Leroy Hood³

“Network Biology is a primary tool”

NON-INTEGRATED APPROACH

Multi-omic approaches reduce noise using prior knowledge, filtering and integration

INTEGRATED, MULTI-OMICS APPROACH

The statistical power of omics experiments can be enhanced through bioinformatics methods that decrease noise through the use of (1) complementary datasets, and (2) incorporation of prior knowledge about the system (e.g., aggregating measurements from entities that belong to the same pathway). This results in an effective decrease in the False Discovery Rate (FDR), at a given t statistic cutoff, or in the ability to relax such cutoff while maintaining the same FDR.

Similarity network fusion for aggregating data types on a genomic scale

Bo Wang^{1,5}, Aziz M Mezlini^{1,2}, Feyyaz Demir^{1,2}, Marc Fiume², Zhuowen Tu³, Michael Brudno^{1,2}, Benjamin Haibe-Kains^{4,5} & Anna Goldenberg^{1,2}

Figure 1 | Illustrative example of SNF steps. (a) Example representation of mRNA expression and DNA methylation data sets for the same cohort of patients. (b) Patient-by-patient similarity matrices for each data type. (c) Patient-by-patient similarity networks, equivalent to the patient-by-patient data. Patients are represented by nodes and patients' pairwise similarities are represented by edges. (d) Network fusion by SNF iteratively updates each of the networks with information from the other networks, making them more similar with each step. (e) The iterative network fusion results in convergence to the final fused network. Edge color indicates which data type has contributed to the given similarity.

Mapping the Human 'Diseasome'

