#### Marty, Romoli, Sudo & Breheny 2022: Experiment 1

### Bott & Chemla 2016

### Baseline

- Bott & Chemla 2016 did not include baselines
- Direction of priming
  - Strong primes boost SIs
  - $\circ~$  Weak primes inhibit SIs
  - $\circ$  Both
- Bott & Chemla discuss PLURAL as a proxy baseline
- Waldon & Degen 2020 included math pseudo-primes as baselines

## Marty, Romoli, Sudo & Breheny 2022

# BLOCK 1 Baseline

# BLOCK 2 Priming

### **Block design**

- BLOCK 1: Only covered box task
  - 4 target items x 3 scales
  - 2 true controls (correct answer = Overt) x 3 scales
  - 2 false controls (correct answer = Covert) x 3 scales
- BLOCK 2: Same as Bott & Chemla 2016
  - 4 prime-prime-target triplets x 3 scales x 2 prime types
  - Filler items with stronger expressions ('all', 'six', 'X and Y')
    - 3 with Covered Card x 3 scales
    - 3 without Covered card x 3 scales

	Some	NUMERAL	AD HOC
Prime Strong	Some of the symbols are crosses $ \begin{array}{c c}                                    $	There are four crosses $\times$	There is a cross
Prime Weak	Some of the symbols are crosses $ \begin{array}{c} \times \times \times \\ \times \times \times \\ \times \times \times \\ \end{array} $	There are four crosses	There is a cross
	Some of the symbols are squares	There are four squares	There is a square