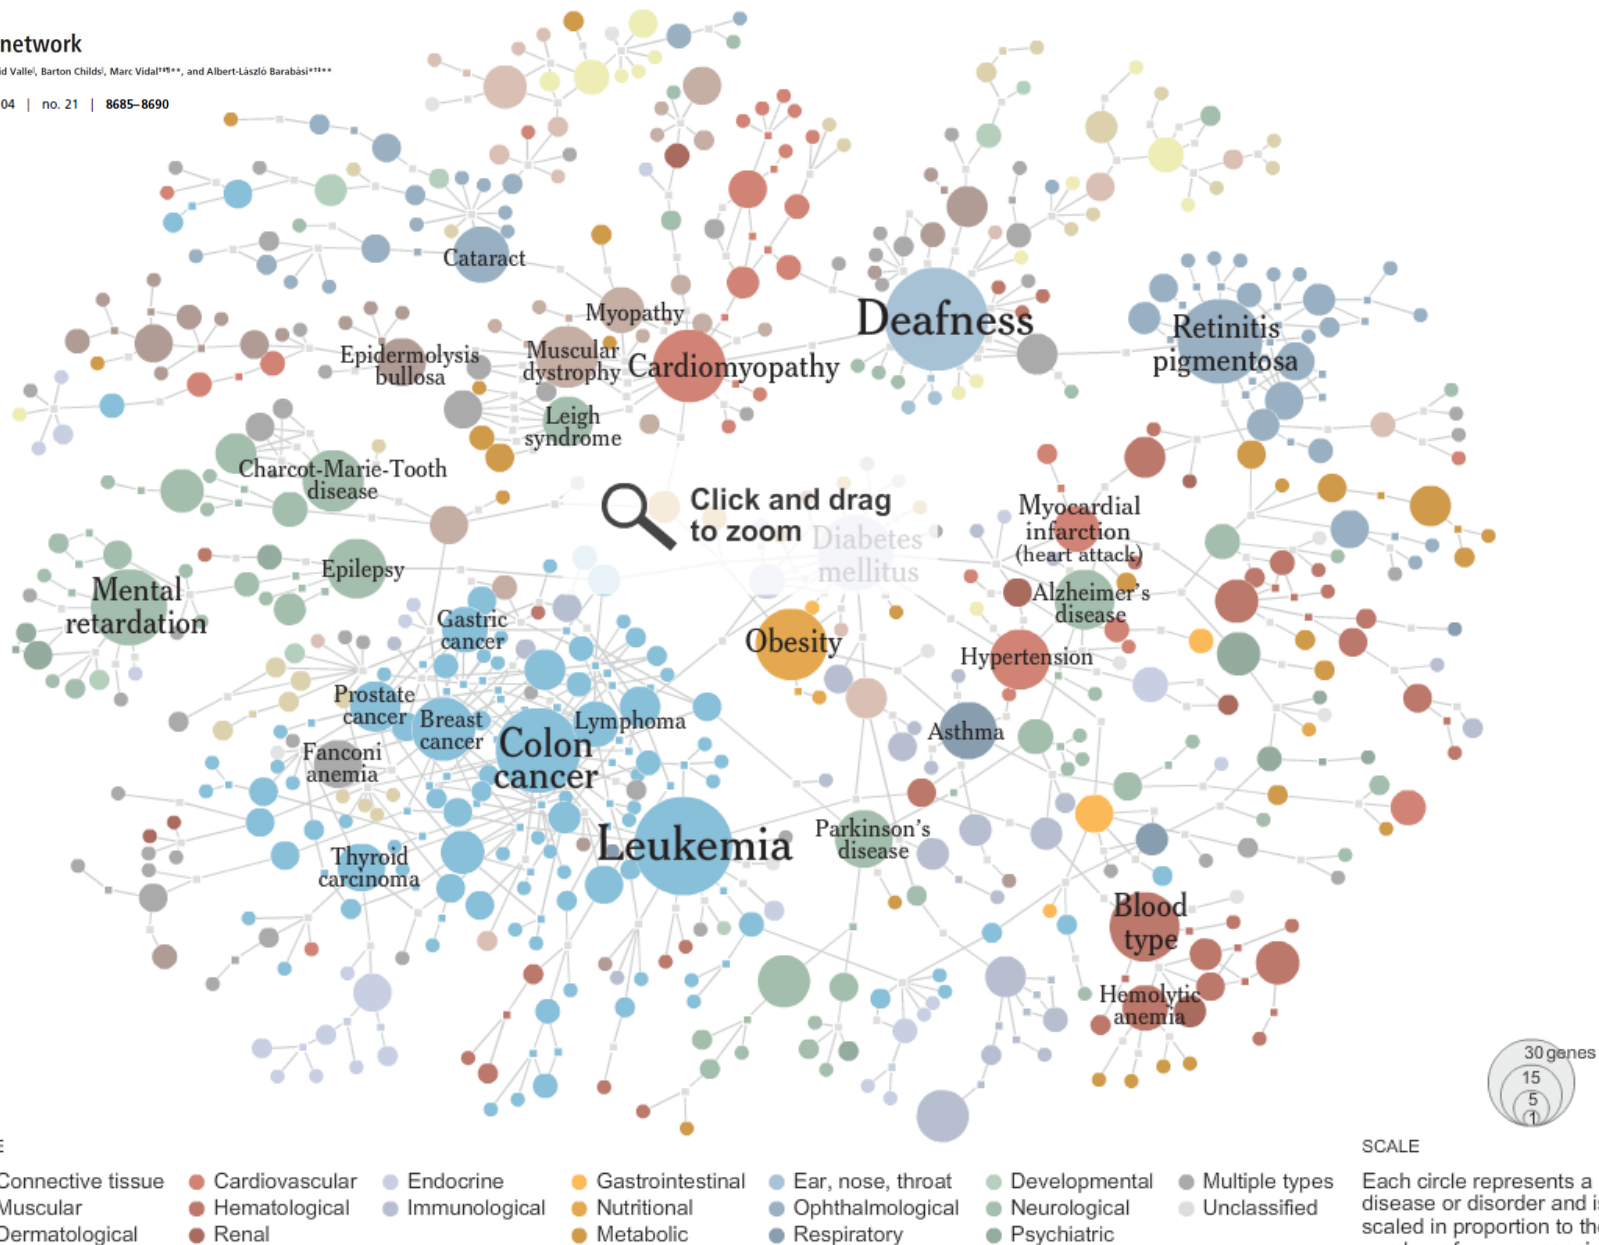

Researchers created a map linking different diseases, represented by circles, to the genes they have in common, represented by squares.

An Expanded View of Complex Traits: From Polygenic to Omnigenic

- A central goal of genetics is to understand the links between genetic variation and disease.
- Intuitively, one might expect disease-causing variants to cluster into key pathways that drive disease etiology.
- But for complex traits, association signals tend to be spread across most of the genome—including near many genes without an obvious connection to disease.
- We propose that gene regulatory networks are sufficiently interconnected such that all genes expressed in disease-relevant cells are liable to affect the functions of core disease-related genes and that **most heritability can be explained by effects on genes outside core pathways**.
- We refer to this hypothesis as an “omnigenic” model.
